f. If 10% of the units in the second sample fail, test all remaining units in the whole group.
g. If at any point, frequent failures are occurring and testing is becoming more troubleshooting than verification, the CxA may stop the testing and require the responsible Sub to perform and document a checkout of the remaining units, prior to continuing with functionally testing the remaining units.

F. Re-Testing And Failure To Remedy Deficiencies
1. Despite Contractor’s best efforts to ensure systems are problem-free, it is expected that some deficiencies will be found during initial inspection of Pre-functional Checklist, and during initial Functional Testing; such deficiencies are expected to be minimal.
2. It is Contractor’s responsibility to remedy identified deficiencies, both in Pre-functional Checklist and in Functional Testing phases of work, in a timely and thorough manner.
3. It is Contractor’s responsibility to ensure that all deficiencies are corrected prior to requesting a re-inspection or re-test of systems and equipment. Do not request re-inspection or re-test until deficiencies are corrected.
a. At his discretion, CxA may agree to re-testing systems or equipment where deficiencies remain which are beyond Contractor’s control to resolve expeditiously.
b. Typically such re-testing of incomplete systems and equipment will take place only if remaining deficiencies are minor in scope and nature, and are of such nature that they cannot be resolved in a timely manner (such as those due to difficulties in obtaining parts, or where Owner has requested a change that has delayed work, etc.)
4. CxA will carry out a second re-inspection or re-test of systems and equipment subsequent to receiving Contractor’s request.
a. If CxA finds deficiencies identified in initial inspection or test have not been remedied (with exception of un-resolvable deficiencies in 3.b. above), and such remaining deficiencies are significant enough to require additional inspection or re-testing, Contractor will be back-charged for CxA’s expenses, and time at a rate of $150.00 per hour and $100.00 expenses, for a third and any subsequent re-inspections and re-tests.

G. Deferred Testing
1. "Seasonal Commissioning” pertains to testing during peak heating or cooling seasons when HVAC equipment is operating at full-load or heavy-load conditions. Initial commissioning will be done as soon as contract work is completed, regardless of season. Seasonal Commissioning under full- or heavy-load conditions other than the current season will be handled at later time by GC and CxA.
2. If adequate load may be artificially placed upon heating or cooling equipment, CxA, at his discretion, may perform functional testing during non-peak load periods.
3. GC is to provide services of personnel and participate in seasonal testing process in the same manner as he would in non-seasonal testing.
4. Until off-season commissioning can be accomplished, Owner may retain an amount from GC’s payment sufficient to cover the cost of off-season testing.
5. Unforeseen Deferred Tests: If any check or test cannot be completed due to building structure, required occupancy condition, or other reason, execution of checklists and functional testing may be delayed upon approval of Owner. Tests shall be conducted in same manner as seasonal tests, as soon as possible. Services of required parties will be negotiated. Make final adjustments to Operation and Maintenance Manuals and record drawings due to unforeseen deferred tests.
6. GC is to provide services of personnel and participate in deferred testing in the same manner as he would for normal commissioning.

3.7 TRAINING

A. The following requirements are in addition to Operations & Maintenance requirements specified elsewhere in this specifications manual.

B. Contractor shall be responsible for training coordination and scheduling, and ultimately to ensure that training is completed.

C. The training agenda (plan) shall include, at a minimum, the following elements:
1. Purpose of equipment.
2. Principle of how the equipment works.

3. Important parts and assemblies.
4. How the equipment achieves its purpose and necessary operating conditions.
5. Most likely failure modes, causes and corrections.
6. On site demonstration.

D. Commissioning Agent shall be responsible for overseeing and approving content and adequacy of training of Owner personnel for all installed systems. Provide Commissioning Agent with training plan two weeks before planned training.

3.8 OPERATIONS & MAINTENANCE MANUALS

A. The following requirements are in addition to Operations & Maintenance requirements specified elsewhere in this specifications manual.

B. Contractor shall compile and prepare documentation for equipment and systems specified in this Division, and shall deliver documentation to Contractor for inclusion in Operation & Maintenance Manuals, in accordance with requirements of Division 01, prior to training Owner personnel.

C. Provide Commissioning authority with a single, electronic copy of Operation & Maintenance Manuals for review. Commissioning authority's copy of O&M manuals shall be submitted through Architect.

D. Operation and maintenance manuals shall include, service agency contact information, maintenance requirements, controls system settings and a narrative of how each system is intended to operate, including set points.

3.9 DOCUMENTATION

A. Commissioning authority shall provide documentation of process as follows:
1. Preliminary commissioning report including test procedures, results of testing, itemization of deficiencies, deferred tests and climatic conditions required for performance of deferred tests. Preliminary commissioning report shall be issued to owner to demonstrate the first pass of testing has occurred and to demonstrate compliance with applicable codes.
2. Final commissioning report shall include the final test and balance report, final results of functional testing, disposition of deficiencies discovered during testing, including the details of corrective measures used and functional testing procedures used for repeatability of testing in the future.

END OF SECTION

SECTION 26 09 13 - ELECTRICAL POWER MONITORING AND CONTROL

PART 1 - GENERAL

1.1 SCOPE

A. Provide quantity of monitoring devices as shown on drawings.

B. Monitoring devices shall include all necessary accessories to be fully functional as described by this specification.

C. Provide a 4 year warranty on devices.

D. Devices shall be UL listed and CE marked.

1.2 STANDARDS

A. ANSI C12.201(Class 0.2%)

B. IEC62053-22 (Class 0.2%)

C. IEEE C37.90.1

1.3 ACCEPTABLE MANUFACTURERS

A. Electro Industries/GaugeTech.

B. Products judged to be equal by the engineer.

1.4 SUBMITTALS

A. Shop drawings shall include, but not be limited to:
   1. Cutsheets of devices with ratings, physical dimensions and all accessories clearly labeled.
   2. Device labels shall be clearly indicated in cutsheets.
   3. All standards and listings, as specified in section 1.2A, shall be clearly labeled in cutsheets provided.
   4. Cutsheets shall clearly outline that design requirements of this specification have been met.

PART 2 - PRODUCTS

2.1 DESIGN

A. Power meter shall be designed for Multifunction Electrical Measurement on 3 phase power systems.
   1. Meter shall support 3 element Wye, 2.5 element Wye, 2 element Delta, 4 wire Delta systems.
   2. The meter shall accept universal voltage input.
   3. Surge withstand shall conform to IEEE C37.90.1
   4. The meter shall be user programmable for voltage range to any PT ratio.
   5. Meter shall accept a burden of up to 0.36VA per phase, Max at 600V, 0.014VA at 120 Volts.
   6. The meter shall accept a voltage input range of up to 416 Volts Line to Neutral, and a range of up to 721 Volts Line to Line.
   7. Meter shall accept a current reading of up to 11 Amps continuous.

B. The meter shall include a three line, bright red, 0.56” LED display.
   1. The meter shall fit in both DIN 92mm and ANSI C39.1 Round cut-outs.
   2. The meter must display a % of Load Bar on the front panel to provide an analog feel. The % Load bar shall have not less than 10 segments.

C. The meter shall support power supply of 90 to 265 Volts AC and 100 to 370 Volts DC. Universal AC/DC Supply shall be available.
   1. Meter power supply shall accept burden of 10VA max.

2. Meter shall provide upgrade rate of 100msec for Watts, Var and VA. All other parameters shall be 1 second

D. Meter shall be available in transducer only version, which shall not include a display. The meter shall mount directly to a DIN rail.

2.2 OPERATION

A. Power meter shall use a dual input method for current inputs. Method one shall allow the CT to pass directly through the meter without any physical termination on the meter, ensuring the meter cannot be a point of failure on the CT circuit. The second method shall provide additional termination pass-through bars, allowing the CT leads to be terminated on the meter. The meter must support both termination methods.
1. Fault Current Withstand shall be 100 Amps for 10 seconds, 300 Amps for 3 seconds, and 500 Amps for 1 second.
2. Meter shall be programmable for current to any CT ratio. DIP switches or other fixed ratios shall not be acceptable
3. Meter shall accept burden of 0.005VA per phase, Max at 11 Amps.
4. Meter shall begin reading at a 5mA pickup current.
5. Pass through wire gauge dimension of 0.177” / 4.5 mm shall be available.
6. All inputs and outputs shall be galvanically isolated to 2500 Volts AC.
7. The meter shall accept current inputs of class 10: (0 to 11) A, 5 Amp Nominal, and class 2 (0 to 2) A, 1A Nominal Secondary.

2.3 ACCURACY REQUIREMENTS

A. The meter shall have an accuracy of +/- 0.1% or better for volts and amps, and 0.2% for power and energy functions. The meter shall meet the accuracy requirements of IEC62053-22 (Class 0.2%) and ANSI C12.201(Class 0.2%).
1. The meter shall provide true RMS measurements of voltage, phase to neutral and phase to phase; current, per phase and neutral.
2. The meter shall provide sampling at 400+ samples per cycle on all channels measured readings simultaneously.
3. The meter shall utilize 24 bit Analog to Digital conversion.
4. Meter shall provide Harmonics %THD (% of total Harmonic Distortion).

B. Meter shall be a traceable revenue meter, which shall contain a utility grade test pulse allowing power providers to verify and confirm that the meter is performing to its rated accuracy.

2.4 STANDARD FEATURES

A. The meter shall include 2 independent communications ports on the back and face plate, with advanced features.
1. One port, through backplate, shall be an RJ45 port, providing 100BaseT Ethernet communication speaking BACnet/IP protocol and Modbus TCP, and a Web server.
2. The meter shall provide an optical IrDA port (through faceplate), as the second communication port, which shall allow the unit to be set up and programmed using a remote laptop PC without need for a communication cable.

B. The meter shall provide user configured fixed window or rolling window demand. This shall allow user to set up the particular utility demand profile.
1. Readings for kW, kVAR, kVA and PF shall be calculated using utility demand features.
2. All other parameters shall offer max and min capability over the user selectable eaveraging period.
3. Voltage shall provide an instantaneous max and min reading displaying the highest surge and lowest sag seen by the meter.

C. The meter shall have native BACnet/IP protocol.
1. The meter shall provide 40 embedded BACnet Objects consisting of standard voltage, current, and power parameters. The Objects shall be named such that they can be readily identified.
2. The meter shall have an embedded Web interface for configuration and viewing.
a. The Web interface shall have a Home page with power and energy snapshot information.
b. The Web interface shall have a page for configuring the BACnet/IP settings, including IP address, Network mask, Default Gateway, and the like.

c. The Web interface shall allow the user to activate the new configuration and reboot the meter.
d. The Web interface shall have a feature that lets the user download BACnet Object data as a .csv file that can be viewed in MS Excel© or saved as an MS Excel© file.
e. The Web interface shall have a webpage that displays the BACnet objects, their readings, and information about the objects.
f. The Web interface shall have a webpage displaying statistics for the unit, e.g., the number of meter reboots, and the number of BACnet/IP packets sent and received.
g. The Web interface shall allow the user to discard any changes and return to the saved configuration, or return to the factory default configuration.
h. The Web interface shall be viewable with any standard Internet browser.

3. The meter shall be configurable on the Host PC through LAN configuration.
4. The meter's BACnet/IP shall integrate with any BACnet applications or servers.
5. The meter shall also have an open socket for Modbus TCP that shall be simultaneously available through the LAN interface.

2.5 ENVIRONMENTAL REQUIREMENTS

A. Power meter shall be able to be stored in (-20 to +70) degrees C.

B. Operating temperature shall be (-20 to +70) degrees C.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Unless otherwise shown on drawings, meters for monitoring single panel or feeder shall be Shark 100B.

B. Provide 6x6x6 NEMA 1 enclosure for meters that are not mounted within electrical gear enclosures.

C. Provide start-up/commissioning by factory representative. Start-up/commissioning shall be coordinated with Engineer or Owner's representative so they may observe.

3.2 OPERATIONS PERSONNEL TRAINING

A. Provide a training session for the owner's operations personnel. Training session shall be performed by a qualified person who is knowledgeable in the subject/equipment. Submit a training agenda two (2) weeks prior to the proposed training session for review and approval. Training session shall include at the minimum:
1. Purpose of equipment.
2. Principle of how the equipment works.
3. Important parts and assemblies.
4. How the equipment achieves its purpose and necessary operating conditions.
5. Most likely failure modes, causes and corrections.
6. On site demonstration.

END OF SECTION

SECTION 26 09 43 - NETWORK LIGHTING CONTROLS

PART 1 - GENERAL

1.1 SCOPE

A. Electrical contractor shall provide and install a complete networked lighting control system that controls all interior and exterior lighting fixtures, including emergency fixtures. All lighting fixtures shall be controllable from the district energy management office. It is the contractor's responsibility to provide and install a complete and functional system, including, but not limited to all room controllers, occupancy sensors, low voltage control stations, emergency bypass controllers, and network bridges, low voltage control cable and lighting network equipment, even if not specifically called out on the plans.

B. The locations and quantities of sensors shown on the drawings are diagrammatic and indication only rooms that are to be provided with sensors and controls. Provide additional devices if required to properly and completely cover the respective room. Ensure the best possible installation in teh available space and to overcome local difficulties due to space limitations or interefence of structural components.

C. Wireless devices are not allowed, Batteries are prohibited. No Exceptions with Dallas ISD written approval.

D. System shall be comprised of it's own network for lighting and lighting controls, but shall be capable of communicating and future interface with Building Automation Control systems

1.2 SUMMARY

A. Section Includes:
1. Digital Occupancy and Daylighting Sensor Control
2. Emergency Lighting Control

B. Related Section
1. Section 260926 - Lighting Control Panel Boards: Lighting panels (switching) controlled by Digital Network Lighting Control System.
2. Section 260936 - Modular Dimming Controls: Network Lighting
3. Section 262726 - Wiring Devices: Receptacles
4. Section 265113 - Interior Lighting Fixtures, Lamps, and Ballasts: Fluorescent electronic dimming ballasts.
5. Section 25000 - Integrated Automation Building integrator shall provide integration of the lighting control system with Building Automation Systems.
6. Drawings and general provision of the Contact, including General and Supplementary Conditions and Division 01 Specification Sections apply to this Section
7. Electrical Sections, including wiring devices, apply to the work of this Section.

C. Control Intent - Control Intent includes, but is not limited to:
1. Defaults and initial calibration settings for such items as time delay, sensitivity, fade rates, etc.
2. Initial sensor and switching zones
3. Initial time switch settings
4. Task lighting and receptacle controls
5. Emergency Lighting control

1.3 REFERENCES

1.4 SYSTEM DESCRIPTION & OPERATION

A. The Lighting Control and Automation system as defined under this section covers the following equipment:
1. Digital Room Controllers - Self-configuring, digitally addressable one, two or three relays controllers with integral current thyristor, 0-10 volt control for ballasts (if applicable).
2. Digital Occupancy Sensors - Self-configuring, digitally addressable and calibrated occupancy sensors with LCD display and two-way active infrared (IR) communications.
3. Digital Switches - Self-configuring, digitally addressable pushbutton switches, dimmers, and scene switches with two-way active infrared (IR) communications.
4. Digital Photosensors - Single-zone closed loop and multi-zone open loop daylighting sensors with two-way active infrared (IR) communications can provide switching or dimming control for daylight harvesting.
5. Configuration Tools - Handheld remote for room configuration provides two way infrared (IR) communications to digital devices and allows complete configuration and reconfiguration of the device / room from up to 30 feet away. Unit to have Organic LED display, simple pushbutton interface, and allow send and receive of room variables and store of occupancy sensor settings. Computer software also customizes room settings.
6. Handheld remotes for personal control - One-button dimming, two-button on/off, or five-button scene remotes provide control using infrared communications. Remote may be configured in the field to control selected loads or scenes without special tools.
7. Network Lighting local network - Free topology, plug-in wiring system (Cat 5e) for power and data to room devices.
8. Network Bridge - provides BACnet MS/TP-compliant digital networked communication between rooms, panels and the Segment Manager or building automation system (BAS).
9. Segment Manager - provides web browser-based user interface for system control, scheduling, power monitoring, room device parameter administration and reporting.
10. Emergency Lighting Control Unit (ELCU) - allows a standard lighting control device to control emergency lighting in conjunction with normal lighting in any area within a building

1.5 SUBMITTALS

A. Submittals Package: Submit the shop drawings, and the product data specified below at the same time as a package.

B. Shop Drawings:
1. Composite wiring and/or schematic diagram of each control circuit as proposed to be installed (standard diagrams will not be accepted).
2. Scale drawing for each area showing exact location of each sensor, room controller, and digital switch.

C. Product Data: Catalog sheets, specifications and installation instructions.

D. Include data for each device which:
1. Indicates where sensor is proposed to be installed.
2. Prove that the sensor is suitable for the proposed application.

1.6 QUALITY ASSURANCE

A. Manufacturer: Minimum 5 Years experience in manufacture of lighting controls.

1.7 PROJECT CONDITIONS

A. Do not install equipment until following conditions can be maintained in spaces to receive equipment:
1. Ambient temperature: 0° to 40° C (32° to 104° F).
2. Relative humidity: Maximum 90 percent, non-condensing.

1.8 WARRANTY

A. Provide a five year complete manufacturer’s warranty on all products to be free of manufacturers’ defects.

1.9 MAINTENANCE

A. Spare Parts:
1. Provide 1 spare gateway. Provide 5 spares of each product listed below to be used for maintenance. Electrical contractor deliver items to maintenance department within 30 days of substantial completion.
a. Room Controllers
b. Occupancy Sensors
c. Emergency Bypass controllers
d. Low voltage switches
e. Daylighting harvesting photocells

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. nLight

B. EchoFlex

2.2 WALL SWITCH OCCUPANCY SENSORS

A. Manual-ON, Automatic-OFF dual technology (passive infrared and ultrasonic) wall switch occupancy sensor Furnish the Company's model which suits the electrical system parameters, and accommodates the square-foot coverage and wattage requirement for each area (and type of lighting) controlled

B. Shall have masking or integral shielding to control coverage area. stickers or external adhesives are not acceptable.

2.3 DIGITAL WALL OR CEILING MOUNTED OCCUPANCY SENSOR SYSTEM

A. Ceiling mounted dual technology digital (passive infrared and ultrasonic) occupancy sensor. Furnish the Company's system which accommodates the square-foot coverage requirements for each area controlled, utilizing room controllers, digital occupancy sensors and accessories which suit the lighting and electrical system parameters.

B. Digital Occupancy Sensors shall provide graphic LCD display for digital calibration and electronic documentation. Features include the following:
1. Digital calibration and pushbutton programming for the following variables:
a. Sensitivity - 0-100% in 10% increments
b. Time delay - 1-30 minutes in 1 minute increments
c. Test mode - Five second time delay
d. Detection technology - Dual Technology activation and/or re-activation.
e. Walk-through mode
f. Load parameters including Auto/Manual-ON, blink warning, and daylight enable/disable when photosensors are included in the Lighting local network.
2. One or two RJ-45 port(s) for connection to Lighting local network.
3. Device Status LEDs including:
a. PIR Detection
b. Ultrasonic detection
c. Configuration mode
d. Load binding
4. Assignment of occupancy sensor to a specific load within the room without wiring or special tools.
5. Manual override of controlled loads.

C. Multiple occupancy sensors may be installed in a room by simply connecting them to the free topology lighting local network. No additional configuration will be required.

D. Shall have masking or integral shielding to control coverage area. stickers or external adhesives are not acceptable.

2.4 DIGITAL WALL SWITCHES

A. Low voltage momentary pushbutton switches in 1, 2, 3, 4, 5 and 8 button configuration; available in white, light almond, ivory, grey and black; compatible with wall plates with decorator opening. Wall switches shall include the following features:
   1. Two-way infrared (IR) transceiver for use with personal and configuration remote controls.
   2. Removable buttons for field replacement with engraved buttons and/or alternate color buttons. Button replacement may be completed without removing the switch from the wall.
   3. Red configuration LED on each switch that blinks to indicate data transmission.
   4. Scene Status LED on each switch button with the following characteristics:
      a. Bi-level LED
      b. Dim locator level indicates power to switch
      c. Bright status level indicates that load or scene is active

B. Two RJ-45 ports for connection to lighting local network.

C. Multiple digital wall switches may be installed in a room by simply connecting them to the free topology Lighting local network. No additional configuration will be required to achieve multi-way switching.

D. The following switch attributes may be changed or selected using a wireless configuration tool:
   1. Load and Scene button function may be reconfigured for individual buttons (from Load to Scene, and vice versa).
   2. Individual button function may be configured to Toggle, On only or Off only.
   3. Individual scenes may be locked to prevent unauthorized change.
   4. Fade Up and Fade Down times for individual scenes
   5. Ramp rate may be adjusted for each dimmer switch.
   6. Switch buttons may be bound to any load on a room controller and are not load type dependent; each button may be bound to multiple loads.

E. Shall have masking or integral shielding to control coverage area. stickers or external adhesives are not acceptable.

2.5 ROOM CONTROLLERS

A. Room Controllers automatically bind the room loads to the connected devices in the space without commissioning or the use of any tools. Room Controllers shall be provided to match the room lighting load and control requirements. The controllers will be simple to install and will not have, dip switches, potentiometers or require special configuration. The control units will include the following features:
   1. Automatic room configuration to the most energy-efficient sequence of operation based upon the devices in the room.
   2. Simple replacement - Using the default automatic configuration capabilities, a room controller may be replaced with an off-the-shelf unit without requiring any configuration or setup.
   3. Device Status LEDs to indicate:
      a. Data transmission
      b. Device has power
      c. Status for each load
      d. Configuration status
   4. Quick installation features including:
      a. Standard junction box mounting
      b. Quick low voltage connections using standard RJ-45 patch cable
   5. Plenum rated
   6. Manual override and LED indication for each load
   7. Dual voltage (120/277 VAC, 60 Hz)
   8. Zero cross circuitry for each load.

B. On/Off/Dimming enhanced Room Controllers shall include:
   1. Real time current monitoring
   2. One, two or three relay configuration
   3. Efficient 250 mA switching power supply
   4. Four RJ-45 Lighting local network ports.
   5. One 0-10 volt analog output per relay for control of compatible ballasts and LED drivers.
   6. The following dimming attributes may be changed or selected using a wireless configuration tool:
      a. Establish preset level for each load from 0-100%
      b. Set high and low trim for each load

c. Set lamp burn in time for each load up to 100 hours

7. Discrete model listed for connection to receptacles, for occupancy-based control of plug loads within the space.
   a. One relay configuration only
   b. Automatic-ON/OFF configuration

2.6 DIGITAL PHOTOSENSORS

A. Digital photosensors work with room controllers to provide automatic switching or dimming daylight harvesting capabilities for any load type connected to a room controller. Closed loop photosensors measure the ambient light in the space and control a single lighting zone. Open loop photosensors measure incoming daylight in the space, and are capable of controlling up to three lighting zones. Photosensors shall be interchangeable without the need for rewiring.

B. Digital photosensors include the following features:
   1. An internal photodiode that measures only within the visible spectrum, and has a response curve that closely matches the photopic curve. The photodiode shall not measure energy in either the ultraviolet or infrared spectrums. The photocell shall have a sensitivity of less than 5% for any wavelengths less than 400 nanometers or greater than 700 nanometers.
   2. Sensor light level range shall be from 1-10,000 footcandles (fc).
   3. The capability of switching one-third, one-half or all lighting ON and OFF, or raising or lowering lighting levels, for each controlled zone, depending on the selection of room controller(s) and load binding to room controller(s).
   4. For switching daylight harvesting, the photosensor shall provide a deadband or a separation between the “ON Setpoint” and the “OFF Setpoint” that will prevent the lights from cycling after they turn off.
   5. For dimming daylight harvesting, the photosensor shall provide the option, when the daylight contribution is sufficient, of turning lights off or dimming lights to a user-selectable minimum level.
   6. Optional programmable wall switch override to allow occupants to reduce lighting level to increase energy savings or, if permitted by system administrator, raise and lower lighting levels for a selected period of time or cycle of occupancy.
   7. Infrared (IR) transceiver for configuration and/or commissioning with a handheld configuration tool, to transmit detected light level to wireless configuration tool, and for communication with personal remote controls.
   8. Red configuration LED that blinks to indicate data transmission.
   9. Blue status LED indicates test mode, override mode and load binding.
   10. Recessed switch to turn controlled load(s) ON and OFF.
   11. One RJ-45 port for connection to Lighting local network.
   12. An adjustable head and a mounting bracket to accommodate multiple mounting methods and building materials. The photosensor may be mounted on a ceiling tile, skylight light well, suspended lighting fixture or backbox.

C. Closed loop digital photosensors include the following additional features:
   1. An internal photodiode that measures light in a 100 degree angle, cutting off the unwanted light from bright sources outside of this cone.
   2. Automatic self-calibration, initiated from the photosensor, a wireless configuration tool or a PC with appropriate software.
   3. Automatically establishes setpoints following self-calibration.
   4. A sliding setpoint control algorithm for dimming daylight harvesting with a “Day Setpoint” and the “Night Setpoint” to prevent the lights from cycling.

D. Open loop digital photosensors include the following additional features:
   1. An internal photodiode that measures light in a 60 degree angle cutting off the unwanted light from the interior of the room.
   2. Automatically establishes setpoints following calibration using a wireless configuration tool or a PC with appropriate software.
   3. A proportional control algorithm for dimming daylight harvesting with a “Setpoint” to be maintained during operation.

E. Shall include integral masking or shielding to control coverage area. stickers and other external adhesives are not acceptable.

2.7 EMERGENCY LIGHTING

A. Emergency Lighting Control Unit - A UL 924 listed device that monitors a switched circuit providing normal lighting to an area. The unit provides normal ON/OFF control of emergency lighting along with the normal lighting. Upon normal power failure the emergency lighting circuit will close, forcing the emergency lighting ON until normal power is restored. Features include:
1. 120/277 volts, 50/60 Hz., 20 amp ballast rating
2. Push to test button
3. Auxiliary contact for remote test.

2.8 LIGHTING LOCAL NETWORK

A. The Lighting local network is a free topology lighting control physical connection and communication protocol designed to control a small area of a building. Digital room devices connect to the network using CAT 5e cables with RJ-45 connectors which provide both data and power to room devices. Features of the Lighting local network include:
1. Plug & Play automatic configuration and binding of occupancy sensors, switches and lighting loads to the most energy-efficient sequence of operation based upon the device attached.
2. Simple replacement of any device in the network with a standard off the shelf unit without requiring commissioning, configuration or setup.
3. Push n' Learn configuration to change the automatic configuration, including binding and load parameters without tools, using only the buttons on the digital devices in the local network.
4. Two-way infrared communications for control by handheld remotes, and configuration by a handheld tool including adjusting load parameters, sensor configuration and binding, within a line of sight of up to 30 feet from a sensor, wall switch or IR receiver.

2.9 BACNET BASED DIGITAL COMMUNICATIONS

A. The lighting control panel shall support digital communications to facilitate the extension of control to include interoperation with building automation systems and other intelligent field devices. Digital communications shall be RS485 master/slave token passing-based using the BACnet® protocol.

B. The panel shall have provision for an individual BACnet device ID. The device ID description property shall be writable via the network to allow unique identification of the lighting control panel on the network.

C. The panel shall support MS/TP MAC addresses in the range of 0 - 127 and baud rates of 9600k, 38400k, 76800k, and 115.2k bits per second.

D. Lighting control relays shall be controllable as binary output objects in the instance range of 1 - 64. The state of each relay shall be readable and writable by the BAS via the object present value property

E. Lighting control relays shall report their true on/off state as binary input objects in the instance range of 1 - 64.

F. The 99 channel groups associated with the panel shall be represented by binary value objects in the instance range of 201 - 299. The occupancy state of each channel group shall be readable and writable by the BAS via the object present value property. Commanding 1 to a channel group will put all relays associated with the channel into the normal hours mode. Commanding 0 or NULL shall put the relays into the after hours mode.

G. Setup and commissioning of the panel shall not require manufacturer-specific software or a computer. All configuration of the lighting control panel shall be performed using standard BACnet objects or via the handheld IR programming remote.

H. The description property for all objects shall be writable via the network and shall be saved in non-volatile memory within the panel.

I. Lockout of all digital switch buttons connected to a given panel shall be command-able via a single object.

2.10 USER INTERFACE

A. Each lighting control panel system shall be supplied with at least (1) handheld IR remote programming interface consisting of a keypad and associated OLED display screen. The user interface shall allow setup, configuration, and diagnostics of the panel without the need for software or connection of a computer. The user interface shall have the following functions as a minimum:

B. Set network parameters including panel device ID, MS/TP MAC address, baud rate and max master range.

C. Relay Group creation of up to 99 groups. Group creation shall result in programming of all seven key relay parameters for member relays. The seven parameters are as follows: After-hours Override Time Delay, Normal Hours Override Time Delay, Action on Transition to Normal Hours, Action on Transition to After Hours, Sensor Action During Normal Hours, Sensor Action During After Hours, Blink-Warn Time for After Hours.

D. Program up to 254 separate scheduled events. Events shall occur on seven (7) day intervals with each day selectable as active or inactive, and shall be configurable as to whether the event is active on holidays. Holidays are also defined through the User Interface.

E. Program up to 32 separate Dark/Light events. Events shall have a selectable source as either calculated Astro with delay, or a digital IO module with an integral 0-5V or 0-10V analog photocell. Dark/Light events shall occur on seven (7) day intervals with each day selectable as active or inactive, and shall be configurable as to whether the event is active on holidays.

F. Button binding of digital switches to groups shall be accessible via the handheld IR remote and accomplished from the digital switch station.

G. Programming of panel location information shall be accomplished by the handheld IR remote and include at a minimum LAT, LON, DST zone, and an approximate city/state location.

H. An additional handheld IR remote may optionally be specified to be permanently mounted to the panel interior via a retractable anti-theft lanyard to allow for convenient programming of the panel while assuring that the handheld programmer is always present at that panel. An unlimited number of handheld IR remotes may also be purchased for facilities staff as seen fit by the end user's representative.

2.11 CONFIGURATIONS TOOLS

A. A configuration tool facilitates optional customization of Lighting local networks and is used to setup open loop daylighting sensors. A wireless configuration tool features infrared communications, while PC software connects to each local network via a USB interface.

B. Features and functionality of the wireless configuration tool shall include:
1. Two-way infrared (IR) communication with Lighting IR-enabled devices within a range of approximately 30 feet.
2. High visibility organic LED (OLED) display, pushbutton user interface and menu- driven operation.
3. Read, modify and send parameters for occupancy sensors, daylighting sensors, room controllers and buttons on digital wall switches.
4. Save up to nine occupancy sensor setting profiles, and apply profiles to selected sensors.
5. Temporarily adjust light level of any load(s)on the local network, and incorporate those levels in scene setting.
6. Adjust or fine-tune daylighting settings established during auto-commissioning, and input light level data to complete commissioning of open loop daylighting controls.

2.12 NETWORK BRIDGE

A. The network bridge connects a Lighting local network to a BACnet-compliant network for communication between rooms, panels and a segment manager or BAS. Each local network shall include a network bridge component to provide a connection to the local network room devices. The network bridge shall use industry standard BACnet MS/TP network communication. Closed or proprietary network communication shall not be acceptable.
1. The network bridge may be incorporated directly into the room controller hardware or be provided as a separate module connected on the local network through an available RJ-45 port.
2. Provide Plug & Play operation to automatically discover all room devices connected to the local network and make all device parameters visible to the segment manager via the segment network. No commissioning shall be required for set up of the network bridge on the local network.
3. The network bridge shall automatically create standard BACnet objects for selected room device parameters to allow any BACnet-compliant BAS to include lighting control and power monitoring features as provided by the Lighting room devices on each local network. Standard BACnet objects shall be provided as follows:
a. Read/write the normal or after-hours schedule state for the room
b. Read the detection state of the occupancy sensor

c. Read/write the On/Off state of loads
d. Read/write the dimmed light level of loads
e. Read the button states of switches
f. Read total current in amps, and total power in watts through the room controller
g. Read/write occupancy sensor time delay, PIR sensitivity and ultrasonic sensitivity settings
h. Activate a preset scene for the room
i. Read/write daylight sensor fade time and say and night setpoints
j. Read the current light level, in footcandles, from interior and exterior photosensors and photocells
k. Set daylight sensor operating mode
l. Read/write wall switch lock status

2.13 SEGMENT MANAGER

A. The Network Lighting system shall include at least one segment manager to manage network communication. It shall serve up a graphical user interface via a standard web browser. Each segment manager shall have support for one, two or three segment networks as required and allow for control of a maximum of 40 local networks (rooms) and/or lighting control panels per segment network.

B. Operational features of the Segment Manager shall include the following:
1. Connection to PC or LAN via standard Ethernet TCP/IP.
2. Easy to learn and use graphical user interface, compatible with Internet Explorer 8, or equal browser.
3. Log in security capable of restricting some users to view-only or other limited operations.
4. Automatic discovery of all control devices on the segment network(s). Commissioning beyond activation of the discovery function shall not be required.
5. After discovery, all rooms and panels shall be presented in a standard navigation tree format. Selecting a device from the tree will allow the device settings and operational parameters to be viewed and changed by the user.
6. Ability to view and modify room device operational parameters. It shall be possible to set device parameters independently for normal hours and after hours operation.
7. Ability to set up schedules for rooms and panels. Schedules shall automatically set controlled zones or areas to either a normal hours or after hours mode of operation.
8. Ability to group rooms and loads for common control by schedules, switches or network commands.
9. Ability to monitor connected load current and display power consumption for areas equipped with room controllers incorporating the integral current monitoring feature.
10. Provide seamless integration with the BAS via BACnet IP. Provide export table with available parameters.

2.14 REALTIME COLOR GRAPHICS

A. System Description
1. Color graphics screens shall allow a user to monitor and control the lighting control system through a graphical color interface. The system will control the room controllers in a real-time environment.
2. The application will provide a visual representation of the floor plan, drawn to scale, with each fixture displayed on screen. Fixtures can automatically indicate the relay controlling them on screen.

B. Graphic Screen Generation
1. The General Contractor shall provide as built CAD floor plans to the manufacturer for generation of graphic screens.
2. As-Built relay panel and reflected ceiling documentation must be provided to the manufacturer before graphic screen development can begin. Graphic screens will be provided and demonstrated to the owner within 90 days of receiving as built CAD files.
3. District Wide Home Screen
   a. Links to all existing WattStopper Schools in the district
4. School Home screen
   a. School Rendering
   b. Day/ Time
   c. Schedule for that day
   d. Exterior FC reading
   e. Current Lighting Watts per sq.ft.

5. Quick Access System tree
    a. Links
    b. 365 day Scheduler
6. Site Plan
    a. All exterior lighting shown on/ off
7. Screens per floor
    a. For navigation and showing lighting on/off
8. Detail screen per architectural area
    a. Room Occupancy (room shaded green)
    b. Lighting states (3 zones with override)
    c. Real time wattage for lighting
    d. Real Time Wattage for plug load
    e. Real time Photocell footcandle reading if applicable
9. Alarms Reports

PART 3 - EXECUTION

3.1 INSTALLATION

A. Contractor shall provide to the manufacturer all quantities for system including but not limited to relays, room controllers, relay panels, plug load controllers, switches, sensors and wire lengths and configurations for both network and device cable at least 1 week before bid.

B. When using wire for connections other than the lighting local network (Cat 5e with RJ-45 connectors), provide detailed point to point wiring diagrams for every termination. Provide wire specifications and wire colors to simplify contactor termination requirements

C. All MSTP network and Cat 5e low voltage wiring must have “Lighting Controls” printed on the wire jacket. Any cable substitutions shall be removed and replaced at the contractor’s expense.

D. All MSTP network terminations shall utilize wire ferrules for terminations and MSTP network manufacturer’s instructions. Any network deficiencies shall be repaired at the contractor’s expense.

E. Electrical contractor must provide a detailed as-built plan in CAD showing MSTP network cable routing and network bridge serial numbers to the manufacturer at least 2 weeks prior to factory commissioning Install the work of this Section in accordance with manufacturer’s printed instructions unless otherwise indicated.

F. All Power packs, relay packs, room controllers, or similar devices typcically located above ceilign shall be located directly above the control device nearest the mainline communications backbone for the lighting control system. For Example, if a space has 2 entrance doors and each has a lighting control device adjacent (scene controller or common switch) the control devices shall be located above the switches nearest the pathway of the backbone network cabling.

3.2 FACTORY COMMISSIONING

A. Upon completion of the installation, the system shall be commissioned by the manufacturer's factory authorized representative who will verify a complete fully functional system.

B. The factory commissioning shall include the following services. Programming of all button stations, configuration of all occupancy sensors and photocells. Verification of a complete and working system including MSTP network status. Provide written or computer-generated documentation on the commissioning of the system including room by room description including:
    1. Sensor parameters, time delays, sensitivities, and daylighting setpoints.
    2. Sequence of operation, (e.g. manual ON, Auto OFF. etc.)
    3. Load Parameters (e.g. blink warning, etc.)

C. The electrical contractor shall request factory commissioning by submitting a startup request form at least (4) weeks before startup is required.

D. The electrical contractor shall provide at least (1) journeyman electrician, familiar with the installation of the system, dedicated to assisting the factory start-up technician for the entire duration of the commissioning process.

E. Upon completion of the system commissioning the factory-authorized technician shall provide the proper training to the owner's personnel on the adjustment and maintenance of the system.

F. Provide a training session for the owner’s operations personnel. Training session shall be performed by a qualified person who is knowledgeable in the subject/equipment. Submit a training agenda two (2) weeks prior to the proposed training session for review and approval. Training session shall include at the minimum:
   1. Purpose of equipment.
   2. Principle of how the equipment works.
   3. Important parts and assemblies.
   4. How the equipment achieves its purpose and necessary operating conditions.
   5. Most likely failure modes, causes and corrections.
   6. On site demonstration.

3.3 RE-COMMISSIONING

A. After 90 days from occupancy the factory authorized representative and electrical contractor shall re-calibrate all sensor time delays and sensitivities to meet the Owner’s Project Requirements. Provide a detailed report to the Architect / Owner of re-commissioning activity

END OF SECTION

SECTION 26 22 13 - LOW VOLTAGE DISTRIBUTIONS TRANSFORMERS

PART 1 - GENERAL

1.1 SCOPE

A. Provide 480 volt primary step down transformers as shown, scheduled and as specified.

B. The type of transformers required includes dry-type general purpose transformers.

1.2 STANDARDS

A. Products shall be designed, manufactured, tested and installed in compliance with applicable ANSI/IEEE and NEMA standards.

B. All low voltage transformers shall be UL listed and labeled.

C. All low voltage transformers 15 kVA and larger shall meet or exceed post-January 1, 2016 U.S. DOE efficiency requirements Energy, 10 C.F.R. §431.196(a)(2) (2015) regardless of whether transformer date of manufacture is pre or post January 1, 2016.

D. All low voltage transformers 15 kVA and larger shall be tested for efficiency in accordance with U.S. DOE test methods Energy, 10 C.F.R. §431, Subpart K, Appendix A (2015).

1.3 ACCEPTABLE MANUFACTURERS

A. Provide one of the following manufacturers for general purpose use:
   1. General Electric Company
   2. Square D Company
   3. Power Quality International
   4. Eaton

1.4 SUBMITTALS

A. Shop drawings shall include, but not be limited to:
   1. Cutsheets of transformers with sound and load ratings, dimensions, weights, impedance rating, insulation type, temperature rise and tap configurations.

1.5 REQUIREMENTS OF REGULATORY AGENCIES

A. National Electrical Code.

B. Local, municipal, and/or state codes that have jurisdiction.

PART 2 - PRODUCTS

2.1 GENERAL PURPOSE

A. Provide dry type, two-winding transformers with primary and secondary voltages and KVA ratings as shown on plans. Transformers shall operate at 60 hertz. All transformers shall be manufacture with standard materials and components.

2.2 MATERIALS AND COMPONENTS FOR GENERAL PURPOSE TRANSFORMERS

A. All cores shall be constructed of high grade, non-aging silicon steel with high magnetic permeability, and low hysteresis and eddy current losses. Magnetic flux densities are to be kept well below the saturation point. The core laminations shall be clamped together with structural steel angles. The completed core and coil shall be isolated from the base by means of rubber, vibration-absorbing mounts. There shall be no metal-to-metal contact between the core and coil and the enclosure. The vibration isolating system shall be designed to provide a permanent fastening of the core and coil to the enclosure. Sound isolating system requiring the complete removal of all fastening devices will not be accepted. Windings shall be copper or electrical grade aluminum terminated on tin plated or copper bars. Foil windings are not acceptable.

B. The transformer core shall be visibly grounded to the enclosure by means of a flexible grounding conductor sized in accordance with NEMA, IEEE and ANSI standards.

C. Transformer coils shall be of continuous-wound type construction and shall be impregnated with non-hygroscopic, thermo-setting varnish.

D. Transformers shall be enclosed in drip-proof, metallic enclosures designed to provide for air cooling and prevent accidental contact with live conductors. Wiring compartment shall be located below the core and coil and cooled by air circulation or insulated from the core and coil by means of a suitable thermal insulation barrier. Transformer exposed to weather or installed in a sprinkled area shall have rain shields on all openings. Entire transformer enclosure shall be cleaned, phosphatized, primed and painted with a gray, baked enamel.

E. Transformers shall operate at 100% nameplate KVA rating continuously while in a 40 degree C ambient without exceeding the rated average winding temperature rise of the ANSI insulation system as described below.

Temperature rating shall be as follows:

RATING	PHASE INSULATION-TEMP. RISE
0.025 through 3 KVA	SingleType B - 80º C
5 through 25 KVA	SingleType F - 115º C
3 through 15 KVA	ThreeType F - 115º C
37½ KVA and larger	SingleType H - 150º C
30 KVA and larger	ThreeType H - 150º C

F. Transformers shall have minimum full load rated taps in the primary windings as follows:

RATING	TAPS
3 through 25 KVA	2 - 5% FCBN
15 through 300 KVA	6 - 2-½% TAPS, 2 above and 4 below nominal

G. Maximum sound ratings shall be as follows:

KVA	dBA
0 to 9	40
10 to 50	45
51 to 150	50
151 to 300	55
301 to 500	60

PART 3 - EXECUTION

3.1 INSTALLATION

A. General: Install transformer in accordance with manufacturer`s written instructions, and recognized industry practices.

B. Housekeeping Pad: Provide a nominal 3-½" high, 2500 PSI (28 Day) concrete reinforced pad with number 6 welded wire mesh. The pad shall conform to the shape of the transformer and extend at least 3 inches beyond the length and width of the transformer. All corners of the pad shall be rounded.

C. Mounting: Install floor mounted transformers on properly sized rubber-in-shear vibration isolators. Trapeze mounted transformers shall use rubber-in-shear hangers. Wall mounted transformers shall not be mounted directly to the wall without vibration isolation.

D. Connection: Route conductors in a minimum of 2 feet of flexible steel conduit to transformer enclosure. Provide grounding conductor sized per NEC, connected to the building grounding electrode system.

3.2 TESTING

A. Insulation, Tests: Prior to energization, check transformers windings for continuity and test the insulation resistance. Tests shall be made using a Biddle Megger or equivalent test instrument, per manufacturers' recommendations. Provide written documentation of testing. Submit with O & M manuals.

B. Tap Setting: Measure current and voltage under load conditions to provide correct tap settings.

END OF SECTION

SECTION 26 22 22 - LOW VOLTAGE HARMONIC MITIGATING DISTRIBUTION TRANSFORMERS

PART 1 - GENERAL

1.1 SCOPE

A. Provide 480 - 208Y/120 volt 3 phase, 4 wire transformers as shown, scheduled and as specified.

B. The type of transformers required are dry-type harmonic mitigating transformers.

1.2 STANDARDS

A. Products shall be designed, manufactured, tested and installed in compliance with applicable ANSI/IEE and NEMA standards.
   1. All low voltage transformers shall be UL listed and labeled.
   2. All low voltage transformers 15 kVA and larger shall meet or exceed post-January 1, 2016 U.S. DOE efficiency requirements Energy, 10 C.F.R. §431.196(a)(2) (2015) regardless of whether transformer date of manufacture is pre or post January 1, 2016.
   3. All low voltage transformers 15 kVA and larger shall be tested for efficiency in accordance with U.S. DOE test methods Energy, 10 C.F.R. §431, Subpart K, Appendix A (2015).

1.3 ACCEPTABLE MANUFACTURERS

A. Provide the following manufacturer:
   1. Power Quality International, Inc. (PQI)

1.4 SUBMITTALS

A. Shop drawings shall include, but not be limited to:
   1. Cutsheets of transformers with sound and load ratings, dimensions, weights, impedance rating, insulation type, temperature rise, phase displacement and tap configurations.

1.5 REQUIREMENTS OF REGULATORY AGENCIES

A. National Electrical Code.

B. Local, municipal, and/or state codes that have jurisdiction.

1.6 DESIGN OBJECTIVES

A. The design of the electrical distribution system, as described by this specification and detailed in the accompanying electrical drawings, provides for control of the harmonic currents that are generated by non-linear electronic loads. These design objectives, and the various standards that apply, are detailed herein as follows:
   1. To reduce the ‘penalty losses’ that are produced by harmonic currents, which would otherwise result in an increase in the cost-of-power, apparatus heating and the cost of air-conditioning, within economic limits.
   2. To limit harmonic current injection into the Point of Common Coupling (PCC), as required in IEEE 519 , Section 10.4, Table 10.3.
   3. To limit positive, negative and zero sequence harmonic currents in the distribution system so that the Individual Harmonic Distortion of Voltage (IHDv) levels do not exceed 3% at the loads and the Total Harmonic Distortion of Voltage (THDv) levels do not exceed 5% at the loads, as recommended in IEEE 519, Section 6.6, Paragraph 2.
   4. To limit zero sequence harmonic currents in the neutral conductors so that their ratings are not exceeded and Common Mode Noise (CMN) neutral-ground voltage levels do not exceed 5 volts at the loads, as recommended by CBEMA. Where computers and/or audio/visual devices are interconnected into a communications ‘network’, to limit the difference in CMN to < 2 volts at all loads, as recommended by EPRI.

1.7 FACTORY TESTING

A. The manufacturer shall provide linear and non-linear efficiency test on each transformer. Transformers not meeting the following criteria will not be used on this job. The data shall be included in the Operations and Maintenance Manuals. The tests shall be conducted between 0% and 100% full load and shall be plotted for each transformer.
   1. Linear Load Efficiency: Transformer shall meet or exceed post-January 1, 2016 U.S. DOE efficiency requirements Energy, 10 C.F.R. §431.196(a)(2) (2015) regardless of whether transformer date of manufacture is pre or post January 1, 2016. Proof of compliance Type Tests, for each transformer type and rating, must be based on U.S. DOE test methods Energy, 10 C.F.R. §431, Subpart K, Appendix A (2015). Type Test are required with each submission.
   2. Non-Linear Load Efficiency: This requirement is defined as meeting the efficiency requirements of NEMA TP1-2002 under non-linear loading, which has 100% THDI and a harmonic profile that is based on IEEE 519, Table 4.3 - 'Spectrum of Typical Switch Mode Power Supplies'. Proof of compliance Type Tests, for each transformer type and rating, must be based on the Voltage and Current Difference Loss Measurement Method using laboratory grade CTs and 0.1% accuracy Wattmeters OR shall be calculated in accordance with IEEE C57.110. Type Tests are required with each submission. The Power In – Power Out Measurements Method is not an acceptable test method due to the limitations associated with CT, PT and WattMeter accuracy.

1.8 FACTORY NAME PLATES

A. Provide two (2) – name plates per transformer indicating all code required items (i.e. kVA voltage, phase etc.). Name plates shall also include, phase shift and a name as indicated on transformer schedule or one-line diagram. The name plates shall be located on a non removable section of the outer shell.

1.9 ALTERNATES

A. In the event the contractor wishes to propose an alternative to the specified Harmonic Mitigating Transformers and/or Zero Sequence Harmonic Filters, the contractor shall provide the engineer with a detailed alternate Harmonic Mitigation Plan, which includes a schedule of proposed replacement devices that will meet all of the requirements described in this specification. The equipment proposal from the non-specified vendor(s) shall include the following information:
   1. Evidence of significant relevant application experience.
   2. Quantitative performance data including before/after effect on voltage distortion at the loads that demonstrates the vendor's capability to achieve the harmonic treatment called for in this specification.
   3. Product technical specification and installation wiring diagram.
   4. Pertinent product application information.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Type 'DV', Single Output, Harmonic Filtering Distribution Transformers (Dry Type) shall be provided for all transformers indicated with a zero (0), thirty (30), fifteen (15), forty-five (45), twenty (20) and forty (40) degree primary to secondary phase shifts.

B. Harmonic mitigating transformers with Wye configured primary windings are not acceptable.

C. Harmonic mitigating transformers without zig-zag configured secondary windings that completely cancel zero-sequence flux under balanced load conditions are not acceptable.

2.2 PRODUCT DESCRIPTION

A. The design of the harmonic filtering transformers, described in this Specification, shall be optimized for harmonic rich environments that are characterized by high neutral currents. These transformers shall:
   1. Provide an ultra-low zero sequence impedance path for all load-generated zero sequence harmonic currents, including I_3, I_9, I_{15}, I_{21}, etc.
   2. Provide for the cancellation of the 5th, 7th, etc. positive and negative sequence harmonic currents, at the units' primary bus, when 0° and 30° (15° and 45°) phase-shifting units are used in combination.

3. Provide for the cancellation of the 5th, 7th, 11th, 13th, etc. positive and negative sequence harmonic currents, at the units' primary bus, when 0°, 20° and 40° phase-shifting units are used in combination.
4. Provide for the cancellation of 5th, 7th, 11th, 13th, 17th, 19th, etc. positive and negative sequence harmonic currents, at the units' primary bus, when 0°, 15°, 30° and 45° phase-shifting units are used in combination.
5. Harmonic cancellation shall be by electromagnetic means only. No capacitors or electronics shall be used.
6. Reduce voltage and current distortion and imbalance at the primary terminals of the unit.
7. Reduce current crest factor at the primary terminals of the unit.
8. Reduce average and peak phase current on the primary terminals of the unit.
9. Reduce system losses.
10. Improve system power factor.
11. Reduce voltage distortion in the secondary sub-system.

2.3 DEVICE CONFIGURATION

A. Type: ANN

B. Insulation Class: 220°C

C. Temperature Rise: 150°C

D. System Frequency: 60 Hertz

E. Primary Voltage: 480 Volts Delta (Wye configured primary is not acceptable)

F. Secondary Voltage: 208/120 Volts Zig-Zag with two (2) windings per core leg for 0 degree phase shift and 208/120 Volt modified zig-zag with three (3) windings per core leg for 30, 15, 45, 20 and 40 degree phase shifts.

G. Phase: Three Phase

H. Rating: as scheduled on drawings

I. Primary-Secondary Phase-Shift: as scheduled on drawings

2.4 TRANSFORMER CHARACTERISTICS

A. Key Requirements
1. Positive & negative sequence impedance: standard %
2. Zero sequence reactance at 60Hz: < 0.3 %
3. Zero sequence impedance at 60Hz: < 0.9 %
4. Crest Factor suitability: 5
5. BIL: 10,000 Volts (windings 1000V
6. Capability to deliver full nameplate kVA to loads of K-factor up to: 30
7. Neutral connection shall be rated at two times the ampacity of the secondary phase current.

B. Basic Requirements:
1. Built to the following Standards: CSA C9-M1981, CSA22.2 No.47-1977, UL 506, IEEE C57.110, and NEMA ST 20
2. Three-phase, common core construction
3. Convection air-cooled
4. Copper or Aluminum Windings
5. Insulation Class: R(200 degree C)
6. Magnetic field at 1.5 feet: max. 0.1 Gauss
7. Full load Efficiency at 170°C
8. Magnetizing Inrush Current: max. 10 times full load rating
9. Taps: 2 x ± 2.5%
10. Sound level: per C57.12.91
11. Enclosure: ventilated, drip-proof NEMA-1 totally enclosed
12. Finish: PQI white power coat
13. Anti-vibration pads shall be used between the core and the enclosure

2.5 VENDOR INFORMATION

A. Evidence of significant relevant application experience.

B. Quantitative performance data including before/after effect on voltage distortion at load panels that demonstrates the capability to achieve the harmonic mitigation called for in this specification.

C. Product technical specification.

D. Pertinent product application information.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General: Install transformer in accordance with manufacturer's written instructions, and recognized industry practices.

B. Housekeeping Pad: Provide a nominal 3-½" high, 2500 PSI (28 Day) concrete reinforced pad with number 6 welded wire mesh. The pad shall conform to the shape of the transformer and extend at least 3 inches beyond the length and width of the transformer. All corners of the pad shall be rounded.

C. Mounting: Install floor mounted transformers on properly sized rubber-in-shear vibration isolators. Trapeze mounted transformers shall use rubber-in-shear hangers. Wall mounted transformers shall not be mounted directly to the wall without vibration isolation.

D. Connection: Route conductors in a minimum of 2 feet of flexible steel conduit to transformer enclosure. Provide grounding conductor sized per NEC, connected to the building grounding electrode system.

3.2 FIELD TESTING

A. Insulation, Tests: Prior to energization, check transformers windings for continuity and test the insulation resistance. Tests shall be made using a Biddle Megger or equivalent test instrument, per manufacturers' recommendations.

Continuity Check

Primary	Pass / Fail		Secondary	Pass / Fail
H_1-H_2			X_1-X_0	
H_2-H_3			X_2-X_0	
H_3-X_1			X_3-X_0	

Insulation Resistance Test (1000V, DC)

Connections	Megohms
High to Low, Gnd	
Low to High, Gnd	
High, Low to Gnd	

B. Tap Setting: Measure current and voltage under load conditions to provide correct tap settings.

Tap Setting	Primary Voltage Reading		Secondary Voltage Reading	
	H_1-H_2		X_1-X_0	
	H_2-H_3		X_2-X_0	
	H_3-X_1		X_3-X_0	

C. Receptacle Tests: At the furthest receptacle from each panel serving a computer or copier, a power quality meter shall be used to determine the following:

Receptacle Test	
Panel Name (Fed From)	
Circuit Number	

Room Name or Number	
Location Inside Room	
Voltage (Line-Neutral)	
THD_V	
Voltage (Neutral-Ground)	
Current (Phase)	
THD_I	

D. Conduct all tests 3 to 6 months after building occupation. Submit all tests for Engineer's review.

END OF SECTION

SECTION 26 24 16 - PANELBOARDS

PART 1 - GENERAL

1.1 SCOPE

A. Provide panelboards as shown, scheduled and as specified herein.

B. The types of panelboards include:
1. Panelboards.
2. Power distribution panelboards.

1.2 STANDARDS

A. Products shall be designed, manufactured, tested and installed in compliance with UL, NEMA and ANSI applicable standards.
1. UL 50 and UL 50E - Enclosures for Electrical Equipment
2. UL 67 - Panelboards
3. UL 489 - Molded Case Circuit Breakers and Circuit Breaker Enclosures
4. UL 943 - Ground fault Circuit Interrupters
5. NEMA PB 1 - Panelboards
6. NEMA PB 1.1 - General Instructions for Proper Installation, Operation and Maintenance of Panelboards Rated 600 Volts or Less
7. NEMA, ABI, Molded Car Circuit Breakers and Molded Case Switches
8. Federal Spec W-P 115, Rev C, Panel, Power Distribution
9. NEMA KSI, Enclosed and Miscellaneous Distribution Equipment Switches (600V)
10. NFPA 70 - National Electrical Code (NEC)
11. ANSI C12.1 - Electric Meters - Code for Electricity Metering
12. ANSI C12.20 - American National Standard for Electricity Meters - 0.2 and 0.5 Accuracy Classes

B. Products shall conform to all applicable UL standards and shall be UL-labeled.

1.3 ACCEPTABLE MANUFACTURERS

A. Provide one of the following manufacturers:
1. General Electric Company/ABB
2. Square D Company
3. Siemens
4. Eaton

1.4 SUBMITTALS

A. Shop drawings shall include, but not be limited to:
1. Cutsheets of all enclosures, circuit breakers, fusible switches, bussing, rating, schedules and all accessories clearly labeled.

1.5 REQUIREMENTS OF REGULATORY AGENCIES

A. WORK IN ACCORDANCE WITH:
1. National Electrical Code.
2. Local, municipal, or state codes that have jurisdiction.

PART 2 - PRODUCTS

2.1 MATERIALS AND COMPONENTS

A. General

1. Provide power distribution and panelboards as indicated in the panelboard schedule and as shown on the plans. Power distribution panelboards shall be equipped with fusible switches or circuit breakers as shown on the schedule. Panelboards shall be equipped with thermal-magnetic, molded case circuit breakers of frame and trip ratings as shown on the schedule.
2. A Fully-rated system shall be provided. Do not series-rate.

B. Busing Assembly and Temperature Rise
1. Panelboard bus structure and main lugs or main breaker shall have current ratings as shown on the panelboard schedule. Such ratings shall be established by heat rise tests with maximum hot spot temperature on any connector or bus bar not to exceed 65°C. rise above 40°C ambient. Heat rise test shall be conducted in accordance with Underwriters Laboratories Standard UL 67. The use of conductor dimensions will not be accepted in lieu of actual heat tests. All current carrying parts of the bus shall be tin or silver plated copper.
2. Bus structure shall be isolated. Bus bar connections to the branch circuit breakers shall be distributed phase or phase sequence type and shall accept bolt-on circuit breakers for lighting and appliance panelboards.
3. The lugs for terminating conductors shall be rated at 75°C on all panel boards and circuit breakers.
4. Provide a non-insulated bare copper ground bus. Provide an isolated ground copper bus in each panel serving isolated ground circuits as indicated on panel schedule or one-line diagram. Provide a full size copper neutral bus in each panelboard enclosure. Provide a 200% neutral buss when served by a harmonic mitigating transformer and any K4 or higher rated transformers.

C. Distribution Panelboards
1. Provide arc energy reduction switch for each overcurrent device rated 1200 amps or larger to comply with 240.87 of the NEC. Switch shall be equipped with a pad lockable cover with a blue LED pilot light that illuminates when system is activated. Locate switch and cover recessed mounted adjacent to the switch it serves or remote as indicated on the plans. Provide label and all required hardware. Remote switch(es) shall be flush mounted in wall near entry to the room.
2. Circuit breakers shall be equipped with individually insulated, braced and protected connectors. The front faces of all circuit breakers shall be flush with each other. Large, permanent, individual circuit numbers shall be affixed to each breaker in a uniform position. Tripped indication shall be clearly shown by the breaker handle taking a position between “ON” and “OFF”. Provisions for additional breakers shall be such that no additional connectors will be required to add breakers. Circuit breakers shall be of the frame size, trip setting and interrupting capacity as indicated on the drawings. Circuit breakers shall be rated 65,000 AIC unless otherwise noted on plans.

D. 480/277 Volt Panelboards
1. Main breakers shall be vertically mounted. Branch mounted main breakers are not acceptable. Provide electronic trip mains with long term, short term and instantaneous trips as indicated on drawings and required for selective coordination.
2. Circuit breakers shall be bolt-on thermal-magnetic, molded case circuit breakers. Breakers shall be 1, 2 or 3 pole with an integral crossbar to assure simultaneous opening of all poles in multiple circuit breakers. Breaker shall have an over-center, trip-free, toggle-type operating mechanism with quick-make, quick-break action and positive handle indication. Handles shall have “ON”, “OFF” and “TRIPPED” positions. Circuit breakers shall be UL listed in accordance with UL Standard 489 and shall be rated 277 volt ac (single pole, 15-30 amperes) or 480Y/277 volts ac (2 and 3 pole) with continuous current ratings as noted on the plan. Interrupting ratings shall be a minimum of 18,000 rms symmetrical amperes at 277 volts ac (single pole) or 480Y/277 volts ac (2 and 3 pole) unless otherwise noted on plans.

E. 240 (208) Volt Panelboards
1. Main breakers shall be vertically mounted. Branch mounted main breakers are not acceptable. Provide electronic trip mains with long term, short term and instantaneous trips as indicated on drawings and required for selective coordination.
2. Circuit breakers shall be bolt-on thermal-magnetic, molded case circuit breakers. Breakers shall be 1, 2, or 3 pole with an integral crossbar to assure simultaneous opening of all poles in multiple circuit breakers. Breakers shall have an overcenter, trip-free, toggle-type operating mechanism with quick-make, quick-break action and positive handle indication. Handles shall have "ON", "OFF" and "TRIPPED" positions.
3. Circuit breakers shall be UL listed in accordance with UL standard 489 and shall be rated 240 volts ac maximum with continuous current rating as noted on the plans.

4. Branch circuit breakers feeding convenience outlets shall have sensitive instantaneous trip settings of not more than 10 times the trip settings of the breaker to prevent repeated arcing short resulting from frayed appliance cords. Single pole 15 and 20 ampere circuit breakers shall be UL listed as "Switching Breakers" at 120V ac and carry the SWD marking.
5. UL Class A 5mA ground fault circuit protection shall be provided on all receptacle circuits serving wet areas and on all 120V ac branch circuits as specified on the plans or panelboard schedule. This protection shall be an integral part of the branch circuit breaker which also provides overload and short circuit protection for branch circuit wiring. Tripping of a branch circuit breaker containing ground fault circuit interruption shall not disturb the feeder circuit to the panelboard. A single pole circuit breaker with integral ground fault circuit interruption shall require no more panelboard branch circuit space than a conventional circuit breaker.
6. UL Class B 30mA ground fault circuit protection (GFEP) shall be provided on all equipment circuits requiring ground fault protection. This protection shall be an integral part of the branch circuit breaker which also provides overload and short circuit protection for branch circuit wiring.
7. Provide Shunt Trip Breakers including control power for circuits under cooking hoods and other equipment having this requirement.
8. Provide Breakers with Switched Neutral circuits with common trip for gasoline pumps and other equipment having this requirement.
9. Circuit breakers shall be rated 10,000 AIC at 240V unless otherwise noted on plans or served by transformers greater than 150 kVA.
10. Provide 200% sized neutral bus with panels served from a non-linear transformer and any K4 or higher rated transformers. This shall be a UL approved assembly.

F. Cabinets and Fronts
1. The panelboard bus assembly shall be enclosed in a steel cabinet. The rigidity and gauge of steel to be as specified in UL 50 for cabinets. Wiring gutter space shall be in accordance with UL 67 for panelboards. The box shall be fabricated from galvanized steel or equivalent rust resistant steel. The front cover shall have a door with hinges, latch and a lock. The piano hinged front covers door-in-door shall allow full access to the circuit breaker gutter area without having to remove the entire front cover. All panelboard lock shall be keyed alike. Circuit breaker and fusible distribution panels shall have four-piece trims. A welded circuit directory frame and card with a clear plastic covering shall be provided on the inside of the door. Provide NEMA 1 enclosure where installed indoors unless otherwise noted. Provide NEMA 3R enclosure where installed outside or in a sprinkled area.

G. Safety Barrier
1. The distribution panelboard interior assembly shall be dead front with panelboard cover removed. Main lugs or main breakers shall have a barrier. The barrier in front of the main lugs shall be hinged to a fixed part of the interior. The end of the bus structure opposite the mains shall have barriers.

H. Integrated Equipment Short Circuit Rating
1. Each panelboard, as a complete unit, shall have a short circuit current rating equal to or greater than the integrated equipment rating shown on the panelboard schedule or on the plans. This rating shall be established by testing with the over-current devices mounted in the panelboard. The short circuit tests on the over-current devices and on the panelboard structure shall be made simultaneously by connecting the fault to each over-current device with the panelboard connected to its rated voltage source. Method of testing shall be per UL 67. The source shall be capable of supplying the specified panelboard short circuit current or greater. Testing of panelboard over-current devices for short circuit rating only while individually mounted is not acceptable. Also, testing of the bus structure alone is not acceptable. Panelboards shall be marked with their maximum short circuit current rating at the supply voltage and shall be UL listed.

I. {CH#54591}

PART 3 - EXECUTION

1. Provide load centers where indicated.

3.2 INSTALLATION

A. General: Install panelboards, including electrical connections, in accordance with manufacturers written instructions, NEC and recognized industry practices.

B. All panels shall be mounted to unistrut. Unistrut shall be securely mounted to the floor and structural ceiling. Toggle bolts or anchor bolts attached to drywall is not acceptable.

C. Housekeeping Pads: Mount floor mounted panelboards on 4 inch high concrete housekeeping pads where inside the building, 6" housekeeping pad where outside the building. Incfre

D. Recessed Panels: Stub up three one inch conduits to an accessible location above the ceiling for each recessed panelboard.

3.3 IDENTIFICATION

A. Nameplate: Each panelboard shall have an engraved bakelite nameplate. Nameplates shall be white with black letters and show panel designation. Nameplates shall be attached with stainless steel screws. Refer to Section 26 02 00, paragraph 2.8(C).

B. Directory Card: Cardholders and directory cards shall be furnished for circuit identification in panelboards. Cardholder shall be located on inside of panel door and shall be in a metal frame with clear plastic front. Circuit lists shall be typewritten. Circuit descriptions shall include location and name of each item of equipment served. Spares and spaces shall be written in erasable pencil for future use. Circuit directory shall show the room served by each circuit. The final graphs/signage room numbers shall be used. Do not use Architectural numbering on plans.

C. Replacement Components: Nameplate shall identify replacement components.

END OF SECTION

SECTION 26 27 26 - WIRING DEVICES

PART 1 - GENERAL

1.1 SCOPE

A. Provide wiring devices as shown; scheduled, required and as specified.

B. The types of wiring devices required include:
   1. Receptacles
   2. Switches
   3. Coverplates

1.2 STANDARDS

A. NEMAWD-1

B. NEMA WD-5

C. UL

D. Federal Spec WC-596-F and WS-896

1.3 ACCEPTABLE MANUFACTURERS

A. Hubbell

B. Leviton

C. Pass & Seymour

1.4 SUBMITTALS

A. Shop drawings shall include but not be limited to:
   1. Cut sheets of all devices indicating NEMA configuration, rating, materials, color, and all accessories.
   2. Cut sheets of all coverplates indicating materials, color and any engraving specified on drawing or in the specifications.

1.5 REQUIREMENTS OF REGULATORY AGENCIES WORK IN ACCORDANCE WITH:

A. National Electric Code.

B. Local, municipal, or state codes that have jurisdiction.

PART 2 - PRODUCTS

2.1 MATERIALS AND COMPONENTS

A. GENERAL
   1. Provide factory assemble wiring devices with the rating type and color as required and specified for the service indicated.
   2. Provide matching one-piece multiple gang plates where switches are ganged.
   3. Provide wall plates for each receptacle furnished.
   4. Architect reserves the right to select wiring device styles and colors to match wall finish.
   5. Wall plates shall be of same manufacturer as devices.

2.2 SWITCHES

A. Provide specification grade White decora style rocker switches where indicated on the Drawings. Provide "Red" switches for switching emergency lighting circuits where switching is indicated. Coordinate exact locations with architect.
   1. Wall switches shall be 20 amp, 120-277 volt and shall be Hubbell Decorator Series, Leviton, Decora or Pass & Seymor Decorator, as follows:
      a. SINGLE POLE SWITCHES: Leviton 5621-2, P&S 2621, Hubbell DS120
      b. DOUBLE POLE SWITCHES: Leviton 5622-2, P&S 2622, Hubbell DS220
      c. THREE WAY SWITCHES: Leviton 5623-2, P&S 2623, Hubbell DS320
      d. FOUR WAY SWITCHES: Leviton 5624-2, P&S 2624, Hubbell DS420
      e. MOMENTARY CONTACT SWITCHES: Hubbell HBL1557, Leviton 1257, P&S 1251
      f. THREE POSITION, TWO CIRCUIT MAINTAINED CONTACT SWITCHES: Leviton 1285, Hubbell HBL1385, P&S 1225
   2. Dimmers: Provide Lutron DIVA wall box dimmers sized to handle the load or as shown on drawings. Where fluorescent dimming ballasts are to be used, coordinate wall box dimmer with ballast manufacturer.
   3. Light Handle Switches: Provide Leviton 5649-2 or P&S 2625 lighted handles to switch emergency lights where noted on the drawings.

2.3 RECEPTACLES

A. Provide specification grade, Decora type White receptacles where indicated on the drawings. Provide “Red” receptacles for receptacles on emergency power. Coordinate exact location with architect.
   1. Receptacles shall be Hubbell StyleLine Decorators Series, Leviton, Decora or Pass & Seymour Decorator as follows:
      a. Duplex 20A-125V-self grounding: (NEMA configuration 5-20R): Hubbell DR20, Leviton 16362, or P&S 26342.
      b. Simplex 20A-125V-Self Grounding: (NEMA configuration 5-20R): Leviton 1635 or P&S 26361.
      c. Isolated ground duplex, 20A-125V: (Orange, NEMA configuration 5-20R) Hubbell IG20DRX, Leviton 16362-IG or P&S IG26362 (where X denotes color).
      d. Clock hanger receptacle 20A-125V: (Brown with stain finish stainless steel plate with hanger, NEMA configuration 5-20R): Hubbell 5235, Leviton 5361-CH P&S S3733-SS
      e. Ground fault circuit interrupter (GFCI) receptacle 20A-125V; GF-5352. (NEMA Configuration 5-20R, shall incorporate self-test, auto monitoring technology and features which will lock-out or render the device incapable of being reset if ground fault protection is compromised, with "Feed through" connectors capable of protecting connected downstream receptacles on a single circuit, and of being installed in a 2-3/4" deep outlet box without adapter,Hubbell GFRST20, Leviton GFNT2 or P&S 2097
         1) Install Hubbell GFTRST20, Leviton GFTR2 or P&S 2095TR Tamper Resistant type for locations requiring Tamper Resistant installations
         2) Install Hubbell GFTWRST20, Leviton GFWR2 or P&S 2097TRWR Weather Resistant type for installations in damp and wet locations.
      f. Tamper resistant receptacles 20A-125V: (NEMA configuration 5-20R): Hubbell DR20TR, Leviton 16262-SG, P&S TR26362 - HIGH LTG.
      g. Surge Protection Duplex Receptacles 20A-125V, (NEMA 5-20R): Hubbell HBL5360, Leviton 5280, Legrand 5362
      h. Special equipment receptacles shall be coordinated with owner/manufacturer requirements and the correct and appropriate receptacle and coverplate shall be installed.
      i. USB Charger types receptacles to b Hubbell, 20A, 125V AC Hospital Grade, Tamper Resistant, with two USB Type 2.0 Ports 5.0 Amp, 5V DC, Decorator Type duplex receptacle. Hubbell USB8300A5, P&S TR20HUSBAC6 or equal by other approved wiring device manufacturers.
      j. Plug load controlled receptacles to be Hubbell DR20C2WHI or P&S 26352CD white, two controlled faces or equal by Leviton.
      k. ARC Fault circuit interrupter receptacles shall be Hubbell AFR20TR
      l. Ground fault circuit interrupter/ARC Fault dual function receptacles shall be Hubbell AFGF20TR or P&S AFGF202TR.

2.4 OCCUPANCY SENSORS

A. Provide White dual technology wall mounted sensors, provide one of the following:
   1. Single Pole:
      a. Wattstopper #DSW301
   2. Double Pole:
      a. Wattstopper # DSW302
   3. Dimmer:
      a. Wattstopper #DW311

B. Provide dual technology ceiling sensor with low voltage controlling switch and power pack.
   1. Single Button:
      a. Wattstopper # DT300 Sensor, BZ150 Power Pack and LVSW101 Digital Switch

C. Provide Ultra Sonic Ceiling sensor for restrooms.
   1. Wattstopper #UT3000, BZ150 Power Pack

2.5 DIGITAL TIMER SWITCHES

A. Provide Wattstopper TS-400-G digital timer. Locate in mechanical, electrical, MDF, and IDF rooms.

B. The time switch shall provide audible notification and visual notification (blink the room lights) prior to turning lights off.

C. The time switch shall have a 12-hour manual override setting.

2.6 PLATES

A. Furnish and install plates on all outlet boxes. Oversize (Jumbo) plates are not acceptable.

B. Plates shall be smooth nylon and 302/304 smooth stainless steel in kitchen and coffee bar areas.

C. Provide Hubbell WP Series, Bell, Carlon or Leviton NEMA 3R weatherproof coverplates on all exterior wiring devices. Enclosure shall be suitable for wet locations when in use.

D. Plates shall be Hubbell SS Series, Leviton, Pass & Seymour 302/304 smooth stainless steel on all receptacles 30 amps and larger.

E. Stainless steel device plates shall be provided at locations with tile or stone walls.

PART 3 - EXECUTION

3.1 WIRING DEVICE MOUNTING HEIGHTS

A. Reference Architectural and Electrical elevation details. Architectural elevations supersede Electrical elevations indicated. Failure to confirm mounting heights of all devices with architect and owner prior to rough-in may consitute rework at the expense of the contractor.

3.2 INSTALLATION (REFER TO 26 05 33 FOR OUTLET BOX SPECIFICATIONS).

A. Wall switches shall be set in a suitable steel box and shall be installed on the strike side of the door as finally hung, whether so indicated on the Drawings or not.

B. Receptacles shall be installed in a suitable steel box.

C. The Architect reserves the right to relocate wiring device up to a distance of 5 feet from the location shown, before rough-in, without additional cost.

D. Provide multi-gang device covers at locations where devices gang together.

E. Device locations are indicated schematically on the drawings along with the type and mounting height. Final locations and mounting heights shall be coordinated with the Architect on the jobsite, and with shop drawings of equipment; including equipment to be furnished and installed by the Owner. Devices installed in walls covered with vinyl, fabric wallpaper or other special finishes shall be coordinated and verified with the Architect on the job-site.

F. Stranded wire termination to switches, receptacles, devices and miscellaneous control devices shall be with an approved solderless terminal if clamp type securing is not possible (i.e. Sta-Con crimp on fork tongue connectors; Burndy Type TP-F).

G. Provide keyed switches in all common areas not monitored by the faculty (i.e. gym, corridors, cafeteria, commons natatoriums).

H. Tamper-resistant type receptacles shall be installed in all classrooms, cafeterias, corridors, special education, ALE, computer labs, special use classroom and all spaces where children 7 years and younger may occupy. In Child-Care facilities, tamper resistant receptacles shall be provided for all spaces with exception to back-of-house spaces, such as kitchens, custodial closets, electrical and mechanical rooms.

I. All 20A, 120V receptacles in food service areas shall be GFCI.

J. All circuit breaker serving electric drinking fountains shall be GFCI.

K. Provide ARC Fault circuit interrupters (AFCI) as required to comply with 210.12 of the N.E.C. This shall include but not be limited to dwelling units and dormitories. AFCI breakers may be used.

L. Provide ground fault circuit interrupter (GFCI)/ARC Fault circuit interrupter (AFCI) dual function receptacles to comply with 210.8, 210.12 and 406.4 of the N.E.C.

END OF SECTION

SECTION 26 28 13 - FUSES

PART 1 - GENERAL

1.1 SCOPE

A. Provide fuses as shown and scheduled and indicate by this specification section and other specifications sections.

B. The type of fuses include:
1. 600 volt current limiting.
2. 250 volt current limiting.

1.2 STANDARDS

A. ANSI

B. UL

1.3 ACCEPTABLE MANUFACTURERS

A. Eaton Bussmann

B. Mersen

1.4 SUBMITTALS

A. Shop drawings shall include, but not be limited to:
1. Cutsheets of all fuses showing ratings and fuse curves.

1.5 REQUIREMENTS OF REGULATORY AGENCIES

A. WORK IN ACCORDANCE WITH:
1. National Electrical Code.
2. Local, municipal, or state codes that have jurisdiction.

PART 2 - PRODUCTS

2.1 CURRENT - LIMITING FUSES

A. General: Provide 200,000 amp interrupting capacity current limiting fuses of the ampacity and voltage indicated and scheduled.

B. Mains, Feeders and Branch Circuits
1. Circuits 601 to 6000 ampere shall be protected by current limiting BUSSMANN HI-CAP Time Delay Fuses KRP-C. Fuses shall employ "O" ring as positive seals between the end bells and the glass melamine fuse barrel. The terminals shall be peened. Fuses shall be time-delay and must hold 500% of rated current for a minimum of 4 seconds, clear 20 times rated current in .1 seconds or less and be listed by Underwriters` Laboratories Inc., with an interrupting rating of 200,000 amperes r.m.s. symmetrical. The fuses shall be UL Class L.

C. Class J Fuses
1. Circuits 0 to 600 ampere shall be protected by current limiting BUSSMANN LOW-PEAK Dual Element Fuses LPJ. All dual-element fuses shall have separate overload and short-circuit elements. Fuse shall incorporate a spring activated thermal overload element having a 284 degree Fahrenheit melting point alloy and shall be independent of the short-circuited clearing chamber. The fuse must hold 500% of rated current for a minimum of 10 seconds and listed by Underwriters' Laboratories Inc., with an interrupting rating of 200,000 amperes rRMS symmetrical. The fuses shall be UL Class J.

2. Motor Circuits - All individual motor circuits rated 600 amperes or less shall be protected by BUSSMANN LOW-PEAK LPJ. The fuses for 1.15 service factor motors shall be installed in ratings approximately 125% of motor full current except where high ambient temperatures prevail, or where the motor drives a heavy revolving part which cannot be brought up to full speed quickly, such as large fans. Under such conditions the fuse should be 150% to 200% of the motor full load current. Larger H.P. Motor shall be protected by BUSSMANN Type KRP-C HI-CAP Time-Delay Fuses of the rating shown on the drawings. 1.0 service factor motors shall be protected by BUSSMANN LOW-PEAK Dual-Element Fuses LPJ installed in ratings approximately 115% of the motor full load current except as noted above. The fuses shall be UL Class LPJ or L. Circuit breaker panels shall be protected by BUSSMANN LOW-PEAK Dual-Element LPJ as shown on the drawings. The fuses shall be UL Class J.

2.2 SPARES

A. Upon completion of the building the contractor shall provide the owner with spare fuses as shown below.
1. 10% (minimum of 3) of each type and rating of installed fuses shall be supplied as spares.
2. BUSSMANN spare fuse cabinets - Catalog No. SFC - shall be provided to store the above spares.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Fuses: Fuses shall not be installed until equipment is ready to be energized. This measure prevents fuse damage during shipment of the equipment from the manufacturer to the job-site or from installation. All fuses shall be furnished and installed by the electrical contractor. All fuses shall be of the same manufacturer.

B. All fuses shall be installed in fuse holders.

END OF SECTION

SECTION 26 28 16 - SAFETY AND DISCONNECT SWITCHES

PART 1 - GENERAL

1.1 SCOPE

A. Provide safety and disconnect switches as shown, scheduled and as specified herein.

1.2 STANDARDS

A. Products shall be designed, manufactured, tested and installed in compliance with applicable standards.
   1. NEMA KS1 - Enclosed switches
   2. Federal specification W-S-865C-Heavy duty switches

B. Products shall conform all applicable UL standards, including UL98 (standard for safety, enclosed and dead front switches) and shall be UL-labeled.

1.3 ACCEPTABLE MANUFACTURERS

A. Provide one of the following manufacturers:
   1. General Electric Company/ABB
   2. Square D Company
   3. Siemens
   4. Eaton

1.4 SUBMITTALS

A. Shop drawings shall include, but not be limited to:
   1. Cutsheets of switches with ratings, physical dimensions and all accessories clearly labeled.

1.5 REQUIREMENTS OF REGULATORY AGENCIES

A. WORK IN ACCORDANCE WITH:
   1. National Electrical Code.
   2. Local, municipal, or state codes that have jurisdiction.

PART 2 - PRODUCTS

2.1 GENERAL

A. Furnish and install heavy duty type safety switches with the number of switched poles as indicated on the plans and specifications. All safety switches shall be NEMA Heavy Duty Type HD, and Underwriters Laboratories listed.

2.2 MATERIALS AND COMPONENTS

A. Switch Interior
   1. All switches shall have switch blades that are fully visible in the "OFF" position when the door is open. Switches shall have removable arc suppressor where necessary, to permit easy access to line side lugs. Lugs shall be front removable and UL listed for 60ºC and 75ºC copper or aluminum cables. All switches blades and contacts shall be plated copper. Adjust fuse block to accept Class J fuses.

B. Switch Mechanism

1. Switches shall have a quick-make and quick-break operating handle and mechanism, which shall be an integral part of the box, not the cover. Padlocking provisions shall be provided for locking in the "OFF" position with at least three padlocks. Switches shall have a dual cover interlock to prevent unauthorized opening of the switch door when the handle is in the "ON" position, and to prevent closing of the switch mechanism with the door open. A means shall be provided to permit authorized personnel to release the interlock for inspection purposes. Handle position shall indicate if switch is "ON" or "OFF".

C. Neutral
1. Provide a solid neutral with the safety switch where a neutral is present in the circuit.

D. Ratings
1. Switches shall be horsepower rated for ac and/or dc as indicated by the plans. The fused switches shall have Class R rejection fuse clips or adjusted for Class J fuses. UL listed short circuit ratings of the switches, when equipped with Class R fuses, shall be 200,000 symmetrical amperes.

E. Enclosures
1. Indoor switches shall be furnished in NEMA 1 enclosures.
2. Outdoor switches, switches located in wet areas or sprinkled areas shall be furnished in NEMA 3R enclosures.
3. Switches installed in wet areas such as cooling tower areas shall be NEMA 4X stainless steel or fiberglass reinforced polyester.
4. Switches installed in kitchens shall be stainless steel.
5. Switches installed in areas of a corrosive nature and subjected to salt air shall be NEMA 4X stainless steel or fiberglass reinforced polyester.

F. Electrical Interlock Contacts
1. Provide electrical interlock contacts on all disconnect switches serving motors in which remote VFDs are serving the motor. Provide conductors from contacts to the safe circuit inside the VFD. De-energizing the disconnect switch shall signal VFD to stop.

G. Service Entrance
1. Switch shall be suitable for use as service entrance equipment when installed in accordance with the National Electrical Code.

PART 3 - EXECUTION

3.1 GENERAL

A. Install safety and disconnect switches, including electrical connections, and fuses in accordance with manufacturer’s written instructions, NEC and recognized industry practices.

B. Location: Install switches within sight of controllers.

C. Hubs: Provide bolt-on hubs for rainproof or wet area applications.

3.2 IDENTIFICATION

A. Nameplate: Each disconnect switch shall have an engraved bakelite nameplate. Nameplates shall be white with black letters and show equipment served. Nameplates shall be attached with stainless steel screws.

END OF SECTION

SECTION 26 29 01 - MOTORS AND STARTERS

PART 1 - GENERAL

1.1 SCOPE

A. Provide manual motor starters as shown, scheduled and as specified herein.

B. All integral motor starters furnished under Division 23 requirements shall be installed under Division 26 requirements unless noted otherwise on the plans.

C. Refer to 26 29 13 for motor starter specifications.

1.2 STANDARDS

A. Products shall be designed, manufactured, tested and installed in compliance with applicable standards.

B. Products shall conform to all applicable UL standards and shall be UL-labeled.

1.3 ACCEPTABLE MANUFACTURERS

A. Provide one of the following manufacturers:
1. General Electric Company/ABB
2. Square D Company
3. Siemens
4. Eaton

1.4 SUBMITTALS

A. Shop drawings shall include, but not be limited to:
1. Cutsheets of all enclosures, switches, overloads, ratings, and all accessories clearly labeled.

1.5 REQUIREMENTS OF REGULATORY AGENCIES

A. WORK IN ACCORDANCE WITH:
1. National Electrical Code.
2. Local, municipal, or state codes that have jurisdiction.

PART 2 - PRODUCTS

2.1 MATERIALS

A. GENERAL: Refer to the Drawings for starter requirements for each motor.

2.2 MANUAL MOTOR STARTERS

A. GENERAL: Manual starters shall consist of a manually operated toggle switch equipped with melting alloy type thermal overload relay. Thermal unit shall be of one-piece construction and interchangeable. Starter shall be inoperative if thermal unit is removed. Contacts shall be double break, silver alloy, visible from both sides of starter. Manual starters shall be square "D" class 2510 or 2512 or approved equal. Provide the size and number of poles shall be as shown and required by equipment served. Furnish red pilot light as indicated.

B. ENCLOSURES: All manual motor starter enclosures shall be NEMA 1, general purpose enclosures, unless shown otherwise. Provide NEMA 3R enclosure where installed outside or in a sprinkled area.

PART 3 - EXECUTION

3.1 INSTALLATION OF MOTORS

A. GENERAL: Mount electric motors which are not factory installed.

B. MOTOR CONNECTIONS: Provide electrical and grounding connections to motors as indicated. Connections as follows:
1. Not less than 18 inch length of Sealtite, extending from motor connection box to motor branch circuit conduit on outdoor and wet locations. Provide Greenfield for inside dry locations.
2. Install connections mechanically secure, assuring electrical continuity, proper and effective grounding.

C. INSTALLATION OF MOTOR STARTER
1. Install motor starters in accordance with the manufacturer`s written instructions, the applicable requirements of the NEC and the NECA`s "Standard of Installation", and recognized industry practices to ensure that products serve the intended function.
2. Combination starter disconnects and starters mounted in ceiling plenums shall be installed 18” above ceiling grid.

END OF SECTION

SECTION 26 29 26 - MISCELLANEOUS ELECTRICAL CONTROLS AND WIRING

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

A. The requirements of the General Conditions and Supplementary Conditions apply to all work herein.

1.2 SCOPE

A. Provide the various miscellaneous control devices, wiring and additional branch circuits as required, shown and specified.

B. The types of miscellaneous control devices and wiring include but not limited to the following.
1. Contactors
2. Relays
3. Photocells
4. Time switches
5. Additional control wiring and safety devices as shown and specified.
6. Connect power from fire alarm relays to starters to shut down air handling units.

C. WORK SPECIFIED ELSEWHERE:
1. Various control devices, of an electrical nature, for the safe operation and temperature control of the heating, ventilating, air conditioning and plumbing systems provided under Division 22 and Division 23.
2. All control wiring and conduit shall be furnished under Division 23. All power wiring 120 volt or larger shall be provided by Division 26.
3. Refer to building controls specification, Division 23 for scope of work required to be performed by Division 26 (electrical contractor).

1.3 REQUIREMENTS OF REGULATORY AGENCIES

A. WORK IN ACCORDANCE WITH:
1. National Electrical Code.
2. Local municipal or state codes that have jurisdiction.

1.4 ACCEPTABLE MANUFACTURERS

A. Provide one of the following manufacturers:
1. LIGHTING CONTACTORS AND RELAYS
a. General Electric Comapny/ABB
b. Square D Company
c. Automatic Switch Company
2. PHOTOCELLS AND TIME SWITCHES
a. Tork, Inc.
b. Intermatic time controls
c. AMF Paragon

PART 2 - PRODUCTS

2.1 MATERIAL

A. GENERAL: This Section shall outline the basic installation of electric devices, conduit, boxes, fittings, and wiring required for complete interconnection of several systems, this may not reflect every required appurtenance. It does not cover integral parts of mechanical equipment.

B. CONTACTORS AND RELAYS: Provide control wiring, contactors, and relays with the ampere-rating and number of poles as shown, specified, and required for a complete and functioning system:
1. Rated at 600 volts, 60 hertz.

2. Continuously rated contacts for all types of ballast and tungsten lighting, resistance and motor loads. Contacts shall be sized as scheduled or noted.
3. Shall have totally enclosed, double-break silver-cadmium-oxide power contacts. Auxiliary arcing contacts are not acceptable. Contact inspection and replacement shall be possible without disturbing line or load wiring.
4. The contactor shall have straight-through wiring with all terminals clearly marked.
5. The contactor shall be approved per UL508 and/or CSA, and be designed in accordance with NEMA ICS2-21 1B.
6. They shall be industrial-duty rated for applications to 600 volts maximum.
7. The contactor shall have provisions for factory or field addition of:
   a. Four (4) N.O. or N.C. auxiliary contacts rated 6 amperes continuous at 600 volts.
   b. Single or double circuit, N.O. or N.C., 30 or 60 ampere 600 volt power-pole adder.
8. The contactor shall have a NEMA type 1 enclosure unless otherwise noted.
9. Control power to the contactor 120V control circuit shall be provided from the nearest panelboard 120V circuit. If the 120V control power circuit is not shown, provide a control power transformer for 120 volt control power and a 120 volt coil when required for control. Provide primary and secondary fuses on the control power transformer.
10. Electrically Held Lighting - Contactor coils shall be continuously rated and encapsulated. Electrically held contactors are not to be used unless specifically shown on the plans.
11. Mechanically Held Lighting Contactors - Coil-clearing contacts shall be supplied so that the contactor coils shall be energized only during the instance of operation. Both latch and unlatch coils shall be encapsulated. All contactors shall be mechanically held unless noted otherwise on the plans.
12. Provide 2-wire or 3-wire control modules as required to operate lighting contactors.
13. Provide hand-off-automatic controls (H-O-A) for each lighting contactor.
14. Provide relays and contactors to shut down air handling units.

C. Photocells: Provide a specification grade self-contained, weatherproof, photoelectric control that shall be mounted on an FS type weatherproof junction box. The photocell shall:
1. Switch "ON" at dusk and "OFF" at dawn.
2. Adjustable from 2 to 50 foot-candles.
3. Rated at 2000 watts.
4. Use 1" diameter cadmium sulphide cell.
5. Have a 2-minute delay to prevent false switching.

D. TIME SWITCHES: Provide a 7-day digital time clock with battery back-up feature installed in a NEMA 3R enclosure.

E. Control wiring shall be not less than #14 AWG type TW and shall be color coded and labeled with Brady markers throughout. Bundle multiple conductors with Ty-Raps.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install miscellaneous electrical controls and wiring to provide a functioning system.

B. Install contactor and relays in electrical/mechanical rooms unless otherwise noted.

C. Install photocells on the roof unless otherwise directed by the architect. Coordinate any roof penetrations with all other trades and shield from other light sources.

D. Provide miscellaneous connections for signs and other furnished equipment as shown on the Drawings.

3.2 DIVISION 22, 23, 27 AND 28 MISCELLANEOUS POWER AND CONTROLS

A. Install electrical devices not an integral part of system equipment providing conduit, boxes, fittings, wiring, circuit breakers, disconnecting means and other devices.

B. Contractor is responsible for providing all line voltage power to devices that require electrical power to operate. Contractor shall terminate line voltage power to termination points. Contractor shall coordinate between all trades to determine sizing and quantities of line voltage circuits to adequately power and control devices. Provide circuits from nearest low voltage panel using spare circuits provided, if device requires power not already available or indicated.

C. Provide GFCI receptacle with weather proof cover within 25 feet of all heating, air conditioning and refrigeration equipment.

3.3 OPERATIONS PERSONNEL TRAINING

A. Provide a training session for the owner's operations personnel. Training session shall be performed by a qualified person who is knowledgeable in the subject/equipment. Submit a training agenda two (2) weeks prior to the proposed training session for review and approval. Training session shall include at the minimum:
1. Purpose of equipment.
2. Principle of how the equipment works.
3. Important parts and assemblies.
4. How the equipment achieves its purpose and necessary operating conditions.
5. Most likely failure modes, causes and corrections.
6. On site demonstration.

END OF SECTION

SECTION 26 33 53 - UNINTERRUPTIBLE POWER SUPPLY (UPS)

PART 1 - GENERAL

1.1 GENERAL

A. These specifications describe requirements for an Uninterruptible Power System (UPS). The UPS shall automatically maintain AC power within specified tolerances to the critical load, without interruption, during failure or deterioration of the normal power source.
   1. The manufacturer shall design, provide all materials and equipment to be fully compatible with electrical, environmental and space conditions at the site. It shall include all equipment to properly interface the AC power source to the intended load and shall be designed for unattended operation.

1.2 STANDARDS

A. The UPS shall be designed in accordance with the applicable sections of the current revision of the following documents. Where a conflict arises between these documents and statements made herein, the statements in this specification shall govern.
   1. UL 1778
   2. CSA 22.2, No. 107.1
   3. FCC Part 15, Subclass B, Class A
   4. IEC 61000-4-5
   5. IEEE 519
   6. National Electrical Code (NFPA 70)
   7. NEMA PE-1
   8. ISTA_1H
   9. The UPS shall be provided with a Short Circuit Withstand Rating (SCWR) label denoting the maximum source fault short circuit current that is applicable to the unit. The withstand rating shall be independently verified by a nationally recognized, third-party lab.

1.3 APPROVED MANUFACTURERS

A. Vertiv/Liebert

B. APC/Schneider Electric

1.4 BASIS OF DESIGN

A. Basis of design is Litthium-ION APC Galaxy VS ISX0002256834 – Please contact Tubbesing for pricing and availability at 469.859.0072

B. Substitutions for basis of design shall include factory sizing verification of the UPS sizing demonstrating that submitted UPS inverter can handle motor starting inrush based on final submitted motor sizes and starting types.

1.5 SYSTEM DESCRIPTION - UPS MODULE

A. Basis of design includes inverter sized for 150 KW/KVA. Input/output voltage specifications of the UPS shall be 480 volt, 3-phase, 3-wire.

1.6 DESIGN REQUIREMENTS - BATTERY

A. Provide high rate charge, valve-regulated, lead acid batteries designed for interior use.

B. Reserve Time: Minimum 120 Minutes at load of 111.4 KW (calculated peak draw), with ambient temperature of 77°F (25°C). Unit shall provide terminal for connection of external batteries.

C. The UPS shall have an active power factor-correct IGBT converter/rectifier, capable of maintaining input power factor and input current total harmonic distortion (THDi) within specifications without an additional input filter.

D. The UPS shall be capable of operating in a High Resistance Ground environment, and shall provide notification when a fault to ground occurs on its input. Leakage current shall not exceed 1.5 amps.

1.7 MODES OF OPERATION

A. The UPS shall be designed to operate as an on-line, reverse-transfer system with the following operating modes:

B. Normal - The critical AC load is continuously supplied by the UPS inverter. The rectifier/charger derives power from an AC source and supplies DC power to the inverter while simultaneously float-charging the reserve battery.

C. Emergency - Upon failure of utility AC power, the critical AC load is supplied by the inverter, which obtains power from the battery. There shall be no interruption in power to the critical load upon failure or restoration of the utility AC source.

D. Recharge - Upon restoration of utility AC power after a utility AC power outage, the rectifier/charger shall automatically restart and assume the inverter and battery recharge loads.

E. Bypass - If the UPS must be taken out of service for maintenance or repair or if the inverter overload capacity is exceeded, the static transfer switch shall perform a reverse transfer of the load from the inverter to the bypass source with no interruption in power to the critical AC load.

F. Energy Optimization Mode (Active Eco Mode) - The critical AC load shall be continuously powered by the bypass with the inverter available to power the load if the bypass source voltage or frequency exceeds adjustable parameters of power quality.

G. Off-Battery - If the battery only is taken out of service for maintenance, it shall be disconnected from the DC-DC converter by means of an external disconnect circuit breaker. The UPS shall continue to function and meet all of the specified steady-state performance criteria, except for the power outage backup time capability. If multiple battery strings are used, each string shall be capable of being electrically isolated for safety during maintenance.

1.8 PERFORMANCE REQUIREMENTS

A. AC Input to UPS
1. Voltage Range: +20%, -15% at full load, -40% at half load
2. Frequency: 40-70Hz
3. Power Factor:Minimum .99 at nominal input voltage and full-rated UPS output load
4. Inrush Current: UPS inrush current not to exceed 1.5 times rated input current. Maintenance bypass and distribution cabinet inrush current not to exceed 8 times rated input current.
5. Current Distortion: <5% reflected THD maximum at full load
6. Surge Protection: Sustains input surges without damage per criteria listed in ANSI C62.41, category B3 (4kV) line to ground.
7. Rectifier Walk-In: 0% to 100% of full rated load over 2.5-90 seconds (adjustable) with full rectifier power.
8. Rectifier Start Delay: Programmable from 1-180 seconds
9. Short Circuit Current Withstand Rating: Unit shall carry as standard 100Ka Short Circuit Withstand Rating (SCWR). All ratings shall be certified and a label shall be applied to the unit clearly identifying this rating by the NEC.

B. AC Output, UPS Inverter
1. Voltage Regulation: ±1% three-phase RMS average for a balanced three-phase load for the combined variation effects of input voltage, connected load, battery voltage, ambient temperature and load power factor; ±3% three-phase RMS average for a 100% unbalanced load for the combined variation effects of input voltage, connected load, battery voltage, ambient temperature and load power factor.
2. Voltage Adjustment Range: ±5% for line drop compensation adjustable by factory service personnel.
3. Frequency Regulation: Synchronized to bypass ±1.2Hz default setting, adjustable by factory personnel. Synchronized to internal clock 0.06Hz.
4. Frequency Slew Rate: Selectable from 0.1Hz/sec maximum for single unit.
5. Phase Displacement: ±0.5 degree for balanced load; ±1.0 degrees for 100% unbalanced load.
6. Bypass Line Sync Range: ±2.0 Hz, field-selectable ±0.5 to 5.0 Hz.
7. Voltage Harmonic Distortion: Maximum 1% RMS total (100% resistive load).

8. Load Power Factor Range: 0.7 lagging to 1.0 leading without derating.
9. Output Power Rating: Rated kVA at 1.0 lagging power factor.
10. Overload at Full Output Voltage with ±1% Voltage Regulation: 100% continuous; 125% of full load for 10 minutes at 95°F ambient; 150% of full load for 1 minute at 95°F ambient.
11. Voltage Transient Response: 100% load step ±5.0%; Loss or return of AC input power ±1.0%.
12. Transient Recovery Time ±1% of nominal within four cycle.
13. Phase In balance: 100% unbalanced load, ±3°, Balanced loads ±1°

1.9 ENVIRONMENTAL CONDITIONS

A. The UPS shall be able to withstand the following environmental conditions without damage or degradation of operating characteristics:
1. Operating Ambient Temperature
2. Storage/Transport Ambient Temperature
3. Relative Humidity
4. Altitude
5. Audible Noise

1.10 SUBMITTALS

A. Proposal Submittals
1. Submittals with the proposal shall include:
a. System configuration with single-line diagrams
b. Functional relationship of equipment including weights, dimensions and heat dissipation
c. Descriptions of equipment to be furnished, including deviations from these specifications
d. Size and weight of shipping units to be handled by installing contractor
e. Detailed layouts of customer power and control connections
f. Detailed installation drawings including all terminal locations

1.11 UPS DELIVERY SUBMITTALS

A. Submittals upon UPS delivery shall include a complete set of submittal drawings and one (1) set of instruction manuals that shall include a functional description of the equipment with block diagrams, safety precautions, instructions, step-by-step operating procedures and routine maintenance guidelines, including illustrations.

1.12 QUALITY ASSURANCE

A. Manufacturer Qualifications
1. A minimum of 20 years' experience in the design, manufacture and testing of solid-state UPS systems is required. The system shall be designed and manufactured according to world-class quality standards. The manufacturer shall be ISO 9001:2000 certified.

PART 2 - PRODUCTS

2.1 FABRICATION

A. Materials
1. All materials of the UPS shall be new, of current manufacture and high grade and shall not have been in prior service except as required during factory testing. All active electronic devices shall be solid-state. All power semi-conductors shall be sealed. Control logic and fuses shall be physically isolated from power train components to ensure operator safety and protection from heat. All electronic components shall be accessible from the front without removing sub-assemblies for service access.

B. Wiring
1. Wiring practices, materials and coding shall be in accordance with the requirements of the National Electrical Code, OSHA and applicable local codes and standards. All bolted connections of busbars, lugs and cables shall be in accordance with requirements of the National Electrical Code and other applicable standards. All electrical power connections shall be torqued to the required value and marked with a visual indicator.

2. Provisions shall be made in the cabinets to permit installation of input, output and external control cabling, using raceway or conduit. Provision shall be made for top and bottom access to input, output, bypass and DC connections. In conformance with NEC, connection cabinets shall provide for adequate wire bend radius. All copper busbars for customer power connections shall be tin plated for connection integrity.

C. Construction and Mounting
1. The UPS shall be in NEMA Type 1 enclosures, designed for floor mounting. The UPS shall be structurally adequate and have provisions for hoisting, jacking and forklift handling. Maximum cabinet height shall be 78.7 in. (2000mm).

D. Cooling
1. Cooling of the UPS shall be by forced air using a redundant fan configuration. Fan power shall be provided by the UPS.
2. The thermal design, along with all thermal and ambient sensors, shall be coordinated with the protective devices before excessive component or internal cabinet temperatures are exceeded. Air filters shall be located at the point of air inlet and be changeable.

2.2 COMPONENTS

A. Rectifier/Charger
1. The term rectifier/charger shall denote the solid-state equipment and controls necessary to convert AC to regulated DC for input to the inverter and for charging the battery.

B. AC Input Current Limiting
1. The rectifier/charger unit shall be provided with AC input current limiting whereby the maximum input current shall be limited to 115% of the full input current rating. Input current limit will be adjustable by service personnel to allow the UPS to be used with undersized feeder breakers.

C. DC Filter
1. The rectifier/charger shall have an output filter to minimize ripple current into the battery. The AC ripple voltage of the rectifier DC output shall not exceed 1% RMS of the float voltage. The filter shall be adequate to ensure that the DC output of the rectifier/charger will meet the input requirements of the inverter without the battery connected.

D. Automatic Rectifier Restart
1. Upon restoration of utility AC power, after a utility AC power outage and prior to a UPS automatic end-of-discharge shutdown, the rectifier/charger shall automatically restart and assume the inverter and battery recharge loads gradually over an adjustable 2.5-90 second walk-in period.

E. Battery Recharge
1. In addition to supplying power for the inverter load, the rectifier/charger shall be capable of producing battery charging current sufficient to replace 95% of the battery discharge power within ten (10) times the discharge time. After the battery is recharged, the rectifier/charger shall maintain the battery at full charge until the next emergency operation.

F. Overvoltage Protection
1. There shall be DC overvoltage protection so that if the DC voltage rises to the preset limit, the UPS will shut down automatically and initiate an uninterrupted load transfer to the static bypass line.

2.3 INVERTER

A. General
1. The term inverter shall denote the equipment and controls to convert DC from the rectifier/charger or battery to precise AC to power the load. The inverter shall be solid-state, capable of providing rated output power, and for increased performance the inverter shall be a pulse-width-modulated design and utilize insulated gate bipolar transistors (IGBTs).

B. Overload Capability
1. The inverter shall be capable of supplying current and voltage for overloads exceeding 100%. The inverter shall provide 150% of full load for 1 minute, 125% of full load for 10 minutes and 110% of full load for 1 hour. A status indicator and audible alarm shall indicate overload operation. The UPS shall transfer the load to bypass when overload capacity is exceeded. The inverter shall be capable of starting and running the motors sized per the load calculations on drawings

C. Fault Clearing and Current Limit

1. The inverter shall be capable of supplying an overload current of 150% of its full-load rating for five seconds. For greater currents or longer time duration, the inverter shall have electronic current-limiting protection to prevent damage to components. The critical load will be transferred to the static bypass automatically and uninterrupted. The inverter shall be self-protecting against any magnitude of connected output overload. Inverter control logic shall sense and disconnect the inverter from the critical AC load without the requirement to clear protective fuses.

2.4 STEP LOAD RESPONSE

A. Voltage Distortion
1. Total harmonic distortion in the output voltage will not exceed 1% for 0% to 100% linear loads.
2. Total harmonic distortion in the output voltage will not exceed 4% for 0% to 100% non-linear loads.
3. Total harmonic distortion in the output voltage will not exceed 5% for 0% to 100% non-linear, unbalanced loads.

B. Phase Balance
1. Electronic controls shall be provided to regulate each phase so that an unbalanced loading will not cause the output voltage to go outside the specified voltage unbalance or phase displacement. With 100% load on one phase (and 0% load on the other two phases) or 100% load on two phases (and 0% load on the other phase), the voltage balance is to be within 2% and the phase displacement is to be 120 degrees within ±1.5 degrees.

C. Inverter Shutdown
1. For rapid removal of the inverter from the critical load, the inverter control electronics shall instantaneously turn off the inverter transistors. Simultaneously, the static transfer switch shall be turned on to maintain continuous power to the critical load.

D. Inverter DC Protection
1. The inverter shall be protected by the following disconnect levels:
   a. DC Overvoltage Shutdown
   b. DC Under-voltage - Warning (Low Battery Reserve) - pre-warning time is adjustable
   c. DC Under-voltage - Shutdown (End of Discharge)

E. Output Frequency
1. The output frequency of the inverter shall be controlled by a high-speed DSP capable of holding the inverter output frequency to within ±0.05% during steady state and transient conditions. Total deviation from the rated frequency, including short time fluctuations and drift, shall not exceed 0.05%.

2.5 DISPLAY AND CONTROLS

A. Monitoring and Control
1. The UPS shall be provided with a microprocessor-based unit status display and controls section designed for convenient and reliable user operation. A graphical liquid crystal display (LCD) shall be used to show a single-line diagram of the UPS and shall be provided as part of the monitoring and controls sections of the UPS. All operator controls and monitors shall be located on the front of the UPS cabinet. Monitoring functions such as metering, status and alarms shall be displayed on the graphical LCD. Additional features of the monitoring system shall include:
   a. Menu-driven display with pushbutton navigation
   b. Real-time clock (time and date)
   c. Alarm history with time and date stamp
   d. Memory with battery backup

B. Metering
1. The following parameters shall be displayed:
   a. Input AC voltage line-to-line
   b. Input AC current for each phase
   c. Input frequency
   d. Battery voltage
   e. Battery charge/discharge current
   f. Output AC voltage line-to-line
   g. Output AC current for each phase
   h. Output frequency
   i. Apparent power

j. Active power
k. Battery time left during battery operation

C. Alarm Messages
1. The following alarm messages shall be displayed:
a. The following alarm messages shall be displayed:
b. Mains Voltage Abnormal
c. Mains Undervoltage
d. Mains Freq. Abnormal
e. Charger Fault
f. Battery Reversed
g. No Battery
h. Control Power 1 Fail
i. Parallel Comm. Fail
j. Bypass Unable To Track
k. Bypass Abnormal
l. Inverter Asynchronous
m. Fan Fault
n. Control Power 2 Fail
o. Unit Over Load
p. System Over Load
q. Bypass Phase Reversed
r. Transfer Time-Out
s. Load Sharing Fault
t. Parallel Connect Fault
u. Bypass Over Current
v. Output Ground Fault

D. Status Messages
1. The following UPS status messages shall be displayed:
a. Rectifier (Off / Soft Start / Main Input On / Battery Input On)
b. Input Supply (Normal Mode / Battery Mode /All Off)
c. Battery Self Test (True / False)
d. Input Disconnect (Open / Closed)
e. EPO (True / False)
f. Charger (On / Off)
g. Output Disconnect (Open / Closed)
h. Maint. Disconnect (Open / Closed)
i. Bypass Disconnect (Open / Closed)
j. Inverter (Off / Soft Start / On)
k. Bypass (Normal / Unable To Trace / Abnormal)
l. Output Supply (All Off / Bypass Mode / Inverter Mode / Output Disable)
m. Inverter On (Enable / Disable)

E. Controls
1. UPS startup, shutdown and maintenance bypass operations shall be accomplished through pushbutton controls on the front panel. Menu-driven user prompts shall be provided to guide the operator through system operation without the use of additional manuals. Pushbuttons shall be provided to display the status of the UPS and to test and reset visual and audible alarms. A mimic screen shall be available on the LCD to depict a single-line diagram of the UPS with switch positions and power flow.

F. On-Line Battery Test
1. The UPS shall be provided with a menu-driven On-Line Battery Test feature. The test shall ensure the capability of the battery to supply power to the inverter while the load is supplied power in the normal mode.

2.6 STATIC TRANSFER SWITCH

A. General

1. A static transfer switch and bypass circuit shall be provided as an integral part of the UPS. The static switch shall be a naturally commutated high-speed static (SCR-type) device rated to conduct full load current continuously. The switch shall have an overload rating to clear a 20-ampere load branch circuit breaker.
2. The static transfer switch control logic shall contain an automatic transfer control circuit that senses the status of the inverter logic signals and operating and alarm conditions. This control circuit shall provide an uninterrupted transfer of the load to an alternate bypass source without exceeding the transient limits specified herein, when an overload or malfunction occurs within the UPS or to bypass the UPS for maintenance.

B. Uninterrupted Transfer
1. The transfer control logic shall automatically turn on the static transfer switch, transferring the critical AC load to the bypass source, after the transfer logic senses any of the following conditions:
   a. Inverter overload capacity exceeded
   b. Critical AC load overvoltage or under-voltage
   c. UPS fault condition

C. The transfer control logic shall inhibit an automatic transfer of the critical load to the bypass source if any of the following conditions are present:
1. Bypass frequency out of limits
2. Bypass out-of-synchronization range with inverter output

D. Uninterrupted Retransfer
1. Retransfer of the critical AC load from the bypass source to the inverter output shall be automatically initiated unless inhibited by manual control. The transfer control logic shall inhibit an automatic retransfer of the critical load to the inverter if one of the following conditions exists:
   a. Bypass out of synchronization range with inverter output
   b. Inverter/bypass voltage difference exceeding preset limits
   c. Overload condition exists in excess of inverter full load rating
   d. UPS fault condition present

2.7 BATTERY CABINET

A. The battery cabinet shall include ten (10) year design life, valve-regulated, lead-acid battery cells housed in a separate cabinet that matches the UPS cabinet styling to form an integral system lineup. The battery shall be of AGM design. (Absorbed Glass Mat). The alloys used in the grids shall be either Pure Lead, Lead Calcium or similar alloy. Cadmium alloys are not acceptable. Battery plates shall be individually formed (IPF) before assembled into battery case to optimize cell voltage balance and performance. Shall employ puncture resistant micro-porous glass mat separators for extended life. The battery shall be designed to allow for positive plate growth without damage to case or cover. Case and cover material shall be flame-retardant polypropylene - UL 94 V-0 / >28% LOI. Batteries shall have case to cover seal 100% leak tested by dunk testing. Battery shall employ epoxy-sealed posts to ensure a leak tight seal. The post seal shall be designed and tested for a 10 year life. All batteries shipped must meet or exceed IEEE-485 capacity requirements. Each cell shall contain a pressure relief valve that will open and close within the rated pressure values specified by the manufacture throughout the life of the battery. Pressure relief valves shall be 100% factory tested. Each cell shall be equipped with a flame arrester to prevent any flame or spark from exiting or entering an individual cell.

B. The UPS shall be capable of performing battery load testing under operator supervision. To accomplish this, the rectifier shall reduce charging voltage to force the batteries to carry the load for a short time. If the curve of battery voltage drop indicates diminished battery capacity, the UPS shall display an alarm message. If the voltage drop indicates battery failure, the UPS shall terminate the test immediately and annunciate the appropriate alarms.

2.8 MAINTENANCE BYPASS PANELBOARD

A. A make-before-break maintenance bypass with Solenoid Key Release Unit (SKRU) interlock shall be available in a free standing enclosure attached to the UPS. Thermal-magnetic breakers shall be provided for bypass and maintenance isolation.

2.9 REMOTE ALARM

A. Provide network card and connect to Owner’s network for remote monitoring. Provide the following alarms:
1. Load on UPS LED

2. Load on Bypass LED
3. Battery Discharging LED
4. Low Battery Warning LED
5. UPS Alarm Condition LED
6. New Alarm Condition LED (For a Second UPS Alarm Condition)
7. Audible Alarm with Reset pushbutton
8. Lamp Test/Reset pushbutton

2.10 LOAD BUS SYNC CONTROLLER

A. Provide a Load Bus Sync Controller to enable two independent single module UPS units to stay in Sync when operating on battery or unsynchronized input sources. The LBS Controller shall determine the master and slave relationship between UPS units. An LBS Controller shall be installed with each single module UPS.

PART 3 - EXECUTION

3.1 FIELD QUALITY CONTROL

A. The following inspections and test procedures shall be performed by factory-trained field service personnel during the UPS startup.

3.2 VISUAL INSPECTION

A. Inspect equipment for signs of damage.

B. Verify installation per drawings.

C. Inspect cabinets for foreign objects.

D. Verify neutral and ground conductors are properly sized and configured.

E. Inspect battery cases.

F. Inspect battery for proper polarity.

G. Verify all printed circuit boards are configured properly.

3.3 MECHANICAL INSPECTION

A. Check all control wiring connections for tightness.

B. Check all power wiring connections for tightness.

C. Check all terminal screws, nuts and/or spade lugs for tightness.

3.4 ELECTRICAL INSPECTION

A. Check all fuses for continuity.

B. Confirm input voltage and phase rotation is correct.

C. Assure connection and voltage of the battery string(s).

3.5 WARRANTY

A. UPS Module
1. The UPS manufacturer shall warrant the UPS module against defects in materials and workmanship for 12 months after initial startup or 18 months after ship date, whichever period expires first. Provide option for 2 year warranty.

B. Battery
1. The battery manufacturer’s standard warranty shall be passed through to the end user.

3.6 FACTORY TESTING

A. Before shipment, the manufacturer shall fully and completely test the system to assure compliance with the specification.

3.7 MANUFACTURER'S FIELD SERVICE

A. Service Personnel
   1. The UPS manufacturer shall directly employ a nationwide service organization consisting of factory-trained field service personnel dedicated to the startup and maintenance of UPS and power equipment.
   2. The manufacturer shall provide a national dispatch center to coordinate field service personnel schedules. One toll-free number shall reach a qualified support person 24 hours a day, 7 days a week, 365 days a year. If emergency service is required, on-site response time shall be four hours.
   3. Two local customer engineers shall be assigned to the site with a regional office as a backup. Escalation procedures shall be in place to notify Power Technical Support if a site is not functioning within 24 hours.

B. Replacement Parts Stocking
   1. Parts shall be available through an extensive network to ensure round-the-clock parts availability throughout the country.
   2. Spare parts shall be stocked by local field service personnel with backup available from national parts center and the manufacturing location. A national parts center Customer Support Parts Coordinator shall be on call 24 hours a day, 7 days a week, 365 days a year for immediate parts availability.

C. Maintenance Contracts
   1. A complete offering of preventive and full-service maintenance contracts for both the UPS system and battery system shall be available.

D. Automated Site Monitoring
   1. The UPS manufacturer shall provide as an option an automated site-monitoring service. This service shall be staffed by a qualified support person 24 hours a day, 7 days a week, 365 days a year. At the detection of an alarm within the UPS, the controls shall initiate communications with the monitoring service. The monitoring service shall be capable of interpreting the communicated alarms to allow dispatch of a service engineer.

3.8 SITE TESTING

A. Provide a portable load bank and test at job site. Notify Owner and Engineer to witness the test. Certified copies of test results shall be provided to Owner and Engineer.

3.9 OPERATIONS PERSONNEL TRAINING

A. Provide a training session for the owner's operations personnel. Training session shall be performed by a qualified person who is knowledgeable in the subject/equipment. Submit a training agenda two (2) weeks prior to the proposed training session for review and approval. Training session shall include at the minimum:
   1. Purpose of equipment.
   2. Principle of how the equipment works.
   3. Important parts and assemblies.
   4. How the equipment achieves its purpose and necessary operating conditions.
   5. Most likely failure modes, causes and corrections.
   6. On site demonstration.

END OF SECTION

SECTION 26 41 13.13 - LIGHTNING PROTECTION SYSTEM

SECTION 26 43 13.13 - SURGE PROTECTIVE DEVICES (SPD) - STANDARD INTERRUPTING

PART 1 - GENERAL

1.1 SCOPE

A. Specify the electrical and mechanical requirements for a non-modular high-energy surge protective device system (SPD). The specified system shall provide effective high energy surge current diversion and be suitable for application in IEEE C62.41.1 Category A, B and C3 environments, as tested by IEEE C62.11, IEEE C62.45.

B. The system shall be constructed using multiple surge current diversion modules utilizing metal oxide varistors (MOV) computer matched to +/- 1-volt variance and tested for manufacturer's defects. The modules shall be designed and constructed in a manner that ensures surge current sharing. Use of gas tubes, silicon avalanche diodes or selenium cells are unacceptable. Devices shall utilize a minimum of three (3) MOV's fuse links pair per phase. This will allow greater than 50% redundant protection in if a MOV fails.

C. Third Party Test Report verifying surge current rating, longevity, testing, and filtering capabilities shall be provided with submittal.

1.2 STANDARDS

A. The specified system shall be designed, manufactured, tested and installed in compliance with the following codes and standards:
1. Canadian Standards Association (CSA or CUL)
2. American National Standards Institute and
3. Institute of Electrical and Electronic Engineers (IEEE C62.11, IEEE C62.41.1, IEEE C62.41.2 and IEEE C62.45)
4. Institute of Electrical and Electronic Engineers 1100 Emerald Book
5. Federal Information Processing Standards Publication 94 (FIPS PUB 94)
6. National Electrical Manufacturer Association (NEMA LS-1 1992)
7. National Fire Protection Association (NFPA 20, NFPA 70, NFPA 75 and NFPA 780)
8. National Electric Code
9. Underwriters Laboratories (UL 1449 and UL 1283)
10. International Electrotechnical Commission (IEC 801)
11. International Standards Organization (ISO) Company certified ISO 9001 for manufacturing, design and service
12. EMC Directive 89/336/EEC - CE compliant

B. The systems individual units shall be UL/ANSI Listed and labeled under UL 1449 (Fourth Edition) Standard for Surge Protection Devices Type 2 20kA with a nominal discharge current of 20kA and the surge ratings shall be permanently affixed to the SPD. The units shall also be listed and labeled to UL 1283 for type 2 locations Standard for Electromagnetic Interference Filters, and CSA/CUL Listed.

1.3 ACCEPTABLE MANUFACTURERS

A. Southern Tier Technologies

1.4 SUBMITTALS

A. Shop drawings shall include, but not be limited to:
1. Cutsheets of surge protection devices with ratings, physical dimensions and all accessories clearly labeled.
2. Device labels shall be clearly indicated in cutsheets.
3. All standards and listings, as specified in section 1.2A-B, shall be clearly labeled in cutsheets provided.
4. Cutsheets shall clearly outline that design requirements of this specification have been met.

1.5 QUALITY ASSURANCE

A. The manufacturer shall be ISO 9001 certified. The specified system shall be tested at the component and fully assembled level, under surge conditions with AC power applied for a minimum of 1 hour. Testing shall include but not be limited to quality control checks, dielectric voltage withstand test per UL and CSA requirements, UL ground continuity tests and operational and calibration tests.

B. The unit shall be designed and manufactured in the USA by a qualified manufacturer of surge protection equipment and Active Tracking Filters. The manufacturer shall have been engaged in the design and manufacture of such products for a minimum of 10 years.

PART 2 - PRODUCTS

2.1 ENCLOSURE

A. The specified system shall be provided in a heavy duty NEMA 4 or better dust-tight, drip-tight enclosure with no ventilation openings.

2.2 OVERCURRENT PROTECTION (FUSING)

A. Individual surge components shall be fused to prevent violent failure. The fusing shall be UL listed and shall be capable of interrupting up to 200kA symmetrical fault current with 480VAC applied. Replaceable fusing is unacceptable. Overcurrent protection that limits specified surge currents is not acceptable. Devices that utilize a single fuse to protect two or more suppression paths are not accepted.

2.3 DESIGN REQUIREMENTS

A. Protection Modes:
1. The SPD shall provide protection as follows: All modes, L-N or L-L, L-G and N-G (where applicable) Note: L = Line, G = Ground, N = Neutral

B. UL 1449 Ratings:
1. The maximum UL 1449 listed surge ratings for each and/or all of the specified protection modes shall not exceed the following in any mode of protection:

System Voltage	Voltage Protection Rating			
	L-N	L-L	N-G	L-L
120/240	600-volts	700-volts	700-volts	1200-volts
120/208	600-volts	700-volts	700-volts	1200-volts
240		1200-volts		1000-volts
277/480	1200-volts	1200-volts	1200-volts	1800-volts
480		1800-volts		1800-volts

C. Noise Attenuation:
1. The unit shall be UL 1283 Listed as an electromagnetic interference filter in type 2 locations. The filter shall provide insertion loss with a maximum of 60 dB from 100 KHz to 100 MHz per 50 Ohm Insertion Loss Methodology from MIL 220A. The system shall provide up to 120 dB insertion loss from 100 KHz to 100 MHz when used in a coordinated facility system.

D. Life Cycle Testing:
1. The SPD system shall be duty life cycle tested to survive 6,000 20kV, 10kA Surges, per IEEE C62.41.1 Category C3 surge current with less than 5% degradation of clamping voltage.

2.4 CONNECTIONS

A. Provide 60” wire leads #10 AWG or UL 1449 tested size.

2.5 STANDARD FEATURES

A. Unit Status Indicators:

1. Red and green solid state indicators with printed labels shall be provided on the front cover to redundantly indicate on-line unit status including N-G monitoring. The absence of the green light and the presence of the red light shall reliably indicate that surge protection is reduced and service is needed to restore full operation.

B. Dry Contacts for remote monitoring:
1. Electrically isolated Form C dry contacts, one normally open and one normally closed set standard on all units for remote monitoring.

C. Undervoltage detection:
1. Unit shall be equipped with 70% undervoltage detection capability.

D. Phase Loss Monitoring:
1. Unit shall be equipped with phase loss monitoring.

E. Power Loss Monitoring:
1. Unit shall be equipped with power loss monitoring.

2.6 TESTING

A. Component Testing and Monitoring:
1. Unit shall include an on-line circuit which tests and redundantly monitors individual components in all protection modes including neutral to ground (where applicable). Units that require external test sets or equipment are not acceptable.

2.7 ENVIRONMENTAL REQUIREMENTS

A. Storage Temperature: -55 to +85 C (-67 to +187 F)

B. Operating Temperature: -40 to +60 C (-40 to 140 F)

C. Relative Humidity: 0% to 95%

D. Audible Noise: less than 45 dBa at 5 feet (1.5 m).

E. Operating Altitude: 0 to 18,000 feet above sea level.

2.8 WARRANTY

A. The manufacturer shall provide a full 10 year parts and a 5 year labor warranty from date of shipment against any part failure when installed in compliance with manufacturer’s written instructions, UL Listing requirements and any applicable national, state or local electrical codes. Direct, factory trained, ISO 9001 certified employees must be available for 48 hour assessment. A 24 hour 800 number must be available to support warranty.

2.9 PART 3 - EXECUTION

A. INSTALLATION
1. Install the parallel SPD with short and straight conductors as practically possible. Locate adjacent to the switchboard or panel it is serving. The contractor shall twist the SPD input conductors together to reduce input conductor inductance. The contractor shall follow the SPD manufacturer’s recommended installation practices as found in the installation, operation and maintenance manual and comply with all applicable codes. Maximum length of conductors from connection at breaker to termination at SPD shall not exceed 18". Failure to meet this length shall require relocation of SPD.
2. Provide Flush Mount Stainless Steel Cover Kit for kitchen areas.
3. Provide Flush Mount Cover Kit for residential units and hotel suites.

END OF SECTION

SECTION 26 51 19 - LIGHTING FIXTURES - LIGHT EMITTING DIODE (LED)

PART 1 - GENERAL

1.1 SCOPE

A. Provide general and emergency lighting fixtures as noted on the drawings. Fixtures shall be completely wired with lamps installed and shall be in perfect operating condition at the time of substantial completion.

B. The types of lighting fixtures required for this project include:
1. LED

1.2 STANDARDS

A. All fixtures shall conform to all applicable UL standards and shall be UL label including damp and wet location ratings. “ETL listed” is an acceptable listing.

B. NFPA 101

C. ANSI C82.1

D. NEMA-LE

E. All LED drivers shall be UL recognized Class 2 per UL1310 or non-Class 2 per UL 1012 as applicable.

F. All LED drivers shall comply with applicable requirements of the Federal Communications Commission (FCC) rules and regulations, Title 47 CFR part 15, for Non-Consumer Equipment.

G. All LED drivers shall be RoHS compliant.

H. TM-21

I. LM-80

J. LM-79

K. L70

L. DLC

M. UL 1008

1.3 ACCEPTABLE MANUFACTURERS

A. Provide lighting fixtures produced by manufacturers as shown and scheduled.

B. LED DRIVER:
1. Provide one of the following manufacturers
a. Eldo
b. Lutron
c. Osram
d. Philips

C. LAMPS:
1. Provide one of the following LED Chip manufacturers
a. Cree
b. Nichia
c. North American Philips
d. Seoul
e. Lumileds

1.4 SUBMITTALS

A. Shop drawings shall include a brochure with a separate cut sheet for each fixture type arranged in alphabetical order with fixture and all accessories/options clearly labeled. Provide performance data for each fixture. Provide an independent test lab report for each fixture if requested by the Architect/Engineer.

B. Provide driver and LED module data brochures for each fixture type.

C. Provide air handling and heat removal data for light fixtures specified with these requirements.

1.5 REQUIREMENTS OF REGULATORY AGENCIES

A. WORK IN ACCORDANCE WITH:
1. National Electrical Code.
2. Local, municipal, or state codes that have jurisdiction.
3. UL fire resistance directory.

PART 2 - PRODUCTS

2.1 MATERIALS AND COMPONENTS

A. General:
1. Provide the size, type and rating of each light fixture shown and scheduled. All light fixtures shall complete with reflectors, lens, trim rings, flanges, LED modules, lamp holders, drivers, fuses, wiring, earthquake clips, etc. to provide a complete functioning light fixture.

B. Lighting Fixture Types:
1. LED Fixtures
a. Fixtures shall be pre-wired with frame-in kit and integral thermal management system for fixtures. Driver shall be encased in metal-can construction for optimal thermal performance.
b. Total fixture lumen output is dependent on the chip, thermal management, driver current and optical system. LED fixtures shall be tested as a complete unit or system. Only DOE recognized CALiPER testing laboratory results shall be utilized.
c. Interior LED fixtures shall have integral common mode and differential mode surge protection of 3kV(1.2/50µs, 2 ohm combination wave).
d. Exterior LED fixtures shall have integral common mode and differential mode surge protection of 10kV/10kA(1.2/50µs, 2 ohm combination wave).
2. Exit signs
a. Exit signs shall meet all federal, state and local codes.
b. Provide fire alarm interface relay when required to flash exit signs.
c. Provide battery packs for emergency operation when not connected to emergency generator power.

2.2 LED MODULES AND DRIVERS - COORDINATE WITH LIGHT FIXTURE SCHEDULE

A. LED
1. Driver manufacturer shall have a 10-year history producing electronic drivers for the North American market.
2. Driver shall carry a five year limited warranty from date of manufacture against defects in material or workmanship (including replacement) for operation at a maximum case temperature of 80 degrees Celsius.
3. Drivers shall not contain any Polychlorinated Biphenyl (PCB).
4. Provide driver with integral color-coded leads.
5. Driver shall operate from 50/60 Hz input source of 120 Volt through 277 Volt or 347 Volt through 480 Volt with sustained variations of +/- 10% (voltage) with no damage to the driver.
6. Driver output shall be regulated to +/- 5% across published load range. And shall have a power factor greater than .90 for primary application to 50% of full load rating with an input current Total Harmonic Distortion (THD) of less than 20% to 50% of full load rating.
7. Provide drivers with a Class A sound rating.
8. Provide LED drivers for outdoor fixtures with a minimum operating temperature of -40 degrees Celsius (-40 F). Provide LED drivers for indoor fixtures with a minimum operating temperature of -20 degrees Celsius (-2F).

9. Drivers shall tolerate sustained open circuit and short circuit output conditions without fail and auto-resetting without need for external fuses or trip devices.
10. Driver output ripple current shall be less than 15% measured peak-to-average, with ripple frequency being greater than 100Hz.
11. Driver performance requirements shall be met when operated to 50% of full load rating.
12. Driver shall have integral thermal foldback to reduce driver power above rated case temperature to protect the driver if temperatures reach unacceptable levels.
13. Drivers shall comply with NEMA 410 for in-rush current limits.
14. Dimmable drivers shall be controlled by a Class 2 low voltage 0-10VDC controller with dimming range controlled between 1 and 8VDC with source current 150µA.

2.3 LAMPS – COORDINATE WITH LIGHT FIXTURE SCHEDULE

A. LED Lamps shall be appropriately matched to the driver with junction-down design for improved thermal management. Maximum DC Forward Current.

2.4 EMERGENCY LED BATTERY BACKUP

A. Provide Bodine #BSL310M for emergency light fixtures in 9 or 10-foot ceiling.

B. Provide Bodine #BSL20 for emergency LED driver for emergency light fixtures in ceiling heights greater than 12 feet.

C. Provide Bodine #BSL17-C2 for emergency LED driver for LED downlights.

D. Provide unswitched hot leg. Hot leg shall originate from the same branch circuit as required in NEC article 700.12 (F).

2.5 EXIT SIGNS

A. All exit signs shall be Vandal Resistant rated. Exit signs specified on fixture schedule are Basis of design for aesthetics purposes only.

B. All exit signs shall be circuited to an unswitched hot conductors originating from the same circuit as that service other lighting in the same space

C. Provide with wire-guard in Gymnasiums

2.6 POLES AND POLE FIXTUERS

A. Provide poles for area lighting fixtures as specified. Steel poles shall be one piece anchor/base/pole with steel bolt cover and vibration dampers. Poles shall be round straight steel.

B. Unless noted otherwise on drawings, poles shall be 30ft tall (maximum) for parking and drives, and 15ft tall for sidwalks and walkways. poles shall be capable of being cut in the field, and still be able to install the necessary fixture head on the top of each pole.

C. Provide all poles with appropriate mounting accessories including arms, tenons, or bullhorns as required. Anchor bolts shall be hot dipped galvanized, sized as required by the manufacturer of the pole.

D. All poles shall have a normal 3” x 5” hand hole at 18” above the base flange and grounding provision.

E. Poles shall be prime painted interior and exterior. The exterior shall be finished with polyester powder coating and architectural finish as specified by the Architect. The interior with 3 mil thermoplastic hydrocarbon resin, or equivalent to meet 1000-hour salt spray exposure (ASTM B-117).

F. All pole mounted fixtures shall be powder coated.

G. All 'flat top' fixture shall be provided with bird-deterrent devices to prevent nesting.

2.7 BRANCH CIRCUIT EMERGENCY TRANSFER SWITCH (BCELTS)

A. Provide 20 amp, 120-277 Volt, UL1008 listed Branch Circuit Emergency Transfer Switch to control emergency light fixtures transferring from normal to emergency branch circuits Provide Bodine GTD 20A or ETC SC 1008 UL 924 Devices are not acceptable

2.8 AUTOMATIC LOAD CONTROL RELAY (ALCR)

A. Provide 3 amp, 120-277 volt UL 924 listed. Relay to bypass switching controlling emergency branch circuit light fixtures Provide Bodine GTD or Wattstopper ELCU.

PART 3 - EXECUTION

3.1 INSTALLATIONS

A. General
1. Install the type of lighting fixture where shown and indicated in accordance with manufacturer's written instructions.
2. Provide earthquake clips on all recessed lay-in lighting fixtures as required by building code.
3. Adjust all adjustable lighting fixtures, as directed by the Architect.
4. Provide safety chains and wire guards for lighting fixtures located in gymnasium, multi-purpose rooms, play areas, etc.
5. All troffers recessed in suspended ceilings shall be furnished with secondary two (2) support cables per fixture, including 2x4, 2x2, 1x4, 1x2, or recessed linear fixtures at a every single fabricated 'section' of continuous fixtures.
6. All fixtures shall be relocated at to 6-feet in any direction at the request of the owner or architect at no additional cost.

B. Coordination
1. The contractor shall verify the type of fixtures with the ceiling types as indicated on the drawings. Any discrepancies shall immediately be brought to the architect's attention before the contractor places his order and accepts delivery. Fixtures shall fit exact in the type of ceiling scheduled. Provide plaster frames, trim rings and other accessories required for a correct fit.
2. Provide supports attached to structural member to support fixtures when the ceiling system cannot maintain support. Provide separate supports for all recessed ceiling mounted HID fixtures.
3. Refer to architectural reflected ceiling plan for the exact location of all lighting fixtures. Notify the architect for any discrepancies or conflicts with structural, architectural, mechanical piping or ductwork before installation.

C. Mounting
1. Provide support channels to support outlet boxes used support surface mounted lighting fixtures such as exit signs or downlights.
2. Pendant or surface mounted fixture shall be provided with required mounting devices and accessories, including hickeys and stud-extensions, ball-aligners, canopies and stems. Locations of fixtures in mechanical areas shall be coordinated with mechanical contractor. Mounting stems of pendant fixtures shall be of the correct length to uniformly maintain the fixture heights shown on the drawings or established in the field. The allowable variation tolerance in mounting individual fixtures shall not exceed 1/4 inch and shall not vary more than 1/2 inch from the floor mounting height shown on the Drawings. Fixtures hung in continuous runs shall be installed absolutely level and in line with each other. Hanging devices shall comply with Code requirements. Fixtures shall employ single - not twin - stem hangers unless otherwise noted.
3. All structure mounted fixtures (i.e. bracket mounted, pipe mounted and surface mounted) shall be provided with cables of suitable size and weight to support the weight of the fixture. Cables shall be fastened around or fastened to the housing of the fixture. On pendant fixtures, one safety cable of suitable size and weight to support the weight of the fixture assembly shall connect the top of the pendant to the supporting structure by means of welding or bolting, and one safety cable shall connect the housing of the fixture to the bottom of the pendant. Where more than one pendant per fixture occurs, only one pendant must be cabled. Track fixtures for pendant mounted track shall also be supplied with clip-on safety cables of suitable size and weight to support the weight of the fixture.
4. Provide secondary support wires from all four (4) corners of the lay-in fixtures to the structure above. Do not support fixtures from ceiling grid wire supports, piping, conduit, side walls, or mechanical equipment. Ceiling specifications do not supersede this requirement.

5. Where pole mounted luminaries are provided, provide appropriate anchor base pole as specified with manufacturer's recommended anchor bolts. Verify exact location on site for poles with Architect, Civil, and Landscape documents. Poles shall be installed on proper footing. Refer to details on the drawings. Provide grounding connection to a separately driven ground rod, outside of the footing. Where indicated provide pole with identification plate indicating pole number.

D. Electrical Connection
1. All light fixtures shall be connected from a branch circuit junction box using 1/2" flexible metal conduit or MC cable fixture pigtails not exceeding 8'- 0". Provide #12 AWG conductors. All fixtures must be grounded by using a grounding conductor. Fixture to fixture wiring of fixtures installed in an accessible ceiling is not permitted. Fixture whips shall not lay-on ceiling tile or grid. Provide caddy clips to provide additional support.

E. Fire Rated Ceiling
1. Provide fire rated canopy or enclosure for all fixtures recessed in a fire rated ceiling. The fire rated canopy or enclosure shall be as required by the UL design number listed in the UL fire resistance directory. Refer to architectural drawing for the UL design number. Coordinate with ceiling installer and manufacturer. Provide proper rated drivers for lighting fixtures installed within these rated enclosures.

F. Air Handling Fixtures
1. Install all air handling light fixtures with return air slot in the open position, if it is to be as an air handling fixture. Coordinate with mechanical contractor.

3.2 FINAL INSPECTION

A. Remove all plastic and protective coating from all fixtures. Fixtures shall be thoroughly cleaned. Replace any damaged fixture or fixture parts including reflectors, louvers, lens and metal parts that show signs of corrosion.

B. Replace all other defective fixtures showing signs of excessive usage.

C. Demonstrate proper operation of all fixtures and controls. Refer to other sections and details on the drawings for lighting controls.

3.3 WARRANTY

A. in addition to other warranties required within these specifications, all battery packs, regardless of their application, shall maintain a minimum 5-year replacement warranty.

END OF SECTION

SECTION 27 02 00 - BASIC MATERIALS AND METHODS FOR COMMUNICATION SYSTEMS

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

A. The requirements of the General Conditions and Supplementary Conditions apply to all Work herein.

B. The Contract Drawings indicate the extent and general arrangement of the systems. If any departure from the Contract Drawings are deemed necessary by the Contractor, details of such departures and the reasons therefore, shall be submitted to the Architect and Engineer for approval as soon as practicable. No such departures shall be made without the prior written approval of the Architect and Engineer.

1.2 SCOPE OF WORK

A. The Work included under this Contract consists of the furnishing and installation of all labor, material, tools, equipment and services necessary and required to form the complete and functioning systems in all of its various phases, all as shown on the accompanying Drawings and/or described in these Specifications. The contractor shall review all pertinent drawings, including those of other contracts prior to commencement of Work.

B. This Division requires the furnishing and installing of all items Specified herein, indicated on the Drawings or reasonably inferred as necessary for safe and proper operation; including every article, device or accessory (whether or not specifically called for by item) reasonably necessary to facilitate each system's functioning as indicated by the design and the equipment specified. Elements of the work include, but are not limited to, materials, labor, supervision, transportation, storage, equipment, utilities, all required permits, licenses and inspections. All work performed under this Section shall be in accordance with the Project Manual, Drawings and Specifications and is subject to the terms and conditions of the Contract.

C. The approximate locations of Communications items are indicated on the Drawings. These Drawings are not intended to give complete and accurate details in regard to location of outlets, apparatus, etc. Exact locations are to be determined by actual measurements at the building, and will in all cases be subject to the Review of the Owner or Engineer, who reserves the right to make any reasonable changes in the locations indicated without additional cost to the Owner.

D. Items specifically mentioned in the Specifications but not shown on the Drawings and/or items shown on Drawings but not specifically mentioned in the Specifications shall be installed by the Contractor under the appropriate section of work as if they were both specified and shown.

E. All discrepancies within the Contract Documents discrepancies between the Contract Documents and actual job-site conditions shall be reported to the Owner or Engineer so that they will be resolved prior to the bidding, where this cannot be done at least seven (7) working days prior to bid; the greater or more costly of the discrepancy shall be bid. All labor and materials required to perform the work described shall be included as part of this Contract.

F. It is the intention of this Section of the Specifications to outline minimum requirements to furnish the Owner with a turn-key and fully operating system in cooperation with other trades.

G. It is the intent of the above "Scope" to give the Contractor a general outline of the extent of the Work involved; however, it is not intended to include each and every item required for the Work. Anything omitted from the "Scope" but shown on the Drawings, or specified later, or necessary for a complete and functioning Communications system shall be considered a part of the overall "Scope".

H. Coordinate with other contractors on items required for the proper functioning of communications system and indicated as provided by others, such as power, backboxes, conduits, sleeves, air conditioning, structural support, etc..

I. Contractor shall participate in the commissioning process; including but not limited to meeting attendance, completion of checklists and participation in functional testing.

1.3 RELATED SECTIONS

A. Div 1 and conditions of the contract

B. Div 26 Electrical

C. Div 28 Electronic Safety and Security

1.4 COOPERATION WITH TRADES:

A. Cooperation with trades of adjacent, related, or affected materials or operations shall be considered a part of this work in order to affect timely and accurate placing of work and bring together in proper and correct sequence, the work of such trades.

1.5 REFERENCES

A. National Electrical Code (NEC)

F. Institute of Electrical and Electronics Engineers (IEEE).

G. American National Standards Institute (ANSI).

H. National Fire Protection Association (NFPA).

I. International Energy Conservation Code (IECC).

J. BICSI (Building Industry Consulting Services International)

K. Owner’s Design Guidelines and Construction Standards

L. Local, county, state and federal regulations and codes in effect as of date of installation.

1.6 COMPLETE FUNCTIONING OF WORK

A. All work fairly implied as essential to the complete functioning of the electrical systems shown on the Drawings and Specifications shall be completed as part of the work of this Division unless specifically stated otherwise. It is the intention of the Drawings and Specifications to establish the types of the systems, but not set forth each item essential to the functioning of the system. In case of doubt as to the work intended, or in the event of amplification or clarification thereof, the Contractor shall call upon the Architect for supplementary instructions, Drawings, etc.

B. Contractor shall review all pertinent Drawings and adjust his work to all conditions shown there on. Discrepancies between Plans, Specifications, and actual field conditions shall be brought to the prompt attention of the Architect.

1. Approximate location of communications outlets, devices, equipment cabinets, cable trays, conduits and sleeves, etc., are indicated on the Drawings. However, the Drawings, do not give complete and accurate detailed locations of such items and exact locations must be determined by actual field measurement. Such locations will, at all times, be subject to the approval of the Architect.
2. Communicate with the Architect and secure his approval of any location about which there may be the least question. Outlets obviously placed in a location not suitable to the finished room or without specific approval, shall be removed and relocated when so directed by the Architect. Location of ceiling devices shall be coordinated with reflected ceiling plans.

C. Additional coordination with mechanical, electrical, plumbing contractor may be required to allow adequate clearances for all building components. Contractor to notify Architect and Engineer of unresolved clearances, conflicts or equipment locations.

1.7 SCHEMATIC NATURE OF CONTRACT DOCUMENTS

A. The contract documents are schematic in nature in that they are only to establish scope and a minimum level of quality. They are not to be used as actual working construction drawings. The actual working construction drawings shall be the approved shop drawings.

1.8 QUALITY ASSURANCE

A. Contractor shall have a complete working knowledge of the communications system being installed.

B. Contractor shall have installed similar-sized systems in at least ten (10) other projects in the last five (5) years prior to this bid and be regularly engaged in the business of installation of the types of systems specified in this document.

C. Contractor and individual installation crew members shall be experienced and qualified to perform the work specified herein at time of bid submission. All onsite supervision personnel that will be assigned to this project shall be listed in the Pre-Installation Submittal.
   1. 80% shall have a minimum of three (3) years of experience in the installation of the types of systems, equipment, and cables specified in this document prior to this bid.
   2. All installation team members must demonstrate knowledge and compliance with all applicable methods, standards, and codes.
   3. All members of the Structured Cabling System installation team shall be certified by the Structured Cabling System Assurance Warranty provider as having completed the necessary training to complete their part of the installation and capable of an installation that falls under manufacturer's guidelines necessary to obtain the Manufacturer's System Assurance Warranty.
   4. Any personnel substitutions shall be noted in writing to the Owner.

D. A BICSI RCDD shall supervise and approve all on-site structured cabling work as a recognized member of the Contractor's installation team.

E. Contractor shall obtain Communications system product manufacturer's certification if applicable.

F. Refer to General Conditions for other requirements.

1.9 CONTRACTOR REQUIREMENTS

A. In order to accomplish the conditions of this agreement, the Contractor shall perform the specific duties listed herein.

B. Contractor shall provide and pay for all labor, supervision, tools, equipment, test equipment, tests and services to provide and install a complete communications cabling infrastructure system. Pay all required sales, gross receipts, and other taxes.

C. Insurance
   1. The Contractor shall procure, submit for review, and maintain for the duration of this agreement, insurance against claims for injuries to persons or damages to property which may arise from, or in connection with, the performance of work hereunder by the Contractor, his agents, representatives, employees or subcontractor. The Contractor shall pay the cost of such insurance.
   2. The Owner, its directors, officers, representatives, agents and employees, respectively, shall have no responsibility to the Contractor with respect to any insurance in accordance with the provisions set forth herein.

D. Regulatory Requirements
   1. Communications Contractor shall supply all city, county, and state telecommunication cabling permits required by Authority Having Jurisdiction (AHJ).
   2. Communications Contractor shall be licensed and/or bonded as required for telecommunications/low voltage cabling systems.

E. Privacy and Confidentiality
   1. The Contractor will respect and protect the privacy and confidentiality of Owner, its employees, processes, products, and intellectual property to extent necessary, consistent with the legal responsibilities of the Owner policies.
   2. Contractors shall sign a non-disclosure agreement and abide by the requirements to keep confidential all information concerning bid documents and this project.

F. Use of Subcontractors

1. Successful bidder shall inform the Owner's contact and General Contractor in writing about the intention to use Subcontractors and the scope of work for which they are being hired.
2. The Owner or Owner's designated contact must approve the use of Subcontractors in writing prior to the Subcontractor's hiring and start of any work.

G. The Contractor's designated Project Manager will be recognized as the single point of contact. The Project manager shall oversee all work performed to ensure compliance with specifications as outlined in bid documents (which includes all specifications, references, and drawings) to ensure a quality installation and attend project meetings with the telecommunication consultant, the Owner and others.

H. Coordination
1. Coordinate installation work with other trades (examples include ceiling grid contractors, HVAC and sheet metal contractors, etc.) to resolve procedures and installation placement for cable trays and cable bundle pathways.
2. The goal of this coordination will be to establish priority pathways for critical data/voice network cable infrastructure, materials, associated hardware, as well as mitigate delays to the project and to allow service access for communications components.
3. Exchange information and agree on details of equipment arrangements and installation interfaces.
4. Coordinate with electrical contractors and plan for the pathway routes used communications cabling to minimize cable lengths. Report any potential over distance cable runs for approval before pulling the cables.
5. Record agreements with other trades and distribute record to other participants, Owner and telecommunication consultant.

1.10 DATE OF FINAL ACCEPTANCE

A. The date of final acceptance shall be the date of owner occupancy, or the date all punch list items have been completed or final payment has been received. Refer to Division One for additional requirements.

B. The date of final acceptance shall be documented in writing and signed by the architect, owner and contractor.

1.11 DEFINITIONS AND SYMBOLS

A. General Explanation: A substantial amount of construction and Specification language constitutes definitions for terms found in other Contract Documents, including Drawings which must be recognized as diagrammatic and schematic in nature and not completely descriptive of requirements indicated thereon. Certain terms used in Contract Documents are defined generally in this article, unless defined otherwise in Division 1.

B. Definitions and explanations of this Section are not necessarily either complete or exclusive, but are general for work to the extent not stated more explicitly in another provision of the Contract Documents.

C. Indicated: The term "Indicated" is a cross-reference to details, notes or schedules on the Drawings, to other paragraphs or schedules in the Specifications and to similar means of recording requirements in Contract Documents. Where such terms as "Shown", "Noted", "Scheduled", "Specified" and "Detailed" are used in lieu of "Indicated", it is for the purpose of helping the reader locate cross-reference material, and no limitation of location is intended except as specifically shown.

D. Directed: Where not otherwise explained, terms such as "Directed", "Requested", "Accepted", and "Permitted" mean by the Architect or Engineer. However, no such implied meaning will be interpreted to extend the Architect's or Engineer's responsibility into the Contractor's area of construction supervision.

E. Reviewed: Where used in conjunction with the Engineer's response to submittals, requests for information, applications, inquiries, reports and claims by the Contractor the meaning of the term "Reviewed" will be held to limitations of Architect's and Engineer's responsibilities and duties as specified in the General and Supplemental Conditions. In no case will "Reviewed" by Engineer be interpreted as a release of the Contractor from responsibility to fulfill the terms and requirements of the Contract Documents.

F. Furnish: Except as otherwise defined in greater detail, the term "Furnish" is used to mean supply and deliver to the project site, ready for unloading, unpacking, assembly, installation, etc., as applicable in each instance.

G. Install: Except as otherwise defined in greater detail, the term "Install" is used to describe operations at the project site including unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protection, cleaning and similar operations, as applicable in each instance.

H. Provide: Except as otherwise defined in greater detail, the term "Provide" is used to mean "Furnish and Install", complete and ready for intended use, as applicable in each instance.

I. Installer: Entity (person or firm) engaged by the Contractor or its subcontractor or Sub-contractor for performance of a particular unit of work at the project site, including unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protection, cleaning and similar operations, as applicable in each instance. It is a general requirement that such entities (Installers) be expert in the operations they are engaged to perform.

J. Imperative Language: Used generally in Specifications. Except as otherwise indicated, requirements expressed imperatively are to be performed by the Contractor. For clarity of reading at certain locations, contrasting subjective language is used to describe responsibilities that must be fulfilled indirectly by the Contractor, or when so noted by other identified installers or entities.

K. Minimum Quality/Quantity: In every instance, the quality level or quantity shown or specified is intended as minimum quality level or quantity of work to be performed or provided. Except as otherwise specifically indicated, the actual work may either comply exactly with that minimum (within specified tolerances) or may exceed that minimum within reasonable tolerance limits. In complying with requirements, indicated or scheduled numeric values are either minimums or maximums as noted or as appropriate for the context of the requirements. Refer instances of uncertainty to Owner or Engineer via a request for information (RFI) for decision before proceeding.

L. Abbreviations and Symbols: The language of Specifications and other Contract Documents including Drawings is of an abbreviated type in certain instances and implies words and meanings which will be appropriately interpreted. Actual word abbreviations of a self-explanatory nature have been included in text of Specifications and Drawings. Specific abbreviations and symbols have been established, principally for lengthy technical terminology and primarily in conjunction with coordination of Specification requirements with notations on Drawings and in Schedules. These are frequently defined in Section at first instance of use or on a Legend and Symbol Drawing. Trade and industry association names and titles of generally recognized industry standards are frequently abbreviated. Singular words will be interpreted as plural and plural words will be interpreted as singular where applicable and where full context of Contract Documents so indicate. Except as otherwise indicated, graphic symbols and abbreviations used on Drawings and in Specifications are those recognized in construction industry for indicated purposes. Where not otherwise noted symbols and abbreviations are defined by 1993 ASHRAE Fundamentals Handbook, chapter 34 "Abbreviations and Symbols", ASME and ASPE published standards.

1.12 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

B. Deliver products to the project at such time as the project is ready to receive the equipment, pipe or duct properly protected from incidental damage and weather damage.

C. Damaged equipment shall be promptly removed from the site and new, undamaged equipment shall be installed in its place promptly with no additional charge to the Owner.

1.13 SUBMITTALS

A. Coordinate with Division 01 for submittal timetable requirements, unless noted otherwise within thirty (30) days after the Contract is awarded. The Contractor shall submit an electronic copy of a complete set of shop drawings and complete product data covering each item of equipment or material. The submittal of each item requiring a submittal must be received by the Architect or Engineer within the above thirty-day period. The Architect or Engineer shall not be responsible for any delays or costs incurred due to excessive shop drawing review time for submittals received after the thirty-day (30) time limit. The Architect and Engineer will retain a copy of all shop drawings for their files. All literature pertaining to items subject to Shop Drawing submittal shall be submitted at one time. Submittals shall be placed in one electronic file in PDF format and bookmarked for individual specification sections. Individual electronic files of submittals for individual products shall not be permitted. Each submittal shall include the following items:

1. A cover sheet with the names and addresses of the Project, Architect, Engineer, General Contractor and the Subcontractor making the submittal. The cover sheet shall also contain the section number covering the item or items submitted and the item nomenclature or description.
2. An index page with a listing of all data or drawings ncluded in the Submittal.
3. Product Data and Shop Drawings shall be submitted in separate submittals, to avoid rejection of one due to errors in the other.

B. Shop Drawings
1. Communications Contractor shall submit, for approval, floor plans that identify all device locations, device ID, cable routes and quantities, cable types, riser locations, and references to installation details and diagrams.
    a. Communication Contractor shall notify A&E team of any cable routes that will exceed the permanent link distance limit and get approval before work to start. Without advance notice and approval from A&E team, the contractor shall be fully responsible for make corrections as needed to bring all installed cables within the distance limit.
2. Communications Contractor shall submit, for approval, diagrams that show communications room layouts, rack layouts (including wall and rack elevations), cabling riser and interconnection diagrams, etc.
3. Communications Contractor shall submit, for approval, labelling scheme for all communications devices and cabling components (faceplates, horizontal cables, riser cables, inter-building cables, racks, patch panels, etc.) installed.
4. The Contractor shall make any corrections as required by the Engineer and submit revised shop drawings to the team for approval.
5. Approval by the Engineer of such drawings or schedules shall not relieve the Contractor from responsibility for deviations from the drawings or specifications, nor shall it relieve the Contractor from responsibility for errors of any sort in shop drawings or schedules. Requests to deviate shall be submitted in writing to the Architect.
6. Drawings shall show the proposed firestop systems and locations, (stamped/embossed by the PE) to restore/maintain the designed fire rating of the building structure (walls, ceilings, floors, etc).
7. Shop Drawings shall be newly prepared and not reproduced from the Contract Documents. Drawings shall be prepared by a draftsman skilled in this type of work. Submitting copy of the engineering drawings or engineering drawings with contractor's markup as shop drawings is NOT ACCEPTABLE.
8. Shop drawings shall be developed in coordination with other trades (MEP, Architecture, Structural, etc.) to avoid any collision or conflict and to meet all industry standards best practices, codes and regulation requirements. By submitting shop drawings on the project, this Contractor is indicating that all necessary coordination has been completed and that the systems, products and equipment submitted can be installed in the building and will operate as specified
9. Additional coordination with other trade contractors may be required to allow adequate clearances and meet code requirements. All transitions, offsets and relocations as required by actual field conditions shall be performed by the contractor at no additional cost to the owner

C. Product Data Submittals
1. Communications Contractor shall submit catalogue cutsheets that include manufacturer, trade name, and complete model number for each product specified. Model number shall be handwritten and/or highlighted to indicate exact selection.
2. Communications Contractor shall identify applicable specification section reference for each product performance for each component specified for approval prior to purchase and installation.
3. Product information sheets for the proposed system test equipment to include certification of test equipment calibration. Installer is to use test equipment with a calibration date within one year of test date. Installer is to recalibrate and resubmit if necessary.
4. All data sheets shall be organized by specification sections and provided with table of contents. All products required in the spec section shall be included in one submittal.
5. Provide specification variations pages with a listing all variations, including unfurnished or additional required accessories, items or other features, between the submitted equipment and the specified equipment. If there are no variations, then this specification page shall state "NO VARIATIONS". Where variations affect the work of other Contractors, then the Contractor shall certify on this page that these variations have been fully coordinated with the affected Contractors and that all expenses associated with the variations will be paid by the submitting Contractor, and this page shall be signed by the submitting Contractor.

6. Equipment information including manufacturer's name and designation, size, performance and capacity data as applicable. All applicable Listings, Labels, Approvals and Standards shall be clearly indicated.
7. Dimensional data and scaled drawings as applicable to show that the submitted equipment will fit the space available with all required Code and maintenance clearances clearly indicated and labeled at a minimum scale of 1/4" = 1'-0", as required to demonstrate that the alternate or substituted product will fit in the space available.
8. Identification of each item of material or equipment matching that indicated on the Drawings.
9. Sufficient pictorial, descriptive and diagrammatic data on each item to show its conformance with the Drawings and Specifications. Any options or special requirements or accessories shall be so indicated. All applicable information shall be clearly indicated with arrows or another approved method.
10. All product substitutions shall be submitted in advance for review and approval before being included in product submittal package.
11. Certification by the General Contractor and Subcontractor that the material submitted is in accordance with the Drawings and Specifications, signed and dated in longhand.

D. Structured Cabling System Warranty
1. The Communications Contractor shall submit appropriate documentation from the certifying manufacturer showing the project is registered and qualified for the System Assurance Warranty.
2. All subsequent work shall be in accordance with approved submittals. The Communications Contractor shall not perform any portion of the work requiring approval of the System Assurance Warranty manufacturer’s warranty registration qualification procedures that would disqualify any part or all of the wiring system from that warranty qualification.

E. Qualifications
1. Communications Contractor shall submit a list of the Contractor’s previous projects that demonstrate qualification for this project. This list shall include, but not be limited to:
   a. At least ten (10) other projects in the last five (5) years
   b. Name and location of project
   c. Project contacts, email addresses, and phone numbers
   d. Total square footage
   e. Total number of cables/drops
   f. Types of media
2. Communications Contractor shall submit an up-to-date and valid statement of qualifications for those assigned to perform the work specified herein at time of bid submission.
   a. Communications Contractor Employees
   b. Subcontractors
3. Manufacturer certifications for Contractor and installers.

F. Cable Testing Plan
1. The Contractor shall provide a complete and detailed test plan for approval of the cabling system specified herein, including a complete list of test equipment for copper and fiber components and accessories prior to beginning cable testing.
2. The following minimal items shall be submitted for review:
   a. A testing plan that clearly describes procedures and methods.
   b. Product data for test equipment.
   c. Certifications and qualifications of all persons conducting the testing.
   d. Calibration certificates indicating that equipment calibration meets National Institute of Standards and Technology (NIST) standards and has been calibrated at least once in the previous year of the testing date.
   e. Examples of test reports, including all graphs, tables, and charts necessary for display of testing results.

G. Samples
1. For workstation outlet connectors, jack assemblies, housings and faceplates for color selection and evaluation of technical specifications and requirements. Confirm with Architect, interior designer, and Owner representative for color before purchasing materials.

H. Refer to Division 1 for additional information on shop drawings and submittals.

I. Equipment and materials submittals and shop drawings will be reviewed for compliance with design concept only. It will be assumed that the submitting Contractor has verified that all items submitted can be installed in the space allotted. Review of shop drawings and submittals shall not be considered as a verification or guarantee of measurements or building conditions.

J. Where shop drawings and submittals are marked "REVIEWED", the review of the submittal does not indicate that submittals have been checked in detail nor does it in any way relieve the Contractor from his responsibility to furnish material and perform work as required by the Contract Documents.

K. Submittals shall be reviewed and returned to the Contractor with one of the following categories indicated:
1. REVIEWED: Contractor does not need to take further submittal action, shall include this submittal in the O&M manual, and verify with Architects and other parties (Owner, etc) reviewing the submittals that no other correction is required before placing orders and starting installations.
2. REVIEWED AS NOTED: Contractor shall submit a letter verifying that required exceptions to the submittal have been received and complied with including additional accessories or coordination action as noted, and shall include this submittal and compliance letter in the O&M manual. The contractor may order the equipment submitted on at the time of the returned submittal providing the Contractor complies with the exceptions noted, and verifed with Architects and other parties (Owner, etc) reviewing the submittals that no other correction is required before placing orders and starting installations.
3. NOT APPROVED: Contractor shall resubmit new submittal on material, equipment or method of installation when the alternate or substitute is not approved, the Contractor will automatically be required to furnish the product, material or method named in the Specifications and/or drawings. Contractor shall not order equipment that is not approved. Repetitive requests for substitutions will not be considered.
4. REVISE AND RESUBMIT: Contractor shall resubmit new submittal on material, equipment or method of installation when the alternate or substitute is marked revise and resubmit, the Contractor will automatically be required to furnish the product, material or method named in the Specifications and/or provide as noted on previous shop drawings. Contractor shall not order equipment marked revise and resubmit. Repetitive requests for substitutions will not be considered.
5. CONTRACTOR'S CERTIFICATION REQUIRED: Contractor shall resubmit submittal on material, equipment or method of installation. The Contractor's stamp is required stating the submittal meets all conditions of the contract documents. The stamp shall be signed by the General Contractor. The submittal will not be reviewed if the stamp is not placed and signed on all shop drawings.
6. MANUFACTURER NOT AS SPECIFIED: Contractor shall resubmit new submittal on material, equipment or method of installation when the alternate or substitute is marked manufacturer not as specified, the Contractor will automatically be required to furnish the product, material or method named in the specifications. Contractor shall not order equipment where submittal is marked manufacturer not as specified. Repetitive requests for substitutions will not be considered.

L. Materials and equipment which are purchased or installed without shop drawing review shall be at the risk of the Contractor and the cost for removal and replacement of such materials and equipment and related work which is judged unsatisfactory by the Owner or Engineer for any reason shall be at the expense of the Contractor. The responsible Contractor shall remove the material and equipment noted above and replace with specified equipment or material at his own expense when directed in writing by the Architect or Engineer.

M. Refer to each specification section for additional requirements.

1.14 COORDINATION DRAWINGS

A. Before submit shop drawings, Contractor shall prepare coordination drawings to a scale of 1/4"=1'-0" or larger; detailing major elements, components, and systems of mechanical equipment and materials in relationship with other systems, installations, and building components. Indicate locations where space is limited for installation and access and where sequencing and coordination of installations are of importance to the efficient flow of the Work, including (but not necessarily limited to) the following:
1. Indicate the proposed locations of communications conduits/sleeves, cable trays, equipment, cabinet and other materials. Include the following:
   a. Wall and type locations.
   b. Clearances from other building structure and MEP equipment.
   c. Clearances for servicing and maintaining equipment and cabling, and space for equipment disassembly required for periodic maintenance.

d. Equipment connections and support details.
e. Exterior wall and foundation penetrations.
f. Fire-rated wall and floor penetrations.
g. Sizes and location of required concrete pads and bases.
h. Structural floor, wall and roof opening sizes and details.

2. Indicate scheduling, sequencing, movement, and positioning of large equipment into the building during construction.
3. Prepare floor plans, elevations, and details to indicate penetrations in floors, walls, and ceilings and their relationship to other penetrations and installations.
4. Prepare reflected ceiling plans to coordinate and integrate installations, air distribution devices, light fixtures, communication systems components, and other ceiling-mounted items.

B. This Contractor shall be responsible for coordination of all items that will affect the installation of the work of this Division. This coordination shall include, but not be limited to: cable routing, equipment location, clearance, space requirements, sequence of construction, building requirements and special conditions.

C. By submitting shop drawings on the project, this Contractor is indicating that all necessary coordination has been completed and that the systems, products and equipment submitted can be installed in the building and will operate as specified and intended, in full coordination with all other Contractors and Subcontractors.

1.15 OPERATION AND MAINTENANCE MANUALS

A. Prepare maintenance manuals in accordance with Division 1 and in addition to the requirements specified in Division 1, include the following information for equipment items:
1. Description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and commercial numbers of replacement parts.
2. Manufacturer's printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions; and summer and winter operating instructions.
3. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions.
4. Servicing instructions and lubrication charts and schedules.
5. Prepare maintenance manuals in accordance with Special Project Conditions, in addition to the requirements specified in Division 27, include the following information for equipment items:
a. Identifying names, name tags designations and locations for all equipment.
b. Fault Current calculations and Coordination Study.
c. Reviewed shop drawing submittals with exceptions noted compliance letter.
d. Fabrication drawings.
e. Equipment and device bulletins and data sheets clearly highlighted to show equipment installed on the project and including performance curves and data as applicable, i.e., description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and model numbers of replacement parts.
f. Manufacturer's printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions; and summer and winter operating instructions.
g. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions, servicing instructions and lubrication charts and schedules.
h. Equipment name plate data.
i. Wiring diagrams.
j. Exploded parts views and parts lists for all equipment and devices.
k. Color coding charts for all painted equipment and conduit.
l. Location and listing of all spare parts and special keys and tools furnished to the Owner.
m. Furnish recommended lubrication schedule for all required lubrication points with listing of type and approximate amount of lubricant required.
6. The Communications Contractor shall deliver the Installer's Extended Product Warranty and Manufacturer's signed System Assurance Warranty of installed cabling system to include all components that comprise the complete cabling system.

a. Delivery shall be completed within two (2) weeks of the time of final punch list review.

7. Product Certificates shall be signed by manufacturers of cables, connectors, and terminal equipment certifying that products furnished comply with requirements.
8. Cable Testing Report Requirements
   a. Submit certified test reports of Contractor-performed tests. Contractor shall submit the required Test Reports in the format and media specified, upon completion of testing the installed system.
9. The tests shall clearly demonstrate that the media and its components fully comply with the requirements specified herein.
10. Three (3) sets of electronic and hardcopy versions of test reports shall be submitted together and clearly identified with cable designations.
11. Cable inventory data shall be submitted for all fiber, copper, and coaxial cabling and termination components. Include products furnished:
    a. Manufacturer's name
    b. Manufacturer's part numbers
    c. Cable designations
    d. Location and riser assignments
    e. Product Data
12. The Contractor’s BICSI Registered Communications Distribution Designer (RCDD) supervisor shall review, approve and stamp all documents prior to submitting. The Contractor’s RCDD shall warrant in writing that 100% of the installation meets the requirements specified herein upon completion of all work.
13. Supply Owner with training manuals with instructions on methods of adding or removing cabling to/from firestopped sleeves and chases.

1.16 RECORD DRAWINGS

A. Maintain a continuous record during the course of construction of all changes and deviations in the work from the contract drawings. Upon completion of the work, purchase a set of "Auto Positive Tracings" on vellum and make corrections as required to reflect the electrical systems as installed. Location and size of all conduit shall be accurately shown to dimension. Submit three prints of the tracings for approval. Make corrections to tracings as directed and deliver "Auto Positive Tracings" to the Architect. Record drawings shall be furnished in addition to shop drawings. Symbols on the Record drawings shall correspond to the identification symbols on the contract drawings and equipment identification plates and tags.

B. The Contractor shall maintain a set of clearly marked black line record "AS-BUILT" prints on the job site on which he shall mark all work details, alterations to meet site conditions and changes made by "Change Order" notices. These shall be kept available for inspection by the Owner, Architect or Engineer at all times.

C. Refer to Division 1 for additional requirements concerning record drawings. If the Contractor does not keep an accurate set of as-built drawings, the pay request may be altered or delayed at the request of the Architect. Mark the drawings with a colored pencil. Delivery of as-built prints and reproducibles is a condition of final acceptance.

D. The record prints shall be updated on a daily basis and shall indicate accurate dimensions for all buried or concealed work, precise locations of all concealed device and cabling, and any deviations from the work shown on the Construction Documents which are required for coordination. All dimensions shall include at least two dimensions to permanent structure points.

E. Submit three prints of the tracings for approval. Make corrections to tracings as directed and delivered "Auto Positive Tracings" to the architect. "As-Built" drawings shall be furnished in addition to shop drawings.

F. For all cables and devices served from a wall mounted equipemnt enclosure, provide printed as-built wiring diagram showing all the cable route and type, device IDs and locations, and brand and models of all system components inside the enclosure, and attach the wiring diagram to the interior face of the enclosure's front door.

G. When the option described in paragraph E., above is not exercised then upon completion of the work, the Contractor shall transfer all marks from the submit a set of clear concise set of reproducible record "AS-BUILT" drawings and shall submit the reproducible drawings with corrections made by a competent draftsman and three (3) sets of black line prints to the Architect or Engineer for review prior to scheduling the final inspection at the completion of the work. The reproducible record "AS-BUILT" drawings shall have the Engineers Name and Seal removed or blanked out and shall be clearly marked and signed on each sheet as follows:

CERTIFIED RECORD DRAWINGS
DATE:
(NAME OF GENERAL CONTRACTOR)
BY:_____
(SIGNATURE)
(NAME OF SUBCONTRACTOR)
BY:_____
(SIGNATURE)

1.17 CERTIFICATIONS AND TEST REPORTS

A. Submit a detailed schedule for completion and testing of each system indicating scheduled dates for completion of system installation and outlining tests to be performed and schedule date for each test. This detailed completion and test schedule shall be submittal at least 90 days before the projected Project completion date.

B. Test result reporting forms shall be submitted for review no later than the date of the detailed schedule submitted.

C. Submit 4 copies of all certifications and test reports to the Architect or Engineer for review adequately in advance of completion of the Work to allow for remedial action as required to correct deficiencies discovered in equipment and systems.

D. Certifications and test reports to be submitted shall include, but not be limited to those items outlined in Section of Division 27.

1.18 OPERATOR TRAINING

A. The Contractor shall furnish the services of factory trained specialists to instruct the Owner's operating personnel. The Owner's operator training shall include 12 hours of onsite training in three 4-hour shifts.

B. Before proceeding with the instruction of Owner Personnel, prepare a typed outline in triplicate, listing the subjects that will be covered in this instruction, and submit the outline for review by the Owner. At the conclusion of the instruction period obtain the signature of each person being instructed on each copy of the reviewed outline to signify that he has a proper understanding of the operation and maintenance of the systems and resubmit the signed outlines.

C. Refer to other Division 27 Sections for additional Operator Training requirements.

1.19 SITE VISITATION

A. Visit the site of the proposed construction in order to fully understand the facilities, difficulties and restriction attending the execution of the work.

B. Before submitting a bid, it will be necessary for each Contractor whose work is involved to visit the site and ascertain for himself the conditions to be met therein in installing his work and make due provision for same in his bid. It will be assumed that this Contractor in submitting his bid has visited the premises and that his bid covers all work necessary to properly install the equipment shown. Failure on the part of the Contractor to comply with this requirement shall not be considered justification for the omission or faulty installation of any work covered by these Specifications and Drawings.

C. Understand the existing utilities from which services will be supplied; verify locations of utility services and determine requirements for connections.

D. Determine in advance that equipment and materials proposed for installation fit into the confines indicated.

1.20 WARRANTY

A. The undertaking of the work described in this Division shall be considered equivalent to the issuance, as part of this work, of a specific guarantee extending one year beyond the date of completion of work and acceptance by Owner, against defects in materials and workmanship. Materials, appliances and labor necessary to effect repairs and replacement so as to maintain said work in good functioning order shall be provided as required. Replacements necessitated by normal wear in use or by Owner's abuse are not included under this guarantee.

B. All normal and extended warranties shall include parts, labor, miscellaneous materials, travel time, incidental expenses, freight/shipping, refrigerant, oils, lubricants, belts, filters and any expenses related to service call required to diagnose warranty problems.

C. Structured System Warranty
   1. The Contractor shall be a certified Manufacturer’s Value Added Reseller (VAR) and/or Authorized Installer and provide an end-to-end product warranty, adhere to the industry standard engineering, installation and testing procedures and utilize the authorized manufacturer components and distribution channels in provisioning this project.
   2. Contractor shall coordinate with manufacturer for warranty paperwork and procedures prior to the start of the project.
   3. Contractor shall provide a minimum one (1) year warranty on installation and workmanship PLUS an Extended Product Warranty and System Assurance Warranty for this wiring system and shall commit to make available local support for the product and system during the Warranty period.
      a. The Extended Product Warranty shall apply to all passive structured cabling system components and shall cover the replacement or repair of defective products and labor for the replacement or repair of such defective products for a minimum of one (1) year.
      b. The System Assurance Warranty provides a complete system and product warranty that will be extended to the end-user, ensuring the structured cabling system will be free of defects in materials and workmanship, will meet or exceed applicable performance requirements defined in the contract documents, and support all current and future network applications for a minimum of twenty (20) years.
   4. System Certification: Upon successful completion of the installation and subsequent inspection, the customer shall be provided with a numbered certificate, from the manufacturer, registering the installation.

1.21 TRANSFER OF ELECTRONIC FILES

A. Project documents are not intended or represented to be suitable for reuse by Architect/Owner or others on extensions of this project or on any other project. Any such reuse or modification without written verification or adaptation by Engineer, as appropriate for the specific purpose intended, will be at Architect/Owner’s risk and without liability or legal exposure to Engineer or its consultants from all claims, damages, losses and expense, including attorney’s fees arising out of or resulting thereof.

B. Because data stored in electric media format can deteriorate or be modified inadvertently, or otherwise without authorization of the data’s creator, the party receiving the electronic files agrees that it will perform acceptance tests or procedures within sixty (60) days of receipt, after which time the receiving party shall be deemed to have accepted the data thus transferred to be acceptable. Any errors detected within the sixty (60) day acceptance period will be corrected by the party delivering the electronic files. Engineer is not responsible for maintaining documents stored in electronic media format after acceptance by the Architect/Owner.

C. When transferring documents in electronic media format, Engineer makes no representations as to the long term compatibility, usability or readability of documents resulting from the use of software application packages, operating systems, or computer hardware differing from those used by Engineer at the beginning of the Project.

D. Any reuse or modifications will be Contractor’s sole risk and without liability or legal exposure to Architect, Engineer or any consultant.

E. The Texas Board of Architectural Examiners (TBAE) has stated that it is in violation of Texas law for persons other than the Architect of record to revise the Architectural drawings without the Architect’s written consent.

1. It is agreed that “MEP” hard copy or computer-generated documents will not be issued to any other party except directly to the Architect/Owner. The contract documents are contractually copyrighted and cannot be used for any other project or purpose except as specifically indicated in AIA B-141 Standard Form of Agreement Between Architect and Owner.
2. If the client, Architect or Owner of the project requires electronic media for “record purposes”, then AutoCAD/ Revit documents will be prepared by Engineer on electronic media such as removable memory devices, flash drives or CD’s. These documents can also be submitted via file transfer protocols. AutoCAD/ Revit files will be submitted with all title block references intact to permit the end user to only view and plot the drawings. Revisions will not be permitted in this configuration.
3. At the Architect/Owner’s request, Engineer will assist the Contractor in the preparation of the submittals and prepare one copy of AutoCAD/ Revit files on electronic media or submit through file transfer protocols. The electronic media will be prepared with all indicia of documents ownership removed. The electronic media will be prepared in a “.rvt” or “.dwg” format to permit the end user to revise the drawings.

1.22 PRE-INSTALLATION MEETINGS

A. Communications Contractor shall attend and/or arrange a scheduled pre-installation conference prior to beginning any work of this section. This venue is to ask and clarify questions in writing with consultant and/or project manager/Owner representative.

B. Agenda
1. Safety
2. Work to be performed
3. Scheduling
4. Coordination
5. Other topics as necessary

C. Attendance
1. Communications project manager/supervisor shall attend meetings arranged by General Contractor, Owner’s representatives, and other parties affected by work of this document.
2. All individuals who will serve in an on-site supervisory capacity, including project managers, site supervisors, and lead installers, shall be required to attend the pre-installation conference. Individuals who do not attend the conference will not be permitted to supervise the installation and testing of communications cables on the project.

1.23 CONTRACT ADMINISTRATION

A. The Engineer may perform site visits and provide job field reports upon inspection of Contractor's installation, materials, supporting hardware, coordination with other trades and progress to schedule to the client.

B. Job Field Report outline:
1. General: The general installation progress in relation to scheduled work made by the Contractor up to that date.
2. Deficiencies and/or Items of Note: Documents observations of the cable installation that may require corrective action by the Contractor.

1.24 POST INSTALLATION MEETINGS

A. At the time of substantial completion the contractor shall call and arrange for a post installation meeting to present and review all submittal documents to include but not be limited to As-Built Drawings, Test reports, Warranty paperwork, etc.

B. Attendees shall include
1. Communications Contractor
2. Project Manager/Owner Representative
3. General Contractor
4. Communications Engineer.
5. Other trades that the GC deems appropriate.

C. At this meeting the Communications Contractor shall present and explain all documentation.

D. Any discrepancies or deviations noted by and agreed to by participants shall be remedied by the Communications Contractor and resubmitted within one (1) week of the meeting.

PART 2 - PRODUCTS

2.1 SUBSTITUTIONS

A. The names and manufacturers and model numbers have been used in the Contract documents to establish types of equipment and standards of quality. Where more than one manufacturer is named for a specific item of equipment, only one of the specified manufacturers will be considered for approval. Where only one manufacturer is mentioned with the phrase "or approved equal", Contractor may submit an alternate manufacturer for consideration, provided the following conditions are met:
   1. Submit alternate equipment with complete descriptive data in shop drawing form. Provide sample of equipment upon request for review by Architect. Samples will be returned if requested in writing.
   2. Alternate equipment must be equal from the standpoint of materials, construction and performance.
   3. Alternate submittal must be presented to the Engineer/Architect ten (10) days prior to bid date for approval.

B. Where only one manufacturer is mentioned without the phrase "or approved equal". No substitution is allowed. If the product specified is discontinued,. Contractor shall submit an alternate product of equal or better performance at no additionla cost for review and approval.

C. The Architect and Engineer shall be the sole judge of quality and equivalence of equipment, materials and methods.

2.2 GENERAL REQUIREMENTS

A. All materials and products used on this project shall be listed by Underwriters' Laboratories.

B. Equipment and materials shall be standard products of a manufacturer regularly engaged in the manufacture of telecommunications cabling products and shall be the manufacturer’s latest standard design in satisfactory use for at least one year prior to bid opening.

C. All material and equipment, as provided, should be the standard Commercial-Off-The-Shelf (COTS) products of a manufacturer engaged in the manufacturing of such products.
   1. All shall be typical commercial designs that comply with the requirements specified.
   2. All material and equipment shall be readily available through manufacturers and/or distributors.

D. Installer is to comply in every way with the requirements of local laws, ordinances, and rules, , the National Board of Fire Underwriters, and the National Electrical Code.

E. In the event of any conflicts between documents referenced herein and the contents of this specification, the Installer is to notify in writing to the Architect/Engineer of any such occurrences before the purchasing of any equipment, materials and/or installation by the Installer. The Architect/Engineer will notify the Installer of any actions required to resolve these conflicts.

F. No change in the plans or in the specifications is to be made without written instruction to do so from the Owner or Architect/Engineer.

G. Materials are to be installed in accordance with manufacturer’s recommendations and best industry practices.

H. The Installer is to promptly correct all discrepancies and/or defects for which the Installer is responsible.
   1. The Installer is to maintain a set of working specifications and drawings on site at all times and to make this set available for inspection during site visits.

I. All materials are to be new and of the highest quality.

J. All products installed in the above ceiling space are to meet or exceed the Underwriters Laboratories (UL) fire rated cable insulation requirements and are to be Plenum rated.

K. The Installer is to seal ALL penetrations, conduits, sleeves, cable trays, etc., where cabling has been installed through rated walls/floors with Wiremold Flamestopper intumescent fire- stop system (or approved equivalent) where they pass through rated walls. The Installer is responsible for returning any and all penetrations through rated walls or floors made for communications cable to their pre-penetration rating.

L. All material used to dress cable bundles shall be applied loosely to allow the dressing material to slide around the bundle. Tension of dressing materials shall not deform the cable sheath. Dressing materials should be limited to the telecommunications rooms only. Cabling shall be placed unbundled in cable tray and/or j hooks in the above ceiling spaces. No bundling materials are to be used above ceiling. All j hooks installed shall include the corresponding clip provided by the hook manufacturer. Plastic cable ties will not be permitted.

M. Any discrepancy in the contract documents is to be remedied by the Installer providing and installing the newer, greater quality or quantity of the item or items in question.

N. Horizontal cabling is to have minimum ten (10) feet of service loop coiled and stored above the ladder rack in the telecommunication room.

O. Horizontal cabling is to have no less than twelve (12) and no more than eighteen (18) inches of maintenance loop coiled and stored as close to the entrance to the workstation outlet as possible.

P. Horizontal cabling is to have no less than six (6) and no more than twelve (12) inches of maintenance loop coiled and stored inside the back box at the workstation outlet.

Q. Horizontal cable lengths for individual links shall not exceed 90 m (295 ft) from the point of termination at the connector to the point of termination at the patch panel.

R. A pull cord (nylon; 1/8" minimum) shall be co-installed with all cable installed in any conduit.

S. Provide nylon bushings for all conduit openings.

T. All horizontal cables not in a cable tray or conduit shall be supported at a maximum of 48 to 60 inch intervals. Cable support system is to be independent of supports for other trades. At no point shall cable(s) make contact with acoustic ceiling supports, grids, panels, electrical conduits, water pipes or HVAC ductwork or supports.

U. Any cable damaged or exceeding recommended installation parameters during installation shall be replaced by the installer prior to final acceptance at no cost to the Owner.

V. Pair untwist at the termination shall not exceed 3.18mm.

W. Bend radius of the cable in the termination area shall not be less than 4 times the outside diameter of the cable.

X. The cable jacket shall be maintained to within 25mm (one inch) of the termination point.

2.3 ACCESS DOORS

A. Wherever access is required in walls or ceilings to concealed junction boxes, pull boxes, equipment, etc., installed under this Division, furnish a hinged access door and frame with flush latch handle to another Division for installation. Doors shall be as follows:
   1. Plaster Surfaces: Milcor Style K.
   2. Ceramic Tile Surfaces: Milcor Style M.
   3. Drywall Surfaces: Milcor Style DW.
   4. Install panels only in locations approved by the Architect.

2.4 FIRE STOPPING

A. Contractor shall restore the fire rating of penetrations to rated walls, ceiling, flooring after cable pulling. Fire stopping products shall be as follows:
   1. Hilti
      a. CP 653 2 Inches/4 Inches Speed Sleeve
      b. CP 658T 2 Inches/4 Inches Firestop Plug
      c. 675T Firestop Board
      d. CP 620 Fire Foam
      e. CP 618 Firestop Putty Stick

2. Wiremold Flamstopper Thru-Wall/Floor Fitting Systems for New & Retrofit Applications
3. STI EZ-Path System
4. Owner approved alternate

2.5 IDENTIFICATION (LABELING) SYSTEM

A. Contractor shall label al communications system components installed. Labeling products shall be as follows:
1. Brady (LAT-19-361-4)
2. Dymo
3. Hellerman-Tyton
4. Owner approved alternate

2.6 ESCUTCHEONS

A. Provide heavy chrome or nickel plated plates, of approved pattern, on conduit passing through walls, floors and ceilings in finished areas. Where conduit passes through a sleeve, no point of the conduit shall touch the building construction. Caulk around such conduit with sufficient layers of two hour rated firesafing by Thermafiber 4.0 P.C.F. density, U.S.G. fire test 4/11/78 and seal off openings between conduit and sleeves with non-hardening mastic prior to application of escutcheon plate. Escutcheons shall be Gravler Sure-Lock, or approved equal.

2.7 SPACE LIMITATIONS

A. Equipment shall be chosen which shall properly fit into the physical space provided and shown on the drawings, allowing ample room for access, servicing, removal and replacement of parts, etc. Adequate space shall be allowed for clearances in accordance with Code requirements. Physical dimensions and arrangement of equipment shall be subject to the approval of the Architect.

2.8 PAINTING

A. All factory assembled equipment shall be delivered with a hard surface factory applied finish such as baked-on machinery enamel which will not require additional field painting. The finish shall consist of not less than 2 coats of medium gray color paint USA No. 61 Munsell Notation 8-3G, 6. 10/0.54 enamel. This Contractor shall protect this finish from damage due to construction operations until acceptance of the building. He shall be responsible for satisfactorily restoring any such finishes or replacing equipment that becomes stained or damaged.

PART 3 - EXECUTION

3.1 PREPARATION

A. Field Measurements
1. Verify dimensions in areas of installation by field measurements before fabrication and indicate measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delaying the work.

B. Established Dimensions
1. Where field measurements cannot be made without delaying the work, coordinate with the General Contractor to establish dimensions.
2. When approved in writing, proceed with fabricating units without field measurements.
3. Coordinate supports, adjacent construction, and fixture locations to ensure actual dimensions correspond to established dimensions.

C. Pre-installation inspection
1. The Contractor shall visually inspect all cables, cable reels, and shipping cartons to detect possible cable damage incurred during shipping and transport.
2. Visibly damaged goods are not acceptable and shall be replaced by the contractor at no additional cost to the Owner.

3.2 DEMOLITION AND REMODELING

A. Where only portions of the existing Communications system are to be modified as part of the renovation and addition project, devices related to or part of this system outside of the renovation area shall be kept in operations.

B. The Drawings do not show all demolition work required. The Contractor shall make himself familiar with the required scope of work to accomplish the work required by these documents. All demolition work implied or required shall be included in the scope of this contract.

C. Utility service outages required by the new installation will be permitted but only at a time approved by the Owner. The Contractor shall allow the Owner two (2) weeks in order to schedule required outages. The time allowed for outages will not be during normal working hours unless otherwise approved by the Owner. All costs of outages, including overtime charges, shall be included in the contract amount.

D. The contractor shall perform a preconstruction walk thru of the site to observe and test the existing systems for operation. The owner assumes that the system is 100% operational and functioning prior to the commencement of construction. If any portion of the system observed or tested to be non-functional or inoperable at the commencement of the project will be noted by the contractor. A written report will be generated by the contractor noting their findings and submitted to the project team for review and handling. The owner will determine if the items found to be non-functional are to be repaired by contractor or repaired by the owner. If this repair of the equipment found to be non-functional is to be added to the contractor's scope of work the contract amount for the Work shall be adjusted accordingly.

E. Work Sequence and Timing. The Owner will cooperate with the Contractor; however, the following provisions must be observed:
   1. During the construction of this project, normal facility activities will continue in existing buildings until new buildings or renovated areas are completed. Plumbing, fire protection, lighting, electrical, communications, heating, air conditioning, and ventilation systems shall be maintained in service within the occupied spaces of the existing building.
   2. A meeting will be held at the project site, prior to any construction, between the Owner's Representative, the General Contractor, the Subcontractors and Sub-subcontractors, and the Engineer to discuss Contractor's employee parking space, access, storage of equipment or materials, and use of the Owner's facilities or utilities. The Owner's decisions regarding such matters shall be final.

F. In the preparation of these documents every effort has been made to show the approximate locations of, and connections to the existing Local Area Network (LAN) and Wide Area Network (WAN) infrastructure and workstation outlets. However, this Contractor shall be responsible for verifying all of the above information. This Contractor shall visit the existing site to inspect the facilities and related areas. This Contractor shall inspect and verify all details and requirements of all the Contract Documents, prior to the submission of a proposal. All discrepancies between the Contract Documents and actual job-site conditions shall be resolved by the contractor, who shall produce drawings which shall be submitted to the Architect/Engineer for review. All labor and materials required to perform the work described shall be a part of this Contract.

G. All equipment and/or systems noted on the Drawings "To Remain" shall be inspected and tested on site to certify its working condition. A written report on the condition of all equipment to remain, including a copy of the test results and recommended remedial actions and costs shall be made by this Contractor to the Architect/Engineer for review.

H. All equipment and/or systems noted on the Drawings "To Be Removed" should be removed including, associated pipe and duct, pipe and duct hangers and/or line supports. Where duct or pipe is to be capped for future or end of line use, it shall be properly tagged with its function or service appropriately identified. Where existing equipment is to be removed or relocated and has an electric motor or connection, the Electrical Contractor shall disconnect motor or connection, remove wiring to a safe point and this Contractor shall remove or relocate motor or connection along with the equipment.

I. During construction and remodeling, portions of the Project shall remain in service. Construction equipment, material, tools, extension cords, etc., shall be arranged so as to present minimum hazard or interruption to the occupants of the building. None of the construction work shall interfere with the proper operation of the existing facility; or be so conducted as to cause harm or danger to persons on the premises. All fire exits, stairs or corridors required for proper access, circulation or exit shall remain clear of equipment, materials or debris. The General Contractor shall maintain barricades, other separations in corridors and other spaces where work is conducted.

J. Certain work during the demolition and construction phases may require overtime or night time shifts or temporary evacuation of the occupants. Coordinate and schedule all proposed down time with the Owner at least seventy-two (72) hours in advance in writing.

K. Any salvageable equipment as determined by the Owner, shall be delivered to the Owner, and placed in storage at the location of his choice. All other debris shall be removed from the site immediately.

L. Equipment, piping or other potential hazards to the occupants of the building shall not be left overnight outside of the designated working or construction area.

M. Make every effort to minimize damage to the existing building and the Owner's property. Repair, patch or replace as required any damage which occurs as a result of work at the site. Care shall be taken to minimize interference with the Owner's activities during construction and to keep construction disrupted areas to a minimum. Coordinate with the Owner and other trades in scheduling and performance of the work.

N. When applicable, Include in the contract price all rerouting of existing backbone cabling, , etc., and the reconnecting of the existing equipment as necessitated by field conditions to allow the installation of the new systems regardless of whether or not such rerouting, reconnecting or relocating is shown on the drawings. Furnish all temporary pipe, duct, controls, etc., as required to maintain heating, cooling, and ventilation services for the existing telecommunications rooms in areas scheduled to remain operational with a minimum of interruption.

O. All existing cabling, equipment, controls and appurtenances not included in the remodel or alteration areas are to remain in place.

P. Cabling and equipment s serving technology and communications, etc., which is to remain but which is served by pipe, duct, equipment and controls that are disturbed by the remodeling work, shall be reconnected in such a manner as to leave this equipment in proper operating condition.

Q. It is the intention of this Section of the Specifications to outline minimum requirements to furnish the Owner with a turn-key and operating system in cooperation with other trades with a minimum of disruption or downtime.

R. Refer to Architectural Demolition and/or Alteration plans for actual location of walls, ceilings, etc., being removed and/or remodeled.

S. Field verify measurements, and cabling arrangements are as shown on Drawings.

T. Verify that scheduled cabling and equipment serving only those abandoned devices to be demolished and removed in its entirety.

U. Demolition Drawings are based on casual field observation and existing Record Documents. Report discrepancies to Architect and Engineer before disturbing existing installation.

V. Beginning of demolition means that the contractor accepts existing conditions.

W. Demolish and extend existing communications work under provisions of Division 02 and this Section.

X. Remove, relocate, and extend existing systems to accommodate new construction.

Y. Remove abandoned cabling to source of origination point. Remove racks and other equipment as scheduled on the drawings.

Z. Remove exposed / abandoned cabling systems, including abandoned systems above accessible ceiling finishes. Cut systems flush with walls and floors, and patch surfaces.

AA. Repair adjacent construction and finishes damaged during demolition and extension work.

BB. Maintain access to existing systems which remain active. Modify installation or provide access doors as appropriate.

CC. Extend existing systems using materials and methods compatible with existing systems, or as specified.

DD. Clean and repair existing materials and equipment which remain or are to be reused. The Contractor shall modify, remove, and/or relocate all materials and items so indicated on the Drawings or required by the installation of new facilities. All removals and/or dismantling shall be conducted in a manner as to produce maximum salvage. Salvage materials shall remain the property of the Owner and shall be delivered to such destination as directed by the Owner. Materials and/or items scheduled for relocation and which are damaged during dismantling or reassembly operations shall be repaired and restored to good operating condition. The Contractor may, at his discretion and upon the approval of the Owner, substitute new materials and/or items of like design and quality in lieu of materials and/or items to be relocated.

EE. All items which are to be relocated shall be carefully removed in reverse to original assembly or placement and protected until relocated. The contractor shall clean and repair and provide all new materials, fittings, and appurtenances required to complete the relocations and to restore to good operative order. All relocations shall be performed by workmen skilled in the work and in accordance with standard practice of the trades involved.

FF. When items scheduled for relocation are found to be in damaged condition before work has been started on dismantling, the Contractor shall call the attention of the Owner to such items and receive further instructions before removal. Items damaged in repositioning operations are the Contractor's responsibility and shall be repaired or replaced by the Contractor as approved by the Owner, at no additional cost to the Owner.

GG. Service lines and wiring to items to be removed, salvaged, or relocated shall be removed to points indicated on the Drawings, specified, or acceptable to the Owner. Service lines and wiring not scheduled for reuse shall be removed to the points at which reuse is to be continued or service is to remain. Such services shall be sealed, capped, or otherwise tied-off or disconnected in a safe manner acceptable to the Owner. All disconnections or connections into the existing facilities shall be done in such a manner as to result in minimum interruption of services to adjacent occupied areas. Services to existing areas or facilities which must remain in operation during the construction period shall not be interrupted without prior specific approval of the Owner as hereinbefore specified.

HH. The Contractor shall be responsible for loss or damage to the existing facilities caused by him and his workmen and shall be responsible for repairing such loss or damage. The Contractor shall send proper notices, make necessary arrangements, and perform other services required for the care, protection and in-service maintenance of all electrical services for the new and existing facilities. The Contractor shall erect temporary barricades, with necessary safety devices, as required to protect personnel from injury, removing all such temporary protection upon completion of the work.

II. Where existing construction is removed to provide working and extension access to existing utilities, Contractor shall remove doors, piping, conduit, outlet boxes, wiring, light fixtures, air conditioning ductwork and equipment, etc., to provide this access and shall reinstall same upon completion of work in the areas affected.

JJ. Where partitions, walls, floors, or ceilings of existing construction are being removed, all contractors shall remove and reinstall in locations approved by the Architect all devices required for the operation of the various systems installed in the existing construction.

3.3 INSTALLATION

A. General
   1. Contractor shall install work in accordance with specifications, drawings, manufacturer’s instructions and approved submittal data.

B. Allowable cable bend radius and pull tension:
   1. In general, communications cable cannot tolerate sharp bends or excessive pull tension during installation.
   2. Refer to cable manufacturer's bend radius recommendations for the maximum allowable limits.
   3. After installation, exposed cable and other surfaces must be cleaned free of lubricant residue. Use only lubricants specifically designed for cable installation.

C. Pull Strings
   1. Provide pull strings in all new conduits, including all conduits with cable installed (trailer strings) as part of this contract.
   2. Data and video cables can be pulled in tandem with pull strings.

3. The pull strings must move freely to prevent cable jacket/cable damage during pulls.

3.4 EXCAVATING AND BACKFILLING

A. Trenching and backfilling and other earthwork operations required to install the facilities specified herein shall conform to the applicable requirements of Division 2 (95% of maximum standard density). Where trenching or excavation is required in improved areas, the backfill shall be compacted to a condition equal to that of adjacent undisturbed earth and the surface of the area restored to the condition existing prior to trenching or excavating operations. Provide a minimum of 3” of sand underneath all conduits. The plans indicate information pertaining to surface and sub-surface obstructions; however, this information is not guaranteed. Should obstructions be encountered whether or not shown, the Contractor shall alter routing of new work, reroute existing lines, remove obstructions where permitted, or otherwise perform whatever work is necessary to satisfy the purpose of new work and leave existing surfaces and structures in a satisfactory and serviceable condition. All work shall comply with OSHA Standards.

3.5 WORKMANSHIP AND CONCEALMENT

A. The work of this Section shall be performed by workman skilled in their trade. Installation shall be consistent in completeness whether concealed or exposed. Each item of Communications work shall be concealed in walls, chases, under floors and above ceilings except:
1. Where shown to be exposed.
2. Where exposure is necessary to the proper function.

3.6 SLEEVES, CUTTING AND PATCHING

A. This section shall be responsible for placing sleeves for all conduit passing through walls, partitions, sound walls, beams, floors, roof, etc. Sleeves through below-grade walls shall use water-tight fitting manufactured by O-Z/Gedney.

B. All cutting and patching will be done under another Division, but this Section will be responsible for timely performance of this work and layout of holes and setting sleeves.

C. All un-used sleeves shall be sealed with 2 hour UL approved fire sealant manufactured by “3M” or approved equal.

3.7 LABELING

A. All communications system field devices, faceplates, cables, termination devices, equipment enclosures (racks, cabinets, wall mounted boxes, etc) shall be clearly labelled with printed labels showing the device/cable ID, type, and the origination and destination location for cables.

B. All labelling shall conform to Owner's labelling standard and industry standards. Submit labelling scheme as part of the shop drawing for review and approval before work to start.

C. Cable labels: Self-adhesive vinyl or vinyl-cloth wraparound tape markers, machine printed with alphanumeric cable designations.

D. Flat-surface labels: Self-adhesive vinyl or vinyl-cloth labels, machine printed with alphanumeric cable designations.

E. Provide transparent plastic label holders, and 4-pair marked colored labels.

F. In accordance with ANSI/TIA-606-B "Administration Standard for Commercial Telecommunications Infrastructure":
1. Install colored labels according to the type of field as per color code designations.
2. Use “designation strip color-code guidelines for voice, data, cross-connect, riser, and backbone fields”.

G. Pathway Labels and Labeling System
1. Labeling system shall consist of a hand-held portable printer
2. Conduits: General-purpose label designed for powdered coated surfaces with an ultra-aggressive adhesive. Label size shall be appropriate for the conduit size. Font size shall be legible from the finished floor.
3. Inner duct: Polyethylene general-purpose tagging material attached using tie wraps.

4. Junction boxes: General-purpose label designed for powdered coated surfaces with an ultra-aggressive adhesive, trade name. Font size shall be easily visible from the finished floor.
5. All labels shall be permanent, i.e. will not fade, peel, or deteriorate due to environment or time.
6. Identification
    a. All conduits, junction boxes, gutters, and pull boxes shall have machine-generated labels easily visible from the finished floor.
    b. Conduits shall be labeled with the word “communications” and the conduit’s origination room number and destination room number.
    c. The Contractor shall label conduit at each wall and floor penetration and at each conduit termination, such as outlet boxes, pull boxes, and junction boxes, or as otherwise specified in other sections.
    d. Junction boxes, gutters and pull boxes shall be labeled with identification name or number as determined by contractor and submitted for approval.
    e. The Contractor shall label conduit sleeves at each wall and floor penetration.

3.8 FIRESTOPPING

A. Provide approved fire-resistant materials to restore originally-designed fire-ratings to all wall, floor, and ceiling penetrations used in the distribution and installation for communications cabling system.

B. Install and seal penetrations (conduit, sleeves, slots, chases) in fire-rated barriers created for communications infrastructure to prevent the passage of smoke, fire, toxic gas, or water through the penetrations.

C. The firestopping material shall maintain/establish the fire-rated integrity of the wall/barrier that has been penetrated.

D. All through penetrations in a fire rated surface require a sleeve, regardless of penetration diameter or penetrating cable count.

E. Using a “ring and string” method of installing cabling for membrane penetrations in a wall cavity is acceptable, provided the solution was accepted by the Owner in writing. Code-compliant firestopping rules still apply.

F. Coordinate firestopping procedures and materials with General Contractor.

G. Sharing the pathway of other trades/utilities through compliant and non-compliant penetrations does not remove the requirement to maintain code-compliant firestopping.

H. Provide and install removable, intumescent mechanical systems in floor chases for all openings greater than 0’-4”.

I. Provide and install removable, intumescent, firestop bricks for all openings greater than 0’-4” where there are penetrations through walls.

J. Bricks shall be listed for insertion in fire-rated openings and require restraining materials or apparatus as needed per manufacturers’ specifications.

K. Provide manufacturer recommended material for rated protection for any given barrier.

L. Laminate and permanently affix adjacent to chases the following information:
1. Manufacturer of firestop system.
2. Date of installation/repair.
3. Part and model numbers of system and all components.
4. Name and phone numbers of local distributor and manufacturer’s corporate headquarters.

M. Solutions and shop drawings/submittals for firestop materials and systems shall be presented to the General Contractor for written approval of materials/systems prior to purchase and installation.

N. Materials shall be installed per manufacturer instructions, be UL-listed for intended use, and meet NEC and locals codes for fire stopping measures.

O. The material chosen shall be distinctively colored to be clearly distinguishable from other materials, adhere to itself, and maintain the characteristics for which it is designed to allow for the removal and/or addition of communication cables without the necessity of drilling holes in the material.

P. Develop training manuals with instructions on methods of adding or removing cabling to/from firestopped sleeves and chases.

Q. Within the normal environment, the installed systems shall not generate nor be susceptible to any harmful electromagnetic emission, radiation, or induction that degrades, or obstructs any equipment.

R. Expansion Capability: Unless otherwise indicated, provide spare conductor pairs in cables, positions in patch panels, cross connects, and terminal strips, and space in cable pathways and backboard layouts to accommodate 20% future increase in structure cable system capacity.

S. In the event of a breach of the representations and warranties contained herein, the Contractor, at their own expense, shall take all measures necessary to make the cabling system work and comply with the applicable manufacturer written technical recommendations and standards.

3.9 TESTING CABLING SYSTEM

A. Upon completion of the installation of the communications infrastructure systems, including all pathways and grounding, the Contractor shall test the system.
1. Cables and termination modules shall be affixed, mounted or installed to the designed/specified permanent location prior to testing.
2. Any removal and reinstallation of any component in a circuit, including faceplates, shall require retesting of that circuit and any other disturbed or affected circuits.
3. Approved instruments, apparatus, services, and qualified personnel shall be utilized.
4. The Contractor must verify that the requirements of the specifications are fully met through testing with an approved tester (rated for testing parameters listed elsewhere), and documentation as specified below.
5. This includes confirmation of requirements by demonstration, testing and inspection. Demonstration shall be provided at final walk-through in soft copy and printed test data.

B. Non-Compliant Cabling
1. Testing that shows some or all pairs of a cable do not comply with specifications, without written approval by the Owner, shall be replaced at Contractor’s expense (including respective connectors).
2. With the Owner’s written approval, the over-length cable(s) shall be excluded from requirements to pass standardized tests and shall be explicitly identified.
   a. Testing is still required for non-compliant cabling.
   b. The tests shall be for wire-mapping, opens, cable-pair shorts, and shorts-to-ground.
   c. The test results must be within acceptable tolerances and shall be submitted with the Owner’s acceptance document.

C. Failed Tests
1. If tests fail, Contractor shall correct as required to produce a legitimate passing test.
2. Manipulation of tester parameters on a failing test in order to achieve a passing test is unacceptable.
3. If the Contractor is found to have manipulated or falsified any failing test result to show a “PASS” for any reason (without written notice and prior approval of the Owner), the Contractor shall be required to employ a Third-Party Testing Agent selected by the Owner to retest the complete cable plant and shall be required to pay all costs associated with this retesting.

D. Owner reserves the right to be present during any or all testing.

3.10 WALL MOUNTED EQUIPMENT

A. Install all wall mounted equipment in accordance with the National Electrical Code, industry standards and as shown on the drawings.

B. Unless noted otherwise, all wall mounted equipment that need to be accessed for operation or maintenance shall be mounted at a working height not requiring a ladder when wall space is available. Installation of these devices at greater elevations shall be approved by the Engineer. Contractor shall provide a coordination sketch of each mechanical/electrical room noting locations and mounting heights of all electrical devices(note bottom and top elevations) shown to be installed. Sketches shall be provided to the Engineer for review and the general contractor for coordination with other trades working in these rooms.

3.11 CLEANING

A. The Contractor will clean all surfaces of equipment and devices prior to final acceptance by Owner.

3.12 CORROSIVE AREAS

A. In areas of a corrosive nature, which include but are not limited to the following: pool equipment rooms, cooling towers and areas subject to salt air, etc., provide NEMA 4X stainless steel or fiberglass reinforced enclosures for contactors, panel boards, controllers, starters, disconnects and materials used as supporting means (i.e. plastibond unistrut, pipe, fittings). The use of spray on coating may be acceptable in some applications.

3.13 TESTS AND INSPECTIONS

A. Tests and inspection requirements shall be coordinated with Division I.

B. Date for final acceptance test shall be sufficiently in advance of completion date of contract to permit alterations or adjustments necessary to achieve proper functioning of equipment prior to contract completion date.

C. Conduct re-tests as directed by Architect on portions of work or equipment altered or adjusted as determined to be necessary by final acceptance test. No resultant delay or consumption of time as a result of such necessary re-test beyond contract completion date shall relieve Contractor of his responsibility under contract.

D. Put circuits and equipment into service under normal conditions, collectively and separately, as may be required to determine satisfactory operation. Demonstrate equipment to operate in accordance with requirements of these specifications. Perform tests in the presence of Architect. Furnish instruments and personnel required for tests.

E. Final Inspection:
   1. At the time designated by the Architect, the entire system shall be inspected by the Architect and Engineer. The contractor or his representative shall be present at this inspection.
   2. All devices, equipment, equipment cabinets and enclosure shall be cleaned and in operating condition.
   3. Certificates and documents required hereinbefore shall be in order and presented to the Architect prior to inspection.
   4. Panel covers, junction box covers, etc., shall be removed for visual inspection of the wire, bus bars, etc.
   5. After the inspection, any items which are noted as needing to be changed or corrected in order to comply with these specifications and the drawings shall be accomplished without delay.

3.14 ACCEPTANCE

A. Once all work has been completed, test documentation has been submitted, and Owner is satisfied that all work is in accordance with contract documents, the Owner shall notify Contractor in writing of formal acceptance of the system.

B. Contractor must warrant in writing that 100% of the installation meets the requirements specified herein (Standards Compliance & Test Requirements).

C. Acceptance shall be subject to completion of all work, successful post-installation testing which yields 100% PASS rating, and receipt of full documentation soft and hard copies as described herein.

END OF SECTION

SECTION 27 05 26 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes grounding and bonding products, design requirements and installation for communications systems.

B. Related Sections
1. Section 27 02 00 - BASIC MATERIALS AND METHODS FOR COMMUNICATION SYSTEMS
2. Section 27 05 28 - PATHWAYS FOR COMMUNICATIONS SYSTEMS
3. Section 27 11 00 - COMMUNICATIONS ROOM FITTINGS
4. Section 27 15 00 - COMMUNICATIONS HORIZONTAL CABLING
5. Section 27 13 00 - COMMUNICATIONS BACKBONE CABLING
6. Section 27 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR COMMUNICATIONS SYSTEMS

1.2 REFERENCES

A. The publications referenced in Section 27 02 00 form a part of this specification. The publications are referred to in the text by basic designation only.

B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean the latest printed edition of each in effect at the date of contract unless the document is shown dated.

C. Conflicts
1. Refer to Section 27 02 00.

D. Codes and Standards
1. Refer to Section 27 02 00.

1.3 SYSTEM REQUIREMENTS

A. General
1. All conductor wire, busbars and conduit shall be UL listed.
2. The communications ground system shall be independent from all power grounding except for the connection to the building's electrical service main grounding electrode system.
3. Power grounding and/or bonding shall not be allowed to interfere or provide any back feed or be a conductor to the separate communications ground system source or to any communications bonded materials or equipment.

B. Telecommunications Main Grounding Busbar (TMGB) and Bonding Conductor for Telecommunications (BCT)
1. The main ground source feed for the Telecommunications Main Grounding Busbar (TMGB) in the MC (MDF) shall be an independent feed from the building's electrical service main grounding electrode system, known as the Bonding Conductor for Telecommunications (BCT).
2. The BCT shall be a stranded copper ground wire from the building ground system to the TMGB in the MC (MDF) sized at a minimum #4/0 unless otherwise sized by the Electrical Engineer of Record.
3. The BCT connections shall be low emission exothermic welds at the connecting ends.

C. Telecommunication Bonding Backbone (TBB) and Telecommunications Grounding Busbar (TGB)
1. The Telecommunication Bonding Backbone (TBB) originates at the TMGB and shall be extended from the TMGB within the MC (MDF) throughout the building along the same route as the telecommunications backbone pathways, to the Telecommunications Grounding Busbar(s) (TGBs) in each TR (IDF).
2. The minimum TBB conductor size between busbars shall be a stranded copper ground wire one (1) AWG size smaller than the Bonding Conductor for Telecommunications (BCT).

D. Grounding Equalizer (GE)
1. Whenever two or more TBBs are used in a multistory building, the TBBs shall be bonded together with a GE (by low emission exothermic welds) at the top floor and at a minimum of every third floor in between with a copper conductor equal to the gauge of the TBB.

E. TEBC and RBC
1. All cabinets and racks shall be connected by the Telecommunications Equipment Bonding Conductor (TEBC). The TEBC is a stranded copper #4 conductor from the TMGB/TGB extending along each row of racks within the room. Bond each rack with a Rack Bonding Conductor (RBC). The RBC is a stranded copper #6 conductor connected to the vertical rack bonding terminal. All connections shall be irreversible crimp connections. Route conductor so as to minimize the quantity of sweeping bends.

1.4 SUBMITTALS

A. Refer to Section 27 02 00.

1.5 QUALITY ASSURANCE

A. Refer to Section 27 02 00.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 27 02 00.

B. The Contractor shall ship on manufacturer`s standard reel sizes of one continuous length. Where cut lengths are specified, mark reel quantity accordingly.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with requirements, manufacturers that may be incorporated in the work, include:

B. Cable Manufacturers
1. Houston Wire and Cable Company
2. Okonite Company
3. General Cable
4. Pirelli Cable Corporation
5. Triangle Wire and Cable
6. Owner Approved Alternate

C. Electrical Service Entrance Bonding Conductor and Connector Manufacturers
1. Copperweld
2. Thomas & Betts
3. Blackburn
4. Owner Approved Alternate

D. Exothermic Connector Manufacturers
1. Erico Products (Cadweld)
2. Continental Industries (thermOweld)
3. Harger
4. Owner Approved Alternate

E. Crimp Connector Manufacturers
1. Thomas & Betts
2. FCI Burndy Electrical
3. O-Z/Gedney
4. Owner Approved Alternate

F. Telecommunication Grounding Busbars
1. Chatsworth
2. Panduit
3. Leviton

4. Owner Approved Alternate

G. Bonding Straps
1. Chatsworth
2. Harger
3. Brundy
4. Owner Approved Alternate

H. C-Type Compression Taps
1. Brundy
2. Harger
3. Owner Approved Alternate

I. Antioxidant Joint Compound
1. Chatsworth
2. Owner Approved Alternate

J. Labeling
1. Refer to Section 27 02 00.

K. Firestopping
1. Refer to Section 27 02 00.

2.2 MATERIALS

A. Communications Grounding Conductors: Copper American Wire Gauge (AWG) wire of the following sizes:
1. Bonding Conductor for Telecommunications (BCT): #4/0 (unless otherwise sized by the Electrical Engineer of Record)
2. Telecommunication Bonding Backbone (TBB): #3/0 (unless otherwise sized by the Electrical Engineer of Record)
3. Grounding Equalizer (GE): equal AWG as the TBB (unless otherwise sized by the Electrical Engineer of Record)
4. Telecommunications Equipment Bonding Conductor (TEBC): #4
5. Rack Bonding Conductor (RBC): #6

B. Grounding Connectors
1. Connectors shall be a copper alloy material and two-hole, double-crimp compression lug type at the connecting ends.

C. Telecommunications Main Ground Busbar (TMGB)
1. Use pre-drilled copper busbar with standard NEMA bolt hole sizing and spacing for the type of connectors.
2. Sized for the immediate requirements and allow for 25% growth.
3. The minimum dimensions shall be 0’-¼” thick X 0’-4” wide X 1’-8” long.
4. Contain (2) tiers of pre-drilled holes for use with standard sizes of two-hole copper compression lugs.
5. ASTM-B187-C11000 Copper bar suitable for use with two-hole compression-type copper lugs.

D. Telecommunications Ground Busbar (TGB)
1. Use pre-drilled copper busbar with standard NEMA bolt hole sizing and spacing for the type of connectors.
2. Sized for the immediate requirements and allow for 25% growth.
3. The minimum dimensions shall be 0’-1/4” thick X 0’-4” wide X 0’-10” long.
4. Contain (2) tiers of pre-drilled holes for use with standard sizes of two-hole copper compression lugs.
5. ASTM-B187-C11000 Copper bar suitable for use with two-hole compression type copper lugs.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Refer to Section 27 02 00.

3.2 PREPARATION

A. Refer to Section 27 02 00.

B. Copper and copper alloy connections should be cleaned prior to connection.

3.3 INSTALLATION

A. Refer to Section 27 02 00.

B. The Contractor shall install the work in accordance with the specifications, drawings, manufacturer's instructions and approved submittal data.

C. All work shall be supervised and reviewed by the Contractor's on-site RCDD.

D. Installation plans and Requests For Information (RFIs) shall be reviewed by the Contractor's RCDD.

E. General
1. Bonding and grounding procedures and components shall comply with ANSI/TIA-607-B "Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications".
2. Bonding should be accomplished such that the bonding system is integrated and compliant with NEC specifications.
3. Bonding conductors shall be routed with minimum bends or changes in direction and should be made directly to the points being bonded.
4. Bonding connections should be made by using compression copper lugs. However, for parts of the ground electrode system that are subject to corrosion, must carry high currents reliably, or for locations that require minimum maintenance, connections are made with low emission exothermic welding (see NEC Article 250).
5. Make connections to dry surfaces only.
6. Remove paint, rust, oxides, scales, grease and dirt from surfaces before making connection.
7. Burnish clean a 0'-1" X 0'-1" area, drill, tap, apply an adequate amount of antioxidant joint compound mixed for the metal surface types affected, and bolt conductor and connector to burnished and compounded area. Ensure proper conductivity.
8. Route bonding conductor(s) the shortest distance between bonding contact points.
9. The ground-wire connecting ends shall have a minimum amount of insulation removed at the ground lug.
10. Do not connect ground wire in power cable assemblies to the telecommunications ground system.
11. All grounding and bonding conductors shall be copper and may be insulated. If bare-bonding conductors are used, isolate bonding conductors and prevent contact.
12. Antioxidant material shall be installed to separate dissimilar metals and prevent corrosion.
13. If multiple systems are involved (lightning protection systems, communications, radio and TV, CATV, etc.), those systems shall be bonded together to minimize potential differences between the systems, per NEC 250.94.

F. Telecommunication Bonding Conductors
1. Each telecommunications grounding and bonding conductor shall be labeled at each end detailing the function and room number of its opposite end. Labels shall be located on conductors as close as practicable to their point of termination in a readable position. Labels shall be nonmetallic and include the following text, "TELECOMMUNICATIONS GROUND - DO NOT REMOVE. IF THIS CONNECTOR OR CABLE IS LOOSE OR MUST BE REMOVED, PLEASE CALL THE BUILDING TELECOMMUNICATIONS MANAGER".
2. Furnish and install all required bonding material, hardware, and utilize tools manufactured for this purpose.
3. The connections of the BCT, TBB, GE, TEBC, and RBC shall be made using low emission exothermic welding or hydraulically crimped with a double crimp connector. Two-hole grounding lugs are preferred for connection to the grounding bus bars.
   a. All low emission exothermic welding shall be by Division 26.
   b. Coordinate with the building services personnel in occupied spaces to prevent the smoke from the exothermic weld process from potentially setting off smoke/fire alarms.
4. Grounding and bonding conductors should not be placed in ferrous metallic conduit. If it is necessary to place grounding and bonding conductors in a ferrous metallic conduit that exceeds 1m (3ft) in length, the conductors shall be bonded to each end of the conduit using a grounding bushing or a No. 6AWG conductor, minimum.
5. The bonding conductors should be installed without splices.

a. Where splices are necessary, the number of splices should be minimized, be accessible, and be located within the telecommunications spaces.
b. Joined segments of a bonding conductor shall be connected using exothermic welding, irreversible compression-type connectors, or equivalent. All joints shall be adequately supported and protected from damage.

G. Equipment Cabinets and Racks
1. The busbar shall be installed at the base and back of each cabinet/rack for floor fed cabinets/racks.
2. The busbar shall be installed at the top and back of each cabinet/rack for top fed cabinets/racks.
3. Each cabinet and rack shall be provided with a minimum # 6 AWG ground wire.
4. Do not loop from cabinet/rack to cabinet/rack.
5. Each cabinet or rack bay against the wall shall be bottom/side ground fed from the wall.
a. Wall ground feeds/raceways to racks shall not be exposed on the walls.
b. Exception: Some cabinet or rack bays will require the ground to be fed from the ceiling raceway.
6. All ground raceways within each cabinet/rack or cabinet base and adjacent-ganged cabinet base shall be an insulated metallic flex type raceway and shall not interfere with equipment mounting frames or equipment mounting brackets.

H. Cable Runway, Cable Raceway and Support System Grounding
1. The Contractor shall provide communications cable tray and cable runway systems with a communications dedicated ground from the TGB.
2. All cable tray needs to be electrically continuous per NEC 250.96.
a. Metal raceways, wire-mesh cable trays, cable armor, cable sheath, enclosures, frames, fittings, and other metal non-current-carrying parts that are to serve as an alternate grounding path, with or without the use of supplementary equipment grounding conductors, shall be effectively bonded where necessary to ensure electrical continuity and the capacity to conduct safely any fault current plausibly to be imposed on them.
b. Any nonconductive paint, enamel, or similar coating shall be removed at the threads, contact points, and contact surfaces.
c. Grounding or bonding conductors shall be connected by fittings designed for that purpose to ensure adequate bonding.
3. The Contractor shall provide and install a #6 AWG ground wire to bond one end of each cable tray/runway system to the TGB.
4. For electrically non-continuous conduits that contain only grounding conductor, the Contractor shall bond the conduit and conductor together at both ends to ground to the nearest TGB with grounding bushings or ground clamps.

I. Shielded Backbone Cabling
1. The Contractor shall terminate and bond the shield to the nearest TGB or TMGB at both ends, following manufacturer’s guidelines.

3.4 FIELD QUALITY CONTROL

A. Testing
1. Upon completion of the electrical system, including all grounding, the Electrical Contractor shall test the system for stray currents, ground shorts, etc.
2. Approved instruments, apparatus, services, and qualified personnel shall be utilized.
3. If stray currents, shorts, etc., are detected, eliminate or correct as required.

END OF SECTION

SECTION 27 05 28 - PATHWAYS FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes
1. Hangers and Supports, including open-top supports (cable hooks) for communications systems.
2. Conduits and Pull Boxes for communications systems.
3. Cable Tray and Cable Runway with associated accessories and fittings for communications systems.

B. Related Sections
1. Section 27 02 00 - BASIC MATERIALS AND METHODS FOR COMMUNICATION SYSTEMS
2. Section 27 05 26 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS
3. Section 27 11 00 - COMMUNICATIONS ROOM FITTINGS
4. Section 27 15 00 - COMMUNICATIONS HORIZONTAL CABLING
5. Section 27 13 00 - COMMUNICATIONS BACKBONE CABLING
6. Section 27 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR COMMUNICATIONS SYSTEMS

1.2 REFERENCES

A. The publications referenced in Section 27 02 00 form a part of this specification. The publications are referred to in the text by basic designation only.

B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer’s instructions, or requirements of regulatory agencies shall mean the latest printed edition of each in effect at the date of contract unless the document is shown dated.

C. Conflicts
1. Refer to Section 27 02 00.

D. Codes and Standards
1. Refer to Section 27 02 00.

1.3 SUBMITTALS

A. Refer to Section 27 02 00.

1.4 QUALITY ASSURANCE

A. Refer to Section 27 02 00.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 27 02 00.

B. Conduit Storage
1. Package conduits in bundles maximum 10’-0” long, with conduit and coupling thread protectors for indoor/outdoor storage.
2. Package fittings in manufacturer`s standard quantities and packaging suitable for indoor storage.
3. Protect coating on plastic-coated rigid conduit, fittings, and bodies from damage during shipment and storage.
4. Store conduit above ground on horizontal racks to prevent corrosion and entrance of debris.
5. Equipment and components shall be protected from the weather, humidity, temperature variations, dirt, dust, or other contaminants. Protect plastic conduit and inner duct from sunlight. Equipment damaged prior to system acceptance shall be replaced at no cost to the Owner.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with requirements, manufacturers that may be incorporated in the work, include:

B. Cable Hooks
1. Hilti
2. Erico
3. Caddy
4. B-Line
5. Owner approved alternate

C. Basket Type Cable Tray (for use in work areas)
1. Cablofil
2. Owner approved alternate

D. Innerduct
1. Maxcell
2. Owner approved alternate

E. Measured pull tape (pull tape printed with sequential footage markings)
1. Fibertek
2. Condux International
3. Owner approved alternate

F. Labeling
1. Refer to Section 27 02 00.

G. Firestopping
1. Refer to Section 27 02 00.

2.2 CABLE HOOKS

A. Cable hooks shall be factory assembled for direct attachment to walls, hanger rods, beam flanges, purlins, strut, floor posts, etc. to meet job conditions.

B. Features
1. Cable hooks shall have a flat bottom and provide a minimum of 0'-1.625" cable-bearing surface.
2. Cable hooks shall have 90° radius edges to prevent damage while installing cables.
3. Cable hooks shall be designed so that the mounting hardware is recessed to prevent cable damage.
4. Cable hooks for non-corrosive areas shall be pre-galvanized steel. Where additional strength is required, cable hooks shall be spring steel with a zinc-plated finish.
5. Cable hooks for corrosive areas shall be stainless steel.
6. Cable hooks shall have a stainless steel cable latch retainer to provide containment of cables within the hook.
7. The retainer shall be removable and reusable.

C. Factory assembled multi-tiered cable hooks shall be used where required to provide separate cabling compartments, or where additional capacity is needed.

D. Load cable hooks in accordance with manufacturer requirements and recommendations.

E. Provide capacity for 25% growth, add additional hooks as needed.

2.3 PULL BOXES, JUNCTION BOXES, AND GUTTERS

A. All junction boxes, gutters and pull boxes shall be UL listed and comply with NEC requirements.

B. All junction boxes, gutters and pull boxes shall meet the following minimum material requirements:
1. 16-gauge steel or heavier
2. Seams shall be continuously welded and grounded smooth
3. External screws and clamps
4. External mounting feet (where applicable)
5. Oil-resistant gasket and adhesive
6. ANSI 61 gray polyester powder coating inside and out over phosphatized surface

C. All junction boxes, gutters and pull boxes shall be provided with bushings for conduits and/or cabling.

D. All junction boxes, gutters and pull boxes shall be securely installed.

2.4 CONDUITS

A. All conduits shall be UL listed and comply with NEC requirements.

B. Conduit Fittings
1. All fittings shall be compression or threaded.
2. Fittings shall provide a secure connection for pulling communications cables.
3. Setscrew fittings are not permitted.
4. Conduit “condulets” are not permitted.

C. Non-metallic conduits are not permitted in above ground installations. Conversion fittings are required for non-metallic (below ground) to metallic (above ground) transitions.

D. Innerduct:
1. All fiber shall be installed in innerduct unless fiber cabling is armored.
2. Shall be constructed of non-metallic material.

E. Only manufacturer’s fittings, transition adapters, terminators and fixed bends shall be used.

F. Measured Pull Tape
1. Pre-lubricated, woven polyester, low friction, and high abrasion resistant yarn with footage markers printed on the tape.
2. Minimum average tensile strength shall be 1130 lbs. for 0’-1.5” and smaller conduits and innerduct.
3. Minimum average tensile strength shall be 1800 lbs. for conduits larger than 0’-1.5”.

G. Fill and Bend Radius
1. Conduit fill shall comply with NEC requirements.
2. The minimum bend radius is 6 X the conduit inside diameter (ID) for 0’-2” conduit or less.
3. The minimum bend radius is 10 X the conduit ID for a conduit greater than 0’-2”.
4. There shall be no more than two 90° bends (180° total) between conduit pull boxes.
5. Changes in direction shall be accomplished with sweeping bends observing minimum bend radius requirements above.
6. Do not use pull boxes for direction changes unless specifically designated otherwise in the drawings.
7. Unless otherwise noted in the drawings, conduits entering pull boxes shall be aligned with exiting conduits.

H. Routing
1. Conduits shall be routed in the most direct route possible, with the fewest number of bends possible.
2. There shall be no continuous conduit sections longer than 100’-0” for premises conduits. For runs that total more than 100’-0”, insert junction or pull boxes so that no continuous run between pull boxes is greater than 100’-0”.

I. Penetrations
1. All conduit penetrations shall comply with all applicable fire codes.
2. All conduit penetrations in fire-rated walls or floors shall be sealed and fire-proofed to meet or exceed the designed rating of the penetration area.

2.5 CABLE TRAY

A. Cable tray systems are defined to include, but are not limited to, straight sections of cable trays, bends, tees, elbows, reducers, crosses, wyes, vertical bends, up/down tees, cable support fittings, drop-outs, supports and accessories.

B. Install all tray types utilizing manufacturer recommended installation instructions and applicable standards.

C. Load cable tray and cable runway in accordance with manufacturer requirements and applicable standards.

D. Cable Tray Materials
1. Aluminum
2. Pre-galvanized Steel

3. Hot-dip Galvanized Steel
4. Stainless Steel
5. Yellow Zinc Dichromate
6. Pre-Galvanized Zinc
7. Electro-Galvanized Zinc

E. Cable Tray Systems
1. Wire basket (mesh) of types and sizes indicated on the drawings; with connector assemblies, clamp assemblies, connector plates, splice plates, cable drop outs, bonding accessories, and splice bars. Construct units with rounded edges and smooth surfaces.
2. Continuous mesh polyethylene cable-support system: with connector assemblies and appropriate support components. All parts shall be UL-listed. Plastic (non-metallic) parts shall have a zero detectable halogen content as substantiated by an independent test laboratory.
3. Ladder type trays shall consist of two longitudinal members (side rails) with transverse members (rungs) welded to the side rails. Rungs shall be spaced 0`-9" on center. Spacing in radius fittings shall be 0’-9” as measured at the center of the tray`s width. Rungs shall have a minimum cable-bearing surface of 0’-.875” with radius edges. No portion of the rungs shall protrude below the bottom plane of the side rails.
4. Ventilated trough type trays shall consist of two longitudinal members (side rails) with a corrugated bottom welded to the side rails.
5. Solid bottom trough type trays shall consist of two longitudinal members welded to the side rails.

F. Cable trays shall have sufficient depth and width so as not to exceed a maximum 50% fill ratio, including 25% capacity for anticipated growth.

G. All straight sections shall be supplied in minimum 8’-0” lengths, except where shorter lengths are permitted to facilitate tray assembly lengths.

2.6 HANGERS AND SUPPORT

A. Steel support brackets shall be galvanized steel and capable of supporting a minimum of 200 lbs with a safety factor of 3.

B. Steel support brackets shall have a removable galvanized steel retaining strap.

C. Steel support brackets shall accept 0’-3/8” (10mm) threaded rod for attachment to building structure or sub structure.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Refer to Section 27 02 00.

3.2 PREPARATION

A. Refer to Section 27 02 00.

B. Verify system is properly sized for cables before installation.

C. Verify that the manufacturer recommended loads are not exceeded.

D. Verify general routing and coordinate locations with other trades before installation. Layout cable runs in advance to determine quantities of cable to be installed along pathways, and to ensure non-interference from other trade installations.

3.3 INSTALLATION

A. Refer to Section 27 02 00.

B. Cable Hooks
1. Provide cable hook (j-hook) cable support system for horizontal and/or riser cabling in accessible ceiling space. Assemblies shall be complete with mounting hardware.
2. Provide threaded rod for supporting hangers when hanging from floor deck and deck members.
3. Follow manufacturers fill capacities.

4. Locate cable hooks on 4’ to 5’ centers to adequately support and distribute the cable’s weight.
5. Suspended cables shall be installed with at least 0’-3” of clear vertical space above the ceiling tiles and support channels.
6. For larger quantities of cables, provide special supports that are specifically designed to support the required cable weight and volume.
7. Do not support pathways or cables with the ceiling suspension system or use electrical, plumbing, or other pipes for support.
8. Cable supports shall be permanently anchored to building structure or substrates. Provide attachment hardware and anchors designed for the structure to which attached, and that are suitably sized to carry the weight of the cables to be supported.
9. Secure and support exposed horizontal cable at intervals not exceeding 5’-0” and not less than 1’-4” (16”) from cabinets, pack pole, boxes, fittings, outlets, racks, frames, and terminals.
10. Cable sag between vertical supports for horizontal pathway shall not exceed 0’-6”. Provide at least 0’-3” cable sag between supports.
11. Painted J-hooks shall meet or exceed NEC requirements for the environment in which the product is installed.

C. Conduit and Pull Boxes
1. The Contractor shall route the conduit in approximate locations unless drawing is dimensioned for precise placement.
2. Conduit cuts shall be square. Ream ends of burrs, and remove metal shavings and cutting lubricants before conduit is connected to the conduit system.
3. For conduit embedded in concrete, coat threaded connections in conduits with colloidal rust and corrosion inhibitor and sealant. Conduit must be clean and dry and must pass standard sizing test after concrete is poured.
4. Cap unused conduits with watertight caps
5. Make conduit connections with appropriate fittings and tighten securely.
6. Use appropriate tools to install PVC coated conduit; avoid damage to exterior coating.
7. Install liquid-tight flexible metal conduit where exposed to weather, water, or other liquids.
8. Use IMC, PVC conduit, or rigid galvanized steel conduit in underground installations.
9. The Contractor shall provide fabric innerduct in all underground conduits, as indicated on the drawings.
    a. The Contractor shall use pre-lubricated, woven polyester, low friction, and high abrasion resistant fabric.
    b. The Contractor shall be trained for proper installation technique by the innerduct manufacturer. The Contractor shall coordinate with the owner to demonstrate that pull ropes in each inner duct cell move freely from end to end.

D. Cable Tray and Cable Runway
1. Cut wire basket tray members square with approved cable tray cutting tool as to not leave sharp edges at cut point. Remove burrs and smooth the ends before the cut is connected to wire-mesh tray system.
2. Ensure that standard splices are designed to have less than 1 milliohm (0.0001 Ω) of resistance between connections and provide bonding between sections. Painted wire mesh tray requires the outer mask of the non-conductive surface be removed at each end of the tray prior to installing the splice to provide continuity between painted tray sections.
3. Threaded rod (minimum 0’-½” diameter) or equivalent and slotted channel shall be used for hanging cable tray between floor deck and deck members

E. Fiber Support:
1. Support vertical fiber optic cable with basket weave wire/cable grips. Support fiber riser with single weave support grip with a single offset eye.
2. Mount/attach pulling eye to a wall or ceiling deck secured hook to support/provide strain relief to riser cable. Provide a minimum 3’-0” loop of fiber prior to entering fire stopped floor sleeve.
3. Where required coil up slack fiber cable into pull box and secure with single weave support grip.

F. Clearances
1. A minimum of 1’-0” access headroom shall be provided above a cable tray. Ensure that other building components do not restrict access to the cable trays from the sides.
2. Power outlets shall not be installed in or mounted to cable tray or cable runway.
3. Provide 3’-0” of unencumbered space for every 10’-0” segment of tray.
4. Cable tray clearances
    a. Motors or transformers: 4’-0”

b. Power cables and conduit: 1’-0”
c. Fluorescent lighting: 0’-5”
d. Halide lights: 1’-0”
e. Above the ceiling tiles: 0’-3”
f. Access above and on one side of the cable tray: 1’-0”

3.4 FIELD QUALITY CONTROL

A. Test system to ensure electrical continuity of bonding and grounding connections.

B. Ensure compliance with specified maximum ground resistance.

C. Refer to NFPA 70B Chapter 18 for testing and test methods.

3.5 CLEANING

A. Remove all unnecessary tools and equipment, unused materials, packing materials, and debris from each area where Work has been completed unless designated for storage.

B. Wipe clean all cable trays and apply appropriate manufacturer’s paint to areas that have been scratched.

END OF SECTION

SECTION 27 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes underground communications duct banks, hand-holes and maintenance holes

8. Local, county, state and federal regulations and codes in effect as of date of installation
9. Equipment of foreign manufacture must meet U.S. codes and standards.
   a. It shall be indicated in the proposal the components that may be of foreign manufacture, if any, and the country of origin.
10. IEEE C2, National Electrical Safety Code (NESC).

D. Related Documents
1. Refer to section 27 02 00.

1.3 SUBMITTALS

A. Refer to section 27 02 00.

1.4 QUALITY ASSURANCE

A. Refer to section 27 02 00, and IEEE C2.

B. Follow Annex B of National Electrical Code (NEC)

C. Items of the same classification shall be identical. This requirement includes equipment, assemblies, parts, and components.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver ducts to Project site with ends capped.
   1. Store nonmetallic ducts with supports to prevent bending, warping, and deforming

B. The contractor shall endeavor to make the site ready for installation of manholes when delivered so that they can be placed off of the truck into final position.
   1. When this is not possible, store precast concrete and other factory-fabricate underground utility structures as Project site as recommended by manufacturer to prevent physical damage. Arrange so identification markings are visible.

C. Lift and support precast concrete units only at designated lifting or supporting points.

D. Clearly mark containers "For Communications Duct Banks Only".

E. Refer also to section 27 02 00.

1.6 WARRANTY

A. Refer to IEEE C2.

B. Refer also to section 27 02 00.

1.7 MAINTENANCE

A. Refer to IEEE C2.

B. Refer also to section 27 02 00.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Ducts
   1. Use owner approved solution

B. Hand Holes
   1. Christy Concrete Products

   3. Oldcastle Precast Group
   4. Oldcastle Precast Inc/; Utility Vault Division
   5. Utility Concrete Products, LLC
   6. Owner Approved equivalent

C. Maintenance (Man) Holes
   1. Christy Concrete Products
   2. Cretex Concrete Products West, Inc.; Riverton Division
   3. Oldcastle Precast Group
   4. Oldcastle Precast Inc/; Utility Vault Division
   5. Utility Concrete Products, LLC
   6. Owner Approved equivalent

2.2 MATERIALS

A. Continuous Tape for Underground Conduit
   1. The Contractor shall use orange warning ribbon, PVC tape (detectable, i.e., containing metallic tracings), three inches wide, permanently imprinted with "CAUTION--BURIED COMMUNICATIONS LINE BELOW" in black letters, minimum 0’-1” high.

B. Labeling
   1. Refer to section 27 02 00.

C. Firestopping
   1. Refer to section 27 02 00.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Where necessary, Contractor shall provide all excavation, boring, trenching, backfill and restoration of grounds for all OSP pathways.
   1. In addition, Contractor shall include all labor, materials, and equipment.

B. The owner of the property has the option to obtain a testing laboratory to ensure proper soil compaction.

C. All work shall comply with all city, county and State Codes, NEC, EIA/TIA, OSHA, and BICSI TDMM requirements, codes and standards.

D. The above referenced codes and standards are to be considered as a minimum requirement.
   1. If the plans or specifications call for material and/or methods of construction higher than the standard, the plans or specification shall govern.

E. All holes, trenches and/or any other excavation shall be covered, fenced, and/or taped off to make the area safe at all times.
   1. Conform to general Contractor requirements.

F. The Contractor will visit the job site prior to submitting a proposal to determine existing conditions.
   1. Contractor shall evaluate the site for materials, and any other information that may affect the work to be performed.

G. The Contractor shall locate and protect all existing conduits.
   1. Should damage occur notify the appropriate utility.
   2. Damage costs are the responsibility of the Contractor.

H. The Contractor shall CALL BEFORE YOU DIG, One Call Directory Telephone Numbers (Texas: 1-800-245-4545, 1-800-344-8377) to locate any existing conduits (Power, Gas, Telephone, and other utilities) prior to start of work.

I. Any proposed re-routing of all trenches/pole lines shall be reviewed and approved by the owner/consultant.

3.2 PREPARATION

A. Refer to Section 27 02 00.

B. The Contractor shall verify materials are on-site in proper condition and of sufficient quantity.

C. The Contractor shall verify proper excavation depth (minimum 4’-0” below finished grade), width, route and support of work.
   1. Verify proper location of hand-holes and maintenance holes (minimum every 350’-0”).
   2. Communications facilities must be placed in separate hand-holes and maintenance holes from electrical facilities.

D. Trenches greater than or equal to 5’-0” deep shall:
   1. Be shored to prevent cave-in.
   2. Have 2’-0” clearance from the dirt pile.

E. Directional boring is a suitable option when trenching is impractical or impossible.
   1. Locating existing underground utilities is crucial when directional boring is planned because of the potential for the drilling unit to encounter high voltages.
   2. Although directional boring machines are manufactured with electrical strike sensing capabilities, which can warn the operator of any contact with a high voltage source, accidents may still occur.
   3. Operators of directional boring machines require special protection due to the potential for exposure to high voltage.
      a. Therefore, operators must always have a ground mat grid underfoot as insulation protection.
      b. In addition, operators must wear insulating boots and gloves, along with hard hats and safety glasses.

F. Minimum separation between electrical and communications underground cable (measured from conduit sidewall:
   1. Concrete: 0’-3”

2. Masonry: 0’-4”
3. Well-tamped earth: 1’-0”

G. Before encasement, the Contractor shall:
1. Prove and verify all ducts are free of debris and properly installed in support and spacer system.
2. Verify the system is properly fitted together and hold-down hardware is properly installed.
3. Verify ducts are capped at both ends

3.3 INSTALLATION

A. Refer to section 27 02 00.

B. Hand Holes
1. Unless otherwise shown, Hand-holes shall be at least 4’-0” X 4’-0” and shall be constructed of 0’-2” thick cement covered with 0’-3/8” steel plate.
2. The hand-hole or maintenance hole shall rest on a 0’-4” blanket of sand, and 0’-4” around the sidewalls shall be filled with sand.
3. Each hand-hole or maintenance hole which contains a pedestal shall have four bollards installed 1’-6” (18”) diagonally from each corner, with a cross member welded at 2’-6” (30”) connecting the four corners.
a. These barriers will be constructed of 0’-4” ridged conduit filled with concrete, driven 4’-0” in the ground and extending 3’-0” above the protective cover.
4. All Hand-holes shall have a hasp and locking plate installed so they can be locked with padlock.

C. Maintenance (Man) Holes
1. Precast concrete maintenance hole components shall be in accordance with ASTM C478/C478M.
2. Maintenance hole components shall be designed for H-20 highway wheel loading and specific site conditions.
3. Maintenance hole bases may be either precast or cast-in-place, as appropriate for the application, with a formed recess shaped to match the first precast shaft section.
a. The maintenance hole base shall extend 0’-10” below the bottom of the lowest pipe and 0’-6” above the top of the largest pipe.
4. Maintenance hole shafts shall be fabricated only from precast shaft sections, eccentric cone sections and grade rings.
5. Precast maintenance holes shall utilize either an integrally cast embedded pipe connector, or a boot-type connector installed in a circular block out opening in accordance with ASTM C923/C923M.
a. Connections to existing maintenance holes shall utilize a boot-type connector per ASTM C923/C923M installed in a cored opening.
b. Cast-in-place bases shall incorporate a ring-type seal on the pipe to be imbedded in the concrete.

D. Concrete and Reinforcing Steel for Encasement
1. Furnish products following Division 03, except strengths as follows:
a. Compressive Strength: 2,500 psi at 28 days, class A
b. Flexural Strength: 500 psi at 28 days
c. Dye concrete encasement “orange” to identify communications conduit

E. The Contractor shall install conduit in excavations following drawings.
1. If directional boring is utilized, cable or flexible conduits can be attached to the unit and pulled back to the origination point (after the drilling unit reaches its destination).

F. The Contractor shall install watertight penetrations through foundation, hand-hole and maintenance-hole walls.
1. Wherever a hand-hole is used to simply pass through, the conduit entrances and exits will be situated at opposite ends of the hand-hole instead of 90° angles.

G. The Contractor shall assemble duct banks with non-magnetic saddles, spacers and separators.
1. Position separators for 0’-2” minimum concrete separation between outer surfaces of adjacent ducts, and:
a. Make uniform required bends with a minimum 2’-0” radius for conduits less than 0’-3” diameter, and a minimum 4’-0” radius for conduits 0’-3” and larger.
b. Maintain vertical or horizontal separations of 1’-0” of well-packed topsoil from any electrical service conduit run parallel to communications conduits.

H. Install concrete encasement fully surrounding reinforcing steel and ducts

I. Unless otherwise noted on the drawings, reinforce with longitudinal #5 steel bars placed at each corner and along each face at maximum parallel spacing of 1’-0” on center, and #5 tie-bars transversely placed at 1’-0” on center maximum longitudinal.
   1. Maintain maximum clearance of 0’-2” from bars to edge of forms and ducts.

J. For duct banks that are being installed for future use, extend rebar well past end of concrete for future tie-in to future concrete pour to ensure that both sections are firmly tied together to prevent slippage between the two pours.

K. Add orange colorants at mixing site at the rate of 10 lbs per cubic yard for voice and data cable.

L. Place concrete with minimum 0’-2” cover surrounding ducts and reinforcement.

M. Maintain ducts in proper place during concrete placement.

N. For duct banks that are being installed for future use, all conduits shall be extended minimum of 1’-0” past the end of the concrete and capped.

O. Transition from nonmetallic to metallic conduit where duct banks enter structures or turn upward for continuation above grade
   1. Where ducts enter structures such as hand-holes, maintenance holes, pull boxes, or buildings, terminate ducts in proper end bells, insulated L-bushings, Meyers hubs or couplings on steel conduits.
   2. Ducts shall be sealed to prevent water and debris from entering the building.

P. Extend below grade conduits to 0’-4” above the finished floor inside a building.
   1. Cover or temporarily seal open conduit ends to prevent water and other foreign matter from entering conduit.

Q. Tag conduits entering pull boxes with stamped stainless steel tags following cable and conduit schedule.

R. Backfill after concrete cures 24 hours.

S. The Contractor shall pull a 1’-0” long mandrel (0’-¼” smaller than duct diameter) through ducts.
   1. Pull a rag swab or sponge through to remove debris, until it shows clean.

T. Where fiber optic cables will be used and/or where indicated in the drawings, innerduct shall be provided.

U. The Contractor shall provide a metered pull tape in all underground conduits and innerduct:
   1. Pre-lubricated, woven polyester, low friction, and high abrasion resistant yarn.
   2. Minimum average tensile strength shall be 1,130 lbs for 0'-1.5” and smaller conduits and innerduct.
   3. Minimum average tensile strength shall be 1,800 lbs for conduits larger than 0’-1.5”.

3.4 CLEANING

A. Refer to section 27 02 00.

END OF SECTION

SECTION 27 11 00 - COMMUNICATIONS ROOM FITTINGS

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes basic communications and equipment room design requirements and fittings including:
   1. Equipment cabinets, racks, frames and enclosures
   2. Cable management and ladder racks
   3. Telecommunications service entrance pathways
   4. Rack mounted power protection and power strips

B. Related Sections
   1. Section 27 02 00 - BASIC MATERIALS AND METHODS FOR COMMUNICATION SYSTEMS
   2. Section 27 05 26 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS
   3. Section 27 05 28 - PATHWAYS FOR COMMUNICATIONS SYSTEMS
   4. Section 27 15 00 - COMMUNICATIONS HORIZONTAL CABLING
   5. Section 27 13 00 - COMMUNICATIONS BACKBONE CABLING
   6. Section 27 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR COMMUNICATIONS SYSTEMS

1.2 REFERENCES

A. The publications listed below form a part of this specification. The publications are referred to in the text by basic designation only.

B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean the latest printed edition of each in effect at the date of contract unless the document is shown dated.

C. Conflicts
   1. Refer to section 27 02 00.

D. Codes and Standards (Most recent editions or as required in contract)
   1. Refer to section 27 02 00.

1.3 COMMUNICATIONS ROOMS

A. Communications rooms must be dedicated to designated equipment and services:
   1. Space shall not be used for storage of equipment not related to designated equipment and services.
   2. Hazardous or corrosive materials shall not be stored in the space.
   3. Piping, ductwork and distribution of power, not related to designated equipment and services shall not pass through or be located within the space.
      a. Foreign piping such as water pipes, steam pipes, soil pipes, sanitary drains, storm drains, A/C ducts, and other unrelated systems utilized for or containing liquids, or gases shall not be installed or pass through communication rooms.
      b. With the exception of fire sprinklers, all water pipes shall be routed around communications room.

B. Each communication room shall be equipped with fire detection, fire-extinguishing system and prevention devices. Connect detection devices to base building fire alarm system. A minimum of one (1) smoke detector shall be installed in each communications room.

C. Walls shall be covered with 0'-3/4" X 4'-0" X 8'-0" AC-grade plywood backboard 1'-0" AFF (smooth side to interior of room mounted vertically), capable of supporting mounted hardware and equipment.
   1. Plywood shall be affixed to the studs in the walls with screws that penetrate the studs a minimum of 0'-1", are spaced not greater than 1'-6" (18") apart in each stud, and with screws 0'-0" from the top and bottom of plywood.

2. Plywood shall be sealed against the wall and painted on all exposed sides with two coats of flat white non-reflective paint.
3. If applicable fire-treatment verification stamps on plywood shall be left unpainted to be readable.

D. Communications room walls shall extend from floor slab to ceiling deck, with no drop ceilings installed.

E. Cable tray or ladder rack should be used to distribute cables between rooms through finished wall penetrations.

F. Cable ladder rack should be used to distribute cables within rooms, complete with cable bend limiters (drop outs).

G. To reduce static, floors should not have carpet, but be sealed concrete to prevent concrete dust from forming.

H. Communications rooms shall have only one lockable entrance door, a minimum of 3’-0” wide and 7’-0” high, that opens towards the outside of the room, and does not open into another room.
1. Doors shall be provided with a lockset for the appropriate technology key with pinned hinges and anti-pry guards.
2. Doors should have no windows or door seals.
3. Communications rooms should have no exterior identifying markings.

I. Mechanical
1. Install monitoring sensors with dedicated environmental controls operating 24 hours a day, 365 days a year in the communications rooms.
2. Provide ventilation in the communications rooms to dissipate heat generated by active devices.
3. Temperature and Humidity requirements:
   a. Maintain communication rooms at an average of 60°F to 70°F, with a relative non-condensing humidity of 30% to 50%.
   b. The temperature range should be maintained within ± 9°

J. Plumbing
1. If “wet” fire suppression is used, install wire cages on sprinkler heads to prevent accidental operation.
2. Do not place sprinkler heads over equipment or cabling. In the event of a leak this will protect the equipment and cabling.
3. Drainage troughs are also recommended for leakage protection.

K. Electrical
1. One manufacturer’s product is recommended for each type of installation. The mixing of different manufacturer products for one item is not acceptable.
2. No electrical feeders/branch circuits shall be placed in or run through any communications room except as required to service those rooms.
3. The Contractor shall install a slot (a UL-approved fire-rated assembly) to accommodate cable runway entry from corridor and a fire-retardant system (bricks, boards, mechanical, etc). The formed slot shall have no burrs or sharp edges. This opening in the wall will be used to pass data and voice cabling from the corridor cable tray into the communications room.
4. The Contractor shall provide uniform illumination of at least 50 foot-candles (fc) 3’-0” AFF for communications rooms located a minimum of 8’-6” AFF.
   a. Light fixtures in communications rooms are to be positioned for maximum lighting. Do not install over cable tray, ladder rack, or 1’-7” (19”) standing racks.
   b. Provide enough power receptacles to support equipment and service. Coordinate power requirements of active equipment with electrical designer.

L. Relay Racks
1. 1’-7” (19”) X 7’-0” relay racks are to be used for mounting and termination of inter-building and intra-building fiber optic/ copper cables and components.
   a. The racks shall have adequate horizontal and vertical cable management for the 8P8C patch panels and switches.
   b. Racks with active electronics shall have rack mounted power strips.

1.4 SUBMITTALS

A. Refer to section 27 02 00.

1.5 QUALITY ASSURANCE

A. Refer to section 27 02 00.

B. Product Standards
1. Equipment and materials shall be standard products of a manufacturer regularly engaged in the manufacture of telecommunications cabling products and shall be the manufacturer's latest standard design in satisfactory use for at least one year prior to bid opening.
2. Items of the same classification shall be identical. This requirement includes equipment, modules, assemblies, parts, and components.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Refer to section 27 02 00.

B. Coordinate layout and installation of equipment with owner's communications and LAN equipment and service suppliers. Coordinate service entrance arrangement with local exchange carrier.

1.7 PROJECT/SITE CONDITIONS

A. Refer to section 27 02 00.

1.8 WARRANTY

A. Refer to section 27 02 00.

B. At the start of the project, contractor shall register the project with the manufacturer to help insure and facilitate manufacturer's warranty process.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. 1'-7" (19") x 7" Floor-Mounted 2-post Equipment Racks
1. Hoffman
2. Owner approved alternate

B. 1'-7" (19") x 7" Floor-Mounted 4-post Equipment Racks
1. Hoffman
2. Owner approved alternate

C. Wall-mounted Equipment Cabinet
1. Ortronics
2. Owner approved alternate

D. Horizontal Runway and Support Components (ladder tray in MDF/IDF)
1. CPI
2. DMAC
3. Hoffman
4. Legrand/Ortronics
5. Owner approved alternate

E. Horizontal Runway Radius Drop
1. CPI
2. DMAC
3. Hoffman
4. Legrand/Ortronics
5. Owner approved alternate

F. Cable Runway Elevation Kit
1. CPI
2. DMAC
3. Hoffman
4. Legrand/Ortronics
5. Owner approved alternate

G. Horizontal Rack-Mount Cable Management
   1. Chatsworth (CPI, 1RU #30139-719, 2RU #30130-719)
   2. Owner approved alternate

H. Vertical Rack-Mount Cable Management
   1. Hoffman
   2. Legrand
   3. Ortronics
   4. Owner approved alternate

I. Labeling
   1. Refer to section 27 02 00.

J. Firestopping
   1. Refer to section 27 02 00.

2.2 ACCESSORIES

A. Rack-mounted Uninterruptible Power Supply (UPS)
   1. Eaton 9PX
   2. Owner furnished owner installed.

B. Rack-mounted Power Strips
   1. Hoffman
   2. Owner furnished owner installed.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Refer to Section 27 02 00.

3.2 PREPARATION

A. Refer to section 27 02 00.

B. Meet jointly with telecommunications and LAN equipment suppliers, local exchange carrier representatives, and Owner to exchange information and agree on details of equipment arrangements and installation interfaces.

C. Adjust arrangements and locations of equipment with distribution frames, cross-connects, and patch panels of cabling systems of other communications, electronic safety and security, and related systems that share space in the equipment room.

D. Coordinate location of power raceways and receptacles with locations of communications equipment requiring electrical power to operate.

3.3 INSTALLATION

A. Refer to section 27 02 00.

3.4 FIELD QUALITY CONTROL

A. Refer to section 27 02 00.

3.5 CLEANING

A. Refer to section 27 02 00.

3.6 ACCEPTANCE

A. Refer to section 27 02 00.

END OF SECTION

SECTION 27 13 00 - COMMUNICATIONS BACKBONE CABLING

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes the backbone cabling portion of a structured cabling system including:
   1. Copper backbone cabling
   2. Fiber backbone cabling
   3. Splicing
   4. Termination and patch cables

B. Provide all backbone cabling, terminating hardware, adapters, and cross-connecting hardware necessary to interconnect all system equipment including equipment located in Communications rooms.

C. Related Sections
   1. Section 26 02 00 - Electrical (including related sub-sections)
   2. Section 27 02 00 - BASIC MATERIALS AND METHODS FOR COMMUNICATION SYSTEMS
   3. Section 27 05 26 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS
   4. Section 27 05 28 - PATHWAYS FOR COMMUNICATIONS SYSTEMS
   5. Section 27 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR COMMUNICATIONS SYSTEMS
   6. Section 27 11 00 - COMMUNICATIONS ROOM FITTINGS
   7. Section 27 15 00 - COMMUNICATIONS HORIZONTAL CABLING

1.2 REFERENCES

A. The publications listed below form a part of this specification. The publications are referred to in the text by basic designation only.

B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean the latest printed edition of each in effect at the date of contract unless the document is shown dated.

C. Conflicts
   1. Refer to section 27 02 00.

D. Codes and Standards (Most recent editions or as required in contract)
   1. ANSI/TIA-568-C: Commercial Building Telecommunications Wiring Standard
   2. ANSI/TIA-569-B: Commercial Building Standard for Telecommunications Pathways and Spaces
   3. ANSI/TIA-606-A: Administration Standard for Commercial Telecommunications Infrastructure
   4. ANSI/NECA/BICSI-607-A: Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
   5. TIA/EIA-758-A: Customer-Owned Outside Plant Telecommunications Infrastructure Standard
   6. National Electrical Code (NEC), based upon year approval by local codes or AHJ
   7. BICSI Telecommunications Distribution Methods Manual (TDMM)
   8. Local, county, state and federal regulations and codes in effect as of date of purchase
   9. Equipment of foreign manufacture must meet U.S. codes and standards. It shall be indicated in the proposal the components that may be of foreign manufacture, if any, and the country of origin.

1.3 SUBMITTALS

A. Refer to section 27 02 00.

B. Cable Pulling Plan
   1. The contractor shall submit a cable pulling plan prior to installation.
   2. Submittal requirements:
      a. Indicate the installed backbone conduit layout in schematic format, including junction boxes and distances between junction boxes.
      b. Indicate contents of each conduit.
      c. Indicate the cable pulling calculations, conduit fill ratios and actual cable runs and tensions.

d. Include detail and schedule showing the construction sequence of communications rooms.
e. Installation of cabling shall not commence prior to approval of the pulling plan and calculations by the engineer.

C. Splice Plan
1. The contractor shall submit shop drawings indicating the intended cable splice points, mounting method and equipment list prior to installation

D. Cable Testing Plan
1. Refer to Section 27 02 00.

E. Cable Testing Reports
1. Refer to Section 27 02 00.

1.4 QUALITY ASSURANCE

A. Refer to section 27 02 00.

B. Cable splicing personnel shall have a minimum of five years splicing experience and shall have completed a minimum of five major splicing projects.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Refer to section 27 02 00.

B. Storage temperature range: -40°F to 149°F (-40°C to 65°C)

C. Fiber cables shall be shipped on reels in lengths as specified with a minimum overage of 10%:
1. The cable shall be wound on the reel so that unwinding can be done without kinking the cable.
2. Two meters of cable at both ends of the cable shall be accessible for testing.
a. All fiber shall be tested on the reel for continuity and distance compliance before installation.
3. Each reel shall have a permanent label attached showing length, cable identification number, cable size, cable type, attenuation, bandwidth, and date of manufacture.
a. Labels shall be water resistant and the writing on the labels shall be indelible.

1.6 PROJECT/SITE CONDITIONS

A. Refer to section 27 02 00.

1.7 WARRANTY

A. Refer to section 27 02 00.

1.8 MAINTENANCE AND SUPPORT

A. Refer to section 27 02 00.

PART 2 - PRODUCTS

2.1 ACCEPTABLE COPPER CABLE MANUFACTURERS

A. Backbone (Riser) cableCat3
1. Superior Essex
2. Owner approved alternate

2.2 ACCEPTABLE FIBER CABLE MANUFACTURERS

A. OSP (Outside Plant) armored cable (indoor/outdoor OM4 Multimode and OS1 Singlemode, armored)
1. Superior Essex
a. ArmorTek S
b. ArmorTek Series GIGAlite 10XB
2. Owner approved alternate

B. Plenum rated cable(OM4 Multimode and OS2 Singlemode)
1. Superior Essex

a. ArmorTek Series GIGAlite-10
2. Owner approved alternate

2.3 ACCEPTABLE COMPONENT MANUFACTURERS

A. Fiber Connectors (LC)
1. Ortronics
2. Owner approved alternate

B. Fiber Duplex Patch Cables (Type SM and MM)
1. Corning
2. Berk-tek
3. CommScope
4. Owner approved alternate

C. Fiber adapter panels (6-port)
1. Ortronics
2. Owner approved alternate

D. Fiber Termination Shelf (Rack-Mounted)
1. Ortronics
2. Owner approved alternate

E. Fiber Distribution Cabinet (Wall Mounted)
1. Ortronics
2. Owner approved alternate

F. Building Entrance Terminals - 110in/110out - complete with 5 pin fast acting solid state protection modules for all terminated cable pairs.
1. Circa
2. Portasystems
3. Emerson
4. Owner approved alternate

G. Wall and/or Rack-mounted 110 Terminations Blocks .
1. Ortronics
2. Owner approved alternate

H. Labeling
1. Refer to section 27 02 00.

I. Firestopping
1. Refer to section 27 02 00.

2.4 FIBER BACKBONE CABLING

A. Fiber General Requirements
1. Fiber shall be certified to meet all parts of TIA-455 and comply with TIA-492, ANSI/ICEA S-83-596 and ANSI/ICEA S-83-640 and the NEC.
2. Fibers shall have D-LUX coating or approved equivalent to ensure color retention, minimize micro bending losses and improve handling. The coating shall be mechanically strippable.
3. Cable installed in plenums or air-handling spaces shall meet UL 910 and shall be marked OFNP (optical fiber non-conductive plenum) in accordance with the NEC.
   a. Plenum Fiber rated cable consisting of multiple fibers shall have a Plenum PVC outer jacket.
      1) Each group of fibers shall have a color-coded Low Smoke PVC buffer.
      2) The buffered fibers are organized in subunits of fibers, reinforced with aramid yarn for extra strength and surrounded with a color-coded low smoke tube.
   b. Within the premises, all fiber shall be placed in plenum rated innerduct the entire length of the cable for protection. Use manufacturer plenum rated couplings for all connections.
4. Riser cable shall meet UL 1666 and be marked OFNR (optical fiber nonconductive riser) in accordance with the NEC.
   a. Non-plenum, riser rated cable consisting of multiple fibers, shall have an orange, Polyvinyl Chloride (PVC) outer jacket.
5. OSP (Outside Plant) Fiber

a. Stranded loose tube dielectric fiber cable shall be utilized for underground conduit, direct buried, or aerial applications.
b. Underground cable, including cable installed in conduits or duct banks, shall contain an additional moisture barrier in the form of a flooding compound.
c. All OSP fiber strength members shall be dielectric without any metallic elements.

6. Fiber conductors shall follow standard color code schemes. Fiber numbers and binders shall correspond to the following color codes:
   a. Fiber/Binder No. 1 - blue
   b. Fiber/Binder No. 2 - orange
   c. Fiber/Binder No. 3 - green
   d. Fiber/Binder No. 4 - brown
   e. Fiber/Binder No. 5 - slate
   f. Fiber/Binder No. 6 - white
   g. Fiber/Binder No. 7 - red
   h. Fiber/Binder No. 8 - black
   i. Fiber/Binder No. 9 - yellow
   j. Fiber/Binder No. 10 - violet
   k. Fiber/Binder No. 11 - rose
   l. Fiber/Binder No. 12 - aqua
7. Cable Minimum Bending Radius:
   a. During Installation: 20X cable diameter
   b. After Installation: 10X cable diameter
8. Operating temperature range: -76°F to 185°F (-60°C to 85°C)

B. Multi-mode Fiber Requirements
1. Fibers shall have dual wavelength capability; transmitting at 850 and 1300 nm ranges.
2. 50/125 µm ± 2.5 µm core (OM 4)
3. Core non-circularity: = 5%
4. 125 µm ± 1 µm cladding diameter
5. Cladding non-circularity: =1%
6. Colored fiber diameter: 254 µm ± 7 µm
7. Buffering diameter: 890 mm ± 50 mm
8. Minimum tensile strength: 100,000 psi
9. Maximum Attenuation: 3.5 dB/km at 850 nm and 1.5 dB/km at 1300 nm
10. Minimum Bandwidth: 2000 MHz per km with laser launch at 850 nm ensured by differential mode delay at 850 nm" in TIA-492AAAC and 500 MHz at 1300 nm.
11. Additional component and transmission requirements for a 50/125 µm fiber cable capable of supporting 10 Gb/s serial transmission up to 984'-0" (300m) using 850 nm nominal wavelength lasers. These cables are suitable for use in accordance with ANSI/TIA-568-B.1.

C. Single Mode Fiber Requirements
1. Fibers shall have dual wavelength capability, transmitting at 1310 and 1550 nm ranges.
2. 8.3 µm core
3. 125 µm ± 1 µm cladding diameter
4. Cladding non-circularity: = 1%
5. Core/cladding concentricity error: = .5 µm
6. Colored fiber diameter: 254 µm ± 7 µm
7. Maximum Attenuation: 1.0 dB/km at 1310 and 1550 nm (inside premises) and 0.5 dB/km at 1310 and 1550 nm (OSP)
8. Minimum Bandwidth: 20 GHz
9. The mechanical and environmental specifications for OSP fiber cable shall be in accordance with ANSI/ICEA S-87-640. OSP fiber cables shall be of a water-block construction and meet the requirements for compound flow and water penetration as established by ANSI/ICEA S-87-640. Outdoor cable shall have minimum pull strength of 2670 N (600 lbf).

2.5 COPPER BACKBONE CABLING

A. Copper Cable Requirements
1. 100 Ω balanced twisted-pair
2. Plenum-rated cabling: Cable installed in plenums or air-handling spaces shall meet UL 910 and shall be marked CMP (communications multipurpose plenum) in accordance with the NEC.

a. Plenum cable shall consist of #24-AWG solid copper conductors insulated with color-coded FEP

3. Non-plenum riser-rated cabling shall meet UL 1666 and be marked CMR (communications multipurpose riser) in accordance with the NEC, and shall consist of 24 AWG copper conductors insulated with color-coded PVC copper cables.
4. ASP-filled multi-pair copper cables shall be utilized for underground conduit or direct buried applications.
   a. All OSP copper cable shall be transitioned to inside cable within 50'-0" of building entry.
   b. The metallic portion of the cables, if present, must be bonded to the building ground upon entry.
5. The bending radius and pulling strength requirements of all backbone cables shall be observed during handling and installation.

B. Coaxial Cable Requirements
1. All cable must be plenum-rated 0.500 hard line or RG-11
2. All cable shall be shielded, with a copper clad aluminum center conductor; expandable polyethylene dielectric; continuous aluminum outer conductor, and a flame retardant jacket.
3. All cable shall be tested and marked to comply with the NEC requirements for (CATVR) riser rating.

2.6 COPPER PATCH CABLES

A. Refer to Section 27 15 00.

2.7 FIBER PATCH CABLES

A. Verify exact quantities and lengths with Owner prior to purchase

B. Provide the appropriately-rated (matched to the installed cable plant) Modular Patch Cords for the appropriate location and equipment.

C. Multi-mode patch cables shall be a buffered, graded-index fiber with a 50 µm core and a 125 micron cladding

D. Single Mode patch cables shall be a stepped-index 8.3 µm core with a 125 µm cladding.

E. Duplex SC connectors shall meet the following specifications:
1. Made and warranted by the manufacturer of the cabling system installed in this project and shall meet or exceed patch cord specifications as outlined in TIA standards.
2. Patch cords shall be in original packaging when presented to the Owner.

F. Aramid yarn and a jacket of flame-retardant PVC shall cover the fiber cladding.

G. Multi-mode patch cables additional requirements:
1. Mated Connector Loss: $\mu = 0.3$ dB, $\sigma = 0.2$ dB
2. Connection Repeatability: 0.20 dB maximum changes per 100 reconnects

H. Single Mode patch cable additional requirements:
1. Return Loss: -50 dB maximum
2. Mated Connector Loss: $\mu = 0.35$ dB, $\sigma = 0.2$ dB
3. Connection Repeatability: 0.20 dB maximum changes per 200 re-connects.

I. The Multi-mode connector (visible portion) and adapter/outlet shall be identified by the color beige.

J. The Single Mode connector (visible portion) and adapter/outlet shall be identified by the color blue.

2.8 LABELING

A. Refer to Section 27 15 00.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Refer to Section 27 02 00.

B. Verify the following before proceeding:

1. Conduits, cable trays and pull boxes are properly installed following section 270528
2. Backboards in communications rooms are properly installed following section 271100
3. Grounding system is properly installed and tested following section 270526
4. Liquid-carrying pipes are not installed in or above voice and data system communications rooms.
    a. Do not proceed with installation in affected areas until removed.

3.2 PREPARATION

A. Refer to section 27 02 00.

3.3 COPPER INSTALLATION

A. Backbone Cable
    1. The Contractor shall install riser cables according to manufacturer’s instructions for compliance to warranty requirements.

B. OSP Cable
    1. The Contractor shall verify pulling material (pull rope, mule tape, etc.) average breaking strength based on cable type and size, pulling distance and pathway, and other pertinent factors.

C. Copper Cable and Connectors
    1. The Contractor shall install connectors according to manufacturer’s instructions for compliance to warranty requirements.

3.4 TERMINATION FOR COPPER BACKBONE

A. Copper
    1. 110-type Wiring Blocks using C5 clips, Insulation Displacement Connector Systems, with proper patch cord
        a. Compatible with all voice and data circuits
        b. Underwriter`s Laboratories (UL) listed
    2. Protector Panels shall be provided for all outside plant installed copper circuits. The protectors shall provide pair-for-pair protection and be mounted on a 0’-3/4” fire-rated wallboard.

3.5 FIBER INSTALLATION

A. Fiber Cable Installation
    1. Fiber cable shall be installed in innerduct from near end termination point to far end termination point.
        a. Only UL-approved plenum-rated innerduct shall be installed in all plenum areas.
        b. Metallic conduit may be used in lieu of innerduct in plenum-rated ceilings if it is bonded and grounded correctly.
    2. Only technicians certified by the product manufacturer shall perform terminations.
        a. Terminations shall be made in a controlled environment.
        b. Cables may be assembled off-site, although testing must be completed with the cable in its final installed condition.
        c. Test optical fiber on the reel for distance and continuity verification before installation.
    3. At each location where fiber cable is exposed to human intrusion, it shall be marked with warning tags.
        a. These tags shall be yellow or orange in color, and shall contain the warning "CAUTION FIBER OPTIC CABLE".
        b. The text shall be permanent, black, block characters, and at least 0’-.1875” high.
        c. A warning tag shall be permanently affixed to each exposed cable or bundle of cables, at intervals of not less than 5’-0”.
        d. Any section of exposed cable that is less than 5’-0” in length shall have at least one warning tag affixed to it.

B. Fiber Distribution Center
    1. Contractor shall provide sufficient spare adapter plates to fill the appropriate-sized FDC.

3.6 FIBER TERMINATION AND SPLICING

A. Interconnect Units and Distribution Shelves
    1. Modular in design and used in fiber interconnection, cross-connection, and splicing applications

2. 1’-7” (19”) rack-mountable
3. Accept 12-strand, 24-strand, 48-strand or 72-strand terminations
4. Owner approved industry standard connector

B. Splicing and closures
1. Fiber splice modules shall be utilized for all OSP terminations.
2. The link shall consist of:
a. Fiber cable
b. Splice
c. Splice tray holder/closure
d. Fiber panel/coupler
e. Pre-manufactured fiber pigtail with pre-polished fiber connector
f. Fiber jumper to connect the pigtail-coupled link to the appropriate electronic switch

C. Fiber Fusion Splice
1. Fusion splices shall be mounted in protective trays within the closure.
2. Fusion splices shall not exceed a maximum optical attenuation of 0.3 dB when measured in accordance with ANSI/TIA-455-34, Method a (factory testing) or ANSI/TIA-455-59 (field testing).
a. Fiber splices shall have a minimum return loss of 20 dB for Multi-mode
b. Fiber splices shall have a minimum return loss of 26 dB for Single Mode
1) Minimum Single Mode return loss for broadband analog video (CATV) applications is 55 dB.

3.7 INSTALLATION REQUIREMENTS

A. All installation shall be done in conformance with ANSI/TIA-568-B standards, BICSI methods, and industry standard installation guidelines.
1. The Contractor shall ensure that the maximum pulling tensions of the specified distribution cables are not exceeded and cable bends maintain the proper radius during the placement of the facilities.
2. Failure to follow the appropriate guidelines shall require the Contractor to provide in a timely fashion the additional material and labor necessary to properly rectify the situation.
3. This shall also apply to any and all damages sustained to the cables by the Contractor during the implementation.

B. The Contractor shall provide service loops for cables terminating in the communications rooms.
1. A 10’-0” service loop shall be provided and secured in a neat and standards-compliant manner above the equipment racks or cable trays unless specified otherwise.
2. This allows for future changes or expansion without installing new cables.

C. Documentation
1. All cable inventory data documentation shall be submitted in format coordinated with and approved by owner so that data can be incorporated into existing databases.
2. Documentation shall include cable identification number, source and destination, type of cable, length of cable and number of pairs or fibers.
3. Complete cross connect documentation is required. It shall include detailed documentation of each pair of all copper backbone cable and strand of fiber.

3.8 FIELD QUALITY CONTROL

A. Refer to section 27 02 00.

3.9 COPPER POST-INSTALLATION TESTING

A. Contractor shall test each pair or strand of every cable prior to acceptance.

B. Refer to Sections 27 02 00 and 27 15 00.

C. Copper Test Documentation
1. Refer to Section 27 15 00.

D. Copper testing requirements
1. Refer to Section 27 15 00.
2. Copper backbone shall exceed ANSI/TIA-568-B.2 Backbone Cabling requirements and meet the manufacturer’s specifications for the installed product.

3. OSP cabling test equipment shall be capable of making frequency sweeps at an impedance of 135 Ω at the following frequencies (kHz): 20, 30, 50, 69, 90, 110, 138, 276, 400, 600, 800, 1000, and 1100.
   a. A far-end device shall be used for all frequency measurements.
   b. The loss at 138 kHz shall not exceed 46 dB.
   c. The test set shall have the ability to store 100 tests and be able to upload to a PC.
   d. The test set shall be able to measure resistance between the following conductors: tip to ring, tip to ground, and ring to ground.
   e. All measurements shall be greater than 999 Ω.

E. Copper Test Equipment
1. Refer to Section 27 02 00.

3.10 FIBER POST-INSTALLATION TESTING

A. Provide all labor, materials, tools, field-test instruments and equipment required for the complete and proper test measurements of the installed fiber cabling.

B. Contractor shall have successfully attended a fiber testing training program, which includes testing with an OLTS and an OTDR and have obtained a certificate as proof thereof.

C. All outlets, cables, patch panels and associated components shall be fully assembled and labeled prior to field-testing.
1. Any testing performed on incomplete systems shall be redone on completion of the work.

D. Dust caps shall be placed on fiber endfaces or adapters for each optical fiber link after all testing is complete on the fiber link.

E. Pre-test Submittals
1. Manufacturers catalog sheets and specifications for the fiber cable field-test instruments including
   a. OLTS (Optical Loss Test Set)
   b. OTDR (Optical Time Domain Reflectometer)
   c. End-face inspection capture device
2. A schedule (list) of all fiber cables to be tested
3. Fiber testing training program certificate
4. Sample test reports

F. Fiber testing standards
1. The Contractor shall meet or exceed the following standards and guidelines:
   a. ANSI/TIA-568-C.0 Optical Fiber Transmission/Test Requirements, and Annex E: Optical Fiber Field Test Guidelines (Tier 2)
      1) Tier 2 testing is a higher level of testing that provides qualitative measures of the installed condition and performance of the cabling system
   b. ANSI/TIA-568-B.3 Optical Fiber Cabling Components Standard
   c. TIA/TSB-140 Additional Guidelines for Field-Testing Length, Loss and Polarity of Optical Fiber Cabling Systems
2. Multi-mode requirements
   a. ANSI/TIA-526-14-A, Method B
   b. ANSI/TIA-455-50B
3. Single Mode requirements
   a. ANSI/TIA-526-7, Method A.1: Optical Power Loss Measurements of Installed Single Mode Fiber Cable Plant-OFSTP-7
4. The cable installers shall have a copy of these references in their possession and be familiar with the contents

G. In order to conform to the overall project event schedule, the contractor shall survey and coordinate the optical fiber testing with other applicable trades.

H. In addition to the test regiment detailed in this document, the contractor shall notify the Owner of any additional tests that are deemed necessary to guarantee a fully functional system.
1. The contractor shall carry out and record any additional measurement results at no additional charge.

I. The contractor shall provide all test measurement results two (2) weeks prior to substantial completion in spreadsheet format and native file format from the test instrument.

1. Software shall also be provided to view the native results.

J. All tests performed on optical fiber cabling that use a laser or LED in a test set shall be carried out with safety precautions in accordance with ANSI Z136.2.
   1. A visible fault locator (VFL) normally uses a Class 2 or 3 light source and should not be directly viewed.
   2. Safe usage of the tool requires indirect viewing of the light source by pointing the end of the fiber at an adjacent surface (or introducing another surface in front of a fixed mounted connector) until the presence of light is determined.

K. Link attenuation measurement and allowance calculation
   1. The measured link attenuation shall be less than the link attenuation allowance. The link attenuation allowance is calculated as:
      a. Link Attenuation Allowance (dB) = Cable Attenuation Allowance (dB) + Connector Insertion Loss Allowance (dB) + Splice Insertion Loss Allowance (dB)
         1) Connector Insertion Loss Allowance (dB) = Number of Connector Pairs X 0.4dB
         2) Splice Insertion Loss Allowance (dB) = Number of Splices X 0.15dB
         3) Cable Attenuation Allowance (dB) = Maximum Cable Attenuation Coefficient (dB/km) X Length (km)

L. Fiber Testing Requirements
   1. All installed fiber links shall be field-tested and pass the following tests:
      a. OLTS (Optical Loss Test Set) length and dual wavelength attenuation
      b. OTDR (Optical Time Domain Reflectometer) traces and event tables
      c. Image captures of connector end-faces
   2. OLTS (Optical Loss Test Set)
      a. The length and attenuation of each installed fiber link shall be measured and documented.
      b. System loss measurements requirements:
         1) 850 and 1300 nanometers for Multi-mode
         2) 1310 and 1550 nanometers for Single Mode
      c. Reflective events (connections) shall not exceed 0.75 dB.
      d. Non-reflective events (splices) shall not exceed 0.3 dB.
      e. The acceptable link attenuation for Multi-mode horizontal fiber is based on the maximum distance of 295’-0”.
      f. A horizontal link in a network with a consolidation point may be tested using a fixed upper limit for attenuation of 2.75 dB.
      g. Optical sources shall be turned on for a minimum of 5 minutes prior to referencing.
      h. Fiber links shall be measured and reported for attenuation in each direction and attenuation bi-directionally (averaged in both directions)
      i. Polarity shall be verified for duplex connector systems
      j. Mandrels
         1) Mandrels shall be used when testing attenuation of Multi-mode fiber cabling
         2) Where mandrels are used, secure the mandrel to the light source by some means such as a cable tie or tape.
         3) Care should be taken to ensure that the fiber jacket is not deformed or damaged when using a cable tie or tape.
         4) The light source shall be referenced to the meter a minimum of twice daily (i.e., in the morning and noon).
   3. OTDR (Optical Time Domain Reflectometer)
      a. An OTDR trace shall be taken of each fiber link in one direction to ensure uniformity of cable attenuation and connector insertion loss
      b. Testing shall consist of a bi-directional end to end OTDR trace performed per TIA 455-61
      c. Individual connector, splice and fiber insertion loss shall be evaluated using the OTDR trace.
      d. Fibers shall be inspected at 250X for Multi-mode and 400X for Single Mode
   4. End-face Image Capture
      a. An image of each fiber optic connector end-face shall be taken, recorded and provided as part of the records.
   5. Maximum Attenuation
      a. Single Mode ISP (inside) 1.0 dB/km at 1310 nm and 1550 nm
      b. Single Mode OSP (outside) 0.5 dB/km at 1310 nm and 1550 nm
      c. Multi-mode 3.5 dB/km at 850 nm and 1.5 dB/km at 1300 nm
   6. Test Cords (Jumpers)

a. Testing of the cabling shall be performed using high-quality test cords of the same fiber type and core size as the cabling under test. Use a single patch cord reference for fiber testing.
   1) OLTS test cords shall be between 3’-3” (1m) and 16’-4” (5m).
   2) OTDR testing shall be approximately 328’-0” (100m) for the launch cable and at least 82’-0” (25m) for the receive cable. . OTDR testing shall be Bidirectional with Pigtails installed.
b. The test jumper, the adapters, and fiber under test shall be cleaned immediately prior to each fiber being tested.
   1) After cleaning, cleaning solutions shall be given sufficient time to evaporate (approximately 30 seconds) prior to the mating of fiber test jumper to the fiber under test.

7. Test Failure
   a. Any fiber link that fails these requirements shall be diagnosed and corrected.
   b. Any corrective action that must take place shall be documented and followed with a new test to prove that the corrected link meets performance requirements
8. Acceptable Testers
   a. Fluke DTX CableAnalyzer
   b. Owner Approved equivalent

M. The Owner or the Owner’s representative shall be invited to witness, review or both witness and review field-testing.
1. The Owner or the Owner’s representative shall be notified of the testing start date, five (5) business days before testing commences.
2. The Owner or the Owner’s representative will select a random sample of 5% of the installed links and test that sample.
   a. The measured results obtained from the random sample shall be compared to the data provided by the contractor.
   b. If more than 2% of the sample results differ in terms of the pass/fail determination, the contractor under supervision of the Owner or Owner’s representative shall repeat 100% of the testing at no cost to the Owner.

N. Test Results
1. The detailed test results documentation data is to be provided in an electronic database for each tested fiber strand and shall contain the following information:
   a. Identification of the customer site as specified by the end-user
   b. Name of the test limit selected to execute the stored test results
   c. Name of the personnel performing the test
   d. Date and time the test results were saved
   e. The manufacturer, model and serial number of the test instrument.
   f. The version of the test software and the version of the test limit database held within the test instrument.
   g. Fiber identification number
   h. Length for each optical fiber
   i. Index of refraction used for length calculation when using a length capable OLTS.
   j. Test results to include OLTS attenuation link and channel measurements at the appropriate wavelength(s) and the margin (difference between the measured attenuation and the test limit value).
   k. Test results to include OTDR link and channel traces and event tables at the appropriate wavelength(s).
   l. Length for each optical fiber as calculated by the OTDR
   m. Overall Pass/Fail evaluation of the link-under-test for OLTS and OTDR measurements
   n. Circuit IDs reported by the test instrument should match the specified label ID

3.11 CLEANING

A. Refer to section 27 02 00.

3.12 ACCEPTANCE

A. Refer to Section 27 15 00.

END OF SECTION

SECTION 27 15 00 - COMMUNICATIONS HORIZONTAL CABLING

PART 1 - GENERAL

1.1 SUMMARY

A. This section of the horizontal cabling portion of a structured cabling system includes:
   1. UTP Copper cabling
   2. Termination and patch cables

B. Provide all horizontal cabling, terminating hardware, adapters, and cross-connecting hardware necessary to interconnect all system equipment including equipment located in communications rooms.

C. Related Sections
   1. Section 27 02 00 - BASIC MATERIALS AND METHODS FOR COMMUNICATION SYSTEMS
   2. Section 27 05 26 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS
   3. Section 27 05 28 - PATHWAYS FOR COMMUNICATIONS SYSTEMS
   4. Section 27 11 00 - COMMUNICATIONS ROOM FITTINGS

1.2 REFERENCES

A. The publications listed below form a part of this specification. The publications are referred to in the text by basic designation only.

B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean the latest printed edition of each in effect at the date of contract unless the document is shown dated.

C. Conflicts
   1. Refer to section 27 02 00.

D. Codes and Standards
   1. Refer to section 27 02 00.

1.3 SUBMITTALS

A. Refer to sections 27 02 00 and 27 13 00.

1.4 QUALITY ASSURANCE

A. Refer to section 27 02 00.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Refer to sections 27 02 00 and 27 13 00.

B. Storage temperature range: -40°F to 149°F (-40°C to 65°C)

1.6 PROJECT/SITE CONDITIONS

A. Refer to section 27 02 00.

1.7 WARRANTY

A. Refer to section 27 02 00.

1.8 MAINTENANCE AND SUPPORT

A. Refer to section 27 13 00

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Labeling
   1. Refer to section 27 02 00.

B. Firestopping
   1. Refer to section 27 02 00.

2.2 ACCEPTABLE COPPER MANUFACTURERS

A. UTP Plenum Rated Cable Cat6 (blue)
   1. Superior Essex
   2. Owner approved alternate

B. Data/Voice Outlet Components Cat6
   1. Ortronics Series II
   2. Owner approved alternate

C. Patch Panels (24 or 48 port)
   1. Ortronics
   2. Owner approved alternate

D. Copper Patch Cords Cat6 Pre-assembled
   1. Legrand
   2. Ortronics
   3. Owner approved alternate

E. Wall and/or Rack Mount 110 Termination Blocks
   1. Ortonics 110 Cross Connect System
   2. Owner approved alternate

2.3 ACCESSORIES

A. Mount one laminated full-size hard copy in color of an as-built floor plan designating workstation locations, pathways, and communications room locations. Confirm hard copy size with Owner.

B. Provide clear plastic lamination serving each communication room.

C. Install the laminated drawings within a protective Plexiglas encasement on the wall of the servicing communications rooms. To ease accessibility the Plexiglas encasement shall be in either flip-down format or file folder format.

2.4 HORIZONTAL COPPER CABLING

A. Recognized cabling for providing the signal medium from the work area to the communications room shall include the following:
   1. Category 6 UTP cable

B. Category 6 UTP Cable Requirements
   1. 23/24 AWG solid bare copper.
   2. Cable jacket shall comply with NEC Article 800 for use as a plenum cable and shall be UL and c (UL) Listed Type CMP (communications multipurpose plenum).
   3. Cable shall terminate on an eight-pin modular jack at each outlet. All horizontal cabling shall meet or exceed the ANSI/TIA-568-C.2 Commercial Building Telecommunications Cabling Standard, Part 2: Balanced Twisted Pair Cabling Components.
   4. Cables shall be marked as UL verified with a minimum of Category 6 rating.
   5. The cable shall support Voice, Analog Base band Video/Audio, Fax, Modem, Switched-56, T-1, ISDN, RS-232, RS-422, RS-485, 10BASE-T Ethernet, Token Ring, 100Mbps TP-PMD, 100BASE-T Ethernet, 155 Mbps ATM, AES/EBU Digital Audio, 270 Mbps Digital Video, 622 Mbps 64-CAP ATM and emerging high-bandwidth applications, including 1 Gbps Ethernet, gigabit ATM, as well as all 77 channels (550 Mhz) of analog broadband video.

6. The maximum horizontal cable tested length for Category 6 copper cable from the termination of the cable in the communications room to the outlet is 295’-0”. It’s contractor’s responsibility to reroute as necessary to bring all cable runs within distance limit without additional cost to the project. Plan ahead and get approval or exception from Owner before pulling the cables that would ne over the distance limit.
7. Cable shall meet or exceed the following electrical characteristics:
8. Cable shall be specified to 250 MHz and shall meet the manufacturer’s guaranteed electrical performance and physical specifications.

2.5 TERMINATION HARDWARE

A. Patch panels
   1. Ortronics
      a. OR-PHA66U48
      b. OR-PHA662
   2. Patch panels shall be rated to match installed cable plant
   3. The wiring block shall accommodate #23 AWG cable conductors.
   4. All modular cross connect panels shall be UL-listed.

B. Work Area Outlet Cat6
   1. Ortronics Series II
      a. (1) OR-40300158 Series II Faceplate
      b. (1) OR-S22600 Series II
      c. (2) Cat6 modules
      d. (2) OR-40300164 Series II
      e. Blanking Module.
   2. Universal eight-position jack pin/pair assignments
   3. Jack Color:
      a. Data: Blue (or approved alternate).

C. Work Area Outlet Faceplates:
   1. White or ivory to match electrical outlets.

2.6 PATCH CABLES

A. Verify exact quantities and lengths with Owner prior to purchase

B. Patch Cable requirements:
   1. Category 6, stranded UTP cable
   2. Standard modular non-keyed, 8-position 8-conductor plug
   3. 94V-0 rated
   4. UL listed
   5. Meets FCC Part 68

C. Provide 3’-0”, 5’-0”, 7’-0”, and 10’-0” Patch Cords at the communications room for each installed port.
   1. Coordinate with Owner on the active equipment layout prior to purchase to ensure correct sizing of patch cords from patch panels to switching equipment.
   2. When connecting voice ports to a copper riser, provide a one-pair stranded 8P8C connector on one end and 110GS on the other end and shall be of appropriate length for application.

D. Provide a 10’-0” Station Cord for each work area outlet port.

E. Place each size/length patch cord in a separate container, and mark the containers that hold the patch cords with the length of patch cords contained within.

F. All cords shall conform to the requirements of ANSI/TIA-568-C.2 Commercial Building Telecommunications Cabling Standard, Horizontal Cabling Section, and be part of the UL LAN Certification and Follow-up Program.

G. Cords shall be equipped with an eight-pin modular connector on each end, wired straight through and shall be of appropriate length for application.

H. All rated patch cords shall be round, and consist of #23 AWG copper, stranded conductors, tightly twisted into individual pairs.

I. Patch cords shall be made and warranted by the manufacturer of the cabling system installed in this project and shall meet or exceed patch cord specifications as outlined in TIA standards.

2.7 IDENTIFICATION (LABELING) SYSTEM

A. Refer to sections 27 02 00 and 27 13 00.

PART 3 - EXECUTION

3.1 EXAMINATION

3.2 PREPARATION

A. Refer to section 27 02 00.

B. The Contractor shall check pathways, raceways, and other elements for compliance with space allocations, installation tolerances, debris, hazards to cable installation, and other conditions affecting installation prior to installation.

3.3 INSTALLATION REQUIREMENTS

A. Refer to section 27 02 00.

B. All installation shall be done in conformance with ANSI/TIA-568-C standards, BICSI methods, industry standards and manufacturer`s installation guidelines.
1. The Contractor shall ensure that the maximum pulling tensions of the specified distribution cables are not exceeded and cable bends maintain the proper radius during the placement of the facilities.
2. Failure to follow the appropriate guidelines shall require the Contractor to provide in a timely fashion the additional material and labor necessary to properly rectify the situation.
3. This shall also apply to any and all damages sustained to the cables by the Contractor during the implementation.

C. Install cable using techniques, practices, and methods that are consistent with specified data cabling and the installed components and that ensure specified performance levels of completed and linked signal paths, end to end.
1. Pull cables in smooth and regular motions using methods that prevent cable kinking.
2. Pull cables simultaneously if more than one is being installed in the same raceway/pathway.
3. If necessary, use approved cable pulling lubricant
4. Use fish tape, cable, rope, basket weave wire/cable grips, and other tools that will ensure no damage to the media or raceway.
5. Install open cabling parallel and perpendicular to surfaces or structural members following surface contours where possible.
6. Do not bend cable greater than a bend radius of 0’-1”.

D. Provide a 10’-0” service loop at the communications room and shall provide a 3’-0” service loop above the access ceiling or cable trays unless specified otherwise.
1. All service loops shall be a minimum of 1’-6” (18”) in diameter and be accessible for maintenance.

E. Coordinate loop placement and orientation with the technology consultant.
1. This allows for future changes or expansion without installing new cables.

F. Install cables in continuous “home run” lengths from work station outlet to specified patch panel.
1. No intermediate punch down blocks or splices may be installed or utilized between the communications rooms and the workstation outlet without written Owner permission.

G. All cable must be handled with care during installation so as not to change performance specifications.
1. Factory twists of each individual pair must be maintained up to the connection points at both ends of the cable.
2. There shall never be more than 0’-1/2” of unsheathed cable at either the wiring closet or the workstation termination locations.

H. All cabling and associated hardware shall be placed so as to make efficient use of available space.
1. All cabling and associated hardware shall be placed so as not to impair equipment`s efficient use of their full capacity.

3.4 CABLING METHODS

A. The Contractor shall provide cabling in accessible spaces, cable tray, (surface and/or enclosed raceway), conduits, and/or J-Hook cable support system.
   1. Within consoles, racks, cabinets, desks, and counters, in accessible ceilings spaces and in gypsum board partitions where open cable method may be used.
   2. Use UL or ETL listed plenum rated cable in all spaces.
   3. Provide all necessary installation materials, hardware, tools and equipment to perform insulation displacement type terminations at all data outlets, patch panels, and voice termination materials.

B. Conceal raceway and cabling except in unfinished spaces as is practical.

C. Exposed Cable
   1. All station cabling shall be installed inside walls or ceiling spaces whenever possible.
   2. Exposed station cable will only be run where indicated on the drawings and will only be allowed when no other options exist.
      a. Owner must approve all exceptions.

D. The Contractor shall utilize conduits/cable tray as indicated on the drawings.

E. All cabling placed above drop ceilings must be supported by cable tray, J-hooks, caddy bags or conduit.
   1. The Contractor shall permanently affix cable supports to the building structure or substrates and provide attachment hardware and anchors designed for the structure to which attached and are suitably sized to sustain the weight of the cables to be supported.
      a. Attaching cable to pipes or other mechanical items is not permitted.
      b. Cabling shall not be attached to ceiling grid wires.
   2. Multiple cables are to be dressed every 5’-0” to 7’-0”.
      a. Maximum cable sag between cable hooks is 3”-6”.

F. The Contractor shall route data and voice cables separately in a neat and orderly fashion.
   1. No cable ties or wraps shall be used to secure the cables in the runway outside of the communications rooms. Cable ties shall be rated for the environment.

G. Keep all items protected before and after installation with dust and moisture proof barrier materials/envelopes.

H. If wiring is terminated on patch panels, data, voice jacks prior to painting, carpet installation, and general finish clean up, these jacks shall be placed in a protective envelope to ensure dust, debris, moisture, and other foreign material do not settle onto jacks’ contacts.
   1. Envelope will be removed on final trim out after other trades have completed their finish work.
   2. It shall be the Contractor’s responsibility to ensure the integrity of these protective measures throughout the life/installation of the project.
      a. Cable bundles brought into the communications rooms shall be routed and dressed in such a manner that prior to termination the cables are not subject to damage and misuse such as installers walking on the bundles that are on the floor.
      b. Cable pulling force shall not exceed 25 lbs of pulling tension or cable manufacturer’s recommended pulling tensions.
      c. Do not leave cables on the floor unprotected or cable bundles hanging from the ceilings. Coil them up in a temporary manner and protect them from damage.

I. Communications room cables shall be combed and dressed in a manner as to prevent twists, “braiding” and crossed cables in the cable bundle from the communication room entrance to the termination point at the rear of the patch panel.
   1. Behind the patch panel, the cable bundle shall be attached to the rear cable support bar, and shall drop out each cable in a neat, cascading manner to prevent crossed and/or interwoven cables to each patch panel port termination point.
      a. Use Velcro wraps instead of cables ties for all bundling in the communications rooms.
      b. Plastic/nylon tie-wraps are not allowed to permanently secure cables inside the communications room.

3.5 CABLING SEPARATION

A. Comply with TIA rules for separating unshielded copper communication and data-processing equipment cables from potential EMI sources, including electrical power lines and equipment.

B. Maintain a minimum spacing of 1’-6” (18”) from electrical feeders and/or branch circuit wiring including, but not limited to, light fixtures, sources of heat and EMI sources.

C. Maintain a minimum spacing of 1’-0” from auxiliary systems cabling.

D. Maintain a 1’-0” separation where cables must pass perpendicularly to electrical, plumbing, or other wiring, conduit, or piping systems.
   1. Use non-conduit bushings, if necessary to maintain separation, which allow for the addition of a reasonable number of cables in the future.

E. Maintain communications pathways away from electrical apparatus such as motor driven equipment and transformers, minimum separation distance of 10’-0” is recommended.

3.6 CABLING TERMINATION

A. Terminate cables in consistent consecutive order.

B. Terminate cables onto 8P8C modular patch panels without damaging twisted pairs or jacket.

C. Arrange cables on patch panels and voice termination hardware in ascending order of room numbers and outlet numbers within rooms.

D. Provide a 10’-0” service loop for horizontal cables at each rack in communications rooms.
   1. Locate loop at ceiling deck or on bottom of cable runway in minimum 1’-6” (18”) diameter.

E. Provide a 3’ service loop for horizontal cables at work area outlets. Locate service loop above or below data/voice outlet were vertical cable run transitions to horizontal run.

F. Maintain twists in cable pairs to within 0’-1/2” of termination.

G. Building Systems Cabling (BAS, FA, elevator line, etc)
   1. Coordinate exact placement and connectivity requirements with applicable trade prior to installation.
   2. Group all building systems cables in one group.
   3. Clearly label cable number and function, in the last positions on the horizontal cabling blocks in each communications room.

H. Limit cable-bending radius to 20X the cable diameter during installation, and 15X the cable diameter after installation.

I. Start numbering at the left of the main door to the room and continue in a clockwise direction around the room.
   1. The cables within the room will be terminated starting with the cables located to the left of the main door to the room and continue around the room in a clockwise direction.

3.7 TERMINATION HARDWARE

A. Station Hardware
   1. Flush mount jacks shall be mounted in a faceplate with back box.
   2. Outlets shall not be mounted on temporary, movable, or removable surfaces, doors, or access hatches without prior Owner approval.
   3. 8P8C Jack Pin Assignments for work area outlets shall match the T-568B wiring scheme.

B. Patch panels
   1. Copper cables shall be terminated in eight position/eight conductor (8P8C) modular patch panels.
   2. All Modular jack panels shall match the T-568B wiring scheme.

C. Work Area Outlet
   1. 8P8C non-keyed modular outlets for applications up to one Gbps and ANSI/TIA-568-C compliant for the specified transmission requirements

D. Work Area Outlet Faceplates:
   1. Furnish and install blank plates in all unused ports.

3.8 SPECIAL CIRCUITS

A. The Contractor shall coordinate with the Owner on the cable termination plan for special circuits, including cables to wireless access point locations, security, elevators, fire alarms, etc.

B. Wireless Access Points
1. Install two (2) cable(s) from dedicated wireless patch panel(s) in communications room to outlets having 8P8C connectors within a BISCUIT box.
2. Enclosures shall be NEMA rated for the environment to which they are exposed.
3. 30’-0” of cable slack shall be coiled and hung on a “J”-hook at the enclosure location.

3.9 IDENTIFICATION AND LABELING

A. Labeling system shall consist of a hand-held portable printer and labels appropriate to the application. Handwritten labels are not acceptable.

B. Labelling scheme shall meet Owner’s IT cabling standard and industry standards and best practices. Submit labelling scheme for approval before work to start.

C. Fiber termination hardware (designation strip) shall have a 0’-3/4” x 0’-1/4” thermal transfer printable label with a permanent acrylic adhesive

D. All labels shall be permanent and shall not fade, peel, or deteriorate due to environment or time.

E. The Contractor shall provide a copy of the finalized plan in writing to the Owner representative and DBR for review and authorization to proceed.
1. Coordinate with Owner for specifications on labeling of all hardware, cabling, and related equipment prior to any testing.

F. Labeling requirements:
1. Label cable terminations on designation strips
2. Label all cable at each terminating point.
3. Label each port of the work area outlet.
4. Cable identification numbers shall not be duplicated.
5. Label patch panels in the communications rooms to match those on the corresponding voice and data outlets.
a. The font shall be at least 0’-1/8” in height.
6. Where a wireless access point is installed above an acoustical ceiling, label the ceiling grid frame below the access point, displaying the data port number and, if applicable, the access point identification number. Coordinate labeling of grid with Owner and Architect prior to application of labels.
7. Label each distribution rack, block and other terminating equipment unit and field within that unit within 0’-4” from the block or patch panel termination. Keep labels in a neat and orderly lineup.
8. Label each connector and each discrete unit of cable-terminating and connecting hardware within connector fields, in wiring closets and equipment rooms.
a. Where similar jacks and plugs are used for both communication and data-processing equipment, use a different color for jacks and plugs of each service.
9. Post the cable schedule in a prominent location in each wiring closet and equipment room. List incoming and outgoing cables and their designations, origins, and destinations.

G. Location and termination field description
1. Room location
2. Rack-mount or Wall mount
3. Termination field type
a. Specific patch panel ports versus a separate dedicated patch panel

H. Unique identifiers
1. Segregation and position on equipment rack
2. Port color-coding
3. Unique labeling

I. Documentation
1. Provide electronic copy of final comprehensive schedules for project in software and format selected by Owner.
a. All labels shall correspond to as-built drawings and to final test reports.
2. All cable inventory data documentation shall be submitted in format coordinated with and approved by Owner so that data can be incorporated into existing databases.
3. Documentation shall include cable identification number, source and destination, type of cable, length of cable and number of pairs or fibers.
4. Complete cross connect documentation is required.

3.10 FIELD QUALITY CONTROL

A. Refer to section 27 02 00.

3.11 POST-INSTALLATION TESTING

A. Contractor shall test each pair or strand of every cable prior to acceptance. (100% PASS)

B. Contractor shall submit acceptance documentation as defined below. No cabling installation is considered complete until test results have been completed, submitted and approved.

C. Standards Compliance and Test Requirements:
   1. Cabling shall meet ANSI/TIA-568-C.2 Category 6 Horizontal cabling requirements.

D. Attenuation, NEXT, PSNEXT, Return Loss, ELFEXT, and PSELFEXT data that indicate the worst case result, the frequency at which it occurs, the limit at that point, and the margin.
   1. These tests shall be performed in a swept frequency manner from 1 MHz to highest relevant frequency, using a swept frequency interval that is consistent with TIA and ISO requirements.
   2. Information shall be provided for all pairs or pair combinations and in both directions when required by the appropriate standards.
   3. Length, propagation delay, and delay skew relative to the relevant limit.
      a. Length, propagation delay, and delay skew shall be tested relative to the relevant limit.
      b. Test shall also include mutual capacitance and characteristic impedance.
         1) Any individual test that fails the relevant performance specification shall be marked as a ‘FAIL”.

E. Cable Test Documentation:
   1. Cable test documentation shall be submitted in hard copy and electronic formats.
      a. If proprietary software is used, disk or CD shall contain any necessary software application required to view test results.
      b. Electronic reports shall be accompanied by a Certificate signed by an authorized representative of the Contractor warranting the truth and accuracy of the electronic report.
      c. Certificate shall reference traceable circuit numbers that match the electronic record.
   2. Each test record shall contain the cable ID as follows:
      a. “MEDIA TYPE – SOURCE ROOM – DESTINATION ROOM – STRAND/PAIR #”, e.g. MM-MC-HC23-001.
   3. Test results saved within the field-test instrument shall be transferred into an accessible database utility that allows for the maintenance, inspection and archiving of the test records.
      a. These test records shall be uploaded to the PC unaltered, i.e., “as saved in the field-test instrument”.
      b. The file format, CSV (comma separated value), does not provide adequate protection of these records and shall not be used.
   4. Test reports shall include the following information for each cabling element:
      a. Wire map results that indicate that 100% of the cabling has been tested for shorts, opens, miss-wires, splits, polarity reversals, transpositions, presence of AC voltage and end-to-end connectivity.
      b. Length, propagation delay, and delay skew relative to the relevant limit. Any individual test that fails the relevant performance specification shall be marked as a FAIL.
      c. Cable manufacturer, cable model number/type, and NVP
      d. Tester make & model, serial number, hardware version, and software version.
      e. Cable ID and project name
      f. Auto-test specification used
      g. Overall pass/fail indication
      h. Date of test

F. Cable Test Equipment
   1. Contractor shall supply all of the required test equipment used to conduct acceptance tests.
   2. Test equipment used under this contract shall be from manufacturers that have a minimum of 5 years experience in producing field test equipment. Manufacturers shall be ISO 9001 certified.
   3. Testing equipment shall be UL-verified to meet Level III accuracy.
      a. The cable installers shall have a copy of this reference in their possession and be familiar with the contents.
   4. Testing equipment shall be within the calibration period recommended by the manufacturer.
   5. Testing equipment shall have the latest software and firmware installed.

6. Testing equipment of a given type shall be from the same manufacturer, and have compatible electronic results output.
7. Test adapter cables shall be approved by the manufacturer of the test equipment.
    a. Adapter cables from other sources are not acceptable.
    b. Adapter cables must be replaced after 1000 tests to ensure accuracy.
8. Test equipment must have a dynamic range of at least 100 dB to minimize measurement uncertainty.
9. Test equipment must be capable of storing full frequency sweep data for all tests and printing color graphical reports for all swept measurements.
10. Test equipment must include S-Band time domain diagnostics for NEXT and return loss (TDNXT and TDRL) for accurate and efficient troubleshooting.
11. Test equipment must be capable of running individual NEXT, return loss, etc measurements in addition to auto tests. Individual tests increase productivity when diagnosing faults.
12. Test equipment must include a library of cable types, sorted by major manufacturer.
13. Test equipment must be able to internally group auto tests and cables in project folders for good records management.
    a. Test equipment must store at least 1000 auto tests in internal memory.
14. Test equipment must include DSP technology for support of advanced measurements.
15. Test equipment must make swept frequency measurements in compliance with TIA standards.
16. The measurement reference plane of the test equipment shall start immediately at the output of the test equipment interface connector.
17. There shall not be a time domain dead zone of any distance that excludes any part of the link from the measurement.
18. Acceptable testers:
    a. Fluke DTX CableAnalyzer
    b. Owner approved equivalent

3.12 CLEANING

A. Refer to section 27 02 00.

3.13 ACCEPTANCE

A. Once all work has been completed, test documentation has been submitted and approved, and the Owner is satisfied that all work has been completed in accordance with contract documents, the Owner will notify Contractor in writing of formal acceptance of the system.

B. Contractor’s RCDD shall warrant in writing that 100% of the installation meets the requirements specified herein.

C. Acceptance shall be subject to completion of all work, successful post-installation testing which yields 100% PASS rating, and submittal and approval of full documentation as described above. Tests with the “* PASS” (asterisk) will not be acceptable.
    1. These circuits must be repaired to meet “PASS”.

END OF SECTION

SECTION 27 51 23 - INTERCOM COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The drawings and general provisions of the Contract Documents apply to this Section.

B. Section 26 05 33 - Raceways

C. Section 26 05 19 - Wire, Cable and Related Materials

D. Section 26 05 26 - GROUNDING

E. Section 27 02 00 - BASIC MATERIALS AND METHODS FOR COMMUNICATION SYSTEMS

1.2 SUMMARY

A. Provide a complete turnkey zoned two-way voice IP based paging system for routine and emergency announcements and delivery of other audio programming.

B. Provide a complete turnkey Wireless Network Time Protocol synchronized master clock system with correctable secondary clock instruments located throughout the facility and interfaced to the IP based Intercom paging system for time base audible and visual signaling.

C. This section includes a fully operational IP platform for a district-wide internal and school Critical Communications Solution, incorporating school safety notifications and general communications including but not limited to the following:
   1. The platform shall provide complete internal communications and employ state of the art IP Technology including the minimum functions listed.
      a. Two-way internal intercommunications between staff locations and classrooms.
      b. Scheduled bell events.
      c. Emergency announcements that will override any pre-programmed audio, assuring that all Emergency/Lockdown etc., are heard at each and every speaker location.
      d. Capability of prerecording emergency announcements that can be activated by a Soft Key on an administrative console, panic button, dial string, or web browser.
      e. Atomic Time Synchronization with Class Change Tones utilizing multiple, programmable schedules for each zone.
      f. District-wide, Emergency, Group, All School and Zone live voice paging.
      g. District-wide, Emergency, Group, All School and Zone paging for pre-recorded audio - tones, music and voice.
      h. Web-based user interface.
   2. The system shall support a minimum of 1000 level priorities which shall be user-definable, allowing each end point to place a minimum of 5 different priority calls at the same time.
   3. Any authorized administrator shall be able to call from outside the school into any classroom, zone, or entire school directly via the School District supplied SIP enabled Telephone Network. This shall allow remote monitoring, call-in annunciation, and two-way conversation from outside the facility as well as paging into the system. (Compliance with NEMA Standard SB-40 for emergency communications in K-12 Schools).
   4. Authorized system users shall be able to create a minimum of 100 automated sequences with voice instructions, tones, emails, program distribution, and relay activations and replay them.
   5. Automated message strings shall be manually initiated from a single-button access on the console, on a SIP connected telephone, a panic button, from the web-based user interface or via interface with third party systems.
   6. Paging and two-way intercom features shall be accessible from any system console or SIP connected telephone for each campus.
   7. The platform shall synchronize its system time to the network timeserver or a web-based time server.
   8. Each single campus installation shall be locally survivable for intercom, paging, bells, and emergencies such as lockdown, even when the district connection is unavailable.

9. This specification establishes a minimum level of quality, features, and performance for individual components as well as the integrated system.
10. Systems that do not comply with the feature-sets highlighted in this Specification will not be considered.

1.3 DEFINITION OF TERMS

A. Installer(s): Shall refer to the person, persons, or company who or which actually contracts to perform the work specified herein.

1.4 SUBMITTALS

A. Product data for each component.

B. Shop Drawings: Prior to proceeding with the work: Provide detailed equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, location of each field connection, and a complete schedule of all equipment and materials with associated manufacturer's cuts sheets which are to be used.
1. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring. Identify terminals to facilitate installation, operation, and maintenance. Include a single-line diagram showing cabling interconnection of components and levels throughout system and impedances.
2. Artwork drawings and lists indicating proposed nameplate nomenclature and arrangements for control panels and plug panels prior to fabrication reflecting equipment used.
3. Each drawing shall have a descriptive title and all sub-parts of each drawing shall be labeled. All drawings shall have the name and locations of the project, Systems Contractor's name in the title block.
4. Details and descriptions of any other aspect of the system, which must differ from the contract documents due to field conditions or equipment, furnished.
5. Provide an AUTOCAD engineering floor plan diagram, in 11 inches X 17 inches size format, of the system installation details indicating wiring lay out, proposed wire routing, rough in and installation information.

C. FCC Approval: The system shall be approved for direct interconnection to the telephone utility under Part 68 of FCC rules and regulations. Systems, which are not FCC approved or utilize an intermediary device for connection, will not be considered. Provide the FCC registration number of the system being proposed as part of the submittal process.

D. Product Certificates: Signed by manufacturers certifying that products furnished comply with specified requirements.

E. Installer Certificates: Signed by manufacturers certifying that Installers comply with specified requirements.

F. Manufacturer Certificates: Signed by manufacturers certifying that they comply with specified requirements.

G. Field Test Reports: Indicate and interpret test results for compliance with performance requirements. Include record of final matching transformer-tap settings, and signal ground-resistance measurement certified by Installer.

H. Maintenance Data: For equipment to be included in maintenance manuals specified in Division 1.
1. Record of Owners equipment-programming option decisions.
2. All instructions necessary for proper operation and manufacturer's instructions.
3. "Proof of Performance" information.
4. Manufacturer's maintenance information.
5. Copies of non-proprietary computer programs and system set up disks documenting all programmable features of the installed system.

I. Record Drawings: Prior to final acceptance, provide three (3) complete sets of drawings indicating all cable numbers and construction details in accordance with the actual system installation. Revise all shop drawings to represent actual installation conditions. These Record Drawings will be used during "Final Acceptance Testing".

J. System Training: Submit the following information describing the training programs and system trainers as outlined in paragraph 1.06 of this specification and in accordance with Division 1 specifications.

1. Include with the submittal a preliminary staff development training program in outline form for review and approval by the owner's representative.
2. Include with the submittal a current copy of the trainer's certification from the manufacturer that certifies and identifies the trainer(s) who are eligible to provide training and support for the project.
3. Include with the submittal a current copy of trainer's needs assessment form which will be reviewed with the owner's designated representative for the system's preliminary system programming and configuration.
4. Include with the submittal copies of all documentation used to identify for the owner those participants attending and completing the training programs.

K. A copy of the manufacturer's standard statement of warranty proving all equipment provided for the school communications network is covered with the required five-year warranty shall be included with the project submittal. This statement of warranty shall be provided on the manufacturer's stationary.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced Installer who is an authorized representative of equipment manufacturer for both installation and maintenance of equipment required for this Section. Provide the following within thirty (30) days after notification to proceed:
1. Provide a list of installations that the Installer has specifically installed for verification by the Owner. Random installations from other vendors and/or Installers shall not be accepted. The Installer, not its employees, must meet these qualifications.
2. The Installer shall be bondable.
3. The Installer shall demonstrate to the satisfaction of the Owner or his representative that he has:
   a. Adequate plant and equipment to pursue the work properly and expeditiously.
   b. Adequate staff and technical experience to implement the work.
   c. Suitable financial status to meet the obligations of the work.
   d. Technically capable and factory trained service personnel at a local service facility to provide routine and emergency service for all products used in this project.

B. Any Contractor, who intends to bid on this work and does not meet the requirements of the "Quality Assurance" paragraph(s), shall employ the services of an "Installer" who does meet the requirements and who shall provide the equipment, make all connections and continuously supervise the installation. A subcontractor so employed as the "Installer" must be acceptable to the Architect/Engineer. The "Installer" shall be identified within thirty (30) days of notification to proceed for acceptance by the Architect/Engineer.

C. Because the life expectancy of this type of communications structure normally exceeds 10 years, the owner expects continuity from the service provider. If the installing/servicing company has not been an authorized provider of the manufacturer's product for it least (7) years, the following is required:
1. A list of (2) systems manufacturers of which they currently are authorized service providers where the relationship exceeds (7) years.
2. A letter from the manufacturer outlining the details of changes in service providers over the last (7) years and what actions they will take to ensure continuity of service to the customer.

D. Each major component of equipment shall have the manufacturers name, address and model number on a plate securely affixed in a conspicuous place. NEMA code ratings, UL Label, or other data that is die-stamped into the surface of the equipment shall be easily visible.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.

F. Comply with NFPA 70.

G. Comply with NEMA Standard SB-40 for Emergency Communications in K-12 schools.

H. Comply with UL 60950.

1.6 IN-SERVICE TRAINING

A. The contractor shall provide and implement a complete and comprehensive staff training program for all administrators, facility staff members, and teachers. This mandatory training program will provide school staff a complete understanding of how to utilize and properly operate all functions.

B. The training program shall be implemented by a staff member/trainer employed by the contractor. The trainer must be factory certified to provide training on their product.

C. All staff development training is to be coordinated through the owner's designated representative. As training sessions are completed, the trainer will provide the school's administrative staff and school district's staff a document listing all of the staff and faculty members who attended, received, and completed the training program.

1.7 WARRANTY

A. Provide a manufacturer's five-year warranty of the school communications network equipment against defects in material and workmanship. This warranty will cover all electronic system components. Additional warranties cover clocks, speakers, and call in switches. If any defects are found within the warranty period, the defective equipment shall be replaced at no cost (equipment only); a one year warranty shall be provided for labor.

B. A copy of the manufacturer's standard statement of warranty proving all equipment provided for the school communications network is covered with the required five-year warranty shall be included with the project submittal. This statement of warranty shall be provided on the manufacturer's stationary. The standard five-year warranty is an important element in establishing a standard in quality. Manufacturers who circumvent the five-year warranty by offering special "extended warranties" that are not part of their normal published warranty will not be accepted.

C. Contractor shall respond, excluding weekends and holidays, within 24 hours to any warranty service calls. If equipment cannot be repaired within 24 hours of service visit, the contractor shall provide "loaner" equipment to the facility at no charge.

D. Make available a service contract offering continuing factory authorized service of the system after the initial warranty period.

1.8 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide the following system:
1. Rauland-Borg
2. Owner Approved Equivalent

PART 2 - PRODUCTS

2.1 SYSTEM REQUIREMENTS

A. The New Campus Communications System will connect to the Existing District Server for District Wide announcements and all Management Functions.

B. The platform shall utilize state of the art IP Technology for Call-in Notification, School Safety Paging and Evacuation tones, Atomic Time Synchronization, Class Change Tones utilizing multiple, programmable schedules for each zone, Two-way hands-free Internal Communications and Paging, and Program Distribution. The system shall be easy to learn and operate. All standard programming shall be web-based and user friendly to allow the system administrator the ability to easily program system features.

C. Provide complete and satisfactorily operating district/school communications and district/school safety as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated. Use materials and equipment that comply with referenced standards and manufacturers' standard design and construction, in accordance with published product information. Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.

D. The platform shall be a single electronic system consisting of a minimum of 10 audio channels for each campus, (classroom) IP Speaker Modules and call switches, IP Zone Modules connecting corridor speakers, inside and outside horns, IP Administrative Consoles, SIP enabled PBX integration and district-wide integration for paging, emergency notifications, calendar scheduling and configuration.

E. Each Classroom shall be provided with a Speaker Module interface and a minimum of 5 different call switches, each with their own annunciation path and priority.

F. Call-ins may automatically annunciate (display of priority and location) to administrative consoles, SIP enabled phones, and outside phones.

G. Call-ins shall be programmed to automatically change priority and annunciation route based on age of call-in and original priority.

H. Call-ins may have priority (and annunciation route) changed by user action from a console or SIP enabled phone.

I. Call-in annunciation route shall include playing pre-recorded audio over speakers, sending a pre-configured email, and activating relays.

J. The platform shall lend itself to expansion by simple addition of hardware modules.

K. The platform shall connect directly to an existing, standard protocol WAN/LAN network, without the need for a separate server at each school location. Configuration, including bell schedules, calendars, and emergency sequences can be remotely created, changed, stored and downloaded to the system by an authorized user from a web-based user interface.

L. The platform shall provide the ability to initiate school safety paging announcements, evacuation tones and take cover tones from any telephone or connected web browser within the facility or outside the facility to any other location within the facility or district.

M. The platform shall provide the ability to selectively communicate or monitor individual classrooms in emergency situations from any telephone within the facility or outside the facility to any other location within the facility; all communication within the classroom shall be hands-free and will not require any interaction by the classroom user.

N. The platform shall provide classroom users the ability to confirm that they have safely secured their classrooms during an emergency with a single button press. The front office administrator will receive confirmation that the classroom is safely secured via an administrative console and web-based user interface. The front office administrator can view classrooms that are not safely secured via the administrative console. The front office administrator can view classrooms that are not safely secured via the web-based user interface. The front office administrator shall be able to initiate two-way communication, without a pre-announcement tone, to the classroom during an emergency via the administrative console. Web-based user interface will still identify that a school is in an emergency, even if all classrooms are safely secured. Individual classroom check-in and school emergency status shall be viewed from the web-based user interface, both on-site and remotely.

O. IP Addressable and POE powered Speaker Modules for individual rooms shall be system programmable and may be assigned any two, three, four, five or six digit number as well as name and description. Any extension may be reassigned at any time.

P. IP-enabled two-way voice communication shall be available from any provided telephone or administrative console through any speaker in a campus. This shall allow hands-free communication to any classroom or any individual loudspeaker unit. A programmable pre-announce tone shall sound immediately before the intercom path is opened and a supervisory tone shall continue to sound at regular intervals when speaker monitoring is active, complying fully with all privacy legislation. Pre announce tone and supervisory tones shall be disabled during designated emergencies automatically.

Q. The platform shall allow users to configure multiple schedules per school, with a minimum of 500 unique events per schedule, and automatic Daylight Savings time correction. Schedules can be programmed to occur once, daily, weekly, monthly, or in any combination of the preceding recurrences. Each school may have a minimum of 20 unique bell schedules, with a minimum of 5 active schedules on any given day for each campus. User shall be able to select from 25 standard included tones as well additional user created and uploaded audio files for class change signaling and messaging. In addition, scheduled events shall include relay actions, email notifications, and paging exclusions as system configuration changes. The platform shall allow control of the bell schedules via the district WAN/LAN without the need for a separate server at each school location. Bell schedules can be remotely created, changed, stored and assigned to calendar days for the local school by an authorized user from a web-based user interface.

R. The platform shall be able to integrate with an existing PA system or operate as a fully independent IP solution. The platform shall be able to function in combination of said configurations, and allow for seamless communication within a school or district-wide, regardless of the type of configuration used. The platform shall be scalable, with the ability to easily add, install, and configure additional equipment to a system.

S. The platform allows for customization of preprogrammed sequences, used for emergencies, events, and everyday communications. Preprogrammed sequences can be activated from the push of a relay button, soft key of an administrative console, a dial string of a SIP phone, or a web browser configured to the district network. Sequences can be initiated automatically as part of a schedule or on the fly. Preprogrammed sequences can be customized to utilize any combination of audio tones, emails, relays, tone exclusions, swings, delays, duples, SIP phone notifications, and program distribution. Audio tones can include customized audio files and voice messages, recorded in any language. Uploaded audio tones and messages can be preprogrammed to annunciate repeatedly or individually, as part of a scheduled sequence or on the fly. Each school in a district can have its own customized sequences, and can be activated individually, in groups, or district-wide.

T. The intercom system shall integrate with the access control system to facilitate unlocking of doors during bell schedule. Coordinate with Owner Security Deparment.

2.2 EQUIPMENT AND MATERIAL

A. Server Software
1. Provides district-wide paging, bell event scheduling, emergency notification and configuration for entire district.
2. Ability to configure system and initiate system features, per school and district-wide via web-based user interface.
3. The software has the ability to sync system time to the Atomic Clock Signal or to the school’s or district’s network time server.
4. The software will provide a web browser to deliver district-wide emergency paging, pre-recorded messages and tones from any authorized computer in the facility or the district. The software must be capable of automatically notifying district personnel via the WAN/LAN of an alarm condition.
5. The software can automatically broadcast emergency instructions via associated system hardware throughout an entire district when an alarm (e.g. lockdown, lockout, security, fire) is initiated via the web-based user interface. The emergency instructions are preprogrammed and require no user intervention. Bell tones are able to be halted during an emergency. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.
6. The software allows for user-uploaded pre-recorded messages and tones. Software supports the upload of MP3 and WAV file types. User-uploaded pre-recorded messages and tones can be part of emergencies, sequences, and bell schedules.
7. The software can be installed in cloud, virtual or physical server environments.
8. The web-based user interface supports secure HTTP browsing.
9. The software supports encryption to ensure secure access.
10. The system shall monitor itself if devices go offline and system actions are not received. Specified users shall receive email notifications when devices go offline. The software shall be able to keep a log and report on system activity within a school or all schools district-wide for a minimum of one year. These reports can be exported to excel spreadsheets.
11. The software will support a minimum of 20 bell schedules per school, with 5 schedules assignable to a specific school day. Bell schedules can be programmed to annunciate tones, activate relays, send emails, activate program distribution, and notify SIP phones.
12. The system allows programmable end points to be automatically included or excluded for live paging, bell tones, or prerecorded audio, depending on the time or day or day of the week. These inclusions/exclusions can be applied manually or automatically depending on their schedule.
13. The software can automatically send an email, as part of a programmed sequence of events, to district administrators alerting them of an emergency within the district.
14. The software provides the ability to view schools that are in an emergency status, using any web browser on the district’s network. The software shall identify the name of the school in an emergency as well the type of emergency that school is in.
15. The software provides the ability to view individual classrooms that are not checked-in during an emergency, using any web browser on the district’s network. The software shall identify the name, extension, and description of the classroom that is not checked-in during the emergency.
16. The system has a minimum of 5 customizable emergencies, one of them being an All-Clear - with the ability to return the system from an emergency to normal status. Each emergency shall have a minimum of 500 unique events.

17. As a district-wide communications solution, the system shall be able to provide simultaneous communications to all schools or groups of schools within a district. The system shall allow a user to initiate district-wide communications to individual schools, all schools or groups of schools, from a web-based user interface. The system shall allow a user to initiate prerecorded audio, live paging, or programmed sequences to individual schools, all schools or groups of schools, from the web-based user interface. Programmed sequences shall be customizable per school, and the system shall be able to activate them simultaneously to individual schools, all schools or groups of schools, from the web-based user interface.
18. The communications software must allow upgrade from an individual school system to multiple schools, or an entire school district, using the same web-based user interface. The communications software from an individual school system must be identical in typical user operation to the multiple schools or entire school district communications system software.

B. Campus Controller
1. Provides call routing for paging and intercom for a single facility.
2. System shall connect to the district provided Telephone Network via a SIP connection.
3. Support a flexible numbering plan allowing two, three, four, five, or six digit extensions.
4. SIP interface to a district provided Telephone Network shall be capable of allowing connected phones to display classroom call-ins, answer internal intercom call-ins, make pages and change priorities of call-ins in progress.
5. Direct dialing, two-way amplified voice intercom between any provided telephone or admin console and speaker without the use of a press-to-talk or talk-listen switch.
6. Ability to upgrade priority level from individual call switch.
7. The ability to answer intercom call-ins registered at administrative consoles and pre-selected telephones.
8. The ability to automatically escalate incoming call-ins to an alternate telephone or group of telephones if they remain unanswered for a predetermined amount of time.
9. The ability to manually upgrade an intercom call-in to an alternate telephone or group of telephones.
10. The ability for classrooms to “check-in” via push button when they have successfully secured their location during emergency.
11. Administrative console shall display locations that have not checked in to confirm their secured location and provide hands-free audio monitoring and communication to unsecured locations.
12. The controller shall not need direct connection to any classroom via home run or distributed wiring. It shall communicate solely through the IP network.
13. Single button access from any console on the system to distribute emergency announcements within the facility to all or select locations equipped with speakers. Emergency announcements originating from any assigned administrative console shall have priority over all regular system functions.
14. Ability for administrative consoles and connected phones to selectively monitor audio at any two way speaker during an emergency.
15. Stores a minimum of 48 hours worth of Bell Event Schedules, all emergency notification sequences as well as facility wide configuration.
16. System has the ability to sync system time to the Atomic Clock Signal or to the school’s or districts network time server.
17. System’s SIP Interface shall provide:
    a. Audio paging access from any telephone to any single intercom speaker, zone (group) of intercom/paging speakers, or all speakers/paging horns throughout the entire facility.
    b. Ability to answer a call-in directed to that SIP extension.
    c. Ability to upgrade a call-in directed to that SIP extension.
    d. Single button access from any telephone on the system to initiate alarm signals within the facility to all or select locations equipped with speakers. A minimum of 25 separate distinct alarm signals shall be provided. Alarm signals originating from any assigned administrative telephone shall have priority over all regular system functions.
    e. Ability to initiate a school-wide emergency including lockdown and evacuate sequences.
    f. SIP device shall display call-in information from call in switch. Information will include a minimum of Classroom Name, Number, and Priority Level.
18. The system will have the ability to utilize a web browser and a USB microphone connected to the PC to deliver district-wide live emergency paging, pre-recorded messages and tones from any authorized computer in the facility or the district. The system must be capable of automatically notifying district personnel via the WAN of an alarm condition.

19. The system can automatically broadcast emergency instructions throughout an entire campus when an alarm (e.g. lockdown, lockout, security, fire) is tripped or manually activated. The emergency instructions are preprogrammed and require no user intervention. Bell tones are able to be halted during an emergency. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.

C. IP Addressable Modules:
   1. System shall provide multiple IP Addressable Modules for intercom, paging and relay activation.
      a. All Modules are POE 802.3af compliant
      b. All Modules support DHCP.
      c. All Modules connect to network with a single RJ45 connector
   2. IP Addressable Speaker Module
      a. Shall interface to school's data network, a classroom speaker, and multiple call switches.
      b. A minimum of 5 levels of call-in can be placed from an IP Speaker Module. The call-ins are routed to administrative consoles and select SIP connected telephones and can only be cleared from the system once answered. If a call-in is not answered within a preprogrammed time the call-in may reroute to other telephones, consoles, and speakers.
      c. An option for Privacy call in switches is supported. When the Privacy switch is activated it prevents administrative or classroom telephones from monitoring the specific classroom/location intercom speaker.
      d. The ability to belong to one or more of a minimum of 100 independent zones for zone paging, program/music distribution zones and class change tone zones; this assignment is a programmable function, changeable by time of day. Each IP Speaker Module's location shall be programmed in software to belong to any combination of software zones. IP Speaker Modules shall be designed to mount near ceiling and wall speakers and in the plenum space.
      e. Intercom and paging volume adjustable from Software interface.
   3. IP Addressable Zone Paging Module
      a. Zone Paging Module shall connect multiple speakers for district all page, all page, zone paging, bells, audio events and, emergency notification.
      b. Zone Paging Modules shall be rack and wall mountable.
      c. Zone Paging Modules shall be able to belong to one or more of 100 independent zones for live paging, bells, pre-recorded audio and emergency notification.
   4. IP Addressable Aux I/O Module
      a. Aux I/O Module shall have two input contacts and two output contacts.
      b. Input and output contacts are individually addressable.
      c. Aux I/O Module shall be wall and rack mountable.
      d. User can program relays to be activated manually, through an event/bell schedule, or during emergency notification.
      e. Aux I/O Module can perform school lockdown from a single press of a panic button.
   5. IP Addressable Program Line Input Module
      a. Program Line Input Module shall provide line level audio program distribution into system.
      b. Program Line Input Module shall have a 3.5mm cable jack.
      c. Program Line Input Module shall be configured via web-based user interface.
      d. User can configure program distribution to be activated manually or automatically through an event/bell schedule.
      e. Program Line Input Module will have a system priority level such that emergency communications override program distribution.

D. IP Addressable Analog Gateway
   1. IP Addressable Gateway provides integration with existing analog wiring infrastructure - consisting of shielded two-pair classroom field wiring. The Gateway provides the ability to reuse speaker wiring, speakers, and punch blocks to integrate analog infrastructure with IP platform.
   2. Each Gateway will have 5 watts of power per port and 25 watts total per device.
   3. Supports 24 classrooms that utilize 25 Volt speakers and all current call switches for front office notification.
   4. Supports minimum of 5 call switch priorities per classroom, capable of lockdown check-in functionality, while reusing existing shielded two-pair classroom field wiring.
   5. Classroom intercom volume adjustable from Software interface.
   6. Classroom paging volume adjustable from Software interface.
   7. Configured to the school network and can be used in conjunction with IP Addressable Modules.

E. IP Addressable Administrative Control Console

1. A full color screen with 64 soft keys, 3 line select, volume control, push to talk, speakerphone mode and left/right and up/down scrolling.
2. Audio paging access from any Console to any single intercom speaker, zone (group) of intercom/paging speakers, or all speakers/paging horns throughout the entire school.
3. Programmable soft key access from any console on the system to initiate alarm signals within the school to all or select locations equipped with speakers. A minimum of 25 separate distinct alarm signals shall be provided. Alarm signals originating from any assigned administrative console shall have priority over all regular system functions.
4. Programmable soft key access from any console to automatically broadcast page emergency instructions throughout an entire school when an alarm (e.g. lockdown, lockout, security, fire) is tripped or manually activated. The emergency instructions are preprogrammed and require no user intervention. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.
5. Ability to perform intercom to any single IP Addressable Speaker Module.
6. Ability to display 3 call-ins at a time on the screen while other call-ins are annunciating and the ability to scroll to view all call-ins.
7. Ability to upgrade a call-in via soft key.
8. Programmable soft key access from any console for activating relays, campus wide.
9. Ability to maintain, along with controller and other IP Modules system functions, including intercom, bells and paging for the local campus in the event of district-wide connection loss.
10. Classrooms that have not ‘checked-in’ during an emergency are listed on the Administrative Console’s screen.
11. The time duration of an emergency is shown on the screen of the administrative console. The check-in timer is shown on the screen of the administrative console.

F. Audio Paging/Program Amplifiers
1. Power amplifier(s) shall be provided to provide a minimum of 2 watts of power to all paging speakers, and 15 watts of power to all paging horns.
2. The maximum load on the paging/program amplifiers shall be 80% of the rated maximum output of the amplifiers.

G. Normal/Emergency Call Switch (Provide as Shown on Floor plans)
1. Normal/Emergency Call Switches indicated on the drawings shall provide the following functions and features:
   a. One (1) “Normal” call switch that shall activate a distinctive “NORMAL” level call from single button activation. The button shall be clearly marked “NORMAL” and will route the call-in to any one or more Administrative Consoles and/or Marquee Displays for quick and easy response from an Administrative Console.
   b. One (1) “Emergency” call switch that shall activate a distinctive “EMERGENCY” level call from single button activation. The button shall be red in color and shall be clearly marked “EMERGENCY” and will route the call-in to any one or more Administrative Consoles and/or Displays for quick and easy response from an Administrative Consoles.

H. Emergency/Check-In Call Switch
1. Emergency/Check-In Call Switched indicated on the drawings shall provide the following functions and features:
   a. One (1) “Emergency” call switch that shall activate a distinctive “EMERGENCY” level call from single button activation. The button shall be red in color and shall be clearly marked “EMERGENCY” and will route the call-in to any one or more Administrative Consoles and/or Displays for quick and easy response from an Administrative Consoles.
   b. One (1) “CHECK-IN” call switch that shall activate a distinctive “CHECK-IN” level call from single button activation. The button shall be blue in color and shall be clearly marked “CHECK-IN” and will route the call-in to any one or more Administrative Consoles. This button will be used for emergency check-ins during school emergencies, notifying the front office of the classroom occupants’ safety during an emergency.

I. Equipment Racks
1. All equipment racks shall provide 35 spaces (61”) minimum for mounted system equipment.
2. All equipment racks shall be multi-rack format (“gangable”) style, bolted together, and open cavity.
3. All equipment racks will be provided with lockable rear doors.
4. Equipment rack(s) shall be located in climate-controlled areas/rooms as shown on drawings.
5. All head-end, distribution, and source equipment, including data and power, shall be located in racks configured as approved by the Engineer.

6. Rack mounted equipment shall be accessible from front and rear.
7. All unused rack spaces will be covered with appropriate blank/vent panels.

J. Speakers
1. Indoor Loudspeakers - Tile Replacement:
   a. Rauland BAFKIT Flush Ceiling Loudspeaker
      1) No visible hardware after installation.
      2) Acoustically-correct baffle design blends with ceiling tiles.
      3) Mar-proof baked white epoxy finish.
      4) Can be installed before ceiling tile installation.
      5) Speaker tap selector control mounted on backbox.
      6) Speaker Type: 8 inches (20.3 cm) permanent magnet.
      7) Power Rating: 8 watts RMS.
      8) Sensitivity: 93 dB @ 1 meter with 1 watt input.
      9) Frequency Response: 65 to 17,000 Hertz.
      10) Magnet: 5 oz. (141.7 g) PM.
      11) Voice Coil Impedance: 8 ohms.
      12) Voice Coil Diameter: 0.75 inch (1.9 cm).
      13) Transformer: 25V; taps at 0.25, 0.5, 1, 2 and 4 watts.
      14) Baffle: White, 22-gauge cold-rolled steel.
      15) Baffle Size: Width: 23-3/4 inches (60.3 cm) p.
      16) Length: 11-3/4 inches (29.8 cm).
      17) Depth: 3-3/8 inches (8.6 cm).
      18) Weight: 4 lbs. 14 oz. (2.2 kg).
2. Indoor Ceiling Loudspeakers - Hard Ceiling:
   a. Rauland ACC1400 (USO188) 8 inches 5oz speaker assembly with round white baffle, ACC1101 speaker backbox, ACC1104 T-Bar Support.
      1) 8 inches cone.
      2) Frequency Response: 65 to 17,000 Hz.
      3) Power Rated: 8 watts.
      4) Magnet: 5 oz.
      5) Axial Sensitivity: 93 dB at 4 feet with 1 watt input.
      6) 25 watt variable tap transformer.
      7) Surface mounted speaker housings in areas so designated.
      8) Bi directional.
      9) Wall or ceiling mount.
      10) Accommodates 8 inches speakers.
      11) Provide ceiling tile bridge and backbox.
3. Exterior Loudspeakers
   a. Rauland 3607 flush mounted horn, ACC1411 vandal proof baffle, ACC1105 flush backbox.
      1) The horn loudspeaker is to be a Rauland Model 3607 or approved equal, virtually impervious to weather or vandalism. It is to be of the double reentrant type with a power rating of 15 watts at full range. Frequency range is to be 480 to 14,000 Hz; dispersion angle is to be 180°; sound pressure level is to be 106dB at 1 watt at 1 meter.
      2) The loudspeaker is to have impedance selection of 5000/2500/1300/666/333/89/45 ohms. Power taps are to be 1.0/2.0/3.8/7.5/15 watts for 70 volt line and .90/1.9/7.0/14 watts for 25 volt line.
      3) The unit is to be weatherproof, constructed of treated heavy-gauge aluminum, with all exposed parts plated and sealed driver, line transformer and selector switch are to be mounted within the housing.
      4) Wiring terminals are to be fully enclosed. A cork rubber gasket between speaker flange and mounting surface is to be provided. Finish is to be gray baked enamel.
      5) Furnish a Rauland ACC1412 surface back-box for surface or retrofit applications.
4. Main Office Control Equipment:
   a. Rauland Program Control Console
      1) Located in main office for remote program activation.
      2) Middle Atlantic Slim 2 Series 19 inches Sloped Desktop Racks.
      3) EIA compliant slim desktop turret rack is to be Middle Atlantic Products model # 2-6M. Desktop turret rack is to offer 6 rack spaces.
      4) Rack is to be constructed of 5/8 inch furniture grade MDF board with a black wood grain laminate finish. Rubber feet are to be included with rack.

5) Pre-installed front and rear rack rail is to be 10-32 threaded and constructed of 11-gauge steel. Bottom trim panel is to be 16-gauge steel with a durable black powder coat finish.
6) Rack is to be warrantied to be free from defects in material or workmanship under normal use and conditions for a period of seven (7) years.
7) Rauland BPx Blank Panels, charcoal gray, to complete console panel spaces.

b. Denon-DN 300Z CD/Media Player. Substitutions are not allowed.
c. Rauland TCC2055 Program Line Input Module and TCC2099 Universal Rack Mounting Kit:
1) Encodes analog audio signals to digital, IP-based data.
2) Accepts stereo or mono line level audio.
3) Equipped with 3.5 mm socket for enhanced compatibility.
4) Connection status indicator LED.
5) Mounts in rack or desktop.
6) Digital encryption of control signals for excellent security.
7) Compliant with IEEE 802.3af Power Over Ethernet (PoE) Standard.
8) UL listed for enhanced code compliance.
d. Equipment Racks (If required)
1) All equipment racks are to provide 44 spaces (77 inches) minimum for mounted system equipment.
2) All equipment racks are to be multi-rack format (“gangable”) style, bolted together, and open cavity.
3) Provide all equipment racks with lockable rear doors.
4) Locate equipment rack(s) in climate-controlled areas/rooms as shown on drawings.
5) All head-end, distribution, and source equipment, including data and power, are to be located in racks configured as approved by the Engineer.
6) Rack-mounted equipment is to be accessible from front and rear.
7) All unused rack spaces are to be covered with appropriate blank/vent panels.

K. Uninterruptible Power Supplies (UPS)
1. UPS equipment provided for this system will include Power Conditioning to smooth current and voltage fluctuations.
2. UPS equipment will be sized in accordance with the system manufacturer’s recommendations.
3. Provide an individual UPS for EACH SYSTEM CONTROLLER (Gateway) furnished with the system.
4. Provide additional UPS(s) for protection of all other equipment furnished with the system and housed in the equipment racks.
5. All UPS equipment shall be rack mounted.

L. Program Source Equipment (PSE)
1. Provide a Stereo Program Source Preamp Shure SCM262
2. Provide Denon Pro Media Player DN-300Z
3. Provide a ipod Input Panel for owner furnished Program Sources.
4. Provide a cabinet to House all equipment - locate program source in main office unless otherwise directed to by contract documents.

M. Wall Mounted Volume Control with Priority Override
1. Provide a 10 step attenuator mounted on a stainless steel plate
2. Provide a override relay built on to the control to be activated in cases of Fire - or Lock down Emergency

N. Cabling
1. Each IP speaker with associated call-in button shall consist of one (1) Category cable comprised of four twisted pair 24 AWG. in an overall blue plenum jacket and a two conductor 22 AWG plenum rated cable from the speaker to the call button.
2. Each IP speaker with associated volume control button shall consist of one (1) Category 6 cable comprised of four twisted pair 24 AWG. in an overall blue plenum jacket and a two conductor 22 AWG plenum rated cable from the speaker to the volume control button.
3. Each analog speaker a series of speakers without associated call- in button shall consist of one (1) Category 6 cable comprised of four twisted pair 24 AWG. in an overall blue plenum jacket.
4. Each telephone cable shall be wired with industry standard Category 6 cable comprised of four twisted pair 24 AWG in an overall blue plenum jacket.
5. Clearly label all cables and label all blocks for cable destination.

6. All cabling installations for Intercom Systems shall be approved, installed, tested and certified under close supervision of the Owner.
7. Abandoned communication cabling must be removed upon completion and acceptance of any newly installed public address system as per Article 770 and Article 800 of the NEC. Any removed/abandoned Public Address, sound, or electronics equipment must be returned to Owner.

O. Time Clocks (TC)
1. Each time clock shall have a flush or surface-mounted single-gang wall box located at ADA compliant height (42-48 inches) on which to mount a Kronos Clock (maximum height of 48 inches). Six inches (6”) of space should be allowed beneath the box to allow for a properly placed biometric fingerprint scanning device and 12” to 18” of clear space should be allowed to the right of the box location for the installation of a proximity card reader. For purposes of renovation, the contractor is authorized to remove and reinstall timeclocks as needed.
2. Coordinate exact locations with Owner prior to installation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions, with the Installer present, for compliance with requirements and other conditions affecting the performance of the School Communications and School Safety Network.

B. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install system in accordance with NFPA 70 and other applicable codes. Install equipment in accordance with manufacturer`s written instructions.

B. Furnish and install all material, devices, components and equipment for a complete operational system.

C. Impedance and Level Matching: Carefully match input and output impedance’s and signal levels at signal interfaces. Provide matching networks where required.

D. Control Circuit Wiring: Install control circuits in accordance with NFPA 70 and as indicated. Provide number of conductors as recommended by system manufacturer to provide control functions indicated or specified.

E. All housings are to be located as indicated.

F. The contractor shall provide necessary transient protection on the AC power feed, all copper station lines leaving or entering the building, and all central office trunks. All protection shall be as recommended by the equipment supplier and referenced to earth ground.

G. Wiring within Enclosures: Provide adequate length of conductors. Bundle, lace, and train the conductors to terminal points with no excess. Provide and use lacing bars.

H. Provide physical isolation from speaker-microphone, telephone, line-level wiring, and power wiring. Run in separate raceways, or where exposed or in same enclosure, provide 12 inch minimum separation between conductors to speaker-microphones, telephone wiring and adjacent parallel power. Provide physical separation as recommended by equipment manufacturer for other system conductors.

I. Identification of Conductors and Cables: Use color coding of conductors and apply wire and cable marking tape to designate wires and cables so all media are identified in coordination with system wiring diagrams.

J. Weatherproofing: Provide weatherproof enclosures for items to be mounted outdoors or exposed to weather.

3.3 GROUNDING

A. Provide equipment grounding connections for Integrated Electronic Communications Network systems as indicated. Tighten connections to comply with tightening torques specified byUL 486A-486B to assure permanent and effective grounds.

B. Ground equipment, conductor, and cable shields to eliminate shock hazard and to minimize to the greatest extent possible, ground loops, common mode returns, noise pickup, cross talk, and other impairments. Provide 5-ohm ground at main equipment location. Measure, record, and report ground resistance.

C. Provide all necessary transient protection on the AC power feed and on all copper station lines leaving or entering the building. Note in system drawings, the type and location of these protection devices as well as all wiring information.

3.4 FIELD QUALITY CONTROL

A. Manufacturer`s Field Services: Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.

B. Inspection: Make observations to verify that units and controls are properly labeled and interconnecting wires and terminals are identified. Provide a list of final tap settings of paging speaker line matching transformers.

C. Testing: Rectify deficiencies indicated by tests and completely re-test work affected by such deficiencies at Contractor`s expense. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

3.5 FINAL ACCEPTANCE TESTING

A. The Final Acceptance Testing shall be provided to the Owner or the Owners designated representative only. Final acceptance testing to any other trade or service provider for the project will not comply with the requirements of this section.

B. The contractor will provide a Final Acceptance Test record document signed by both the contractor and the Owner or designated Owner’s Representative establishing the “In Warranty” date. The warranty period will not commence until the Final Acceptance Test is completed.

C. Be prepared to verify the performance of any portion of the installation by demonstration, listening and viewing test, and instrumented measurements. Make additional adjustments within the scope of work and which are deemed necessary by the Owner because of the acceptance test.

3.6 COMMISSIONING

A. The contractor shall train the Owner`s maintenance personnel in the procedures and schedules involved in operating, troubleshooting, servicing, and preventative maintenance of the system. This training will be in accordance with the training as outlined in Section 1.06 of these specifications. In addition to the Training Materials provided, the contractor will also furnish Operators Manuals and Users Guides at the time of this training.

B. Schedule training with Owner through the Owner's representative, with at least seven days advance notice.

3.7 OCCUPANCY ADJUSTMENTS

A. The contractor shall provide Occupancy Adjustments in accordance with Section 1.6 of these specifications. A response scenario amenable to both the owner and the contractor will be established and followed for the first year of service.

3.8 CLEANING AND PROTECTION

A. Prior to final acceptance, the contractor shall vacuum and clean all system components and protect them from damage and deterioration. All blank spaces in equipment cabinets will be covered with blank panels. Top and side panels, and all cabinet doors will be installed. All general areas within and around all equipment rack/cabinets in the facility will be swept, vacuumed, and cleaned up. No cabinets will be left unlocked and all cabinet keys will be turned over to the owner or designated owner’s representative.

END OF SECTION

SECTION 27 51 29 - EMERGENCY RADIO COMMUNICATION ENHANCEMENT SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The requirements of the General Conditions, Supplementary Conditions, Division 1, Division 20, and Drawings apply to all Work herein.

B. Requirements of the following Division 20-28 Sections apply to this section:
1. Scope of Work - Section 27 02 00
2. Fire Alarm System - Section 28 46 00

1.2 SCOPE

A. Provide an in-building radio signal amplification system to provide complete coverage in the building for the public safety agencies as required by the local fire department and other agencies and authorities having jurisdiction. System users shall receive and transmit radio broadcasts from their portable radio units within the building. This shall be accomplished utilizing the following components:
1. Bi Directional Amplifiers (Signal Boosters)
2. Plenum rated Coaxial Cable
3. Antennas
4. Cable taps
5. Connectors
6. Power dividers
7. Other components and interconnecting circuitry as required

B. The system shall comply with the requirements of UL 2524 In-building 2-Way Emergency Radio Communication Enhancement Systems, NFPA 72, NFPA 1221 and ICC (IFC), as referenced.

C. The entire system shall meet with approval of the Fire Department, the Building Department and all other agencies and authorities having jurisdiction (AHJ).

D. The work in this section shall include the responsibility for all filings with the AHJ. Where filings require engineer’s signature, documents shall be submitted for his review and signature. This responsibility shall include furnishing of required quantities of floor plans, descriptive notes and/or specifications, wiring diagrams, shop drawings and amendment forms.

E. Early completion of the in-building emergency radio communication enhancement system will be required as to permit a Certificate of Occupancy to be obtained in a timely manner

F. Any permits necessary for the installation of the work shall be obtained prior to the commencement of the work. All permit costs and inspection fees shall be included as the part of the required work.

G. The in-building emergency radio communication enhancement system shall use a UL 2524, NFPA 72, NFPA 1221 and ICC (IFC) compliant NOTIFIER® signal booster or approved equal.

H. All conductors shall be installed in conduit. Conduit installation shall be as specified in the Conduit Section.

I. Related Sections: Other Division 20-28 Sections contain requirements related to the work of this Section. These may include, but not be limited to, the following sections:
1. Conductors - Section 26 05 19
2. Conduit - Section 26 05 33 and 26 06 34
3. Outlet Boxes - 26 05 33

1.3 QUALITY ASSURANCE

A. Basis: To establish the type, quality and features of the system required, the equipment specified is that of the Notifier Fire Systems. All references to manufacturer or supplier model numbers and other pertinent information herein is intended to establish a minimum standard of quality, performance and features required. All equipment proposed as an EQUAL to that specified shall COMPLETELY conform to the Specifications herein.

B. Manufacturers: If they comply with these specifications and requirements, products of the following manufacturers will be acceptable:
1. Notifier Fire Systems (Provided by Fire Tron)
2. Or Engineer approved equal.

C. Contractor Qualifications:
1. The equipment supplier shall be an authorized and designated representative of the In-building Radio System Manufacturer to sell, install, and service the proposed manufacturer`s equipment. The equipment supplier shall have technical factory training specifically for the system proposed.

D. Codes and Standards: The system shall comply with the applicable Codes and Standards as follows:
1. National Fire Protection Association Standards:
a. NFPA 70 National Electrical Code
b. NFPA 72 National Fire Alarm Code
c. NFPA 101 Life Safety Code
d. NFPA 1221 Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems
2. The Americans with Disabilities Act (ADA).
3. The Texas Accessibility Standards.
4. Local and State Building Codes.
5. Requirements of Local Authorities having Jurisdiction.

1.4 SUBMITTALS

A. The installing contractor and/or equipment manufacturer shall provide complete and detailed shop drawings and include:
1. Riser wiring diagram with associated conduit sizes.
2. Complete floor plan drawings locating all devices and interfaces associated with the fire alarm system. Floor plan drawings shall include conduit and wiring routing complete with conduit sizing and number of conductors by type.
3. Factory data sheets on each piece of equipment to be used and so marked as to model, dimensions, size, voltage and configuration.
4. Detailed written system description in this Specification format describing system functions and operation. All specification variations and deviations shall be clearly noted and marked.
5. Complete Bill of Material for reference.

B. All submittal data shall be in bound form with contractor`s name, supplier`s name, project name, and state fire alarm license number adequately identified.

C. Only basic equipment devices have been shown on the contract drawings. Specific wiring between equipment/devices has not been shown. It is the contractor`s responsibility to submit for approval the Complete Engineered System Configuration and Layout showing all devices, wiring, conduit, and locations along with other required information as specified herein.

PART 2 - PRODUCTS

2.1 DESIGN REQUIREMENTS

A. In-building emergency radio communication enhancement systems for emergency responders are an integral component of the life safety equipment of a building or structure. The primary function is to provide reliable emergency responder communications at the required signal strength within the specified areas.

B. Critical Areas such as Fire Command Center, fire pump room, exit stairs, exit passageways, elevator lobbies, standpipe cabinets, sprinkler sectional valve locations and similar critical areas shall be provided with 100% floor area radio coverage.

C. General building areas shall be provided with 95% radio coverage, or as specified by AHJ.

D. The In-building emergency radio communication enhancement systems must provide the following signal strengths:
   1. Downlink - Minimum signal strength of -95 dBm throughout the coverage area.
   2. Uplink - Minimum signal strength of -95 dBm received at the AHJ Radio System.

E. The system shall be complete with all components and wiring required for compliance with all applicable codes and regulations, and for its operations described hereinafter.

F. EC shall sub-contract an approved manufacturer or a qualified and approved vendor to supply, test and determine locations of components which are required for proper operation as well as to supply, deploy, test and certify the performance of the complete system. Vendor qualifications must be acceptable to the AHJ.

G. All tests shall be conducted, documented, and signed by a person in possession of an FCC General Radio Telephone Operators License. All testing personnel shall be certified and authorized by the signal booster manufacturer in the installation and operation of their equipment. Personnel qualifications must be acceptable to the AHJ.

H. The system design shall be based on the NOTIFIER® line of Public Safety Signal Boosters UL 2524, NFPA 72, NFPA 1221, ICC (IFC) and FCC compliant to establish standards of quality for materials and performance. The naming of a specific manufacturer or a catalog number does not waiver any requirement or performance of individual components described in the specifications.

I. Assembly and installation of all components of the Emergency Responder Radio Communication Enhancement System shall comply with all applicable sections of the National Electrical Code.

J. Survivability from attack by fire shall meet NFPA 72, National Fire Alarm and Signaling Code, and NFPA 1221.

K. The system must comply with all applicable sections of the FCC rules. Signal booster shall have FCC certification prior to installation.

L. Antenna isolation shall be maintained between the donor antenna and all inside antennas (D.A.S.) to a minimum of 20 dB under all operating conditions

2.2 PERFORMANCE REQUIREMENTS

A. The basis of design system is specified based upon NOTIFIER® line of Public Safety UL 2524, NFPA 72, NFPA 1221, ICC (IFC) compliant signal boosters.

B. The signal booster shall be a Class B Public Safety type as designated by the FCC and as required by the AHJ.

C. The secondary power supplies, battery chargers and system monitoring shall be fully compliant with NFPA 72 and NFPA 1221. The signal booster shall have both the primary and the secondary power supplies built in a fully sealed NEMA-4 type approved enclosure.

D. All signal boosters and other active system components must have FCC certification prior to installation. The equipment FCC ID must be shown on the product datasheets and technical submittals. The ID must also be displayed on the product as required by the FCC.

E. The signal booster shall be set and tuned by the equipment manufacturer to pass frequencies as specified by the local fire department.

F. To reduce the possibility of unwanted interference affecting the operation of the system, signal boosters shall be band or channel selective type with a maximum 3dB channel bandwidth of 200KHz (Fc +/- 100KHz). Wide-band signal boosters shall not be accepted, unless required to cover multiple channels within the same band.

G. Signal Boosters shall have oscillation prevention circuitry to protect the public safety radio system in case of signal booster malfunction.

H. Signal Booster gain shall be rated at minimum of 80dB and the gain shall be adjustable in a minimum of 25dB range. System gain shall be set and documented at the time of the final system test.

I. Maximum Propagation delay of the signal booster system shall be 14µs (microseconds) or as specified by AHJ.

J. The signal booster system shall include built-in automatic alarming of malfunctions of the signal booster and battery system as per NFPA 1221 Section 9.6, NFPA 72, Sections 24.5.2.6.1, and 24.5.2.6.2. Aftermarket equipment add-ons and modifications to comply with this specification will not be accepted.

K. A dedicated supervised monitoring panel shall be provided within the emergency command center or other location as designated by AHJ to annunciate the status of all signal booster locations. The monitoring panel shall provide visual and labeled indication of the following for each signal booster:
1. Normal AC power
2. Signal booster trouble
3. Antenna Failure
4. Loss of normal AC power
5. Failure of battery charger
6. Low battery capacity

L. The signal booster system shall include a built-in addressable monitor module tied to the Building Fire Alarm Panel for monitoring the signal booster.

M. The vendor shall verify the system monitoring requirements with the AHJ prior to system installation. System monitoring shall be fully compliant with the AHJ requirements.

N. External filters, attachments or other aftermarket modifications of the original equipment shall not be accepted.

O. All signal booster components shall be contained in a NEMA4-type approved waterproof cabinet. All enclosures shall be painted red with signage in bright yellow or as required by AHJ

PART 3 - EXECUTION

3.1 INSTALLATION

A. General: It shall be the responsibility of the installing contractor to coordinate all requirements surrounding installation of the in-building radio system with all trades including, but not exclusive of: electrical contractor, sprinkler contractor, and HVAC/Controls Contractor. Adequate coordination shall be provided to insure proper installation and interface to all peripheral items required to interact with the fire alarm and communication system to provide a complete and functional life safety system.

B. The in-building radio system contractor shall be responsible for coordinating all devices, panels and other equipment requiring 120V input power with the Electrical Contractor prior to bid. Provide a dedicated 120 volt 20 amp emergency circuit for this equipment.

C. Assembly and installation of all components of the Emergency Responder Communication Enhancement System shall comply with all applicable sections of the National Electrical Code, NFPA 70 and the National Fire Alarm and Signaling Code, NFPA 72, NFPA 1221.

D. At least two independent and reliable power supplies shall be provided as specified below.

E. The primary power source shall be supplied from a dedicated twenty (20) ampere branch circuit and comply with NFPA 70 National Electrical Code, NFPA 72, National Fire Alarm and Signaling Code, and NFPA 1221.

F. The emergency responder radio coverage enhancement system shall be equipped with a secondary source of power. The secondary source of power shall be a battery system with a dedicated battery charger powered by a separate, dedicated twenty (20) ampere branch circuit. The secondary power supply shall supply power automatically when the primary power source is lost. The secondary source of power shall be capable of operating the emergency responder radio coverage enhancement system for a period of at least 24 hours. The battery system shall automatically charge in the presence of external power input. Battery charger and all other electronic components must be fully enclosed in a non-vented NEMA4 Type approved enclosure. Batteries shall be enclosed in a separate, vented NEMA 3R Type approved enclosure.

G. The signal booster shall be designed to allow degraded performance in adverse conditions, such as high temperatures in the event of heat from a nearby fire, voltage fluctuations or other abnormal conditions that may occur during an emergency. Circuits that intentionally disable the signal booster in such situations (i.e. under/over voltage, over/under current, over/under temperature, etc.) are not acceptable. External UPS (Uninterruptable Power Supplies) are not acceptable. It is the purpose of this specification to assure the maximum possible level of communications to public safety personnel depending upon the signal booster, even to the extent of damaging the signal booster, as long as some communications benefit can be provided during the emergency.

H. System design shall be such that neither the failure of the normal power source, the transfer to an emergency source, nor the re-transfer to the normal source shall cause a change in system status.

I. The amplifier shall be housed in a 2-hour fire rated room or other suitable space as approved by the Engineer, or where specifically shown on the drawing.

J. Radiating cable, if used, shall be run without conduit. All other cable can be run in conduit.

K. RF Coaxial Cable shall be a fire-resistant, low-smoke type, UL classified as plenum. The classification shall be clearly marked on the outer surface of the cable regular intervals.

L. All vertical wiring for the BDA system shall be located within a 2-hour enclosure.

M. The remote annunciator shall be located adjacent to the fire alarm control panel.

N. All wiring shall be in accordance with NFPA 72, the National Electrical Code, Local Codes, and Article 760 of NFPA 70. All wiring sizes shall conform to recommendations of the equipment manufacturer, and as indicated on the engineered shop drawings.

O. All conductors shall be UL Listed FPL for LIMITED ENERGY (300 volt) and fire alarm applications and shall be installed in conduit.

P. All conductors for intelligent/addressable circuits shall be of the TWISTED/SHIELDED type to guard against outside RF interference and induced noise. Alarm and telephone communications circuits shall also be of the twisted/shielded type. Conductor size shall be determined by calculated voltage drop and circuit loading but shall not be less than #18 AWG.

Q. All wiring shall be run in a supervised fashion (i.e., no branch wiring or dog-legged wiring) per NFPA requirements such that any wiring disarrangement will initiate the appropriate trouble signals via the main control panel per NFPA and UL requirements.

R. Conduit and raceway system shall be installed as specified under the CONDUIT Section of the specifications, and per NEC.

S. Minimum conduit size shall be 2" EMT. Install conduit per engineered shop drawings.

3.2 TEST AND REPORTS

A. Acceptance testing for an in-building radio system is required upon completion of installation.

B. The coverage testing shall be done in accordance with NFPA 72, National Fire Alarm and Signaling Code, NFPA 1221 and as required by the local AHJ.

C. All tests shall be conducted, documented, and signed by a person in possession of a current FCC General Radio Operator License.

D. All test records along with system diagrams, equipment specifications, user manuals, RF link budget calculations, battery backup calculation and other design data shall be submitted upon completion of the project.

3.3 WARRANTY

A. The in-building radio system shall be free from defects in workmanship and materials, under normal use and service, for a period of one year from the date of acceptance or beneficial occupancy, whichever shall occur first. Any equipment shown to be defective shall be repaired, replaced or adjusted during normal working hours at no cost to the owner.

B. The equipment manufacturer shall be represented by a local organization and the name of such shall be furnished to the Owner, Architect, and Engineer.

C. Additions required to the in-building radio system shall not affect or void any warranty to the existing system provided that said additions are installed by an authorized manufacturer's dealer. All additions to sch shall be of compatible components to match existing manufacturer's components.

3.4 OPERATIONS PERSONNEL TRAINING

A. Provide a training session for the owner's operations personnel. Training session shall be performed by a qualified person who is knowledgeable in the subject/equipment. Submit a training agenda two (2) weeks prior to the proposed training session for review and approval. Training session shall include at the minimum
   1. Purpose of equipment.
   2. Principle of how the equipment works.
   3. Important parts and assemblies.
   4. How the equipment achieves its purpose and necessary operating conditions.
   5. Most likely failure modes, causes and corrections.
   6. On site demonstration.

END OF SECTION

SECTION 27 53 13 - WIRELESS CLOCK SYSTEM

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Transmission System
   1. System Controller with CDMA Receiver, GPS receiving antenna or Ethernet connection
   2. Primary Internal Transmitter
   3. Primary External Transmitter
   4. Magnetic mount or Campus transmitting antenna

B. Wireless Synchronized Devices
   1. Analog Clock
   2. Digital Clock
   3. Master Clock Synchronizer Module
   4. Wireless Relay Module
   5. Signal Indicator SiteSync IQ

1.2 RELATED SECTIONS

A. Division 26 - Electrical 120V 60Hz grounded outlet required for SiteSync IQ System Controller. Ex: Minimum 10 amp circuit

B. Division 26 - Electrical 120V 60Hz grounded outlet required for external transmitter. Ex: Minimum 10 amp circuit

C. Division 26 - Electrical 120V 60Hz grounded outlet for each AC powered clock, Master Clock Synchronizer and Wireless Relay.

1.3 REFERENCES

A. This Technical Specification and Associated Drawings.

B. National Fire Protection Agency (NFPA) - 70, National Electric Code.

C. American Time & Signal, Co. SiteSync IQ Wireless Clock System User Manual.

D. American Time & Signal, Co. Master Clock Synchronizer User Manual.

E. American Time & Signal, Co. Wireless Relay (User Manual)

1.4 DEFINITIONS

A. CDMA: Use of Code Division Multiple Access (CDMA) to provide time synchronization. This is often used in the mobile telephone industry. This mode of synchronization eliminates the need to mount an outside data receiving antenna. No wiring hookup is needed for this option as the CDMA receiver is installed inside the system controller. Simply attach the hinged antenna to the system controller to initiate time synchronization. The CDMA sets the time zone information from the cell tower (no service contract required).

B. GPS: Global Positioning System, a worldwide system that employs a constellation of satellites in an integrated network to determine geographic location anywhere in the world, and which employs and transmits atomic time, the most accurate and reliable time. GPS antenna should be mounted outside with a clear view of the sky.

C. Ethernet: Time synchronization via SNTP (Simple Network Time Protocol) or Daytime Protocol. The system controller receives the same time via an Ethernet connection, which is then transmitted to your clocks. This requires a TCP/IP Network with Internet access or connection to a Network Time Server.

D. Ethernet option with CDMA or GPS: To provide system redundancy and to sync with GPS or CDMA time with the ability to control remote circuits via Remote Connect.

1.5 SYSTEM DESCRIPTION AND REQUIREMENTS

5 watt mag	10 watt mag	10 watt campus	25 watt campus	45 watt campus
1-2 stories	3-5 stories	3-6 stories	6-8 stories	8-12 stories
200k sqft per floor	100k sqft per floor	small campus	1 city block	1-2 city blocks
5-10 acres	10-30 acres	30-100 acres	125 acre campus	285 acre campus

A. SiteSync IQ Wireless Timekeeping system shall be capable of synchronizing clocks, intercom, server, computers and other equipment throughout a facility.

B. The system shall synchronize all clocks to each other. The system shall utilize CDMA, GPS, or Ethernet technology to provide atomic time to all its components. The system shall not require any hard wiring for operation (besides AC power for specified components) except for an Ethernet patch cable for Ethernet connection or GPS antenna cable to pick up GPS signal. Analog clocks could be battery operated for full portability if required. Clocks shall automatically adjust for Daylight Saving Time per the settings in the SiteSync IQ System Controller.

C. Clocks shall synchronize to ±1 second of the time displayed on the system controller.

D. The system shall include an internal real time clock reference so that failure of the CDMA, GPS or Ethernet signal shall not cause the clocks to fail to indicate the correct time.

E. The system shall incorporate a “fail-proof” design so that a temporary power interruption shall not cause failure of the system. Upon restoration of power, the system shall resume normal operation.

F. The system shall include a signal indicator to notify local supervisor or maintenance personnel when the SiteSync IQ System Controller transmits to verify signal reception.

G. Analog clocks to be battery operated for complete portability and relocation freedom, or AC powered for many years of maintenance free operation. Batteries included.

H. Site survey instruction manual and equipment to be available for building site transmitter signal reception diagnosis.

I. System controller equipped with wired clock system run and correction output circuits and correction protocols for select wired clock systems. System controller can simultaneously operate a wired clock system and provide wireless clock signal to maintain synchronization of the wired and wireless clock systems throughout a facility. Specify wired clock correction protocol at time of order. Contact American Time & Signal Co. at 1-800-328-8996 to obtain list of standard clock codes or to obtain a custom clock code.

J. System Controller with 6 integrated signal relay circuits available for operating bells, tone generators, lighting circuits, intercom and other electrical equipment. This can be done via a direct wired connection or wirelessly via one or more wireless relay modules. System controller capable of programming and storing 99 schedules with 9999 events. Events may be programmed for momentary 1-9 second activation or toggled on and off.

K. System Controller (with Ethernet option) capable of Remote Connect Web Interface which allows for event and circuit programming as well as manual circuit activation from a remote location via a web browser. No software required.

L. Wireless Relay Module (P/N H004296, H004296-2): A remote relay that receives a wireless signal and supplies a contact closure based on the schedule in the system controller that is assigned to that circuit.

M. The contractor shall provide connection to the intercom system to provide synchronization of the two systems and allow bell tones signals. The wireless clock shall provide master signal for synchronization and provide scheduling for bell tones.

1.6 REGULATORY REQUIREMENTS

A. Equipment and components furnished shall be of manufacturer’s latest model.

B. System Controller, Transmitter and Receiver shall comply with Part 90 of FCC rules, as follows:
1. This device may not cause harmful interference.
2. Transmitter frequency shall be governed by FCC Part 90.35.
3. Transmitter output power shall be governed by FCC Parts 90 and 74.

C. System shall be installed in compliance with local and state authorities having jurisdiction.

1.7 SUBMITTALS

A. Product Data: Submit complete catalog data for each component, describing physical characteristics and method of installation. Submit brochure showing available colors and finishes of clocks.

B. Operating License: A copy of the shared nationwide FCC license can be obtained from American Time & Signal Co. if desired. No special licensing is required for installation or operation.

C. Samples: Submit one clock for approval. Approved sample shall be tagged and shall be installed in the work at location directed. End user logo, mascot or custom artwork on dials is available at no charge. American Time & Signal Co. requires approval of custom dial design by end user prior to volume dial printing.

D. Manufacturer's Instructions: Submit complete installation, set-up and maintenance instructions.

1.8 SUBSTITUTIONS

A. Proposed substitutions to be considered, shall be manufactured of equivalent materials that meet or exceed specified requirements of this Section.

B. Proposed substitutions shall be identified not less than 10 days prior to bid date.

C. Other systems requiring wiring and/or conduit between system controller and clocks will not be acceptable.

1.9 QUALITY ASSURANCE

A. Permits: American Time & Signal Co. offers the use of a shared nationwide FCC license.

B. Qualifications:
1. Manufacturer: Company specializing in manufacturing commercial timekeeping systems with a minimum of 10 continuous years of documented experience.
2. Installer: End user technicians or contractor with documented experience in the installation of commercial timekeeping systems.

C. Warranty: Two year warranty on all SiteSync IQ products excluding batteries.

1.10 DELIVERY, STORAGE AND HANDLING

A. Deliver all components to the site in the manufacturer's original packaging. Packaging shall contain manufacturer's name and address, product identification number, and other related information.

B. Store equipment in finished building, unopened containers until ready for installation.

1.11 PROJECT SITE CONDITIONS

A. A. Clocks shall not be installed until painting and other finish work in each room is complete.

B. B Verify reception of CDMA signal via the use of a CDMA cell phone in the area the system Controller will be installed. No external wiring or antennas required.

C. Coordinate installation of the GPS external signal receiving antenna for access to the roof or exterior side wall so the bracket and related fasteners are securely mounted.

D. Cat 5 or above patch cable with Internet access or connection to a Network Time Server must be available plus; Static IP address from Network Administrator, Gateway IP address, Subnet Mask, Firewall Port, and SNTP Server Address.

PART 2 - PRODUCTS

2.1 WIRELESS CLOCK SYSTEM

A. Provide master clock capable of synchronization via radio frequency. Provide a wireless master/satellite time system for the facility, in order to accomplish this coordination.
1. Locate wireless master transmitter within the MDF room. Depending on equipment capabilities, large facilities need for additional transmitter(s).
2. Locate associated GPS receiver on the roof or in a window without low-E glass.

3. Master clock system to interface with the public address or bell system, in order to provide tone generation (ring bells).
4. Provide for a PC, monitor, and associated wiring for programming the system for class bell changes.
5. All clocks provided as part of this wireless master/satellite time system are to be located at 8’-0” AFF to the center of the device, unless otherwise approved by Dallas ISD.
6. Provide master clock system for all new schools and existing facility additions.
7. Addition projects, locate the new clock system within the new MDF room to serve clocks within the new addition area only.
8. Clocks to be provided in the following building areas:
    a. Administration (reception area).
    b. Auditorium.
    c. Cafeteria.

d. Classrooms (includes all teaching spaces). Conference rooms. Corridors (100 foot maximum distance apart). Gymnasium. Library/media center. Break rooms and workrooms.Provide complete and satisfactorily operating NTP Synchronized Wireless Clock System with analog and/or digital secondary clocks as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated.(NTP) Network Time Protocol is a network standard protocol that assures accurate synchronization to the millisecond of computer clock times in a network of computers. Based on UTC, NTP synchronizes client workstation clocks to the U.S. Naval Observatory Master Clocks in Washington, DC and Colorado Springs, CO. Running as a continuous background client program on a computer, NTP sends periodic time requests to servers, obtaining server time stamps and using them to adjust computer clocks.The system shall be easy to learn and operate. All standard system programming shall be user friendly to allow the system administrator the ability to easily program system features.Use materials and equipment that comply with referenced standards and manufacturers' standard design and construction, in accordance with published product information.Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.The NTP Synchronized Wireless System consists of a master transmitter located on the inside of the building, and an NTP receiver connected to a time server. Wireless analog and digital clocks are synchronized to the NTP time. System shall synchronize all clocks to each other. System shall utilize NTP technology to provide atomic time to components.System components to be hard wired. Battery operated clocks are not allowed.Hallway clocks to be digital with red LED display.Classroom clock are allowed to be digital or analog.Analog Clocks are to synchronize to +/- 1 second of the transmitter displayed time.Clocks are to automatically adjust for Daylight Saving per settings on the transmitter.The system is to have an internal clock that is continually updated by the NTP receiver. If a NTP failure were to occur, the clocks are to continue to be synchronized to the internal clock and not deviate from each other. Once NTP time is restored, all clocks are to once again be synchronized to the NTP time.The system is to have a fail-safe design so that if a power interruption were to occur, the clocks continue to operate. If a synch signal is not received by the analog clocks for 48 hours, the second hand is to double pulse to indicate this condition. Upon restoration of power, the transmitter is to once again communicate with the clocks and normal operation resumes.System is to be 100% programmable from the front operational panel with lights that indicate power status and NTP reception. Panel programming is to also include Time Zone, Frequency, 12 or 24 hour operation and DST on/off.The wireless backbone is to support expansion of the system to include wireless alphanumeric displays for emergency crisis communications for district-wide communications.The system is to be modified to use GPS instead of NTP as the time source without the need to replace the transmitter. A GPS receiver would need to be added with access to the outside of the building.The system is to lend itself to expansion by simple addition of wireless secondary clocks and their required power source.Equipment and materials:Wireless transmitterFCC Part 90 Approved, 467.2125-467.4375 MHz frequency range. Radio Technology (Narrowband FM, 12.5 KHz bandwidth). Ten (10) selectively available channels. 5 watt transmitter. Daylight Savings Time pre-programmed. Time zone pre-set. Non-volatile memory. LCD display for time, date, year, power, time zone and signal reception. Operating Range (32 degrees F to 158 degrees F). Rack or shelf mount. Power Supply Input: 120-volt AC, Output: 12-volt DC, 3 Amps. 7 inches rear mounted antenna. Dimensions: 12 inches L x 6 inches W x 1.75 inches H Weight: 2 lbs. NTP Receiver. Optional external antenna for use in large campus applications. Up to 2 mile radius.Secondary 13 inch analog clock:13 inch analog clock. Maintenance free. Five year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. Durable ABS casing. Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).Face of clock is white.Hour and minute hands are to be black. Second hand is red.The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.The clock to have a low–profile, semi–flush design.Wire guard model in areas where protection is required as indicated on drawings or by Owner.Secondary dual face 13 inch analog clock13 inch analog clock. Wall or ceiling mount is to be determined by drawings or Owner. Maintenance free. Five (5) year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. Durable ABS casing. Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).Face of clock is white. Hour and minute hands are to be black. Second hand is red.

The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.Secondary 16 inch Analog Clock16 inch analog clock (Battery powered using 2”D” cell batteries). Maintenance free. Five year manufacturer’s warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. Durable ABS casing. Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).Face of clock is white.Hour and minute hands are to be black. Second hand is red.The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.Wire guard in areas where protection is required as indicated on drawings or by Owner.The clock is to have a low–profile, semi–flush design.Secondary 2.5 inch digital clock2.5 inch digital clock (AC powered 24V or 120V). 4 digit (hours/minutes). Built-in countdown/count-up timer. Maintenance free. Five year manufacturer’s warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format. Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Wire guard in areas where protection is required as indicated on drawings or by owner.Bright red or white LED digit.Secondary 4 inch digital clock4 inch digital clock (AC powered 24V or 120V). 4 digit (hours/minutes). Built-in countdown/count-up timer. Maintenance free. Five year manufacturer’s warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format.Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Wire guard model in areas where protection is required as indicated on drawings or by Owner.Bright red or white LED digit.Secondary 2.5 inch dual sided digital clock2.5 inch digital clock (AC powered 24V or 120V). Four (4) digit (hours/minutes). Built-in countdown/count-up timer. Maintenance free. Five (5) year manufacturer’s warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format. Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Bright red or white LED digit.Secondary 4 inch dual sided digital clock4 inch digital clock (AC powered 24V or 120V). 4 digit (hours/minutes). Built-in countdown/count-up timer. Maintenance free. Five (5) year manufacturer’s warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format.Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Bright red or white LED digit.

e. Conference rooms.
f. Corridors (100 foot maximum distance apart).
g. Gymnasium.
h. Library/media center.
i. Break rooms and workrooms.

9. Provide complete and satisfactorily operating NTP Synchronized Wireless Clock System with analog and/or digital secondary clocks as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated.
10. (NTP) Network Time Protocol is a network standard protocol that assures accurate synchronization to the millisecond of computer clock times in a network of computers. Based on UTC, NTP synchronizes client workstation clocks to the U.S. Naval Observatory Master Clocks in Washington, DC and Colorado Springs, CO. Running as a continuous background client program on a computer, NTP sends periodic time requests to servers, obtaining server time stamps and using them to adjust computer clocks.
11. The system shall be easy to learn and operate. All standard system programming shall be user friendly to allow the system administrator the ability to easily program system features.
12. Use materials and equipment that comply with referenced standards and manufacturers’ standard design and construction, in accordance with published product information.Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.
13. The NTP Synchronized Wireless System consists of a master transmitter located on the inside of the building, and an NTP receiver connected to a time server. Wireless analog and digital clocks are synchronized to the NTP time. System shall synchronize all clocks to each other. System shall utilize NTP technology to provide atomic time to components.
14. System components to be hard wired. Battery operated clocks are not allowed.Hallway clocks to be digital with red LED display.Classroom clock are allowed to be digital or analog.
15. Analog Clocks are to synchronize to +/- 1 second of the transmitter displayed time.Clocks are to automatically adjust for Daylight Saving per settings on the transmitter

16. The system is to have an internal clock that is continually updated by the NTP receiver. If a NTP failure were to occur, the clocks are to continue to be synchronized to the internal clock and not deviate from each other. Once NTP time is restored, all clocks are to once again be synchronized to the NTP time.
17. The system is to have a fail-safe design so that if a power interruption were to occur, the clocks continue to operate. If a synch signal is not received by the analog clocks for 48 hours, the second hand is to double pulse to indicate this condition. Upon restoration of power, the transmitter is to once again communicate with the clocks and normal operation resumes.
18. System is to be 100% programmable from the front operational panel with lights that indicate power status and NTP reception. Panel programming is to also include Time Zone, Frequency, 12 or 24 hour operation and DST on/off.
19. The wireless backbone is to support expansion of the system to include wireless alphanumeric displays for emergency crisis communications for district-wide communications.
20. The system is to be modified to use GPS instead of NTP as the time source without the need to replace the transmitter. A GPS receiver would need to be added with access to the outside of the building.
21. The system is to lend itself to expansion by simple addition of wireless secondary clocks and their required power source.
22. Equipment and materials:
    a. Wireless transmitter
        1) FCC Part 90 Approved, 467.2125-467.4375 MHz frequency range.
        2) Radio Technology (Narrowband FM, 12.5 KHz bandwidth).
        3) Ten (10) selectively available channels.
        4) 5 watt transmitter.
        5) Daylight Savings Time pre-programmed.
        6) Time zone pre-set.
        7) Non-volatile memory.
        8) LCD display for time, date, year, power, time zone and signal reception.
        9) Operating Range (32 degrees F to 158 degrees F).
        10) Rack or shelf mount.

11) Power Supply Input: 120-volt AC, Output: 12-volt DC, 3 Amps. 7 inches rear mounted antenna. Dimensions: 12 inches L x 6 inches W x 1.75 inches H Weight: 2 lbs. NTP Receiver. Optional external antenna for use in large campus applications. Up to 2 mile radius.Secondary 13 inch analog clock:13 inch analog clock. Maintenance free. Five year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. Durable ABS casing. Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).Face of clock is white.Hour and minute hands are to be black. Second hand is red.The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.The clock to have a low–profile, semi–flush design.Wire guard model in areas where protection is required as indicated on drawings or by Owner.Secondary dual face 13 inch analog clock13 inch analog clock. Wall or ceiling mount is to be determined by drawings or Owner. Maintenance free. Five (5) year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. Durable ABS casing. Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).Face of clock is white. Hour and minute hands are to be black. Second hand is red. The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.Secondary 16 inch Analog Clock16 inch analog clock (Battery powered using 2"D" cell batteries). Maintenance free. Five year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. Durable ABS casing. Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).Face of clock is white.Hour and minute hands are to be black. Second hand is red.The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.Wire guard in areas where protection is required as indicated on drawings or by Owner.The clock is to have a low–profile, semi–flush design.Secondary 2.5 inch digital clock2.5 inch digital clock (AC powered 24V or 120V). 4 digit (hours/minutes). Built-in countdown/count-up timer. Maintenance free. Five year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format. Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Wire guard in areas where protection is required as indicated on drawings or by owner.Bright red or white LED digit.Secondary 4 inch digital clock4 inch digital clock (AC powered 24V or 120V). 4 digit (hours/minutes). Built-in countdown/count-up timer. Maintenance free. Five year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format.Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Wire guard model in areas where protection is required as indicated on drawings or by Owner.Bright red or white LED digit.Secondary 2.5 inch dual sided digital clock2.5 inch digital clock (AC powered 24V or 120V). Four (4) digit (hours/minutes). Built-in countdown/count-up timer. Maintenance free. Five (5) year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format. Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Bright red or white LED digit.Secondary 4 inch dual sided digital clock4 inch digital clock (AC powered 24V or 120V). 4 digit (hours/minutes). Built-in countdown/count-up timer. Maintenance free. Five (5) year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format.Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Bright red or white LED digit.

12) 7 inches rear mounted antenna.
13) Dimensions: 12 inches L x 6 inches W x 1.75 inches H
14) Weight: 2 lbs.
15) NTP Receiver.
16) Optional external antenna for use in large campus applications. Up to 2 mile radius.

b. Secondary 13 inch analog clock:
   1) 13 inch analog clock.
   2) Maintenance free.
   3) Five year manufacturer's warranty.
   4) Microprocessor based with built-in wireless receiver.
   5) Heavy duty construction.

6) Durable ABS casing.
7) Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).
8) Face of clock is white.
9) Hour and minute hands are to be black. Second hand is red.
10) The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.
11) The clock to have a low–profile, semi–flush design.
12) Wire guard model in areas where protection is required as indicated on drawings or by Owner.

c. Secondary dual face 13 inch analog clock
1) 13 inch analog clock.
2) Wall or ceiling mount is to be determined by drawings or Owner.
3) Maintenance free.
4) Five (5) year manufacturer's warranty.
5) Microprocessor based with built-in wireless receiver.
6) Heavy duty construction.
7) Durable ABS casing.
8) Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).
9) Face of clock is white.
10) Hour and minute hands are to be black. Second hand is red.
11) The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.

d. Secondary 16 inch analog clock
e. 16 inch analog clock (Battery powered using 2"D" cell batteries).
f. Maintenance free.
g. Five year manufacturer's warranty.
h. Microprocessor based with built-in wireless receiver. Heavy duty construction. Durable ABS casing. Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).Face of clock is white.Hour and minute hands are to be black. Second hand is red.The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.Wire guard in areas where protection is required as indicated on drawings or by Owner.The clock is to have a low–profile, semi–flush design.
i. Heavy duty construction.
j. Durable ABS casing.
k. Clock numbering graphics are to be Standard Arabic Format (12HR-60 Minute).
l. Face of clock is white.Hour and minute hands are to be black. Second hand is red.
m. The clock lens is to use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.
n. Wire guard in areas where protection is required as indicated on drawings or by Owner.
o. The clock is to have a low–profile, semi–flush design.

23. Secondary 2.5 inch digital clock
a. 2.5 inch digital clock (AC powered 24V or 120V).
b. 4 digit (hours/minutes).
c. Built-in countdown/count-up timer.
d. Maintenance free.
e. Five year manufacturer's warranty.
f. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format. Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Wire guard in areas where protection is required as indicated on drawings or by owner.Bright red or white LED digit.
g. Heavy duty construction.
h. 12/24 hour display format.
i. Clear anti-glare LED display.
j. Adjustable brightness. AM/PM indicator. Wire guard in areas where protection is required as indicated on drawings or by owner.Bright red or white LED digit.
k. AM/PM indicator.
l. Wire guard in areas where protection is required as indicated on drawings or by owner.
m. Bright red or white LED digit.

24. Secondary 4 inch digital clock
a. 4 inch digital clock (AC powered 24V or 120V).

b. 4 digit (hours/minutes).
c. Built-in countdown/count-up timer.
d. Maintenance free.
e. Five year manufacturer's warranty. Microprocessor based with built-in wireless receiver. Heavy duty construction. 12/24 hour display format.Clear anti-glare LED display. Adjustable brightness. AM/PM indicator. Wire guard model in areas where protection is required as indicated on drawings or by Owner.Bright red or white LED digit.
f. Microprocessor based with built-in wireless receiver.
g. Heavy duty construction.
h. 12/24 hour display format.Clear anti-glare LED display.
i. Adjustable brightness. AM/PM indicator. Wire guard model in areas where protection is required as indicated on drawings or by Owner.Bright red or white LED digit.
j. AM/PM indicator.
k. Wire guard model in areas where protection is required as indicated on drawings or by Owner.
l. Bright red or white LED digit.

25. Secondary 2.5 inch dual sided digital clock
    a. 2.5 inch digital clock (AC powered 24V or 120V).
    b. Four (4) digit (hours/minutes).
    c. Built-in countdown/count-up timer.
    d. Maintenance free.
    e. Five (5) year manufacturer's warranty.
    f. Microprocessor based with built-in wireless receiver.
    g. Heavy duty construction.
    h. 12/24 hour display format.
    i. Clear anti-glare LED display.
    j. Adjustable brightness.
    k. AM/PM indicator.
    l. Bright red or white LED digit.
26. Secondary 4 inch dual sided digital clock
    a. 4 inch digital clock (AC powered 24V or 120V).
    b. 4 digit (hours/minutes).
    c. Built-in countdown/count-up timer.
    d. Maintenance free.
    e. Five (5) year manufacturer's warranty.
    f. Microprocessor based with built-in wireless receiver.
    g. Heavy duty construction.
    h. 12/24 hour display format.Clear anti-glare LED display.
    i. Adjustable brightness.
    j. AM/PM indicator.
    k. Bright red or white LED digit.

PART 3 - EXECUTION

3.1 SITE EXAMINATION

A. Verify that construction is complete in the areas where equipment is to be installed and that rooms are clean and dry.

B. Verify that a 120 VAC electrical outlet is located within 6 feet of the location of the System Controller and the outlet is operational and properly grounded.

C. Verify that all 120-volt electrical outlets for the AC powered clocks are located at the exact installation points and the outlets are operational and properly grounded.

3.2 SYSTEM INSTALLATION

A. Refer to the manufacturer installation manuals as supplied with the system, to install each one of the system components.

3.3 INSPECTION

A. Prior to final acceptance, inspect each system component to function properly and replace parts that are found defective.

3.4 CLEANING

A. Prior to final acceptance, clean exposed surfaces of all system components, using cleaning methods recommended by the manufacturer.

3.5 DELIVERY

A. If needed, provide technical assistance as demonstrated in the manufacturer's system user guide, on product start up and system setup, to owners or installers representatives via phone: 800-328-8996, fax: 800-789-1882 or e-mail: www.sitesyncwireless.com

END OF SECTION

SECTION 28 02 00 - BASIC MATERIALS AND METHODS FOR SAFETY AND SECURITY SYSTEMS

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

A. The requirements of the General Conditions and Supplementary Conditions apply to all Work herein.

B. The Contract Drawings indicate the extent and general arrangement of the systems. If any departure from the Contract Drawings are deemed necessary by the Contractor, details of such departures and the reasons therefore, shall be submitted to the Architect and Engineer for approval as soon as practicable. No such departures shall be made without the prior written approval of the Architect and Engineer.

1.2 SCOPE OF WORK

A. The Work included under this Contract consists of the furnishing and installation of all labor, material, tools, equipment and services necessary and required to form the complete and functioning electronic safety and security systems in all of its various phases, all as shown on the accompanying Drawings and/or described in these Specifications. The contractor shall review all pertinent drawings, including those of other contracts prior to commencement of Work.

B. This Division requires the furnishing and installing of all items Specified herein, indicated on the Drawings or reasonably inferred as necessary for safe and proper operation; including every article, device or accessory (whether or not specifically called for by item) reasonably necessary to facilitate each system's functioning as indicated by the design and the equipment specified. Elements of the work include, but are not limited to, materials, labor, supervision, transportation, storage, equipment, utilities, all required permits, licenses and inspections. All work performed under this Section shall be in accordance with the Project Manual, Drawings and Specifications and is subject to the terms and conditions of the Contract.

C. The approximate locations of Security items are indicated on the Drawings. These Drawings are not intended to give complete and accurate details in regard to location of outlets, apparatus, etc. Exact locations are to be determined by actual measurements at the building, and will in all cases be subject to the Review of the Owner or Engineer, who reserves the right to make any reasonable changes in the locations indicated without additional cost to the Owner.

D. Items specifically mentioned in the Specifications but not shown on the Drawings and/or items shown on Drawings but not specifically mentioned in the Specifications shall be installed by the Contractor under the appropriate section of work as if they were both specified and shown.

E. All discrepancies within the Contract Documents discrepancies between the Contract Documents and actual job-site conditions shall be reported to the Owner or Engineer so that they will be resolved prior to the bidding, where this cannot be done at least seven (7) working days prior to bid; the greater or more costly of the discrepancy shall be bid. All labor and materials required to perform the work described shall be included as part of this Contract.

F. It is the intention of this Section of the Specifications to outline minimum requirements to furnish the Owner with a turn-key and fully operating system in cooperation with other trades.

G. It is the intent of the above "Scope" to give the Contractor a general outline of the extent of the Work involved; however, it is not intended to include each and every item required for the Work. Anything omitted from the "Scope" but shown on the Drawings, or specified later, or necessary for a complete and functioning Safety and Security system shall be considered a part of the overall "Scope".

H. Coordinate with other contractors on items required for the proper functioning of Safety Security system and indicated as provided by others, such as power, backboxes, conduits, sleeves, air conditioning, structural support, etc..

I. Contractor shall participate in the commissioning process; including but not limited to meeting attendance, completion of checklists and participation in functional testing.

1.3 RELATED SECTIONS

A. Div 1 and conditions of the contract

B. Section 08 71 00 - Door Hardware

C. DIv 26 Electrical

D. Div 27 Communications

1.4 REFERENCES

M. Owner’s Design Guidelines and Construction Standards

N. Local, county, state and federal regulations and codes in effect as of date of installation.

1.5 COMPLETE FUNCTIONING OF WORK

A. All work fairly implied as essential to the complete functioning of the electrical systems shown on the Drawings and Specifications shall be completed as part of the work of this Division unless specifically stated otherwise. It is the intention of the Drawings and Specifications to establish the types of the systems, but not set forth each item essential to the functioning of the system. In case of doubt as to the work intended, or in the event of amplification or clarification thereof, the Contractor shall call upon the Architect for supplementary instructions, Drawings, etc.

B. Contractor shall review all pertinent Drawings and adjust his work to all conditions shown there on. Discrepancies between Plans, Specifications, and actual field conditions shall be brought to the prompt attention of the Architect.

1. Approximate location of Security devices, equipment cabinets, conduits and sleeves, etc. are indicated on the Drawings. However, the Drawings, do not give complete and accurate detailed locations of such items and exact locations must be determined by actual field measurement. Such locations will, at all times, be subject to the approval of the Architect.
2. Communicate with the Architect and secure his approval of any location about which there may be the least question. Outlets obviously placed in a location not suitable to the finished room or without specific approval, shall be removed and relocated when so directed by the Architect. Location of ceiling devices shall be coordinated with reflected ceiling plans.

C. Additional coordination with mechanical, electrical, plumbing contractor may be required to allow adequate clearances for all building components. Contractor to notify Architect and Engineer of unresolved clearances, conflicts or equipment locations.

1.6 DESCRIPTION OF SYSTEM WORK

A. Furnish and install all materials, tools, equipment, and services for all electronic security/surveillance devices to provide functioning systems in accordance with performance requirements specified and any modifications resulting from reviewed shop and field coordinated drawings.
   1. Access Control System
      a. This system replaces the typical mechanical key-controlled door lock with a door locking system that uses an access card as the access credential.
      b. The system includes an electric door-locking mechanisms, card reader located adjacent the door, door status sensor, door prop alarm and a request to exit device.
      c. Typical system configuration is card or schedule-controlled entry with free exiting.
   2. Intrusion Detection System
      a. This system monitors areas for unauthorized entrance or intruder.
      b. This system can consist of motion sensors, door status sensors, glass break sensors and one or more control keypads.
      c. The keypad is used to arm/disarm system by entering a numeric code on the keypad.
   3. Video Surveillance System
      a. This system is used to provide video surveillance through the use of cameras of security sensitive areas and target items.
      b. The system shall allow for the viewing and recording of images.

B. RACKS AND ENCLOSURES
   1. Wall mounted enclosures, data gathering panels, and power supply panels shall be installed as per manufacturer's requirements.
      a. Coordinate pathways and power with Electrical and Telecommunications Contractors
      b. Furnish all labor, materials, tools, equipment, and services for all control consoles, equipment racks, cabinets, and enclosures not provided by others in accordance with contract documents.
      c. Completely coordinate with work of other trades to avoid duplication in purchasing.
      d. Although such work is not specifically indicated, furnish and install all supplementary or miscellaneous items, and devices incidental to or necessary for a sound, secure and complete installation.
   2. Coordinate with rack/cabinet provider if it's indicated to be provided by others. Include them in scope of work if no other contractor is available or no indication that it is to be provided by others.
      a. Coordinate with G.C.
   3. The designated security space will provide an area reserved for rack and wall mounted security equipment.
      a. The rack area allows for vertical relay rack(s).
      b. Backboard wall area of 8'-0" X 8'-0" shall be reserved for wall-mounted components.
   4. Provide all supplementary or miscellaneous items and devices incidental to or necessary for a sound and complete installation.
   5. Drawings are representative and show general arrangement of systems and equipment, except when dimensioned or detailed.
      a. For exact locations refer to dimensioned architectural drawings.
         1) Field measurements take precedence over dimensioned drawings.
         2) Field verify locations and arrangement of all systems and equipment.
         3) Coordinate all work with other trades and Contractor.
   6. Circuit Supervision
      a. Supervise all signal and data transmission lines, links with other systems, and sensors.
         1) Indicate circuit and detection device faults with both protected zone and trouble signals.
         2) Initiate an alarm in response to opening, closing, or shorting of a signal or data transmission line.
   7. Electronic Safety and Security work as specified in this Section and sub sections shall include but not limited to:
      a. A project kick-off/pre-submittal meeting with the Architect, Designer, and Contractor to review security design package.
         1) Additional participants shall include:
            a) Division 8 subcontractors
            b) Division 26 subcontractors

b. Preparation of pre-installation submittals, including point-to-point wiring information for security equipment to interface to work by others prior to start of any installation work. Include lock permit requests in submittals for review.
c. Furnishing and installation of all devices, components and accessories.
d. The furnishing and coordination on installation of special back boxes for equipment and field devices as required.
e. Furnishing, installation and termination of all wiring and cabling including any special purpose wire and cable for electronic safety and security systems.
    1) Coordinate all phone, network and fiber optic cable interface provided by telecommunications subcontractor or carriers.
f. Coordinate raceway and power distribution systems provided by Division 26.
g. Provide and install 12/24 VAC/DC input power to all field devices as required.
h. Coordination with other trades and Owner required to facilitate the installation of the safety and security equipment including:
    1) Division 08 (doors)
    2) Division 26 (power, raceways, and fire alarms)
    3) Division 27 (telecommunications network interface).
i. Wiring and termination of electrified door hardware by security subcontractor shall be concurrent with the installation of these electrified components by the door hardware subcontractor.
j. Programming of all security control equipment and prior coordination with the Owner's security and telecommunications personnel, unless noted otherwise.
k. Preparation of "As-Built" documentation.
l. Warranty service for completed work.

1.7 SCHEMATIC NATURE OF CONTRACT DOCUMENTS

A. The contract documents are schematic in nature in that they are only to establish scope and a minimum level of quality. They are not to be used as actual working construction drawings. The actual working construction drawings shall be the approved shop drawings.

1.8 QUALITY ASSURANCE

A. Contractor shall have a complete working knowledge of the Security system being installed.

B. Maintain a valid Type B license from the Texas Private Security Bureau.

C. Contractor shall have installed similar-sized systems in at least ten (10) other projects in the last five (5) years prior to this bid and be regularly engaged in the business of installation of the types of systems specified in this document and maintain manufacturer certification for the system to be installed.

D. The security integrator must maintain an operating facility in the local area (50 mile radius) of the Project location to provide service to the Owner for the warranty period.
    1. At the Owners request for service, the security integrator shall dispatch a service technician to the location to affect the required repairs or adjustments.

E. The contractor shall maintain a spare parts inventory necessary to resolve component failures of the system.
    1. Refer to individual specification section for a list of specifically required parts provided to the owner and stored on site. These parts will become the property of the owner.
    2. At the end of the warranty period the Safety and Security integrator shall test the owner's spare parts and repair or replace as needed to bring the parts up to proper operation.

F. Contractor shall obtain Safety and Security system product manufacturer's certification if applicable.

G. Refer to General Conditions for other requirements.

1.9 CONTRACTOR REQUIREMENTS

A. In order to accomplish the conditions of this agreement, the Contractor shall perform the specific duties listed herein.

B. Contractor shall provide and pay for all labor, supervision, tools, equipment, test equipment, tests and services to provide and install a complete Safety and system. Pay all required sales, gross receipts, and other taxes.

C. Insurance
1. The Contractor shall procure, submit for review, and maintain for the duration of this agreement, insurance against claims for injuries to persons or damages to property which may arise from, or in connection with, the performance of work hereunder by the Contractor, his agents, representatives, employees or subcontractor. The Contractor shall pay the cost of such insurance.
2. The Owner, its directors, officers, representatives, agents and employees, respectively, shall have no responsibility to the Contractor with respect to any insurance in accordance with the provisions set forth herein.

D. Regulatory Requirements
1. Safety and Security Contractor shall supply all city, county, and state telecommunication cabling permits required by Authority Having Jurisdiction (AHJ).
2. Safety and Security Contractor shall be licensed and/or bonded as required for Safety and Security systems.

E. Privacy and Confidentiality
1. The Contractor will respect and protect the privacy and confidentiality of Owner, its employees, processes, products, and intellectual property to extent necessary, consistent with the legal responsibilities of the Owner policies.
2. Contractors shall sign a non-disclosure agreement and abide by the requirements to keep confidential all information concerning bid documents and this project.

F. Use of Subcontractors
1. Successful bidder shall inform the Owner’s contact and General Contractor in writing about the intention to use Subcontractors and the scope of work for which they are being hired.
2. The Owner or Owner’s designated contact must approve the use of Subcontractors in writing prior to the Subcontractor’s hiring and start of any work.

G. The Contractor’s designated Project Manager will be recognized as the single point of contact. The Project manager shall oversee all work performed to ensure compliance with specifications as outlined in bid documents (which includes all specifications, references, and drawings) to ensure a quality installation and attend project meetings with the telecommunication consultant, the Owner and others.

H. Coordination
1. Coordinate installation work with other trades (examples include ceiling grid contractors, HVAC and sheet metal contractors, etc.) to resolve procedures and installation placement for cable trays and cable bundle pathways.
2. The goal of this coordination will be to establish priority pathways for critical data/voice network cable infrastructure, materials, associated hardware, as well as mitigate delays to the project and to allow service access for Safety and Security components.
3. Exchange information and agree on details of equipment arrangements and installation interfaces.
4. Coordinate with electrical contractors and plan for the pathway routes used Safety and Security cabling to minimize cable lengths.
5. Record agreements with other trades and distribute record to other participants, Owner and telecommunication consultant.

1.10 GENERAL REQUIREMENTS

A. Upon completion of commissioning testing and Owner acceptance, DBR bears no liability or responsibility for the continued proper operation of the installed systems.

B. The Items described herein shall not be modified or substituted without consent of DBR and/or the Owner.

C. Electronic Safety and Security systems integrator (Safety and Security subcontractor) manager/supervisor shall attend meetings arranged by the Contractor, Architect, Owner or other parties affected by the work of this Section.

D. If the manufacturer of Safety and Security devices or connecting hardware has supplied post manufacture performance data, copies of such are to be kept for inclusion in the documentation and made available to the Owner upon request.

E. All materials are to be new unused and of the latest series of model number, unless otherwise indicated by the Owner or Safety and Security system designer.

F. All Safety and Security integrator personnel must be manufacturer certified and capable of an installation that falls under the manufacturer's guidelines necessary to obtain a manufacturer warranty.
   1. The integrator shall provide all components/materials essential for a complete and functional Safety and Security access and surveillance system.

G. Safety and Security integrator shall issue a 2-year warranty on installation and workmanship.

H. These Specifications and Drawings are intended for bidding purposes only; no part shall be copied or used for any purpose other than bidding on this project.
   1. This package shall be contractual upon bid award.

I. Drawings and Specifications are to be used in conjunction with one another and to supplement one another.
   1. In general Specifications determine the nature and quality of the materials and tests, and drawings establish the quantities, details and give characteristics of performance that should be adhered to in the installation of the Safety and Security system components.
   2. If there is an apparent conflict between the drawings and specifications, or within the specifications themselves, the items with greater quantity or quality shall be estimated and installed.
   3. Clarification with the Owner/Designer about these items shall be made prior to purchase and installation.
   4. Questions regarding the Specification or system requirements should be directed in writing to DBR or the Owner.

J. Safety and Security integrator shall adhere to Division 1 general requirements and written Safety and Security Specifications and Drawings within this construction package and shall be responsible for complying with all local, state and federal laws or regulations applicable to the work being performed, even though said law, rule or regulation is not identified herein.

K. Safety and Security integrator shall arrange and pay for any inspections required by the public agencies having jurisdiction in the area.

L. The Safety and Security contractor shall procure and maintain for the duration of this agreement, insurance against claims for injuries to persons or damages to property which may arise from, or conjunction with, the performance of the work hereunder by the Safety and Security integrator, his agents, representatives, or employees.
   1. The Safety and Security integrator shall pay the cost of such insurance.

M. The Safety and Security integrator will respect and protect the privacy and confidentiality of the Owner, his employees, processes, products, and intellectual property to the extent necessary, consistent with the legal responsibilities of the State of Texas and the Owner.

N. If required the Safety and Security integrator shall sign a non-disclosure agreement and abide by its requirements to keep confidential all information concerning bid documents and this Project.

O. Furnish submittals and manuals in accordance with Division 1.

P. Furnish a detailed material list complete with suppliers (distributors) list of components and distributors name, address, and phone number.

Q. Refer to Specifications issued by Architect, Division 1, for Project and cost payments.

1.11 DATE OF FINAL ACCEPTANCE

A. The date of final acceptance shall be the date of owner occupancy, or the date all punch list items have been completed or final payment has been received. Refer to Division One for additional requirements.

B. The date of final acceptance shall be documented in writing and signed by the architect, owner and contractor.

1.12 DEFINITIONS AND SYMBOLS

A. General Explanation: A substantial amount of construction and Specification language constitutes definitions for terms found in other Contract Documents, including Drawings which must be recognized as diagrammatic and schematic in nature and not completely descriptive of requirements indicated thereon. Certain terms used in Contract Documents are defined generally in this article, unless defined otherwise in Division 1.

B. Definitions and explanations of this Section are not necessarily either complete or exclusive, but are general for work to the extent not stated more explicitly in another provision of the Contract Documents.

C. Indicated: The term "Indicated" is a cross-reference to details, notes or schedules on the Drawings, to other paragraphs or schedules in the Specifications and to similar means of recording requirements in Contract Documents. Where such terms as "Shown", "Noted", "Scheduled", "Specified" and "Detailed" are used in lieu of "Indicated", it is for the purpose of helping the reader locate cross-reference material, and no limitation of location is intended except as specifically shown.

D. Directed: Where not otherwise explained, terms such as "Directed", "Requested", "Accepted", and "Permitted" mean by the Architect or Engineer. However, no such implied meaning will be interpreted to extend the Architect's or Engineer's responsibility into the Contractor's area of construction supervision.

E. Reviewed: Where used in conjunction with the Engineer's response to submittals, requests for information, applications, inquiries, reports and claims by the Contractor the meaning of the term "Reviewed" will be held to limitations of Architect's and Engineer's responsibilities and duties as specified in the General and Supplemental Conditions. In no case will "Reviewed" by Engineer be interpreted as a release of the Contractor from responsibility to fulfill the terms and requirements of the Contract Documents.

F. Furnish: Except as otherwise defined in greater detail, the term "Furnish" is used to mean supply and deliver to the project site, ready for unloading, unpacking, assembly, installation, etc., as applicable in each instance.

G. Install: Except as otherwise defined in greater detail, the term "Install" is used to describe operations at the project site including unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protection, cleaning and similar operations, as applicable in each instance.

H. Provide: Except as otherwise defined in greater detail, the term "Provide" is used to mean "Furnish and Install", complete and ready for intended use, as applicable in each instance.

I. Installer: Entity (person or firm) engaged by the Contractor or its subcontractor or Sub-contractor for performance of a particular unit of work at the project site, including unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protection, cleaning and similar operations, as applicable in each instance. It is a general requirement that such entities (Installers) be expert in the operations they are engaged to perform.

J. Imperative Language: Used generally in Specifications. Except as otherwise indicated, requirements expressed imperatively are to be performed by the Contractor. For clarity of reading at certain locations, contrasting subjective language is used to describe responsibilities that must be fulfilled indirectly by the Contractor, or when so noted by other identified installers or entities.

K. Minimum Quality/Quantity: In every instance, the quality level or quantity shown or specified is intended as minimum quality level or quantity of work to be performed or provided. Except as otherwise specifically indicated, the actual work may either comply exactly with that minimum (within specified tolerances), or may exceed that minimum within reasonable tolerance limits. In complying with requirements, indicated or scheduled numeric values are either minimums or maximums as noted or as appropriate for the context of the requirements. Refer instances of uncertainty to Owner or Engineer via a request for information (RFI) for decision before proceeding.

L. Abbreviations and Symbols: The language of Specifications and other Contract Documents including Drawings is of an abbreviated type in certain instances, and implies words and meanings which will be appropriately interpreted. Actual word abbreviations of a self-explanatory nature have been included in text of Specifications and Drawings. Specific abbreviations and symbols have been established, principally for lengthy technical terminology and primarily in conjunction with coordination of Specification requirements with notations on Drawings and in Schedules. These are frequently defined in Section at first instance of use or on a Legend and Symbol Drawing. Trade and industry association names and titles of generally recognized industry standards are frequently abbreviated. Singular words will be interpreted as plural and plural words will be interpreted as singular where applicable and where full context of Contract Documents so indicate. Except as otherwise indicated, graphic symbols and abbreviations used on Drawings and in Specifications are those recognized in construction industry for indicated purposes. Where not otherwise noted symbols and abbreviations are defined by 1993 ASHRAE Fundamentals Handbook, chapter 34 "Abbreviations and Symbols", ASME and ASPE published standards.

1.13 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

B. Deliver products to the project at such time as the project is ready to receive the equipment, pipe or duct properly protected from incidental damage and weather damage.

C. Damaged equipment shall be promptly removed from the site and new, undamaged equipment shall be installed in its place promptly with no additional charge to the Owner.

1.14 SUBMITTALS

A. Coordinate with Division 01 for submittal timetable requirements, unless noted otherwise within thirty (30) days after the Contract is awarded. The Contractor shall submit an electronic copy of a complete set of shop drawings and complete data covering each item of equipment or material. The submittal of each item requiring a submittal must be received by the Architect or Engineer within the above thirty day period. The Architect or Engineer shall not be responsible for any delays or costs incurred due to excessive shop drawing review time for submittals received after the thirty (30) day time limit. The Architect and Engineer will retain a copy of all shop drawings for their files. All literature pertaining to items subject to Shop Drawing submittal shall be submitted at one time. Submittals shall be placed in one electronic file in PDF format and bookmarked for individual specification sections. Individual electronic files of submittals for individual specifications shall not be permitted. Each submittal shall include the following items:
   1. A cover sheet with the names and addresses of the Project, Architect, MEP Engineer, General Contractor and the Subcontractor making the submittal. The cover sheet shall also contain the section number covering the item or items submitted and the item nomenclature or description.
   2. An index page with a listing of all data included in the Submittal.
   3. Product Data and Shop Drawings shall be submitted in separate submittals, to avoid rejection of one due to errors in the other.

B. Shop Drawings
   1. Safety and Security Contractor shall submit, for approval, floor plans that identify all device locations, device ID, cable routes and quantities, cable types, riser locations, and references to installation details and diagrams.
   2. A functional description of each system.
   3. All cable and wiring types for each device type used.
   4. Certification that lock wiring and access control systems requirements have been coordinated with electrified door hardware, fire alarm systems, automatic door controls, and overhead door controls specified in other sections and other packages.
   5. Riser diagram showing routes between floors or other areas that are not easily identified on the floor plans.
   6. Safety and Security One-line diagrams showing all input and output points of the system.
      a. The Contractor shall make any corrections required by the consultant team, file with him two corrected copies and furnish such other copies as may be needed.
   7. Power supply points listing with devices and maximum loads to prevent overloading.
   8. Equipment schedules listing all system components, manufacturer, model number and quantities of each.

9. Safety and Security Contractor shall submit, for approval, diagrams that show Safety and Security equipment layouts, rack layouts (including wall and rack elevations), cabling riser and interconnection diagrams, etc.
10. Safety and Security Contractor shall submit, for approval, labelling scheme for all Safety and Security devices and cabling components (faceplates, horizontal cables, riser cables, inter-building cables, racks, patch panels, etc.) installed.
11. The Contractor shall make any corrections as required by the Engineer and submit revised shop drawings to the team for approval.
12. Approval by the Engineer of such drawings or schedules shall not relieve the Contractor from responsibility for deviations from the drawings or specifications, nor shall it relieve the Contractor from responsibility for errors of any sort in shop drawings or schedules. Requests to deviate shall be submitted in writing to the Architect.
13. Drawings shall show the proposed firestop systems and locations, (stamped/embossed by the PE) to restore/maintain the designed fire rating of the building structure (walls, ceilings, floors, etc.).
14. Shop Drawings shall be newly prepared and not reproduced from the Contract Documents. Drawings shall be prepared by a draftsman skilled in this type of work. Submitting copy of the engineering drawings or engineering drawings with contractor's markup as shop drawings is NOT ACCEPTABLE.
15. Shop drawings shall be developed in coordination with other trades (MEP, Architecture, Structural, etc.) to avoid any collision or conflict and to meet all industry standards best practices, codes and regulation requirements. By submitting shop drawings on the project, this Contractor is indicating that all necessary coordination has been completed and that the systems, products and equipment submitted can be installed in the building and will operate as specified
16. Additional coordination with other trade contractors may be required to allow adequate clearances and meet code requirements. All transitions, offsets and relocations as required by actual field conditions shall be performed by the contractor at no additional cost to the owner

C. Product Data Submittals
1. Safety and Security Contractor shall submit catalogue cut-sheets that include manufacturer, trade name, and complete model number for each product specified. Model number shall be handwritten and/or highlighted to indicate exact selection.
2. Safety and Security Contractor shall identify applicable specification section reference for each product performance for each component specified for approval prior to purchase and installation.
3. Inlcude battery backup calculations to show load and back-up times for UPS and power supplies with batteries.
4. Include licenses and permit required, and qualifications and proof of work history (with references).
5. All data sheets shall be organized by specification sections and provided with table of contents. All products required shall be included in one submittal.
6. All product substitutions shall be submitted in advance for review and approval before being included in product submittal package.
7. Specification variations pages with a listing of all variations, including unfurnished or additional required accessories, items or other features, between the submitted equipment and the specified equipment. If there are no variations, then the specification page shall state "NO VARIATIONS". Where variations affect the work of other Contractors, then the Contractor shall certify on this page that these variations have been fully coordinated with the affected Contractors and that all expenses associated with the variations will be paid by the submitting Contractor. This page will be signed by the submitting Contractor.
8. Equipment information including manufacturer's name and designation, size, performance and capacity data as applicable. All applicable Listings, Labels, Approvals and Standards shall be clearly indicated.
9. Dimensional data and scaled drawings as applicable to show that the submitted equipment will fit the space available with all required Code and maintenance clearances clearly indicated and labeled at a minimum scale of 1/4" = 1'-0", as required to demonstrate that the alternate or substituted product will fit in the space available.
10. Identification of each item of material or equipment matching that indicated on the Drawings.
11. Sufficient pictorial, descriptive and diagrammatic data on each item to show its conformance with the Drawings and Specifications. Any options or special requirements or accessories shall be so indicated. All applicable information shall be clearly indicated with arrows or another approved method.

12. Certification by the General Contractor and Subcontractor that the material submitted is in accordance with the Drawings and Specifications, signed and dated in long hand. Submittals that do not comply with the above requirements shall be returned to the Contractor and shall be marked "REVISE AND RESUBMIT".

D. Warranty
1. The Safety and Security Contractor shall submit appropriate documentation from the certifying manufacturer showing the project is registered and qualified for the System Assurance Warranty.
2. All subsequent work shall be in accordance with approved submittals. The Safety and Security Contractor shall not perform any portion of the work requiring approval of the System Assurance Warranty manufacturer's warranty registration qualification procedures that would disqualify any part or all of the system from that warranty qualification.

E. Qualifications
1. Safety and Security Contractor shall submit a list of the Contractor's previous projects that demonstrate qualification for this project. This list shall include, but not be limited to:
   a. At least ten (10) other projects in the last five (5) years
   b. Name and location of project
   c. Project contacts, email addresses, and phone numbers
   d. Total square footage
   e. Total number of devices
   f. Types of system platform
2. Safety and Security Contractor shall submit an up-to-date and valid statement of qualifications for those assigned to perform the work specified herein at time of bid submission.
   a. Safety and Security Contractor Employees
   b. Subcontractors
3. Manufacturer certifications for Contractor and installers.

F. Samples
1. Provide sample of all visible devices such as camera mount, motion detectors, card reader, door contact, etc. for color selection and evaluation of technical specifications and requirements. Confirm with Architect, interior designer, and Owner representative for color selection before purchasing materials.

G. Refer to Division 1 for additional information on shop drawings and submittals.

H. Equipment and materials submittals and shop drawings will be reviewed for compliance with design concept only. It will be assumed that the submitting Contractor has verified that all items submitted can be installed in the space allotted. Review of shop drawings and submittals shall not be considered as a verification or guarantee of measurements or building conditions.

I. Where shop drawings and submittals are marked "REVIEWED", the review of the submittal does not indicate that submittals have been checked in detail nor does it in any way relieve the Contractor from his responsibility to furnish material and perform work as required by the Contract Documents.

J. Submittals shall be reviewed and returned to the Contractor with one of the following categories indicated:
1. REVIEWED: Contractor does not need to take further submittal action, shall include this submittal in the O&M manual, and verify with Architects and other parties (Owner, etc) reviewing the submittals that no other correction is required before placing orders and starting installations.
2. REVIEWED AS NOTED: Contractor shall submit a letter verifying that required exceptions to the submittal have been received and complied with including additional accessories or coordination action as noted, and shall include this submittal and compliance letter in the O&M manual. The contractor may order the equipment submitted on at the time of the returned submittal providing the Contractor complies with the exceptions noted, and verifed with Architects and other parties (Owner, etc) reviewing the submittals that no other correction is required before placing orders and starting installations.
3. NOT APPROVED: Contractor shall resubmit new submittal on material, equipment or method of installation when the alternate or substitute is not approved, the Contractor will automatically be required to furnish the product, material or method named in the Specifications and/or drawings. Contractor shall not order equipment that is not approved. Repetitive requests for substitutions will not be considered.and/or drawings. Contractor shall not order equipment that is not approved. Repetitive requests for substitutions will not be considered.

4. REVISE AND RESUBMIT: Contractor shall resubmit new submittal on material, equipment or method of installation when the alternate or substitute is marked revise and resubmit, the Contractor will automatically be required to furnish the product, material or method named in the Specifications and/or provide as noted on previous shop drawings. Contractor shall not order equipment marked revise and resubmit. Repetitive requests for substitutions will not be considered.
5. CONTRACTOR'S CERTIFICATION REQUIRED: Contractor shall resubmit submittal on material, equipment or method of installation. The Contractor's stamp is required stating the submittal meets all conditions of the contract documents. The stamp shall be signed by the General Contractor. The submittal will not be reviewed if the stamp is not placed and signed on all shop drawings.
6. MANUFACTURER NOT AS SPECIFIED: Contractor shall resubmit new submittal on material, equipment or method of installation when the alternate or substitute is marked manufacturer not as specified, the Contractor will automatically be required to furnish the product, material or method named in the specifications. Contractor shall not order equipment where submittal is marked manufacturer not as specified. Repetitive requests for substitutions will not be considered.

K. Materials and equipment which are purchased or installed without shop drawing review shall be at the risk of the Contractor and the cost for removal and replacement of such materials and equipment and related work which is judged unsatisfactory by the Owner or Engineer for any reason shall be at the expense of the Contractor. The responsible Contractor shall remove the material and equipment noted above and replace with specified equipment or material at his own expense when directed in writing by the Architect or Engineer.

L. Shop Drawing Submittals shall be complete and checked prior to submission to the Engineer for review.

M. Furnish detailed shop drawings, descriptive literature, physical data and a specification critique for each section indicating "compliance" and/or "variations" for the following items:
1. Fire Alarm System
2. Access Control System
3. Video Surveillance System
4. Intrusion Detection System

N. Refer to each specification section for additional requirements.

1.15 COORDINATION DRAWINGS

A. Before submit shop drawings, Contractor shall prepare coordination drawings to a scale of 1/4"=1'-0" or larger; detailing major elements, components, and systems of mechanical equipment and materials in relationship with other systems, installations, and building components. Indicate locations where space is limited for installation and access and where sequencing and coordination of installations are of importance to the efficient flow of the Work, including (but not necessarily limited to) the following:
1. Indicate the proposed locations of Safety and Security conduits/sleeves, pullboxes, equipment, cabinet and other materials. Include the following:
   a. Wall and type locations.
   b. Clearances from other building structure and MEP equipment.
   c. Clearances for servicing and maintaining equipment and cabling, and space for equipment disassembly required for periodic maintenance.
   d. Equipment connections and support details.
   e. Exterior wall and foundation penetrations.
   f. Fire-rated wall and floor penetrations.
   g. Sizes and location of required concrete pads and bases.
   h. Structural floor, wall and roof opening sizes and details.
2. Indicate scheduling, sequencing, movement, and positioning of large equipment into the building during construction.
3. Prepare floor plans, elevations, and details to indicate penetrations in floors, walls, and ceilings and their relationship to other penetrations and installations.
4. Prepare reflected ceiling plans to coordinate and integrate installations, air distribution devices, light fixtures, communication systems components, and other ceiling-mounted items.

B. This Contractor shall be responsible for coordination of all items that will affect the installation of the work of this Division. This coordination shall include, but not be limited to: cable routing, equipment location, clearance, space requirements, sequence of construction, building requirements and special conditions.

C. By submitting shop drawings on the project, this Contractor is indicating that all necessary coordination has been completed and that the systems, products and equipment submitted can be installed in the building and will operate as specified and intended, in full coordination with all other Contractors and Subcontractors.

1.16 OPERATION AND MAINTENANCE MANUALS

A. Prepare maintenance manuals in accordance with Division 1 and in addition to the requirements specified in Division 1, include the following information for equipment items:
   1. Description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and commercial numbers of replacement parts.
   2. Manufacturer's printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions; and summer and winter operating instructions.
   3. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions.
   4. Servicing instructions and lubrication charts and schedules.
   5. Prepare maintenance manuals in accordance with Special Project Conditions, in addition to the requirements specified in Division 28, include the following information for equipment items:
      a. Identifying names, name tags designations and locations for all equipment.
      b. Fault Current calculations and Coordination Study.
      c. Reviewed shop drawing submittals with exceptions noted compliance letter.
      d. Fabrication drawings.
      e. Equipment and device bulletins and data sheets clearly highlighted to show equipment installed on the project and including performance curves and data as applicable, i.e., description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and model numbers of replacement parts.
      f. Manufacturer's printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions; and summer and winter operating instructions.
      g. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions, servicing instructions and lubrication charts and schedules.
      h. Equipment name plate data.
      i. Wiring diagrams.
      j. Exploded parts views and parts lists for all equipment and devices.
      k. Color coding charts for all painted equipment and conduit.
      l. Location and listing of all spare parts and special keys and tools furnished to the Owner.
      m. Furnish recommended lubrication schedule for all required lubrication points with listing of type and approximate amount of lubricant required.
   6. The Safety and Security Contractor shall deliver the Installer's Warranty and Manufacturer's signed System Warranty.
      a. Delivery shall be completed within two (2) weeks of the time of final punch list review.
      b. Product Certificates shall be signed by manufacturers certifying that products furnished comply with requirements.
   7. Testing Report Requirements
      a. Submit certified test reports of Contractor-performed tests. Contractor shall submit the required Test Reports in the format and media specified, upon completion of testing the installed system.
      b. The tests shall clearly demonstrate that the media and its components fully comply with the requirements specified herein.
      c. Three (3) sets of electronic and hardcopy versions of test reports shall be submitted together and clearly identified with cable designations.
   8. Supply Owner with training manuals with instructions on methods of adding or removing cabling to/from firestopped sleeves and chases.

1.17 RECORD DRAWINGS

A. Maintain a continuous record during the course of construction of all changes and deviations in the work from the contract drawings. Upon completion of the work, purchase a set of "Auto Positive Tracings" on vellum and make corrections as required to reflect the electrical systems as installed. Location and size of all conduit shall be accurately shown to dimension. Submit three prints of the tracings for approval. Make corrections to tracings as directed and deliver "Auto Positive Tracings" to the Architect. Record drawings shall be furnished in addition to shop drawings. Symbols on the Record drawings shall correspond to the identification symbols on the contract drawings and equipment identification plates and tags.

B. The Contractor shall maintain a set of clearly marked black line record "AS-BUILT" prints on the job site on which he shall mark all work details, alterations to meet site conditions and changes made by "Change Order" notices. These shall be kept available for inspection by the Owner, Architect or Engineer at all times.

C. Refer to Division 1 for additional requirements concerning record drawings. If the Contractor does not keep an accurate set of as-built drawings, the pay request may be altered or delayed at the request of the Architect. Mark the drawings with a colored pencil. Delivery of as-built prints and reproducibles is a condition of final acceptance.

D. The record prints shall be updated on a daily basis and shall indicate accurate dimensions for all buried or concealed work, precise locations of all concealed device and cabling, and any deviations from the work shown on the Construction Documents which are required for coordination. All dimensions shall include at least two dimensions to permanent structure points.

E. Submit three prints of the tracings for approval. Make corrections to tracings as directed and delivered "Auto Positive Tracings" to the architect. "As-Built" drawings shall be furnished in addition to shop drawings.

F. When the option described in paragraph E., above is not exercised then upon completion of the work, the Contractor shall transfer all marks from the submit a set of clear concise set of reproducible record "AS-BUILT" drawings and shall submit the reproducible drawings with corrections made by a competent draftsman and three (3) sets of black line prints to the Architect or Engineer for review prior to scheduling the final inspection at the completion of the work. The reproducible record "AS-BUILT" drawings shall have the Engineers Name and Seal removed or blanked out and shall be clearly marked and signed on each sheet as follows:

CERTIFIED RECORD DRAWINGS
DATE:
(NAME OF GENERAL CONTRACTOR)
BY:_____
(SIGNATURE)
(NAME OF SUBCONTRACTOR)
BY:_____
(SIGNATURE)

1.18 CERTIFICATIONS AND TEST REPORTS

A. Submit a detailed schedule for completion and testing of each system indicating scheduled dates for completion of system installation and outlining tests to be performed and schedule date for each test. This detailed completion and test schedule shall be submittal at least 90 days before the projected Project completion date.

B. Test result reporting forms shall be submitted for review no later than the date of the detailed schedule submitted.

C. Submit 4 copies of all certifications and test reports to the Architect or Engineer for review adequately in advance of completion of the Work to allow for remedial action as required to correct deficiencies discovered in equipment and systems.

D. Certifications and test reports to be submitted shall include, but not be limited to those items outlined in Section of Division 28.

1.19 OPERATOR TRAINING

A. The Contractor shall furnish the services of factory trained specialists to instruct the Owner's operating personnel. The Owner's operator training shall include 12 hours of onsite training in three 4 hour shifts.

B. Before proceeding with the instruction of Owner Personnel, prepare a typed outline in triplicate, listing the subjects that will be covered in this instruction, and submit the outline for review by the Owner. At the conclusion of the instruction period obtain the signature of each person being instructed on each copy of the reviewed outline to signify that he has a proper understanding of the operation and maintenance of the systems and resubmit the signed outlines.

C. Refer to other Division 28 Sections for additional Operator Training requirements.

1.20 SITE VISITATION

A. Visit the site of the proposed construction in order to fully understand the facilities, difficulties and restriction attending the execution of the work.

B. Before submitting a bid, it will be necessary for each Contractor whose work is involved to visit the site and ascertain for himself the conditions to be met therein in installing his work and make due provision for same in his bid. It will be assumed that this Contractor in submitting his bid has visited the premises and that his bid covers all work necessary to properly install the equipment shown. Failure on the part of the Contractor to comply with this requirement shall not be considered justification for the omission or faulty installation of any work covered by these Specifications and Drawings.

C. Understand the existing utilities from which services will be supplied; verify locations of utility services, and determine requirements for connections.

D. Determine in advance that equipment and materials proposed for installation fit into the confines indicated.

1.21 WARRANTY

A. The undertaking of the work described in this Division shall be considered equivalent to the issuance, as part of this work, of a specific guarantee extending one year beyond the date of completion of work and acceptance by Owner, against defects in materials and workmanship. Materials, appliances and labor necessary to effect repairs and replacement so as to maintain said work in good functioning order shall be provided as required. Replacements necessitated by normal wear in use or by Owner's abuse are not included under this guarantee.

B. See requirements in Division 1 Specifications.

C. The Security Integrator shall warrant all completed work, including all materials and labor, to be free from defects in design, workmanship, and/or materials for a period of two (2) years from final acceptance date.
   1. System acceptance is defined as the completion of all functional performance testing and the resolution of all punch list items.

D. Warranty Service
   1. In the event that defects in the materials and/or workmanship are identified during the warranty period, the contractor shall provide all labor and materials to correct the deficiency.
   2. All service work shall be performed by factory certified technicians.
   3. All warranty service shall include the replacement of all parts and or components as required to restore normal system operation.
      a. If parts or components need to be repaired, a loaner will be supplied and installed until the part or component can be repaired and reinstalled.
   4. Immediately following a warranty service request, the Contractor shall provide written documentation to Owner which details the service work completed, cause of trouble, and any outstanding work required to restore a complete and normal system.

E. Warranty service requests shall be responded to within 4 hours of notification with a qualified service technician on site.

F. All repairs shall be completed within 48 hours upon site arrival.
   1. If the failure exceeds 48 hours, the Owner reserves the right to require the contractor provide on-site manufacturer support at no additional cost to Owner.

G. Extended warranties on equipment components offered by the manufacturer shall be passed through to the Owner.
   1. Warranty provisions shall be fully transferable only at the direction of the Owner, in the event that ownership of the installed security systems is transferred.

1.22 TRANSFER OF ELECTRONIC FILES

A. Project documents are not intended or represented to be suitable for reuse by Architect/Owner or others on extensions of this project or on any other project. Any such reuse or modification without written verification or adaptation by Engineer, as appropriate for the specific purpose intended, will be at Architect/Owner's risk and without liability or legal exposure to Engineer or its consultants from all claims, damages, losses and expense, including attorney's fees arising out of or resulting thereof.

B. Because data stored in electric media format can deteriorate or be modified inadvertently, or otherwise without authorization of the data's creator, the party receiving the electronic files agrees that it will perform acceptance tests or procedures within sixty (60) days of receipt, after which time the receiving party shall be deemed to have accepted the data thus transferred to be acceptable. Any errors detected within the sixty (60) day acceptance period will be corrected by the party delivering the electronic files. Engineer is not responsible for maintaining documents stored in electronic media format after acceptance by the Architect/Owner.

C. When transferring documents in electronic media format, Engineer makes no representations as to the long term compatibility, usability or readability of documents resulting from the use of software application packages, operating systems, or computer hardware differing from those used by Engineer at the beginning of the Project.

D. Any reuse or modifications will be Contractor's sole risk and without liability or legal exposure to Architect, Engineer or any consultant.

E. The Texas Board of Architectural Examiners (TBAE) has stated that it is in violation of Texas law for persons other than the Architect of record to revise the Architectural drawings without the Architect's written consent.
   1. It is agreed that "MEP" hard copy or computer-generated documents will not be issued to any other party except directly to the Architect/Owner. The contract documents are contractually copyrighted and cannot be used for any other project or purpose except as specifically indicated in AIA B-141 Standard Form of Agreement Between Architect and Owner.
   2. If the client, Architect or Owner of the project requires electronic media for "record purposes", then AutoCAD/ Revit documents will be prepared by Engineer on electronic media such as removable memory devices, flash drives or CD's. These documents can also be submitted via file transfer protocols. AutoCAD/ Revit files will be submitted with all title block references intact to permit the end user to only view and plot the drawings. Revisions will not be permitted in this configuration.
   3. At the Architect/Owner's request, Engineer will assist the Contractor in the preparation of the submittals and prepare one copy of AutoCAD/ Revit files on electronic media or submit through file transfer protocols. The electronic media will be prepared with all indicia of documents ownership removed. The electronic media will be prepared in a ".rvt" or ".dwg" format to permit the end user to revise the drawings.

1.23 PRE-INSTALLATION MEETINGS

A. Safety and Security Contractor shall attend and/or arrange a scheduled pre-installation conference prior to beginning any work of this section. This venue is to ask and clarify questions in writing with consultant and/or project manager/Owner representative.
   1. Agenda
      a. Safety
      b. Work to be performed
      c. Scheduling
      d. Coordination
      e. Other topics as necessary
   2. Attendance
      a. Safety and Security project manager/supervisor shall attend meetings arranged by General Contractor, Owner's representatives, and other parties affected by work of this document.

b. All individuals who will serve in an on-site supervisory capacity, including project managers, site supervisors, and lead installers, shall be required to attend the pre-installation conference.
c. Individuals who do not attend the conference will not be permitted to supervise the installation and testing of Safety and Security cables on the project.

1.24 CONTRACT ADMINISTRATION

A. The Engineer may perform site visits and provide job field reports upon inspection of Contractor's installation, materials, supporting hardware, coordination with other trades and progress to schedule to the client.

B. Job Field Report outline:
1. General: The general installation progress in relation to scheduled work made by the Contractor up to that date.
2. Deficiencies and/or Items of Note: Documents observations of the cable installation that may require corrective action by the Contractor.

1.25 POST INSTALLATION MEETINGS

A. At the time of substantial completion the contractor shall call and arrange for a post installation meeting to present and review all submittal documents to include but not be limited to As-Built Drawings, Test reports, Warranty paperwork, etc.

B. Attendees shall include
a. Safety and Security Contractor
b. Project Manager/Owner Representative
c. General Contractor
d. Safety and Security Engineer.
e. Other trades that the GC deems appropriate.

C. At this meeting the Safety and Security Contractor shall present and explain all documentation.

D. Any discrepancies or deviations noted by and agreed to by participants shall be remedied by the Safety and Security Contractor and resubmitted within one (1) week of the meeting.

PART 2 - PRODUCTS

2.1 SUBSTITUTIONS

A. The names and manufacturers and model numbers have been used in the Contract documents to establish types of equipment and standards of quality. Where more than one manufacturer is named for a specific item of equipment, only one of the specified manufacturers will be considered for approval. Where only one manufacturer is mentioned with the phrase "or approved equal", Contractor may submit an alternate manufacturer for consideration, provided the following conditions are met:
1. Submit alternate equipment with complete descriptive data in shop drawing form. Provide sample of equipment upon request for review by Architect. Samples will be returned if requested in writing.
2. Alternate equipment must be equal from the standpoint of materials, construction and performance.
3. Alternate submittal must be presented to the Engineer/Architect ten (10) days prior to bid date for approval.

B. The Architect and Engineer shall be the sole judge of quality and equivalence of equipment, materials and methods.

2.2 GENERAL REQUIREMENTS

A. All materials and products used on this project shall be listed by Underwriters' Laboratories.

B. Equipment and materials shall be standard products of a manufacturer regularly engaged in the manufacture of Safety and Security cabling products and shall be the manufacturer’s latest standard design in satisfactory use for at least one year prior to bid opening.

C. All material and equipment, as provided, should be the standard Commercial-Off-The-Shelf (COTS) products of a manufacturer engaged in the manufacturing of such products.
   1. All shall be typical commercial designs that comply with the requirements specified.
   2. All material and equipment shall be readily available through manufacturers and/or distributors.

D. Installer is to comply in every way with the requirements of local laws, ordinances, and rules, the National Board of Fire Underwriters, and the National Electrical Code.

E. In the event of any conflicts between documents referenced herein and the contents of this specification, the Installer is to notify in writing to the Architect/Engineer of any such occurrences before the purchasing of any equipment, materials and/or installation by the Installer. The Architect/Engineer will notify the Installer of any actions required to resolve these conflicts.

F. No change in the plans or in the specifications is to be made without written instruction to do so from the Owner or Architect/Engineer.

G. Materials are to be installed in accordance with manufacturer's recommendations and best industry practices.

H. The Installer is to promptly correct all discrepancies and/or defects for which the Installer is responsible.

I. The Installer is to maintain a set of working specifications and drawings on site at all times and to make this set available for inspection during site visits.

J. All materials are to be new and of the highest quality.

K. All products installed in the above ceiling space are to meet or exceed the Underwriters Laboratories (UL) fire rated cable insulation requirements and are to be Plenum rated.

L. The Installer is to seal ALL penetrations, conduits, sleeves, cable trays, etc., where cabling has been installed through rated walls/floors with Wiremold Flamestopper intumescent fire- stop system (or approved equivalent) where they pass through rated walls. The Installer is responsible for returning any and all penetrations through rated walls or floors made for Safety and Security cable to their pre-penetration rating.
   1. All material used to dress cable bundles shall be applied loosely to allow the dressing material to slide around the bundle. Tension of dressing materials shall not deform the cable sheath. Dressing materials should be limited to the Safety and Security rooms only. Cabling shall be placed unbundled in cable tray and/or j hooks in the above ceiling spaces. No bundling materials are to be used above ceiling. All j hooks installed shall include the corresponding clip provided by the hook manufacturer. Plastic cable ties will not be permitted.

M. Any discrepancy in the contract documents is to be remedied by the Installer providing and installing the newer, greater quality or quantity of the item or items in question.

N. A pull cord (nylon; 1/8" minimum) shall be co-installed with all cable installed in any conduit.

O. Provide nylon bushings for all conduit openings.

P. All horizontal cables not in a cable tray or conduit shall be supported at a maximum of 48 to 60 inch intervals. Cable support system is to be independent of supports for other trades. At no point shall cable(s) make contact with acoustic ceiling supports, grids, panels, electrical conduits, water pipes or HVAC ductwork or supports.

Q. Any cable damaged or exceeding recommended installation parameters during installation shall be replaced by the installer prior to final acceptance at no cost to the Owner.

2.3 ACCESS DOORS

A. Wherever access is required in walls or ceilings to concealed junction boxes, pull boxes, equipment, etc., installed under this Division, furnish a hinged access door and frame with flush latch handle to another Division for installation. Doors shall be as follows:
   1. Plaster Surfaces: Milcor Style K.
   2. Ceramic Tile Surfaces: Milcor Style M.
   3. Drywall Surfaces: Milcor Style DW.
   4. Install panels only in locations approved by the Architect.

2.4 FIRE STOPPING

A. Contractor shall restore the fire rating of penetrations to rated walls, ceiling, flooring after cable pulling. Fire stopping products shall be as follows:
   1. Hilti
   2. SpecSeal
   3. 3M
   4. Owner approved alternate

2.5 IDENTIFICATION (LABELING) SYSTEM

A. Contractor shall label al communications system components installed. Labeling products shall be as follows:
   1. Brady (LAT-19-361-4)
   2. Dymo
   3. Hellerman-Tyton
   4. Owner approved alternate

2.6 ESCUTCHEONS

A. Provide heavy chrome or nickel-plated plates, of approved pattern, on conduit passing through walls, floors and ceilings in finished areas. Where conduit passes through a sleeve, no point of the conduit shall touch the building construction. Caulk around such conduit with sufficient layers of two hour rated firesafing by Thermafiber 4.0 P.C.F. density, U.S.G. fire test 4/11/78 and seal off openings between conduit and sleeves with non-hardening mastic prior to application of escutcheon plate. Escutcheons shall be Gravler Sure-Lock, or approved equal.

2.7 SPACE LIMITATIONS

A. Equipment shall be chosen which shall properly fit into the physical space provided and shown on the drawings, allowing ample room for access, servicing, removal and replacement of parts, etc. Adequate space shall be allowed for clearances in accordance with Code requirements. Physical dimensions and arrangement of equipment shall be subject to the approval of the Architect.

2.8 PAINTING

A. All factory assembled equipment shall be delivered with a hard surface factory applied finish such as baked-on machinery enamel which will not require additional field painting. The finish shall consist of not less than 2 coats of medium gray color paint USA No. 61 Munsell Notation 8-3G, 6. 10/0.54 enamel. This Contractor shall protect this finish from damage due to construction operations until acceptance of the building. He shall be responsible for satisfactorily restoring any such finishes or replacing equipment that becomes stained or damaged.

PART 3 - EXECUTION

3.1 PREPARATION

A. Field Measurements
   1. Verify dimensions in areas of installation by field measurements before fabrication and indicate measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delaying the work.

B. Established Dimensions
   1. Where field measurements cannot be made without delaying the work, coordinate with the General Contractor to establish dimensions.
   2. When approved in writing, proceed with fabricating units without field measurements.
   3. Coordinate supports, adjacent construction, and fixture locations to ensure actual dimensions correspond to established dimensions.

C. Pre-installation inspection
   1. The Contractor shall visually inspect all cables, cable reels, and shipping cartons to detect possible cable damage incurred during shipping and transport.

2. Visibly damaged goods are not acceptable and shall be replaced by the contractor at no additional cost to the Owner.

3.2 DEMOLITION AND REMODELING

A. Where only portions of the existing Safety and Security system are to be modified as part of the renovation and addition project, devices related to or part of this system outside of the renovation area shall be kept in operations.

B. The Drawings do not show all demolition work required. The Contractor shall make himself familiar with the required scope of work to accomplish the work required by these documents. All demolition work implied or required shall be included in the scope of this contract.

C. Utility service outages required by the new installation will be permitted but only at a time approved by the Owner. The Contractor shall allow the Owner two (2) weeks in order to schedule required outages. The time allowed for outages will not be during normal working hours unless otherwise approved by the Owner. All costs of outages, including overtime charges, shall be included in the contract amount.

D. The contractor shall perform a preconstruction walk thru of the site to observe and test the existing systems for operation. The owner assumes that the system is 100% operational and functioning prior to the commencement of construction. If any portion of the system observed or tested to be non-functional or inoperable at the commencement of the project will be noted by the contractor. A written report will be generated by the contractor noting their findings and submitted to the project team for review and handling. The owner will determine if the items found to be non-functional are to be repaired by contractor or repaired by the owner. If this repair of the equipment found to be non-functional is to be added to the contractor’s scope of work the contract amount for the Work shall be adjusted accordingly.

E. Work Sequence and Timing. The Owner will cooperate with the Contractor; however, the following provisions must be observed:
1. During the construction of this project, normal facility activities will continue in existing buildings until new buildings or renovated areas are completed. Plumbing, fire protection, lighting, electrical, Safety and Security, heating, air conditioning, and ventilation systems shall be maintained in service within the occupied spaces of the existing building.
2. A meeting will be held at the project site, prior to any construction, between the Owner's Representative, the General Contractor, the Subcontractors and Sub-subcontractors, and the Engineer to discuss Contractor's employee parking space, access, storage of equipment or materials, and use of the Owner's facilities or utilities. The Owner's decisions regarding such matters shall be final.

F. In the preparation of these documents every effort has been made to show the approximate locations of, and connections to the existing safety and security devices and headend equipment. However, this Contractor shall be responsible for verifying all of the above information. This Contractor shall visit the existing site to inspect the facilities and related areas. This Contractor shall inspect and verify all details and requirements of all the Contract Documents, prior to the submission of a proposal. All discrepancies between the Contract Documents and actual job-site conditions shall be resolved by the contractor, who shall produce drawings which shall be submitted to the Architect/Engineer for review. All labor and materials required to perform the work described shall be a part of this Contract.

G. All equipment and/or systems noted on the Drawings "To Remain" shall be inspected and tested on site to certify its working condition. A written report on the condition of all equipment to remain, including a copy of the test results and recommended remedial actions and costs shall be made by this Contractor to the Architect/Engineer for review.

H. All equipment and/or systems noted on the Drawings "To Be Removed" should be removed including, associated pipe and duct, pipe and duct hangers and/or line supports. Where duct or pipe is to be capped for future or end of line use, it shall be properly tagged with its function or service appropriately identified. Where existing equipment is to be removed or relocated and has an electric motor or connection, the Electrical Contractor shall disconnect motor or connection, remove wiring to a safe point and this Contractor shall remove or relocate motor or connection along with the equipment.

I. During construction and remodeling, portions of the Project shall remain in service. Construction equipment, material, tools, extension cords, etc., shall be arranged so as to present minimum hazard or interruption to the occupants of the building. None of the construction work shall interfere with the proper operation of the existing facility; or be so conducted as to cause harm or danger to persons on the premises. All fire exits, stairs or corridors required for proper access, circulation or exit shall remain clear of equipment, materials or debris. The General Contractor shall maintain barricades, other separations in corridors and other spaces where work is conducted.

J. Certain work during the demolition and construction phases may require overtime or night time shifts or temporary evacuation of the occupants. Coordinate and schedule all proposed down time with the Owner at least seventy-two (72) hours in advance in writing.

K. Any salvageable equipment as determined by the Owner, shall be delivered to the Owner, and placed in storage at the location of his choice. All other debris shall be removed from the site immediately.

L. Equipment, piping or other potential hazards to the occupants of the building shall not be left overnight outside of the designated working or construction area.

M. Make every effort to minimize damage to the existing building and the Owner's property. Repair, patch or replace as required any damage which occurs as a result of work at the site. Care shall be taken to minimize interference with the Owner's activities during construction and to keep construction disrupted areas to a minimum. Coordinate with the Owner and other trades in scheduling and performance of the work.

N. When applicable, Include in the contract price all rerouting of existing backbone cabling, , etc., and the reconnecting of the existing equipment as necessitated by field conditions to allow the installation of the new systems regardless of whether or not such rerouting, reconnecting or relocating is shown on the drawings. Furnish all temporary pipe, duct, controls, etc., as required to maintain heating, cooling, and ventilation services for the existing Safety and Security rooms in areas scheduled to remain operational with a minimum of interruption.

O. All existing cabling, equipment, controls and appurtenances not included in the remodel or alteration areas are to remain in place.

P. Cabling and equipment serving Safety and Security system which is to remain but which is served by pipe, duct, equipment and controls that are disturbed by the remodeling work, shall be reconnected in such a manner as to leave this equipment in proper operating condition.

Q. It is the intention of this Section of the Specifications to outline minimum requirements to furnish the Owner with a turn-key and operating system in cooperation with other trades with a minimum of disruption or downtime.

R. Refer to Architectural Demolition and/or Alteration plans for actual location of walls, ceilings, etc., being removed and/or remodeled.

S. Field verify measurements, and cabling arrangements are as shown on Drawings.

T. Verify that scheduled cabling and equipment serving only those abandoned devices to be demolished and removed in its entirety.

U. Demolition Drawings are based on casual field observation and existing Record Documents. Report discrepancies to Architect and Engineer before disturbing existing installation.

V. Beginning of demolition means that the contractor accepts existing conditions.

W. Demolish and extend existing Safety and Security work under provisions of Division 02 and this Section.

X. Remove, relocate, and extend existing systems to accommodate new construction.

Y. Remove abandoned cabling to source of origination point. Remove racks and other equipment as scheduled on the drawings.

Z. Remove exposed / abandoned cabling systems, including abandoned systems above accessible ceiling finishes. Cut systems flush with walls and floors, and patch surfaces.

AA. Repair adjacent construction and finishes damaged during demolition and extension work.

BB. Maintain access to existing systems which remain active. Modify installation or provide access doors as appropriate.

CC. Extend existing systems using materials and methods compatible with existing systems, or as specified.

DD. Clean and repair existing materials and equipment which remain or are to be reused. The Contractor shall modify, remove, and/or relocate all materials and items so indicated on the Drawings or required by the installation of new facilities. All removals and/or dismantling shall be conducted in a manner as to produce maximum salvage. Salvage materials shall remain the property of the Owner, and shall be delivered to such destination as directed by the Owner. Materials and/or items scheduled for relocation and which are damaged during dismantling or reassembly operations shall be repaired and restored to good operating condition. The Contractor may, at his discretion and upon the approval of the Owner, substitute new materials and/or items of like design and quality in lieu of materials and/or items to be relocated.

EE. All items which are to be relocated shall be carefully removed in reverse to original assembly or placement and protected until relocated. The contractor shall clean and repair and provide all new materials, fittings, and appurtenances required to complete the relocations and to restore to good operative order. All relocations shall be performed by workmen skilled in the work and in accordance with standard practice of the trades involved.

FF. When items scheduled for relocation are found to be in damaged condition before work has been started on dismantling, the Contractor shall call the attention of the Owner to such items and receive further instructions before removal. Items damaged in repositioning operations are the Contractor's responsibility and shall be repaired or replaced by the Contractor as approved by the Owner, at no additional cost to the Owner.

GG. Service lines and wiring to items to be removed, salvaged, or relocated shall be removed to points indicated on the Drawings, specified, or acceptable to the Owner. Service lines and wiring not scheduled for reuse shall be removed to the points at which reuse is to be continued or service is to remain. Such services shall be sealed, capped, or otherwise tied-off or disconnected in a safe manner acceptable to the Owner. All disconnections or connections into the existing facilities shall be done in such a manner as to result in minimum interruption of services to adjacent occupied areas. Services to existing areas or facilities which must remain in operation during the construction period shall not be interrupted without prior specific approval of the Owner as hereinbefore specified.

HH. The Contractor shall be responsible for loss or damage to the existing facilities caused by him and his workmen, and shall be responsible for repairing such loss or damage. The Contractor shall send proper notices, make necessary arrangements, and perform other services required for the care, protection and in-service maintenance of all electrical services for the new and existing facilities. The Contractor shall erect temporary barricades, with necessary safety devices, as required to protect personnel from injury, removing all such temporary protection upon completion of the work.

II. Where existing construction is removed to provide working and extension access to existing utilities, Contractor shall remove doors, piping, conduit, outlet boxes, wiring, light fixtures, air conditioning ductwork and equipment, etc., to provide this access and shall reinstall same upon completion of work in the areas affected.

JJ. Where partitions, walls, floors, or ceilings of existing construction are being removed, all contractors shall remove and reinstall in locations approved by the Architect all devices required for the operation of the various systems installed in the existing construction.

3.3 INSTALLATION

A. General
   1. Contractor shall install work in accordance with specifications, drawings, manufacturer’s instructions and approved submittal data.

B. Allowable cable bend radius and pull tension:
   1. Refer to cable manufacturer's bend radius recommendations for the maximum allowable limits.
   2. After installation, exposed cable and other surfaces must be cleaned free of lubricant residue. Use only lubricants specifically designed for cable installation.

C. Pull Strings
   1. Provide pull strings in all new conduits, including all conduits with cable installed (trailer strings) as part of this contract.
   2. Data and video cables can be pulled in tandem with pull strings.
   3. The pull strings must move freely to prevent cable jacket/cable damage during pulls.

3.4 EXCAVATING AND BACKFILLING

A. Trenching and backfilling and other earthwork operations required to install the facilities specified herein shall conform to the applicable requirements of Division 2 (95% of maximum standard density). Where trenching or excavation is required in improved areas, the backfill shall be compacted to a condition equal to that of adjacent undisturbed earth and the surface of the area restored to the condition existing prior to trenching or excavating operations. Provide a minimum of 3” of sand underneath all conduits. The plans indicate information pertaining to surface and sub-surface obstructions; however, this information is not guaranteed. Should obstructions be encountered whether or not shown, the Contractor shall alter routing of new work, reroute existing lines, remove obstructions where permitted, or otherwise perform whatever work is necessary to satisfy the purpose of new work and leave existing surfaces and structures in a satisfactory and serviceable condition. All work shall comply with OSHA Standards.

3.5 WORKMANSHIP AND CONCEALMENT

A. The work of this Section shall be performed by workman skilled in their trade. Installation shall be consistent in completeness whether concealed or exposed. Each item of Electronic Safety and Security work shall be concealed in walls, chases, under floors and above ceilings except:
   1. Where shown to be exposed.
   2. Where exposure is necessary to the proper function.

3.6 SLEEVES, CUTTING AND PATCHING

A. This section shall be responsible for placing sleeves for all conduit passing through walls, partitions, sound walls, beams, floors, roof, etc. Sleeves through below-grade walls shall use water-tight fitting manufactured by O-Z/Gedney.

B. All cutting and patching will be done under another Division, but this Section will be responsible for timely performance of this work and layout of holes and setting sleeves.

C. All un-used sleeves shall be sealed with 2-hour UL approved fire sealant manufactured by “3M” or approved equal.

3.7 LABELING

A. Cable labels: Self-adhesive vinyl or vinyl-cloth wraparound tape markers, machine printed with alphanumeric cable designations.

B. Flat-surface labels: Self-adhesive vinyl or vinyl-cloth labels, machine printed with alphanumeric cable designations.

C. Provide transparent plastic label holders, and 4-pair marked colored labels.

D. In accordance with ANSI/TIA-606-B "Administration Standard for Commercial Telecommunications Infrastructure":
   1. Install colored labels according to the type of field as per color code designations.
   2. Use “designation strip color-code guidelines for voice, data, cross-connect, riser, and backbone fields”.

E. Pathway Labels and Labeling System
   1. Labeling system shall consist of a hand-held portable printer
   2. Conduits: General-purpose label designed for powdered coated surfaces with an ultra-aggressive adhesive. Label size shall be appropriate for the conduit size. Font size shall be legible from the finished floor.
   3. Inner duct: Polyethylene general-purpose tagging material attached using tie wraps.
   4. Junction boxes: General-purpose label designed for powdered coated surfaces with an ultra-aggressive adhesive, trade name. Font size shall be easily visible from the finished floor.
   5. All labels shall be permanent, i.e. will not fade, peel, or deteriorate due to environment or time.
   6. Identification
      a. All conduits, junction boxes, gutters, and pull boxes shall have machine-generated labels easily visible from the finished floor.
      b. Conduits shall be labeled with the word “Security” and the conduit’s origination room number and destination room number.

c. The Contractor shall label conduit at each wall and floor penetration and at each conduit termination, such as outlet boxes, pull boxes, and junction boxes, or as otherwise specified in other sections.
d. Junction boxes, gutters and pull boxes shall be labeled with identification name or number as determined by contractor and submitted for approval.
e. The Contractor shall label conduit sleeves at each wall and floor penetration.

3.8 FIRESTOPPING

A. Provide approved fire-resistant materials to restore originally-designed fire-ratings to all wall, floor, and ceiling penetrations used in the distribution and installation for Safety and Security cabling system.

B. Install and seal penetrations (conduit, sleeves, slots, chases) in fire-rated barriers created for Safety and Security infrastructure to prevent the passage of smoke, fire, toxic gas, or water through the penetrations.

C. The firestopping material shall maintain/establish the fire-rated integrity of the wall/barrier that has been penetrated.

D. All through penetrations in a fire rated surface require a sleeve, regardless of penetration diameter or penetrating cable count.

E. Using a “ring and string” method of installing cabling for membrane penetrations in a wall cavity is acceptable, provided the solution was accepted by the Owner in writing. Code-compliant firestopping rules still apply.

F. Coordinate firestopping procedures and materials with General Contractor.

G. Sharing the pathway of other trades/utilities through compliant and non-compliant penetrations does not remove the requirement to maintain code-compliant firestopping.

H. Provide and install removable, intumescent mechanical systems in floor chases for all openings greater than 0’-4”.

I. Provide and install removable, intumescent, firestop bricks for all openings greater than 0’-4” where there are penetrations through walls.

J. Bricks shall be listed for insertion in fire-rated openings and require restraining materials or apparatus as needed per manufacturers’ specifications.

K. Provide manufacturer recommended material for rated protection for any given barrier.

L. Laminate and permanently affix adjacent to chases the following information:
1. Manufacturer of firestop system.
2. Date of installation/repair.
3. Part and model numbers of system and all components.
4. Name and phone numbers of local distributor and manufacturer’s corporate headquarters.

M. Solutions and shop drawings/submittals for firestop materials and systems shall be presented to the General Contractor for written approval of materials/systems prior to purchase and installation.

N. Materials shall be installed per manufacturer instructions, be UL-listed for intended use, and meet NEC and locals codes for fire stopping measures.

O. The material chosen shall be distinctively colored to be clearly distinguishable from other materials, adhere to itself, and maintain the characteristics for which it is designed to allow for the removal and/or addition of communication cables without the necessity of drilling holes in the material.

P. Develop training manuals with instructions on methods of adding or removing cabling to/from firestopped sleeves and chases.

Q. Within the normal environment, the installed systems shall not generate nor be susceptible to any harmful electromagnetic emission, radiation, or induction that degrades, or obstructs any equipment.

R. Expansion Capability: Unless otherwise indicated, provide spare conductor pairs in cables, positions in patch panels, cross connects, and terminal strips, and space in cable pathways and backboard layouts to accommodate 20% future increase in structure cable system capacity.

S. In the event of a breach of the representations and warranties contained herein, the Contractor, at their own expense, shall take all measures necessary to make the cabling system work and comply with the applicable manufacturer written technical recommendations and standards.

3.9 WALL MOUNTED EQUIPMENT

A. Install all wall mounted equipment in accordance with the National Electrical Code, industry standards and as shown on the drawings.

B. Unless noted otherwise, all wall mounted equipment that need to be accessed for operation or maintenance shall be mounted at a working height not requiring a ladder when wall space is available. Installation of these devices at greater elevations shall be approved by the Engineer. Contractor shall provide a coordination sketch of each mechanical/electrical room noting locations and mounting heights of all electrical devices(note bottom and top elevations) shown to be installed. Sketches shall be provided to the Engineer for review and the general contractor for coordination with other trades working in these rooms.

3.10 CLEANING

A. The Contractor will clean all surfaces of equipment and devices prior to final acceptance by Owner.

3.11 CORROSIVE AREAS

A. In areas of a corrosive nature, which include but are not limited to the following: pool equipment rooms, cooling towers and areas subject to salt air, etc., provide NEMA 4 X stainless steel or fiberglass reinforced enclosures for contactors, panel boards, controllers, starters, disconnects and materials used as supporting means (i.e. plastibond unistrut, pipe, fittings). The use of spray on coating may be acceptable in some applications.

3.12 TESTS AND INSPECTIONS

A. Tests and inspection requirements shall be coordinated with Division I.

B. Date for final acceptance test shall be sufficiently in advance of completion date of contract to permit alterations or adjustments necessary to achieve proper functioning of equipment prior to contract completion date.

C. Conduct re-tests as directed by Architect on portions of work or equipment altered or adjusted as determined to be necessary by final acceptance test. No resultant delay or consumption of time as a result of such necessary re-test beyond contract completion date shall relieve Contractor of his responsibility under contract.

D. Put circuits and equipment into service under normal conditions, collectively and separately, as may be required to determine satisfactory operation. Demonstrate equipment to operate in accordance with requirements of these specifications. Perform tests in the presence of Architect. Furnish instruments and personnel required for tests.

E. Final Inspection:
1. At the time designated by the Architect, the entire system shall be inspected by the Architect and Engineer. The contractor or his representative shall be present at this inspection.
2. All devices, equipment, and equipment cabinets/enclosure shall be cleaned and in operating condition.
3. Certificates and documents required hereinbefore shall be in order and presented to the Architect prior to inspection.
4. Panel covers, junction box covers, etc., shall be removed for visual inspection of the wire, bus bars, etc.
5. After the inspection, any items which are noted as needing to be changed or corrected in order to comply with these specifications and the drawings shall be accomplished without delay.

3.13 ACCEPTANCE

A. Once all work has been completed, test documentation has been submitted, and Owner is satisfied that all work is in accordance with contract documents, the Owner shall notify Contractor in writing of formal acceptance of the system.

B. Contractor must warrant in writing that 100% of the installation meets the requirements specified herein (Standards Compliance & Test Requirements).

C. Acceptance shall be subject to completion of all work, successful post-installation testing which yields 100% PASS rating, and receipt of full documentation soft and hard copies as described herein.

END OF SECTION

SECTION 28 03 00 - LIFE SAFETY AND SECURITY DEMOLITION FOR REMODELING

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

A. The drawings do not show all demolition work required. The contractor shall make himself familiar with the required scope of work to accomplish the work required by these documents. All demolition work implied or required shall be included in the scope of this contract.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 DEMOLITION WORK

A. The contractor shall be responsible for loss or damage to the existing facilities caused by him and his workmen, and shall be responsible for repairing such loss or damage. The contractor shall send proper notices, make necessary arrangements, and perform other services required for the care, protection and in-service maintenance of all electrical services for the new and existing facilities. The contractor shall erect temporary barricades, with necessary safety devices, as required to protect personnel from injury, removing all such temporary protection upon completion of the work.

B. The contractor shall provide temporary or new services to all existing facilities as required to maintain their proper operation when normal services are disrupted as a result of the work being accomplished under this project.

C. Where existing construction is removed to provide working and extension access to existing utilities, contractor shall remove doors, piping, conduit, outlet boxes, wiring, light fixtures, air conditioning ductwork and equipment, etc., to provide this access and shall reinstall same upon completion of work in the areas affected.

D. Where partitions, walls, floors, or ceilings of existing construction are being removed, all contractors shall remove and reinstall in locations approved by the Architect all devices required for the operation of the various systems installed in the existing construction.

E. Outages of services as required by the new installation will be permitted but only at a time approved by the Owner. The contractor shall allow the Owner 2 weeks in order to schedule required outages. The time allowed for outages will not be during normal working hours unless otherwise approved by the Owner. All costs of outages, including overtime charges, shall be included in the contract amount.

F. The contractor shall modify, remove, and/or relocate all materials and items so indicated on the drawings or required by the installation of new facilities. All removals and/or dismantling shall be conducted in a manner as to produce maximum salvage. Salvage materials shall remain the property of the Owner, and shall be delivered to such destination as directed by the Owner. Materials and/or items scheduled for relocation and which are damaged during dismantling or reassembly operations shall be repaired and restored to good operative condition. The contractor may, at his discretion and upon the approval of the Owner, substitute new materials and/or items of like design and quality in lieu of materials and/or items to be relocated.

G. All items which are to be relocated shall be carefully removed in reverse to original assembly or placement and protected until relocated. The contractor shall clean and repair and provide all new materials, fittings, and appurtenances required to complete the relocations and to restore to good operative order. All relocations shall be performed by workmen skilled in the work and in accordance with standard practice of the trades involved.

H. When items scheduled for relocation are found to be in damaged condition before work has been started on dismantling, the contractor shall call the attention of the Owner to such items and receive further instructions before removal. Items damaged in repositioning operations are the contractor's responsibility and shall be repaired or replaced by the contractor as approved by the Owner, at no additional cost to the Owner.

I. Service lines and wiring to items to be removed, salvaged, or relocated shall be removed to points indicated on the drawings, specified, or acceptable to the Owner. Service lines and wiring not scheduled for reuse shall be removed to the points at which reuse is to be continued or service is to remain. Such services shall be sealed, capped, or otherwise tied-off or disconnected in a safe manner acceptable to the Owner. All disconnections or connections into the existing facilities shall be done in such a manner as to result in minimum interruption of services to adjacent occupied areas. Services to existing areas or facilities which must remain in operation during the construction period shall not be interrupted without prior specific approval of the Owner as hereinbefore specified.

J. During the construction and remodeling, portions of the project shall remain in service. Construction equipment, materials, tools, extension cords, etc., shall be arranged so as to present minimum hazard or interruption to the occupants of the building.

K. Certain work during the demolition phase of construction may require overtime or nighttime shifts or temporary evacuation of the occupants. Coordinate and schedule all proposed down time with the Owner's Representative at least 72 hours in advance.

L. Make every effort to minimize damage to the existing building and the Owner's property. Repair, patch, or replace as required any damage which might occur as a result of work at the site. Care shall be taken to minimize interference with the Owner's activities during construction. Cooperate with the Owner and other trades in scheduling and performance of the work.

M. Include in the contract price all rerouting of existing conduits, wiring, outlet boxes, fixtures, etc., and the reconnecting of existing fixtures as necessitated by field conditions to allow the installation of the new systems. Furnish all temporary conduit, wiring, boxes, etc., as required to maintain lighting and power service for the existing areas with a minimum of interruption. Remove wire and conduit back to nearest accessible active junction box and extend to existing homeruns as required.

N. All existing lighting fixtures, switches, outlets, speakers, materials, equipment and appurtenances not included in the remodel or alteration areas are to remain in place and shall remain in service.

O. Electrical equipment, outlets, speakers, circuits to mechanical and building systems equipment, etc., which are to remain but which are served by conduit and/or circuiting that is disturbed by the remodeling work, shall be reconnected in such as manner as to leave it in proper operating condition.

P. Existing branch circuit wiring which is to be removed, shall be pulled from the raceways and the empty conduit shall be removed to a point of permanent concealment.

Q. Existing lighting fixtures shown to be removed and indicated to be reused, shall be cleaned, repaired, relamped and provided with such new accessories as may be needed for the proper installation in their new locations.

R. New circuiting indicated to be connected to existing panels shall be connected to "spares" and/or "released" breakers as applicable, or new breakers provided where space is available. Contractor shall verify the existing panel load and feeder capacity prior to adding any additional loads.

S. Within the remodeled or alteration areas where existing ceilings are being removed and new ceiling are installed, all existing lighting fixtures, other ceiling mounted devices and their appurtenances shall be removed and reinstalled into the new ceiling, unless otherwise shown or specified.

T. Within the remodeled or alteration areas where existing walls are being removed, all existing lighting fixtures, switches, receptacles, other materials and equipment and their appurtenances shall be removed, where required by the remodel work either shown or specified.

U. Refer to Architectural "Demolition" and "Alteration" plans for actual location of walls, ceilings, etc. being removed and/or remodeled.

END OF SECTION

SECTION 28 05 00 - BASIC MATERIALS AND METHODS FOR FIRE ALARM

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

A. The requirements of the General Conditions and Supplementary Conditions apply to all Work herein.

B. The Contract Drawings indicate the extent and general arrangement of the systems. If any departure from the Contract Drawings are deemed necessary by the Contractor, details of such departures and the reasons, therefore, shall be submitted to the Architect for approval as soon as practicable. No such departures shall be made without the prior written approval of the Architect.

1.2 SCOPE OF WORK

A. The Work included under this Contract consists of the furnishing and installation of all equipment and material necessary and required to form the complete and functioning systems in all of its various phases, all as shown on the accompanying Drawings and/or described in these Specifications. The contractor shall review all pertinent drawings, including those of other contracts prior to commencement of Work.

B. This Division requires the furnishing and installing of all items Specified herein, indicated on the Drawings or reasonably inferred as necessary for safe and proper operation; including every article, device or accessory (whether or not specifically called for by item) reasonably necessary to facilitate each system's functioning as indicated by the design and the equipment specified. Elements of the work include, but are not limited to, materials, labor, supervision, transportation, storage, equipment, utilities, all required permits, licenses and inspections. All work performed under this Section shall be in accordance with the Project Manual, Drawings and Specifications and is subject to the terms and conditions of the Contract.

C. The approximate locations of Electrical items are indicated on the Drawings. These Drawings are not intended to give complete and accurate details in regard to location of outlets, apparatus, etc. Exact locations are to be determined by actual measurements at the building, and will in all cases be subject to the Review of the Owner or Engineer, who reserves the right to make any reasonable changes in the locations indicated without additional cost to the Owner.

D. Items specifically mentioned in the Specifications but not shown on the Drawings and/or items shown on Drawings but not specifically mentioned in the Specifications shall be installed by the Contractor under the appropriate section of work as if they were both specified and shown.

E. All discrepancies within the Contract Documents discrepancies between the Contract Documents and actual job-site conditions shall be reported to the Owner or Engineer so that they will be resolved prior to the bidding, where this cannot be done at least 7 working days prior to bid; the greater or more costly of the discrepancy shall be bid. All labor and materials required to perform the work described shall be included as part of this Contract.

F. It is the intention of this Section of the Specifications to outline minimum requirements to furnish the Owner with a turn-key and fully operating system in cooperation with other trades.

G. It is the intent of the above "Scope" to give the Contractor a general outline of the extent of the Work involved; however, it is not intended to include each, and every item required for the Work. Anything omitted from the "Scope" but shown on the Drawings, or specified later, or necessary for a complete and functioning heating, ventilating and air conditioning system shall be considered a part of the overall "Scope".

H. The Contractor shall rough-in fixtures and equipment furnished by others from rough-in and placement drawings furnished by others. The Contractor shall make final connection to fixtures and equipment furnished by others.

I. Contractor shall participate in the commissioning process; including but not limited to meeting attendance, completion of checklists and participation in functional testing.

J. Refer to 26 03 13 for demolitions requirements.

1.3 RELATED SECTIONS

A. General Conditions

B. Supplementary Conditions

C. Division One

1.4 COOPERATION WITH TRADES

A. Cooperation with trades of adjacent, related, or affected materials or operations shall be considered a part of this work in order to affect timely and accurate placing of work and bring together in proper and correct sequence, the work of such trades.

1.5 REFERENCES

A. National Electrical Code (NEC)

B. American Society for Testing and Materials (ASTM)

C. Underwriter's Laboratories, Inc. (UL)

D. Insulated Cable Engineer's Association (ICEA)

E. National Electrical Manufacturer's Association (NEMA)

F. Institute of Electrical and Electronics' Engineers (IEEE)

G. American National Standards Institute (ANSI)

H. National Fire Protection Association (NFPA)

I. International Energy Conservation Code (IECC)

1.6 COMPLETE FUNCTIONING OF WORK

A. All work fairly implied as essential to the complete functioning of the electrical systems shown on the Drawings and Specifications shall be completed as part of the work of this Division unless specifically stated otherwise. It is the intention of the Drawings and Specifications to establish the types of the systems, but not set forth each item essential to the functioning of the system. In case of doubt as to the work intended, or in the event of amplification or clarification thereof, the Contractor shall call upon the Architect for supplementary instructions, Drawings, etc.

B. Contractor shall review all pertinent Drawings and adjust his work to all conditions shown there on. Discrepancies between Plans, Specifications, and actual field conditions shall be brought to the prompt attention of the Architect.

1. Approximate location of transformers, feeders, branch circuits, outlets, lighting and power panels, outlets for special systems, etc., are indicated on the Drawings. However, the Drawings, do not give complete and accurate detailed locations of such outlets, conduit runs, etc., and exact locations must be determined by actual field measurement. Such locations will, at all times, be subject to the approval of the Architect.
2. Communicate with the Architect and secure his approval of any outlet (light fixture, receptacle, switch, etc.) location about which there may be the least question. Outlets obviously placed in a location not suitable to the finished room or without specific approval, shall be removed and relocated when so directed by the Architect. Location of light fixtures shall be coordinated with reflected ceiling plans.

C. Additional coordination with mechanical contractor may be required to allow adequate clearances of mechanical equipment, fixtures and associated appurtenances. Contractor to notify Architect and Engineer of unresolved clearances, conflicts or equipment locations.

1.7 SCHEMATIC NATURE OF CONTRACT DOCUMENTS

A. The contract documents are schematic in nature in that they are only to establish scope and a minimum level of quality. They are not to be used as actual working construction drawings. The actual working construction drawings shall be the approved shop drawings.

1.8 CONTRACTOR'S QUALIFICATIONS

A. An approved contractor for the work under this division shall be:
   a. A specialist in this field and have the personnel, experience, training, and skill, and the organization to provide a practical working system.
   b. Able to furnish evidence of having contracted for and installed not less than 3 systems of comparable size and type that have served their Owners satisfactorily for not less than 3 years.
   c. Perform work by persons qualified to produce workmanship of specified quality. Persons performing electrical work shall be required to be licensed. Onsite supervision, journeyman shall have minimum of journeyman license. Helpers, apprentices shall have minimum of apprentice license.

1.9 DATE OF FINAL ACCEPTANCE

A. The date of final acceptance shall be the date of owner occupancy, or the date all punch list items have been completed or final payment has been received. Refer to Division One for additional requirements.

B. The date of final acceptance shall be documented in writing and signed by the architect, owner and contractor.

1.10 DEFINITIONS AND SYMBOLS

A. General Explanation: A substantial amount of construction and Specification language constitutes definitions for terms found in other Contract Documents, including Drawings which must be recognized as diagrammatic and schematic in nature and not completely descriptive of requirements indicated thereon. Certain terms used in Contract Documents are defined generally in this article, unless defined otherwise in Division 1.

B. Definitions and explanations of this Section are not necessarily either complete or exclusive but are general for work to the extent not stated more explicitly in another provision of the Contract Documents.

C. Indicated: The term "Indicated" is a cross-reference to details, notes or schedules on the Drawings, to other paragraphs or schedules in the Specifications and to similar means of recording requirements in Contract Documents. Where such terms as "Shown", "Noted", "Scheduled", "Specified" and "Detailed" are used in lieu of "Indicated", it is for the purpose of helping the reader locate cross-reference material, and no limitation of location is intended except as specifically shown.

D. Directed: Where not otherwise explained, terms such as "Directed", "Requested", "Accepted", and "Permitted" mean by the Architect or Engineer. However, no such implied meaning will be interpreted to extend the Architect's or Engineer's responsibility into the Contractor's area of construction supervision.

E. Reviewed: Where used in conjunction with the Engineer's response to submittals, requests for information, applications, inquiries, reports and claims by the Contractor the meaning of the term "Reviewed" will be held to limitations of Architect's and Engineer's responsibilities and duties as specified in the General and Supplemental Conditions. In no case will "Reviewed" by Engineer be interpreted as a release of the Contractor from responsibility to fulfill the terms and requirements of the Contract Documents.

F. Furnish: Except as otherwise defined in greater detail, the term "Furnish" is used to mean supply and deliver to the project site, ready for unloading, unpacking, assembly, installation, etc., as applicable in each instance.

G. Install: Except as otherwise defined in greater detail, the term "Install" is used to describe operations at the project site including unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protection, cleaning and similar operations, as applicable in each instance.

H. Provide: Except as otherwise defined in greater detail, the term "Provide" is used to mean "Furnish and Install", complete and ready for intended use, as applicable in each instance.

I. Installer: Entity (person or firm) engaged by the Contractor or its subcontractor or Sub-contractor for performance of a particular unit of work at the project site, including unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protection, cleaning and similar operations, as applicable in each instance. It is a general requirement that such entities (Installers) be expert in the operations they are engaged to perform.

J. Imperative Language: Used generally in Specifications. Except as otherwise indicated, requirements expressed imperatively are to be performed by the Contractor. For clarity of reading at certain locations, contrasting subjective language is used to describe responsibilities that must be fulfilled indirectly by the Contractor, or when so noted by other identified installers or entities.

K. Minimum Quality/Quantity: In every instance, the quality level or quantity shown or specified is intended as minimum quality level or quantity of work to be performed or provided. Except as otherwise specifically indicated, the actual work may either comply exactly with that minimum (within specified tolerances) or may exceed that minimum within reasonable tolerance limits. In complying with requirements, indicated or scheduled numeric values are either minimums or maximums as noted or as appropriate for the context of the requirements. Refer instances of uncertainty to Owner or Engineer via a request for information (RFI) for decision before proceeding.

L. Abbreviations and Symbols: The language of Specifications and other Contract Documents including Drawings is of an abbreviated type in certain instances and implies words and meanings which will be appropriately interpreted. Actual word abbreviations of a self-explanatory nature have been included in text of Specifications and Drawings. Specific abbreviations and symbols have been established, principally for lengthy technical terminology and primarily in conjunction with coordination of Specification requirements with notations on Drawings and in Schedules. These are frequently defined in Section at first instance of use or on a Legend and Symbol Drawing. Trade and industry association names and titles of generally recognized industry standards are frequently abbreviated. Singular words will be interpreted as plural and plural words will be interpreted as singular where applicable and where full context of Contract Documents so indicate. Except as otherwise indicated, graphic symbols and abbreviations used on Drawings and in Specifications are those recognized in construction industry for indicated purposes. Where not otherwise noted symbols and abbreviations are defined by ASHRAE Fundamentals Handbook, chapter 39 "Abbreviations and Symbols", ASME and ASPE published standards.

1.11 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

B. Deliver products to the project at such time as the project is ready to receive the equipment, pipe or duct properly protected from incidental damage and weather damage.

C. Damaged equipment shall be promptly removed from the site and new, undamaged equipment shall be installed in its place promptly with no additional charge to the Owner.

1.12 SUBMITTALS

A. Coordinate with Division 01 for submittal timetable requirements, unless noted otherwise within thirty (30) days after the Contract is awarded. The Contractor shall submit an electronic copy of a complete set of shop drawings and complete data covering each item of equipment or material. The submittal of each item requiring a submittal must be received by the Architect or Engineer within the above thirty day period. The Architect or Engineer shall not be responsible for any delays or costs incurred due to excessive shop drawing review time for submittals received after the thirty (30) day time limit. The Architect and Engineer will retain a copy of all shop drawings for their files. All literature pertaining to items subject to Shop Drawing submittal shall be submitted at one time. Submittals shall be placed in one electronic file in PDF 8.0 format and bookmarked for individual specification sections. Individual electronic files of submittals for individual specifications shall not be permitted. Each submittal shall include the following items:
   1. A cover sheet with the names and addresses of the Project, Architect, MEP Engineer, General Contractor and the Subcontractor making the submittal. The cover sheet shall also contain the section number covering the item or items submitted and the item nomenclature or description.
   2. An index page with a listing of all data included in the Submittal.
   3. A list of variations page with a listing all variations, including unfurnished or additional required accessories, items or other features, between the submitted equipment and the specified equipment. If there are no variations, then this page shall state "NO VARIATIONS". Where variations affect the work of other Contractors, then the Contractor shall certify on this page that these variations have been fully coordinated with the affected Contractors and that all expenses associated with the variations will be paid by the submitting Contractor. This page will be signed by the submitting Contractor.

4. Equipment information including manufacturer's name and designation, size, performance and capacity data as applicable. All applicable Listings, Labels, Approvals and Standards shall be clearly indicated.
5. Dimensional data and scaled drawings as applicable to show that the submitted equipment will fit the space available with all required Code and maintenance clearances clearly indicated and labeled at a minimum scale of 1/4" = 1'-0", as required to demonstrate that the alternate or substituted product will fit in the space available.
6. Identification of each item of material or equipment matching that indicated on the Drawings.
7. Sufficient pictorial, descriptive and diagrammatic data on each item to show its conformance with the Drawings and Specifications. Any options or special requirements or accessories shall be so indicated. All applicable information shall be clearly indicated with arrows or another approved method.
8. Additional information as required in other Sections of this Division.
9. Certification by the General Contractor and Subcontractor that the material submitted is in accordance with the Drawings and Specifications, signed and dated in long hand. Submittals that do not comply with the above requirements shall be returned to the Contractor and shall be marked "REVISE AND RESUBMIT".

B. Refer to Division 1 for additional information on shop drawings and submittals.

C. Equipment and materials submittals and shop drawings will be reviewed for compliance with design concept only. It will be assumed that the submitting Contractor has verified that all items submitted can be installed in the space allotted. Review of shop drawings and submittals shall not be considered as a verification or guarantee of measurements or building conditions.

D. Where shop drawings and submittals are marked "REVIEWED", the review of the submittal does not indicate that submittals have been checked in detail nor does it in any way relieve the Contractor from his responsibility to furnish material and perform work as required by the Contract Documents.

E. Shop drawings shall be reviewed and returned to the Contractor with one of the following categories indicated:
1. REVIEWED: Contractor need take no further submittal action, shall include this submittal in the O&M manual and may order the equipment submitted on.
2. REVIEWED AS NOTED: Contractor shall submit a letter verifying that required exceptions to the submittal have been received and complied with including additional accessories or coordination action as noted, and shall include this submittal and compliance letter in the O&M manual. The contractor may order the equipment submitted on at the time of the returned submittal providing the Contractor complies with the exceptions noted.
3. and/or drawings. Contractor shall not order equipment that is not approved. Repetitive requests for substitutions will not be considered.
4. REVISE AND RESUBMIT: Contractor shall resubmit new submittal on material, equipment or method of installation when the alternate or substitute is marked revise and resubmit, the Contractor will automatically be required to furnish the product, material or method named in the Specifications and/or provide as noted on previous shop drawings. Contractor shall not order equipment marked revise and resubmit. Repetitive requests for substitutions will not be considered.
5. CONTRACTOR’S CERTIFICATION REQUIRED: Contractor shall resubmit submittal on material, equipment or method of installation. The Contractor’s stamp is required stating the submittal meets all conditions of the contract documents. The stamp shall be signed by the General Contractor. The submittal will not be reviewed if the stamp is not placed and signed on all shop drawings.
6. MANUFACTURER NOT AS SPECIFIED: Contractor shall resubmit new submittal on material, equipment or method of installation when the alternate or substitute is marked manufacturer not as specified, the Contractor will automatically be required to furnish the product, material or method named in the specifications. Contractor shall not order equipment where submittal is marked manufacturer not as specified. Repetitive requests for substitutions will not be considered.

F. Materials and equipment which are purchased or installed without shop drawing review shall be at the risk of the Contractor and the cost for removal and replacement of such materials and equipment and related work which is judged unsatisfactory by the Owner or Engineer for any reason shall be at the expense of the Contractor. The responsible Contractor shall remove the material and equipment noted above and replace with specified equipment or material at his own expense when directed in writing by the Architect or Engineer.

G. Shop Drawing Submittals shall be complete and checked prior to submission to the Engineer for review.

H. Furnish detailed shop drawings, descriptive literature, physical data and a specification critique for each section indicating "compliance" and/or "variations" for the following items:
   1. Fire Alarm System
   2. Intrusion System

I. Refer to each specification section for additional requirements.

1.13 OPERATION AND MAINTENANCE MANUALS

A. Prepare maintenance manuals in accordance with Division 1 and in addition to the requirements specified in Division 1, include the following information for equipment items:
   1. Description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and commercial numbers of replacement parts.
   2. Manufacturer's printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions; and summer and winter operating instructions.
   3. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions.
   4. Servicing instructions and lubrication charts and schedules.

1.14 COORDINATION DRAWINGS

A. Prepare coordination drawings to a scale of 1/4"=1'-0" or larger; detailing major elements, components, and systems of mechanical equipment and materials in relationship with other systems, installations, and building components. Indicate locations where space is limited for installation and access and where sequencing and coordination of installations are of importance to the efficient flow of the Work, including (but not necessarily limited to) the following:
   1. Indicate the proposed locations of pipe, duct, equipment, and other materials. Include the following:
      a. Wall and type locations.
      b. Clearances for installing and maintaining insulation.
      c. Locations of light fixtures and sprinkler heads.
      d. Clearances for servicing and maintaining equipment, including tube removal, filter removal, and space for equipment disassembly required for periodic maintenance.
      e. Equipment connections and support details.
      f. Exterior wall and foundation penetrations.
      g. Routing of storm and sanitary sewer piping.
      h. Fire-rated wall and floor penetrations.
      i. Sizes and location of required concrete pads and bases.
      j. Valve stem movement.
      k. Structural floor, wall and roof opening sizes and details.
   2. Indicate scheduling, sequencing, movement, and positioning of large equipment into the building during construction.
   3. Prepare floor plans, elevations, and details to indicate penetrations in floors, walls, and ceilings and their relationship to other penetrations and installations.
   4. Prepare reflected ceiling plans to coordinate and integrate installations, air distribution devices, light fixtures, communication systems components, and other ceiling-mounted items.

B. This Contractor shall be responsible for coordination of all items that will affect the installation of the work of this Division. This coordination shall include, but not be limited to: voltage, ampacity, capacity, electrical and piping connections, space requirements, sequence of construction, building requirements and special conditions.

C. By submitting shop drawings on the project, this Contractor is indicating that all necessary coordination has been completed and that the systems, products and equipment submitted can be installed in the building and will operate as specified and intended, in full coordination with all other Contractors and Subcontractors.

1.15 RECORD DRAWINGS

A. Prepare Record Documents in accordance with the requirements of Division 00 and Division 01, in addition to the requirements specified in Division 26 and Division 28.

B. The Contractor shall maintain a separate set of clearly and legibly marked Record Drawings on the job site to record all changes and modifications, including, but not limited to the following: work details, alterations to meet site conditions, and changes made by "Change Order" notices. Mark the drawings with colored pencil(s). These shall be available for review by the Owner, Architect or Engineer during the entire construction stage.

C. The Record Drawings shall be updated concurrently as construction progresses, and in no case less frequently than a daily basis. They shall indicate accurate dimensions for all buried or concealed work, precise locations of all concealed pipe or duct, locations of all concealed valves, controls and devices and any deviations from the work shown on the Construction Documents. All dimensions shall include at least two dimensions to permanent structure points.

D. Engage the services of a Land Surveyor or Professional Engineer registered in the state in which the project is located as specified herein to record the locations and invert elevations of underground installations.

E. If the Contractor does not keep an accurate set of Record Drawings, the pay request may be altered or delayed at the request of the Architect. Delivery of Record Documents is a condition of final acceptance. Record Drawings shall be furnished in addition to Shop Drawings.

F. The Contractor shall submit an electronic copy of the record documents in PDF format and one (1) full size set of Record Drawing prints to the Architect or Engineer for review prior to scheduling the final inspection at the completion of the work. The drawings shall have the name(s) and seal(s) of the Engineer(s) removed or blanked out and shall be clearly marked and signed on each sheet as follows:

CERTIFIED RECORD DRAWINGS
DATE:
(NAME OF GENERAL CONTRACTOR)
BY:_____
(SIGNATURE)
(NAME OF SUBCONTRACTOR)
BY:_____
(SIGNATURE)

1.16 CERTIFICATIONS AND TEST REPORTS

A. Submit a detailed schedule for completion and testing of each system indicating scheduled dates for completion of system installation and outlining tests to be performed and schedule date for each test. This detailed completion and test schedule shall be submittal at least 90 days before the projected Project completion date.

B. Test result reporting forms shall be submitted for review no later than the date of the detailed schedule submitted.

C. Submit 4 copies of all certifications and test reports to the Architect or Engineer for review adequately in advance of completion of the Work to allow for remedial action as required to correct deficiencies discovered in equipment and systems.

D. Certifications and test reports to be submitted shall include, but not be limited to those items outlined in Section of Division 26.

1.17 MAINTENANCE MANUALS

A. Coordinate with Division 1 for maintenance manual requirements, unless noted otherwise bind together in “D ring type” binders by National model no. 79-883 or equal, binders shall be large enough to allow ¼” of spare capacity. Three (3) sets of all approved shop drawing submittals, fabrication drawings, bulletins, maintenance instructions, operating instructions and parts exploded views and lists for each and every piece of equipment furnished under this Specification. All sections shall be typed and indexed into sections and labeled for easy reference and shall utilize the individual specification section numbers shown in the Electrical Specifications as an organization guideline. Bulletins containing information about equipment that is not installed on the project shall be properly marked up or stripped and reassembled. All pertinent information required by the Owner for proper operation and maintenance of equipment supplied by Division 26 shall be clearly and legibly set forth in memoranda that shall, likewise, be bound with bulletins.

B. Prepare maintenance manuals in accordance with Special Project Conditions, in addition to the requirements specified in Division 26 and Division 2, include the following information for equipment items:
1. Identifying names, name tags designations and locations for all equipment.
2. Reviewed shop drawing submittals with exceptions noted compliance letter.
3. Fabrication drawings.
4. Equipment and device bulletins and data sheets clearly highlighted to show equipment installed on the project and including performance curves and data as applicable, i.e., description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and model numbers of replacement parts.
5. Manufacturer's printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions; and summer and winter operating instructions.
6. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions, servicing instructions and lubrication charts and schedules.
7. Equipment name plate data.
8. Wiring diagrams.
9. Exploded parts views and parts lists for all equipment and devices.
10. Color coding charts for all painted equipment and conduit.
11. Location and listing of all spare parts and special keys and tools furnished to the Owner.
12. Furnish recommended lubrication schedule for all required lubrication points with listing of type and approximate amount of lubricant required.

C. Refer to Division 1 for additional information on Operating and Maintenance Manuals.

D. Operating and Maintenance Manuals shall be turned over to the Owner or Engineer a minimum of 14 working days prior to the beginning of the operator training period.

1.18 OPERATOR TRAINING

A. The Contractor shall furnish the services of factory trained specialists to instruct the Owner's operating personnel. The Owner's operator training shall include 12 hours of onsite training in three 4 hour shifts.

B. Before proceeding with the instruction of Owner Personnel, prepare a typed outline in triplicate, listing the subjects that will be covered in this instruction, and submit the outline for review by the Owner. At the conclusion of the instruction period obtain the signature of each person being instructed on each copy of the reviewed outline to signify that he has a proper understanding of the operation and maintenance of the systems and resubmit the signed outlines.

C. Refer to other Division 26 Sections for additional Operator Training requirements.

1.19 SITE VISITATION

A. Visit the site of the proposed construction in order to fully understand the facilities, difficulties and restriction attending the execution of the work.

B. Before submitting a bid, it will be necessary for each Contractor whose work is involved to visit the site and ascertain for himself the conditions to be met therein in installing his work and make due provision for same in his bid. It will be assumed that this Contractor in submitting his bid has visited the premises and that his bid covers all work necessary to properly install the equipment shown. Failure on the part of the Contractor to comply with this requirement shall not be considered justification for the omission or faulty installation of any work covered by these Specifications and Drawings.

C. Understand the existing utilities from which services will be supplied; verify locations of utility services and determine requirements for connections.

D. Determine in advance that equipment and materials proposed for installation fit into the confines indicated.

1.20 WARRANTY

A. The undertaking of the work described in this Division shall be considered equivalent to the issuance, as part of this work, of a specific guarantee extending one year beyond the date of completion of work and acceptance by Owner, against defects in materials and workmanship. Materials, appliances and labor necessary to effect repairs and replacement so as to maintain said work in good functioning order shall be provided as required. Replacements necessitated by normal wear in use or by Owner's abuse are not included under this guarantee.

B. All normal and extended warranties shall include parts, labor, miscellaneous materials, travel time, incidental expenses, freight/shipping, refrigerant, oils, lubricants, belts, filters and any expenses related to service call required to diagnose warranty problems.

1.21 TRANSFER OF ELECTRONIC FILES

A. Project documents are not intended or represented to be suitable for reuse by Architect/Owner or others on extensions of this project or on any other project. Any such reuse or modification without written verification or adaptation by Engineer, as appropriate for the specific purpose intended, will be at Architect/Owner’s risk and without liability or legal exposure to Engineer or its consultants from all claims, damages, losses and expense, including attorney’s fees arising out of or resulting thereof.

B. Because data stored in electric media format can deteriorate or be modified inadvertently, or otherwise without authorization of the data’s creator, the party receiving the electronic files agrees that it will perform acceptance tests or procedures within sixty (60) days of receipt, after which time the receiving party shall be deemed to have accepted the data thus transferred to be acceptable. Any errors detected within the sixty (60) day acceptance period will be corrected by the party delivering the electronic files. Engineer is not responsible for maintaining documents stored in electronic media format after acceptance by the Architect/Owner.

C. When transferring documents in electronic media format, Engineer makes no representations as to the long term compatibility, usability or readability of documents resulting from the use of software application packages, operating systems, or computer hardware differing from those used by Engineer at the beginning of the Project.

D. Any reuse or modifications will be Contractor’s sole risk and without liability or legal exposure to Architect, Engineer or any consultant.

E. The Texas Board of Architectural Examiners (TBAE) has stated that it is in violation of Texas law for persons other than the Architect of record to revise the Architectural drawings without the Architect’s written consent.
   1. It is agreed that “MEP” hard copy or computer-generated documents will not be issued to any other party except directly to the Architect/Owner. The contract documents are contractually copyrighted and cannot be used for any other project or purpose except as specifically indicated in AIA B-141 Standard Form of Agreement Between Architect and Owner.
   2. If the client, Architect or Owner of the project requires electronic media for “record purposes”, then AutoCAD/ Revit documents will be prepared by Engineer on electronic media such as removable memory devices, flash drives or CD’s. These documents can also be submitted via file transfer protocols. AutoCAD/ Revit files will be submitted with all title block references intact to permit the end user to only view and plot the drawings. Revisions will not be permitted in this configuration.

3. At the Architect/Owner's request, Engineer will assist the Contractor in the preparation of the submittals and prepare one copy of AutoCAD/ Revit files on electronic media or submit through file transfer protocols. The electronic media will be prepared with all indicia of documents ownership removed. The electronic media will be prepared in a ".rvt" or ".dwg" format to permit the end user to revise the drawings.

PART 2 - PRODUCTS

2.1 SUBSTITUTIONS

A. The names and manufacturers and model numbers have been used in the Contract documents to establish types of equipment and standards of quality. Where more than one manufacturer is named for a specific item of equipment, only one of the specified manufacturers will be considered for approval. Where only one manufacturer is mentioned with the phrase "or approved equal", Contractor may submit an alternate manufacturer for consideration, provided the following conditions are met:
   1. Submit alternate equipment with complete descriptive data in shop drawing form. Provide sample of equipment upon request for review by Architect. Samples will be returned if requested in writing.
   2. Alternate equipment must be equal from the standpoint of materials, construction and performance.
   3. Alternate submittal must be presented to the Engineer/Architect ten (10) days prior to bid date for approval.

B. The Architect and Engineer shall be the sole judge of quality and equivalence of equipment, materials and methods.

2.2 UL LISTING

A. All materials and products used on this project shall be listed by Underwriters' Laboratories.

2.3 ACCESS DOORS

A. Wherever access is required in walls or ceilings to concealed junction boxes, pull boxes, equipment, etc., installed under this Division, furnish a hinged access door and frame with flush latch handle to another Division for installation. Doors shall be as follows:
   1. Plaster Surfaces: Milcor Style K.
   2. Ceramic Tile Surfaces: Milcor Style M.
   3. Drywall Surfaces: Milcor Style DW.
   4. Install panels only in locations approved by the Architect.

2.4 ESCUTCHEONS

A. Provide heavy chrome or nickel plated plates, of approved pattern, on conduit passing through walls, floors and ceilings in finished areas. Where conduit passes through a sleeve, no point of the conduit shall touch the building construction. Caulk around such conduit with sufficient layers of two hour rated firesafing by Thermafiber 4.0 P.C.F. density, U.S.G. fire test 4/11/78 and seal off openings between conduit and sleeves with non-hardening mastic prior to application of escutcheon plate. Escutcheons shall be Gravler Sure-Lock, or approved equal.

2.5 SPACE LIMITATIONS

A. Equipment shall be chosen which shall properly fit into the physical space provided and shown on the drawings, allowing ample room for access, servicing, removal and replacement of parts, etc. Adequate space shall be allowed for clearances in accordance with Code requirements. Physical dimensions and arrangement of equipment shall be subject to the approval of the Architect.

2.6 PAINTING

A. All factory assembled equipment for electrical work, except light fixtures, that normally is delivered with a factory applied finish shall be delivered with a hard surface factory applied finish such as baked-on machinery enamel which will not require additional field painting. The finish shall consist of not less than 2 coats of medium gray color paint USA No. 61 Munsell Notation 8-3G, 6. 10/0.54 enamel. This Contractor shall protect this finish from damage due to construction operations until acceptance of the building. He shall be responsible for satisfactorily restoring any such finishes or replacing equipment that becomes stained or damaged.

2.7 RACEWAY IDENTIFICATION

A. Conduit Systems: Provide adequate marking of major conduit which is exposed or concealed in accessible spaces to distinguish each run as either a power or signal/communication conduit. Use red banding with black lettering except as otherwise indicated. Provide self-adhesive or snap-on type plastic markers. Locate markers at ends of conduit runs, on pull boxes, on junction boxes and other control devices, near items of equipment served by the conductors, at points where conduit passes through walls or floors or enters non-accessible construction and at spacings of not more than 50 feet along each run of conduit.

B. Underground Cable Identification: Bury a continuous, preprinted, bright colored plastic ribbon cable marker with each underground cable (or group of cables), regardless of whether conductors are in conduit, duct bank, or direct buried. Locate each directly over cables, 6 to 8 inches below finished grade.

C. Identification of Equipment:
1. All major equipment shall have a manufacturer’s label identifying the manufacturer’s address, equipment model and serial numbers, equipment size, and other pertinent data. Care shall be taken not to obliterate this nameplate in any way.
2. Prohibited Markings: Markings which are intended to identify the manufacturer, vendor, or other source from which the material has been obtained are prohibited for installation within public, tenant, or common areas within the project. Also, prohibited are materials or devices which bear evidence that markings or insignias have been removed. Certification, testing (example, Underwriters’ Laboratories, Inc.), and approval labels are exceptions to this requirement.
3. Warning Signs: Provide warning signs where there is hazardous exposure associated with access to or operation of facilities. Provide text of sufficient clarity and lettering of sufficient size to convey adequate information at each location; mount permanently in an appropriate and effective location. Comply with recognized industry standards for color and design.
4. Operational Tags: Where needed for proper and adequate information on operation and maintenance of electrical system, provide tags of plasticized card stock, either preprinted or hand printed.

PART 3 - EXECUTION

3.1 EXCAVATING AND BACKFILLING

A. Trenching and backfilling and other earthwork operations required to install the facilities specified herein shall conform to the applicable requirements of Division 2 (95% of maximum standard density). Where trenching or excavation is required in improved areas, the backfill shall be compacted to a condition equal to that of adjacent undisturbed earth and the surface of the area restored to the condition existing prior to trenching or excavating operations. Provide a minimum of 3” of sand underneath all conduits. The plans indicate information pertaining to surface and sub-surface obstructions; however, this information is not guaranteed. Should obstructions be encountered whether or not shown, the Contractor shall alter routing of new work, reroute existing lines, remove obstructions where permitted, or otherwise perform whatever work is necessary to satisfy the purpose of new work and leave existing surfaces and structures in a satisfactory and serviceable condition. All work shall comply with OSHA Standards.

3.2 WORKMANSHIP AND CONCEALMENT

A. The work of this Section shall be performed by workman skilled in their trade. Installation shall be consistent in completeness whether concealed or exposed. Each item of electrical work shall be concealed in walls, chases, under floors and above ceilings except:
1. Where shown to be exposed.

2. Where exposure is necessary to the proper function.

3.3 SLEEVES, CUTTING AND PATCHING

A. This section shall be responsible for placing sleeves for all conduit passing through walls, partitions, sound walls, beams, floors, roof, etc. Sleeves through below-grade walls shall use water-tight fitting manufactured by O-Z/Gedney.

B. All cutting and patching will be done under another Division, but this Section will be responsible for timely performance of this work and layout of holes and setting sleeves.

C. All un-used sleeves shall be sealed with 2 hour UL approved fire sealant manufactured by “3M” or approved equal.

D. Refer to 26 05 33 for additional requirements.

3.4 CONTROL PANELS

A. Install all Panels in accordance with the National Electrical Code, industry standards and as shown on the drawings.

B. Panels mounted in telecom, MDF, IDF, mechanical/electrical rooms shall be mounted at a working height not requiring a ladder when wall space is available. Installation of these devices at greater elevations shall be approved by the Engineer. Contractor shall provide a coordination sketch of each mechanical/electrical room noting locations and mounting heights of all electrical devices (note bottom and top elevations) shown to be installed. Sketches shall be provided to the Engineer for review and the general contractor for coordination with other trades working in these rooms.

3.5 CLEANING

A. Touch-up and refinish scratches and marred surfaces on panels.

3.6 CORROSIVE AREAS

A. In areas of a corrosive nature, which include but are not limited to the following: pool equipment rooms, cooling towers and areas subject to salt air, etc., provide NEMA 4X stainless steel or fiberglass reinforced enclosures for contactors, panel boards, controllers, starters, disconnects and materials used as supporting means (i.e. plastibond unistrut, pipe, fittings). The use of spray on coating may be acceptable in some applications.

3.7 TESTS AND INSPECTIONS

A. Tests and inspection requirements shall be coordinated with Division 01.

B. Dallas ISD M&O represetantatives shall be present for all testing of electrical equipment and gear. Testing of Equipment and Gear shall be provided by installing contractor to ensure operations as intended and prove material is free from defects due to shipping, transport, assembly, install, etc.

C. Bond Projects in construction must provide a mandatory notification to MAINTENANCE when scheduling ANY MEP city inspections. The following personnel should be notified:
1. Bart Webster - Maintenance MEP Director / bawebster@dallasisd.org
2. Bart Braswell - Maintenance Plumbing Manager / bbraswell@dallasisd.org
3. George Lakes - Maintenance Electrical Manager / GLAKES@dallasisd.org
4. Miguel Soto - Maintenance HVAC Manager / misoto@dallasisd.org
5. Dallas ISD Project CM
6. Qamar Haque / qhaque@dallasisd.org and Álvaro Meza almeza@dallasisd.org

D. Date for final acceptance test shall be sufficiently in advance of completion date of contract to permit alterations or adjustments necessary to achieve proper functioning of equipment prior to contract completion date.

E. Conduct re-tests as directed by Architect on portions of work or equipment altered or adjusted as determined to be necessary by final acceptance test. No resultant delay or consumption of time as a result of such necessary re-test beyond contract completion date shall relieve Contractor of his responsibility under contract.

F. Put equipment into service under normal conditions, collectively and separately, as may be required to determine satisfactory operation. Demonstrate equipment to operate in accordance with requirements of these specifications. Perform tests in the presence of Architect. Furnish instruments and personnel required for tests.

G. Final Inspection
   1. At the time designated by the Architect, the entire system shall be inspected by the Architect and Engineer. The contractor or his representative shall be present at this inspection.
   2. Panels shall be cleaned and in operating condition.
   3. Certificates and documents required hereinbefore shall be in order and presented to the Architect prior to inspection.
   4. Panel covers, junction box covers, etc., shall be removed for visual inspection of the wire, bus bars, etc.
   5. After the inspection, any items which are noted as needing to be changed or corrected in order to comply with these specifications and the drawings shall be accomplished without delay.

END OF SECTION

SECTION 28 10 00 - ACCESS CONTROL SYSTEM

PART 1 - GENERAL

1.1 SUMMARY/OVERVIEW

A. This section provides specifications for the installation of Electronic Access Control (AC), and related components.

B. Related Sections
1. Section 08 71 00 - Door Hardware
2. Section 26 00 00 - Electrical (including related sub-sections)
3. Section 27 02 00 - BASIC MATERIALS AND METHODS FOR COMMUNICATION SYSTEMS (including related sub-sections)
4. Section 28 02 00 - BASIC MATERIALS AND METHODS FOR SAFETY AND SECURITY SYSTEMS
5. Section 28 20 00 - VIDEO SURVEILLANCE SYSTEM
6. Section 28 31 00 - Intrusion Detection System
7. Section 28 46 00 - Fire Alarm and Smoke Detection

1.2 REFERENCES

A. See Section 28 02 00.

1.3 SYSTEM COORDINATION

A. The Security Integrator shall completely coordinate all relevant work of other trades/systems including, but not limited to:
1. Door Hardware
2. Fire Alarm System
3. Electrical Systems(s)
4. Telecommunications System(s)

B. Electric Locking Mechanisms
1. The security integrator and door hardware contractor shall coordinate all door hardware, door and door frame design.
2. The security contractor shall verify all specified door hardware is appropriate for the security application and verify the sequence of operations for each access controlled opening.

C. Fire Alarm and Life Safety
1. The security integrator shall coordinate the access control system design with the life safety consultant to insure compliance with applicable codes and requirements.
2. This includes, but is not limited to:
   a. Fire alarm interface
   b. Fail safe/fail secure locking mechanisms
   c. Delayed egress

1.4 GENERAL SYSTEM DESCRIPTION

A. General Requirements
1. Furnish all labor, materials, tools, equipment, and services for a complete security system as indicated and in accordance with provisions of the contract documents.
2. Although such work is not specifically indicated, furnish and install all supplementary or miscellaneous items, and devices incidental to or necessary for a sound, secure and complete installation.
3. Comply with the provisions of Division 1 for General Requirements.
   a. In the event of a conflict between the provisions of this Section and Division 1, the more stringent provisions shall apply.
4. All system devices and components included shall be compatible.

B. The project shall be equipped with new system that is maintained by the police department.
   1. All work required within the project for new AC system head end shall be furnished and installed by the project security contractor.

C. The AC system will support the needs of the project in accordance with these specifications.
   1. The AC system shall have the capability for future expansion to support the security needs of the completed complex.

D. The AC system shall be interfaced with the Fire Alarm system (by others) as required to comply with all building code requirements.

E. Emergency/UPS power will be utilized to power the AC system's computer workstation (client) at the Security head end equipment location.

F. Emergency/APS power will be utilized to power the AC system's Data Gathering Panels and control components as required throughout the facility.

1.5 ACCESS CONTROL SYSTEM

A. The AC system will consist of card readers, door position switches, and request-to-exit sensors operating in conjunction with associated electric door hardware.
   1. Card readers and adjunct devices shall be provided as shown on the drawings.
      a. Provide card readers, Data Gathering Panels (DGP), and alarm input and output devices connected to the security management system via Local Area Network (LAN).
      b. The security integrator shall coordinate network and IP address requirements with Owner to identify the Media Access Control (MAC) address (Layer 2) of each provided device, the location to be installed, and the port configuration needed for communication.
      c. Furnish all labor, materials, tools, equipment, and services for a complete system as indicated and in accordance with provisions of the contract documents.
      d. Although such work is not specifically indicated, furnish and install all supplementary or miscellaneous items, and devices incidental to or necessary for a sound, secure and complete installation.

B. Card readers will work such that upon presentation of a valid AC card, the unique card data shall be transmitted to an associated control panel where the data is compared to an authorized user database and access is approved or rejected accordingly.
   1. A valid authorization will activate operation of the electric lock and shunt the door position switch. The alarm shunt will not affect supervision of the detection circuit.
   2. Coordinate with owner on card format and other pertinent details.

C. Card readers shall support Magnetic Stripe, 125 KHz proximity, and 13.56 MHz smart card technologies

D. Door position switches at card reader controlled location serve to indicate the open/closed status of the associated door and shall establish the basis for reporting a door-propped or unauthorized entry condition.

   1. Security contractor is responsible for coordinating the contact configuration (SPDT) (DPDT) and rating for door position switches, and for connection of switches with the AC.
   2. The Division 08 contractor shall be responsible for providing all flush mounted door position switches as indicated on drawings.

E. Electrified door hardware for card reader controlled doors will include electrified locksets, electric exit devices, and electric power transfer as shown on the drawings.
   1. All electrified door hardware shall be provided under the work of Division 08 unless otherwise noted.
   2. Security subcontractor shall provide all security cables and, low voltage power supplies for operation of electrified door hardware associated with card reader controlled doors.

F. Request-to-exit (REX) devices at designated card reader controlled doors shall cause the associated door position switches to be shunted.
   1. The alarm shunt shall not affect the supervision of the alarm detection circuit.
   2. Electrified Lockset shall have an integral REX switch.
   3. Electrified Exit devices shall have an integral REX switch.
   4. Magnetic Locks shall have a Passive InfraRed (PIR) motion sensor REX device.
      a. Wire the PIR to the Door REX Input. The configuration on this motion shall be non-resettable and activate for only 2 seconds.

b. A second set of output contacts for the REX motion sensor shall be wired in series with the power to the lock, disconnecting power to the lock when motion is sensed.
c. The PIR REX shall be mounted and the sensor positioned to avoid detection more than three feet from the door and at the door bottom sweep.
    1) Deter under door spoofing attacks by pointing the sensor away from the door threshold. Position the sensor to detect motion at the door handle or door push plate.
d. Connect to REX switch in exit device (by Division 8).
    1) Coordinate with Division 8 to ensure proper REX switch configuration
    2) Wire the REX switch as described for the above motion sensor to disconnect power to the lock and activate the REX input on the DGP.
e. Doors with out exit devices, a UL listed double pole pushbutton exit switch shall be provided as a redundant REX device.
    1) It shall be wired as described for the above motion sensor to disconnect power to the lock and activate the REX input on the DGP.
    2) Locate within 6’-0” of the door push-plate/handle.

1.6 SUBMITTALS

A. Follow provisions of Section 28 02 00 for additional requirements.

B. Field Test Reports
1. Upon completion and testing of the installed system, test reports shall be submitted in booklet form and electronic media showing all field tests performed on, and adjustments made to each/any component and all field tests performed to prove compliance with the specified performance criteria.
2. Indicate and interpret test results in written form and verbally to owner/DBR for compliance with performance requirements at a pre-scheduled meeting.

C. Battery calculations to show the expected loads and backup duration for power supplies and UPS devices for all active AC equipment.

D. Security Contractor is responsible to prepare and submit as required to the Authority Having Jurisdiction (AHJ) any and all information to obtain an Electronic Locking Mechanisms permit.

1.7 QUALITY ASSURANCE

A. Follow provisions of Section 28 02 00.

B. Spare Parts:
1. Provide two (2) spare components for every model and configuration of electronic components and devices used on the project as spare parts inventory.
    a. The security integrator will turn over the new and unused components and devices to the owner at project closeout.

1.8 DELIVERY, STORAGE AND HANDLING

A. Follow provisions of Section 28 02 00

1.9 PROJECT/SITE CONDITIONS

A. Follow provisions of Section 28 02 00

1.10 WARRANTY

A. Follow provisions of Section 28 02 00

B. All devices and components shall comply with applicable U.L. standards.

PART 2 - PRODUCTS

2.1 ACCEPTABLE SYSTEM MANUFACTURERS

A. AC System Platform Software

1. Lenel OnGuard
2. S2 Security
3. Open Options DNA Fusion

B. System Platform Server (By Owner)
1. Dell
2. Hewlett Packard
3. IBM
4. Owner Approved Equivalent

C. Workstation (refer to 28 23 00)

2.2 ACCEPTABLE ACCESS CONTROL MANUFACTURERS

A. Access Control Data Gathering Panels (DGP)
1. AC System compatible
2. Owner Approved Equivalent

B. Proximity Card Readers (CR)
1. HID
2. Owner Approved Equivalent

C. ID credential printer (with card stock and consumables to produce 250 credentials)
1. Fargo
2. Nisca
3. Datacard
4. Magicard
5. Owner Approved Equivalent

D. Door Position Switches (DP) (By Division 08)
1. Concealed Magnetic Door Position Switch
   a. Sentrol 1076D
   b. Magnasphere MSS-19C/L / MSS-25C/L
   c. Detection Systems, Inc
   d. Owner Approved Equivalent

E. Electric Locking Mechanism Power Supply
1. Altronix
2. Alarm-Saf
3. LifeSafety Power
4. Owner Approved Equivalent

F. Electric Locking Mechanisms (By Division 08)
1. Sargent
2. Schlage
3. Von Duprin
4. Locknetics
5. Owner Approved Equivalent

G. Electric Power Transfer (By Division 08)
1. Security Door Controls (SDC)
2. Schlage
3. Von Duprin
4. Owner Approved Equivalent

H. Uninterruptible Power Supply (UPS)
1. Eaton UPS
   a. 5S series for workstations
   b. 9170 for rack mounted equipment
2. APC Smart-UPS Series
   a. SMT series for workstations
   b. Smart-UPS on-Line series for rack mounted equipment
3. MinuteMan
   a. Pro series for workstations
   b. Enterprise Plus series for rack mounted equipment

4. Owner Approved Equivalent

I. Wire & Cable
1. Belden
2. Windy City
3. General Cable
4. Owner Approved Equivalent

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

A. Power Supplies
1. Power supply requirements
a. A switch and on/off indicator within the power supply cabinet.
b. Four hours of sealed gel battery backup to provide continuous operation during power failure.
1) Provide batteries as required to provide specified battery backup time for a fully loaded power supply, regardless of the connected load.
c. A battery charger to maintain the battery.
d. Low battery and power fail contacts to monitor the status of the input power and the battery.
1) Connect each power supply low battery and power fail alarm as a separate alarm input into DGP.
e. Key lockable wall mount metal enclosure with tamper switch.
2. Additional DGP Power Supply Requirements
a. The DGP power supply provides power only to DGP's and shall not provide power for locks or any other low voltage device.
3. Additional Electric Locking Mechanism Power Supply Requirements
a. Fail secure electric locking mechanisms shall remain locked during power failure and fire alarm conditions.
b. Connect fail safe locking devices in accordance with applicable life safety codes to unlock automatically under the following conditions:
1) Loss of power to the power supply
2) Failure of the power supply
3) Fire alarm activation
c. Provide power distribution boards with independently fused output relays and fire alarm control panel interface.
4. Additional Device Power Supply Requirements
a. Provide device power supplies for other security system devices requiring power (e.g. card readers, local alarms, motion sensors, etc.)
b. Provide power distribution boards with independently fused outputs.

B. Video Surveillance System Integration
1. Automatic Video Call-up
a. All alarms shall call up all cameras in the area of alarm to the screen of the ACID alarm operator workstation to allow for operator assessment of the alarm.
2. Pre and Post Alarm Video
a. The operator shall be able to view up to 10 seconds of video before the alarm and 30 seconds after the alarm for all cameras associated with the alarm.
b. This feature is to be integrated with the operator alarm notification to assist in alarm assessment.
c. This feature shall be displayed as an option on the alarm notification screen and will not require operator to make a manual video search.
3. Recording
a. All cameras whose field of view that include images of the area affected by the alarm, shall be recorded when an alarm is detected for use in forensic analysis, including the pre and post alarm video.
4. Duress and Emergency Intercommunications Integration
a. Calls from emergency intercoms/phones with cameras shall provide the above video call-up and the pre and post alarm video capabilities.

C. Tamper Resistant Screws
   1. Provide appropriate screw heads for each application (e.g. countersunk heads for recessed cover plate screws, flat head screws for standard junction box covers, etc.).
   2. The security integrator shall provide Torx® tamper resistant screws for:
      a. Junction boxes located above doors
      b. Junction boxes located below ceiling height and/or within reach of hatch ladders
      c. Security device cover plates
      d. Surface mounted door position switches and armored cable

3.2 ENCLOSURE INSTALLATION

A. Enclosures shall be lockable with a tamper switch and installed in a manner to be accessible with clearance to fully open enclosure door.

B. All security panels shall be wired through a dedicated power supply with battery backup.
   1. Power to the data gathering panels is to be hardwired utilizing EMT or rigid conduit in accordance with the Electrical specifications.
   2. A circuit from the Fire Alarm panel must be installed to each lock power distribution panel.

C. Enclosures shall be installed on designated wall fields in a neat and compact manner to allow for future growth.

D. Enclosures shall be sized to allow for 20% growth in each panel.

E. All panels and boards shall be installed in enclosure(s) suitable to their environment and have sufficient size and orientation to include all system components.

F. Each panel shall be labeled accordance with Owner standards.
   1. The label for each panel shall be posted on the exterior of the panel door.
      a. Each panel shall have a list of devices connected to it located on the inside cover.
      b. A detailed device layout drawing will be located on the inside of the panel door in an appropriate sleeve and keeper.

3.3 FURTHER REQUIREMENTS

A. Refer to provisions of Section 28 02 00

B. Furnish and coordinate installation of all special device back boxes and AC field devices as shown on the security drawings and as specified in this section.

C. The exact installation locations of all equipment shall be coordinated and verified with the Contractor prior to installation.
   1. Subcontractor shall notify the Contractor if any location appears to be unsuitable.

D. Provide low voltage power supplies for electric locking devices and AC devices and components as shown on the security drawings and specified in this Section.

E. Coordinate with the Telecommunications Subcontractor for data network connections, IP address requirements, and telephone circuits as required.

F. Prepare all systems for user operation.
   1. The security system must be complete and ready to operate prior to Owner final acceptance of the system.

G. Coordinate with the Owner for all system programming requirements.

H. Perform database programming as required to support the card reader, alarm point, surveillance system integration, and control panel configuration as required.

END OF SECTION

SECTION 28 20 00 - VIDEO SURVEILLANCE SYSTEM

PART 1 - GENERAL

1.1 SUMMARY/OVERVIEW

A. This section provides specifications for the installation of an IP based Video Surveillance System (VS) and related components.

B. Related Sections
1. Section 26 00 00 - Electrical (including related sub-sections)
2. Section 27 00 00 - Communications (including related sub-sections)
3. Section 28 00 00 - Electronic Safety and Security
4. Section 28 10 00 - Access Control System
5. Section 28 31 00 - Intrusion Detection System

1.2 REFERENCES

A. See Section 28 02 00

1.3 SYSTEM DESCRIPTION

A. The project will be equipped with a new Video Management System (VMS) as a Stand Alone System.
1. Provide Network Video Recorder (NVR) and Network Attached Storage (NAS) located in relay rack in the MDF of the project site.
a. The new system shall provide for recording, local monitoring, and remote monitoring of IP cameras.

B. The security integrator shall furnish and install the surveillance system, consisting of camera assemblies, NVR, wiring & cabling, and low voltage camera power supplies.
1. All active surveillance equipment and communication devices shall be on emergency/UPS power.

C. Camera assemblies include camera, lens, housing, and mount. Provide and install wiring and low voltage power from the security wall field/rack to the camera locations.
1. Scope of work shall be complete from point of origin (camera) to point of termination (security rack).

D. Provide rack mount 1U monitor/keyboard/track ball drawer with 20” LCD monitor for display and programming, keyboard, track ball, and integrated four-port KVM switch.
1. Provide additional KVM ports as required plus two spare ports if Work includes more than two NVRs.

E. Coordinate all work that must be performed in security head end spaces with the General Contractor, the Electrical Contractor, and the Telecommunications contractor. (if applicable)

F. Camera images shall support H.264 compression formats.

G. The NVR shall not be loaded to exceed 50% of the camera and/or storage capacity to allow room for expansion.

H. Camera lenses for fixed cameras shall be varifocal and sized to provide the owner approved field of view. The lens shall be IR corrected and have megapixel resolution.

I. Surveillance camera audio functions shall not be installed and/or disabled unless specifically requested by Owner.

1.4 SUBMITTALS

A. Follow provisions of Section 28 02 00 for additional requirements.

B. Project Data
1. Provide a description of system operation indicating the purpose and capability of each device/component of the system with a functional diagram indicating all interfaces to other systems.

C. IP: Video Quality test reports shall be provided for all cameras to confirm an optimum high definition video signal.

D. Shop drawings shall reflect all requirements associated with Owner provided or existing equipment and materials that will be used as part of this system.

E. Video Storage calculations to show the system capacity can accommodate the specified video retention.

F. Battery calculations to show the expected loads and backup duration for camera power supplies and UPS devices for all active surveillance equipment.

G. System programming, camera titles, descriptions, camera images and database
1. Camera titles and descriptions prior to system programming
2. Programming/database prior to performance testing
3. Provide a cross reference between specified camera numbers and programmed camera numbers
4. Final programming, camera images and system documentation on electronic media to Owner

H. Product Data
1. Manufacturer’s technical data sheets and specifications

1.5 QUALITY ASSURANCE

A. Follow provisions of Section 28 02 00

B. Spare Parts:
1. Provide two (2) spare components for every model and configuration of electronic components and devices used on the project as spare parts inventory.
a. The security integrator will turn over the new and unused components and devices to the owner at project closeout.

1.6 DELIVERY, STORAGE AND HANDLING

A. See Section 28 02 00

1.7 PROJECT/SITE CONDITIONS

A. See Section 28 02 00

1.8 WARRANTY

A. See Section 28 02 00

PART 2 - PRODUCTS

2.1 CAMERA SPECIFICATIONS

A. All cameras shall be a Dome Camera unless otherwise specified
1. Compatible with the VMS
2. Vandal resistant with polycarbonate dome
3. Wide Dynamic Range Feature: All exterior cameras and interior cameras that have exterior lighting or headlights in their field of view shall have a Wide Dynamic Range feature to improve picture quality in situations with strong backlighting.
4. Multi-stream so that recording and viewing can be at different frame rate and compression.
5. Day-night Color/B&W camera with cut filter
6. Exterior cameras:
a. Shall be outdoor rated
b. Include a heater to permit fog-free viewing in low temperatures
c. Fan to prevent overheating in high temperatures (as required)

B. Interior Fixed Dome Cameras:
1. Shall be IP, PoE IEEE 802.3 af
2. Day-night Color/B&W camera with cut filter
3. Smoked lower dome
4. Include an SD card sized to allow for scheduled and event based storage of images

5. Resolution shall be a minimum of 2MP (1080p) at 30 FPS
6. Vari-focal auto-iris fixed lens sized to provide the owner approved field of view
7. Shall have a minimum sensitivity of 0.05 Lux at:
    a. 30 IRE
    b. 75% reflectance
    c. AGC off
    d. 1.2 f-stop
    e. Sense-Up off

C. Interior/Exterior Fixed Wide Angle Lens Cameras:
1. Resolution shall be a minimum of 5.0 MP at 30 FPS
2. Dome Camera is preferred over a Box Camera
3. Include an SD card sized to allow for scheduled and event based storage of images
4. Auto-iris wide angle lens
    a. Shall be Rectilinear Lens to minimize barrel distortion
    b. C/CS mount removable lens
    c. Wide horizontal field of view minimum of 90 degrees
    d. Size lens to provide the owner approved field of view
5. Size camera and lens for facial recognition at a minimum of 60 pixels per foot at the target location
6. Shall have a minimum sensitivity of 0.05 Lux at:
    a. 30 IRE
    b. 75% reflectance
    c. AGC off
    d. 1.2 f-stop
    e. Sense-Up off

D. Exterior Fixed Dome Cameras:
1. Shall be IP, PoE IEEE 802.3 af
2. Clear lower dome, unless otherwise specified
3. Include an SD card sized to allow for scheduled and event based storage of images
4. Resolution shall be a minimum of 2MP (1080p) at 30 FPS
5. Vari-focal auto-iris fixed lens sized to provide the owner approved field of view.
6. Shall include remote focus and zoom over the network
7. Shall have a minimum sensitivity of 0.05 Lux at:
    a. 30 IRE
    b. 75% reflectance
    c. AGC off
    d. 1.2 f-stop
    e. Sense-Up off

E. Exterior Pan Tilt Zoom (PTZ) Dome Cameras
1. Shall be IP
2. Clear lower dome
3. Include an SD card sized to allow for scheduled and event based storage of images
4. Resolution shall be a minimum of 1.3MP (720p) at 30 FPS
5. Auto-iris
6. Zoom - 18 x optical zoom lens and 12 x digital zoom.
7. Operator controlled panning speed shall be at least 300 degrees per second and 360 degree continuous pan rotation.
8. 50 presets minimum
9. Shall have a minimum sensitivity of 0.04 Lux at:
    a. 30 IRE
    b. 75% reflectance
    c. AGC off
    d. 1.2 f-stop
    e. Sense-Up off

F. License Plate Cameras:
1. Shall be IP, PoE IEEE 802.3 af or IEEE 802.3 at
2. Include pole and wall mount accessories
3. Include infrared (IR) illuminator accessory
4. Include camera housing with sunshield, heater/blower to meet IP66, IP67 and NEMA 4
5. Include an SD card sized to allow for scheduled and event based storage of images

6. Camera resolution shall be a minimum of 2MP (1080p) at 30 FPS
7. Include IR corrected, varifocal CS-mount lens. Provide lens sized to provide the owner approved field of view. Size camera and lens to view a minimum of 60 pixels per foot at the target location
8. Camera shall have remote focus and zoom over the network
9. Camera shall have a minimum sensitivity of 0.22 lux (color) and 0.02 lux (B/W) at 50 IRE
10. Locate camera perpendicular to the viewing surface

2.2 NETWORK VIDEO RECORDER

A. The Network Video Recorder shall be compatible with the existing video management system along with the following minimal requirements:
   1. Provide hot swappable storage drives in a RAID 5 array
   2. Support dual stream cameras
   3. Include a dual Network Interface Card (NIC) that supports:
      a. Full duplex
      b. Fault tolerance
      c. Link aggregation
      d. Load Balancing
      e. Traffic prioritization
      f. Hot swap
   4. Native support of H.264 compression that does not require the use of additional software or equipment
   5. Provide a 20 inch 1080P service monitor and keyboard at each NVR equipment rack
   6. Provide video storage capacity for 30 days using the following minimum criteria
      a. All cameras using H.264 compression
      b. Interior cameras: Use native camera resolution
      c. Exterior cameras: Use native camera resolution
      d. Wide angle lens cameras: Use native camera resolution
      e. Motion triggered recording
         1) Assume that motion will be detected 50% of the day
         2) Motion detection will be configurable by camera and schedule to mitigate nuisance triggers
         3) Record video at 12 FPS when motion is detected
         4) Record video at 1 FPS when no motion is detected

B. Coordinate with owner on the number of user licenses required

C. Provide UPS for backup power to the NVR and peripheral equipment
   1. Follow provisions of Section 28 02 00 for UPS power requirements
   2. Coordinate with Division 26 to provide a dedicated Emergency Power circuit

2.3 POE NETWORK SWITCH

A. Provide a fully configured rack mounted PoE Managed 10/100/1000Mbps Layer 3 Switch.
   1. Coordinate switch make and model with Owner / Owner network representative prior to purchase to ensure compatibility with existing and non-surveillance related network appliances.
   2. Coordinate with Owner / Owner network representative on video surveillance subnet assignment.
   3. Switch port count shall allow for 10% growth.

2.4 ACCEPTABLE MANUFACTURERS

A. Video Management System (VMS) Platform Software
   1. Ubiquiti`s Unifi Protect
   2. Milestone Systems
   3. Salient Systems
   4. Video Insight
   5. Owner Approved Equivalent

B. NVR Server: Compatible with VMS Requirements
   1. NVR specification compliant hardware

C. Workstation Hardware:
   1. Dell
   2. HP

3. Owner Approved Equivalent

D. Video Monitor:
1. Viewsonic
2. Samsung
3. Optiquest
4. LG
5. Owner Approved Equivalent

E. TYPE A: Exterior Color Camera
1. Axis Communications
2. Bosch
3. Pelco
4. Samsung
5. Owner Approved Equivalent

F. TYPE B: Interior Color Dome Camera
1. Axis Communications
2. Bosch
3. Pelco
4. Samsung
5. Owner Approved Equivalent

G. TYPE C: Interior/Exterior Color Camera Multilense
1. Axis Communications
2. Bosch
3. Pelco
4. Samsung
5. Owner Approved Equivalent

H. TYPE D: Interior 3-Lens Multisensor Camera
1. Axis Communications
2. Bosch
3. Pelco
4. Samsung
5. Owner Approved Equivalent

I. Type E: Dual Head Camera
1. Axis Communications
2. Bosch
3. Pelco
4. Samsung
5. Owner Approved Equivalent

J. Camera Power Supply
1. Altronix
2. Alarm-Saf
3. LifeSafety Power
4. Owner Approved Equivalent

K. Equipment Racks and Racks Components: (By Division 27)
1. Chatsworth Products (CPI)
2. Ortronics
3. Newton Instruments
4. Owner Approved Equivalent

L. Lockable Equipment Cabinet and Components: (By Division 27)
1. Chatsworth Products (CPI)
2. Ortronics
3. Newton Instruments
4. Owner Approved Equivalent

M. Media Converter - Copper-to-Fiber Outdoor rated (Hardened for extreme temperatures)
1. Axis Communications
2. Pelco

3. IFS / UTC Security
4. Owner Approved Equivalent

N. PoE Network Switch
1. Brocade
2. Cisco
3. Juniper
4. Arista
5. Owner Approved Equivalent

O. Video Wire & Cable
1. Windy City
2. General Cable
3. Belden
4. CommScope
5. Owner Approved Equivalent

P. Uninterruptible Power Supply (UPS)
1. Eaton UPS
   a. 5S series for workstations
   b. 9170 for rack mounted equipment
2. APC Smart-UPS Series
   a. SMT series for workstations
   b. Smart-UPS on-Line series for rack mounted equipment
3. MinuteMan
   a. Pro series for workstations
   b. Enterprise Plus series for rack mounted equipment
4. Owner Approved Equivalent

PART 3 - EXECUTION

3.1 CONFIGURATION

A. Video Cameras
1. Provide day/night cameras in exterior locations
2. Lenses shall be field tested with Owner present to verify clear, crisp images and desired field of view
   a. Substitute camera lenses as necessary to obtain required field of view at no additional cost
   b. Provide spot filters for exterior lenses as required to reduce picture washout caused by sunlight

B. IP PoE Cameras
1. The security integrator shall coordinate network and IP address requirements with Owner to identify the Media Access Control (MAC) address (Layer 2) of each provided camera, the location to be installed, and the port configuration needed for communication.
2. Make all necessary adjustments to camera lenses to obtain clear, crisp images and desired field of view to the Owners satisfaction.
   a. Substitute camera lenses as necessary to obtain required field of view at no additional cost.
      1) Adjust all cameras to produce high-definition images with no blooming, streaking or noticeable lag.
      2) Provide and install in-line PoE injectors as required when non PoE network switches are used or when manufacturer specified power is not available to the camera.
      3) All camera power shall comply with the specified power requirements.

3.2 POWER REQUIREMENTS

A. Provide uninterruptible power supplies for all active surveillance equipment
1. Rack mounted components, including all active network communication hardware, shall be on an Uninterruptible Power Supply (UPS) system.
2. Refer to Section 28 02 00 for UPS and power requirements
3. Camera power supplies shall be on an Auxiliary Power Supply (APS), system as required, with a battery backup.

a. The Auxiliary power supply shall be furnished with a power distribution panel with each camera individually fused or protected with an over-current protector.

B. Power supplies shall provide:
1. 120 VAC input and output voltage as required
2. UL Listed
3. Power fail contacts to monitor the status of the input power
a. Connect each power supply power fail alarm as a separate alarm input into AC/ID system
4. Key lockable wall mount metal enclosure with tamper switch
5. Independently fused outputs

3.3 INSTALLATION

A. Refer to provisions of Section 28 02 00

B. All surveillance system devices and components shall be compatible.

C. Camera Housings and Mounts
1. Cameras shall include housings and mounts as indicated in the Drawings.
a. Provide the smallest available housing for each camera application.
1) Integrated miniature dome cameras are preferred
2. Wiring to cameras shall pass from the back-box through the mount and into the housing. Exposed wiring or conduit shall not be acceptable.
3. Provide sun shields for camera housings in outdoor locations exposed directly to sunlight.
4. Provide surge protection for power and copper video cables for exterior cameras at the camera and at the point of termination (security rack).
5. Field verify the exact camera location, position, and mounting prior to installation.
6. Roof mounted cameras shall use roof deck brackets.

D. Video Management Control System
1. System platform software shall be ‘open architecture’ allowing for compatibility and integration with other building automated systems.
2. The system shall allow for secure remote viewing of live and recorded video as required.

E. Provide labeling suitable to Owner for all major equipment components. Coordinate with Owner on numbering scheme to match existing. Major equipment components:
1. IP Video monitors, IP camera Patch Panels, PoE Switches (or mid-span units), Network Video Recorders (NVR), and fiber mux units (if required).

F. Coordinate with Telecommunication subcontractor for network and patch panel provisions for security connections in the IT room. (If applicable)

G. Coordinate with Owner for all system programming and database requirements.
1. Provide all programming, setup, camera and device titling and data entry
2. Camera and device title and descriptions shall be consistent for all components

H. Install all Point-to-Point wiring with appropriate terminal connections for every wire and component termination so that all connections are mechanically and electrically secure.

I. Install field wiring in continuous lengths, without splices.

J. Verify upon job completion that all wiring and terminations are clearly labeled to identify the wire and terminal.

K. Testing of the surveillance system includes checkout of installed cameras back to the Security head end equipment to confirm proper operation of camera assemblies. Security integrator shall provide all necessary test equipment to fully demonstrate proper performance of field devices. Copies of test results shall be included in the project completion submittals given to the Owner.

END OF SECTION

SECTION 28 31 00 - INTRUSION DETECTION SYSTEM

PART 1 - GENERAL

1.1 SUMMARY/OVERVIEW

A. This section provides specifications for the installation of Electronic Intrusion Detection (ID), and related components.

1.2 RELATED SECTIONS

A. Section 08 71 00 - Door Hardware

B. Section 26 00 00 - Electrical (including related sub-sections)

C. Section 27 02 00 - Basic Materials and Methods for Communications Systems

D. Section 28 02 00 - Basic Materials and Methods for Safety and Security Systems

E. Section 28 10 00 - Access Control System

F. Section 28 20 00 - VIDEO SURVEILLANCE SYSTEM

G. Section 28 46 00 - Fire Alarm and Smoke Detection

1.3 REFERENCES

A. See Section 28 02 00 Basic Materials and Methods for Safety and Security Systems.

B. Latest Dallas ISD Technical Design Guidelines.

1.4 SYSTEM COORDINATION

A. The Security Integrator shall completely coordinate all relevant work of other trades/systems including, but not limited to:
   1. Door Hardware
   2. Fire Alarm System
   3. Electrical Systems(s)
   4. Telecommunications System(s)

1.5 GENERAL SYSTEM DESCRIPTION

A. General Requirements
   1. Furnish all labor, materials, tools, equipment, and services for a complete security system as indicated and in accordance with provisions of the contract documents.
   2. Although such work is not specifically indicated, furnish and install all supplementary or miscellaneous items, and devices incidental to or necessary for a sound, secure and complete installation.
   3. Comply with the provisions of Division 1 for General Requirements.
      a. In the event of a conflict between the provisions of this Section and Division 1, the more stringent provisions shall apply.
   4. All system devices and components included shall be compatible.

B. The project shall be equipped with new system that is maintained by the police department.
   1. All work required within the project for new ID system head end shall be furnished and installed by the project security contractor.

C. The ID system will support the needs of the project in accordance with these specifications.
   1. The ID system shall have the capability for future expansion to support the security needs of the completed complex.

D. The ID system shall be interfaced with the Fire Alarm system (by others) as required to comply with all building code requirements.

E. Emergency/UPS power will be utilized to power the ID system's computer workstation (client) at the Security head end equipment location.

F. Emergency/APS power will be utilized to power the ID system's Data Gathering Panels and control components as required throughout the facility.

G. Confirm intrusion system monitoring program requirements with Dallas ISD-IT-CSS, Central DIspatch, and M&O.

H. For building addiion project, connect new devices to existing system, if applicable. In the event that there is not adequate capacity, the existing panel is to be increased in capacity or replaced. If replacement of the existing system is required, existing intrusion detection devices and cabling are also to be replaced.

I. For renovation project, if Electronic safety and security are in the scope, provide new intrusion detection system including all new cabling and devices. Reuse of existing cabling and devices is not allowed.

1.6 INTRUSION DETECTION SYSTEM

A. A series of field installed alarm initiating devices shall be connected to the ID system so that status changes of the devices are transmitted to the security management system.
   1. Provide Intrusion Detection Panels (IDP), alarm devices, and keypads to be connected to the security management system via Local Area Network (LAN).
   2. The security integrator shall coordinate network and IP address requirements with Owner to identify the Media Access Control (MAC) address (Layer 2) of each provided device, the location to be installed, and the port configuration needed for communication.

B. Tamper Switches
   1. Typically closed tamper switches to monitor the secure status of all IDP's, power supplies, terminal cabinets, power distribution units, and other Security System cabinets and enclosures.
   2. Fasten tamper switches within the cabinet to provide no access to the switch and fasteners when the cabinet is closed.
   3. Provide independent monitoring of tamper conditions for each cabinet.
      a. Include the number of tamper switches in the total alarm input figures.

C. Provide ID keypads conveniently located near areas being protected so as to allow devices to arm and disarm.

1.7 SUBMITTALS

A. Follow provisions of Section 28 02 00 additional requirements.

B. Field Test Reports
   1. Upon completion and testing of the installed system, test reports shall be submitted in booklet form and electronic media showing all field tests performed on, and adjustments made to each/any component and all field tests performed to prove compliance with the specified performance criteria.
   2. Indicate and interpret test results in written form and verbally to owner/DBR for compliance with performance requirements at a pre-scheduled meeting.

C. Battery calculations to show the expected loads and backup duration for power supplies and UPS devices for all active ID equipment.

D. Security Contractor is responsible to prepare and submit as required to the Authority Having Jurisdiction (AHJ) any and all information to obtain an Electronic Locking Mechanisms permit.

1.8 QUALITY ASSURANCE

A. Follow provisions of Section 28 02 00.

B. Spare Parts:
   1. Provide two (2) spare components for every model and configuration of electronic components and devices used on the project as spare parts inventory.
      a. The security integrator will turn over the new and unused components and devices to the owner at project closeout.

1.9 DELIVERY, STORAGE AND HANDLING

A. Follow provisions of Section 28 02 00.

1.10 PROJECT/SITE CONDITIONS

A. Follow provisions of Section 28 02 00.

1.11 WARRANTY

A. Follow provisions of Section 28 02 00.

B. All devices and components shall comply with applicable U.L. standards.

PART 2 - PRODUCTS

2.1 ACCEPTABLE INTRUSION DETECTION MANUFACTURERS

A. ID System Platform Software
1. NAPCO GEmini
2. Owner Approved Equivalent

B. Intrusion Detection Data Gathering Panels (IDP)
1. NAPCO Gemini #GEM-P9600 (for Elementary and Middle Schools to provide up to 96 zones)
2. NAPCO Gemini #GEM-P9600 (for High Schools to privide up to 25 zones)
3. Owner Approved Equivalent

C. Alarm Communicator
1. AES 7007 Burglary Subscribers IntelliNet 2.0
2. Intrusion detection systems are monitored by an AES-Multinet receiver at Dallas ISD's central monitoring system. Intrusion Detection systems are to report to central monitoring system via an AES 7007 Burglary Subscribers IntelliNet 2.0 or Dallas ISD approved equal. If central monitoring system is not available, signal is to be sent to Southwest Dispatch or as directed by Dallas ISD designated

D. Expansion Modules
1. NAPCO
a. Provide external power supply for each expansion module installed.
b. All expansion modules shall be tied into the main intrusion detection panel.
c. Provide wall mounted enclosure for all expansion module and the power supply devices.

E. Keypads
1. NAPCO #GEMK1CA
2. Owner Approved Equivalent

F. Tamper Switches
1. Sentrol 3010
2. Owner Approved Equivalent

G. Dual Technology Motion Detectors
1. Bosch #ISC-CDL1-WA15G
2. NAPCO
3. Owner Approved Equivalent

H. Medium Range Motion Detectors
1. Bosch #ISC-PDL1-WC30G
2. NAPCO
3. Owner Approved Equivalent

I. Long Range Motion Detectors
1. Bosch #DS794Z
2. NAPCO
3. Owner Approved Equivalent

J. 360 Degree Motion Detector

1. Bosch #DS9370
2. NAPCO
3. Owner Approved Equivalent

K. Roof Beam Detectors
1. Optex AX-100PLUS or approved equivalent
   a. Contractor shall provide roof beam detection devices on roofs with HVAC equipment at the locations indicated on the drawings. Provide any additional transmitter/receivers, or miscellaneous components required to provide complete coverage of the roof.
   b. Penetration of roof membrane or flashing by devices, mounting, or conduits is not allowed.
2. Roof beam detection device shall be installed per the manufacturer's specifications.

L. Door Position Switches (DP + DT)
1. Concealed Magnetic Door Position Switch
   a. Sentrol 1076D
   b. Magnasphere MSS-19C/L / MSS-25C/L
   c. Detection Systems, Inc
   d. Owner Approved Equivalent

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

A. Power Supplies
1. Power supply requirements
   a. A switch and on/off indicator within the power supply cabinet.
   b. Four hours of sealed gel battery backup to provide continuous operation during power failure.
      1) Provide batteries as required to provide specified battery backup time for a fully loaded power supply, regardless of the connected load.
   c. A battery charger to maintain the battery.
   d. Low battery and power fail contacts to monitor the status of the input power and the battery.
      1) Connect each power supply low battery and power fail alarm as a separate alarm input into IDP.
   e. Key lockable wall mount metal enclosure with tamper switch.
2. Additional IDP Power Supply Requirements
   a. The IDP power supply provides power only to IDP’s and shall not provide power for locks or any other low voltage device.
3. Additional Device Power Supply Requirements
   a. Provide device power supplies for other security system devices requiring power (e.g. card readers, local alarms, motion sensors, etc.)
   b. Provide power distribution boards with independently fused outputs.

B. Tamper Resistant Screws
1. Provide appropriate screw heads for each application (e.g. countersunk heads for recessed cover plate screws, flat head screws for standard junction box covers, etc.).
2. The security integrator shall provide Torx® tamper resistant screws for:
   a. Junction boxes located above doors
   b. Junction boxes located below ceiling height and/or within reach of hatch ladders
   c. Security device cover plates
   d. Surface mounted door position switches and armored cable

3.2 ENCLOSURE INSTALLATION

A. Enclosures shall be lockable with a tamper switch and installed in a manner to be accessible with clearance to fully open enclosure door.

B. All security panels shall be wired through a dedicated power supply with battery backup.
1. Power to the data gathering panels is to be hardwired utilizing EMT or rigid conduit in accordance with the Electrical specifications.
2. A circuit from the Fire Alarm panel must be installed to each lock power distribution panel.

C. Enclosures shall be installed on designated wall fields in a neat and compact manner to allow for future growth.

D. Enclosures shall be sized to allow for 20% growth in each panel.

E. All panels and boards shall be installed in enclosure(s) suitable to their environment and have sufficient size and orientation to include all system components.

F. Each panel shall be labeled accordance with Owner standards.
   1. The label for each panel shall be posted on the exterior of the panel door.
      a. Each panel shall have a list of devices connected to it located on the inside cover.
      b. A detailed device layout drawing will be located on the inside of the panel door in an appropriate sleeve and keeper.

3.3 FURTHER REQUIREMENTS

A. Refer to provisions of Section 28 02 00.

B. Furnish and coordinate installation of all special device back boxes and ACID field devices as shown on the security drawings and as specified in this section.

C. The exact installation locations of all equipment shall be coordinated and verified with the Contractor prior to installation.
   1. Subcontractor shall notify the Contractor if any location appears to be unsuitable.

D. Provide low voltage power supplies for electric locking devices and ACID devices and components as shown on the security drawings and specified in this Section.

E. Coordinate with the Telecommunications Subcontractor for data network connections, IP address requirements, and telephone circuits as required.

F. Prepare all systems for user operation.
   1. The security system must be complete and ready to operate prior to Owner final acceptance of the system.

G. Coordinate with the Owner for all system programming requirements.

H. Perform database programming as required to support the card reader, alarm point, surveillance system integration, and control panel configuration as required.

END OF SECTION

SECTION 28 46 01 - FIRE ALARM AND SMOKE DETECTION SYSTEM WITH VOICE EVACUATION

PART 1 - GENERAL

1.1 SCOPE

A. The contractor shall furnish and install a complete distributed microprocessor based 24VDC, electrically supervised, MULTIPLEX fire alarm and voice evacuation communication system as specified herein and indicated on the drawings The system shall include, but not be limited to, all control equipment, remote transponders, power supplies, signal initiating and signaling devices, conduit, wire, fittings, and all other accessories required to provide a complete and operable system

B. The system shall operate as a non-coded, continuous sounding system which will sound alarm devices until manually silenced, as herein specified

C. The system shall be wired as a Class A supervised system for all circuits

D. The Fire alarm system shall be fully designed, permitted, documented, installed, and inspected by a licensed fire alarm engineer. The fire alarm engineer shall be solely responsible for a code compliant system, meeting the criteria of Dallas ISD guidelines, and local code adaptations of the local AHJ. Provide all necesary devices, as guided by device locations suggested on the Electrical drawings. Devices shown on the electrical plans are suggestive locations only, and may not depict all required devices and locations.

1.2 CODES AND STANDARDS

A. The system shall comply with the applicable Codes and Standards as follows:
   1. National Electrical Code - Article 760
   2. National Fire Protection Association Standards:
      a. NFPA 70 NEC
      b. NFPA 72 National Fire Alarm Code (1996)
      c. NFPA 90A Air Conditioning
      d. NFPA 101 Life Safety Code
      e. UL 1971 Visual Devices
      f. ANSI 117.1 Visual Devices
   3. Local & State Building Codes (Including all adopted amendments)
   4. Texas Accessibility Standards (TAS)
   5. American’s with Disabilities Act (ADA)
   6. Requirements of Local Authorities having Jurisdiction
   7. Underwriters Laboratory Requirements and Listings for use in Fire Protective Signaling Systems as follows:
      a. UL 864 Control Panels (9th Edition)
      b. UL 268 Smoke Detectors - Systems
      c. UL 268A Duct Smoke Detectors
      d. UL 521 Heat Detectors
      e. UL 228 Door Holder-Closers
      f. UL 464 Audible Signaling Appliances
      g. UL 1971 Visual Signaling Appliances
      h. UL 38 Manual Alarm Stations

1.3 ACCEPTABLE MANUFACTURERS

A. All equipment, materials, accessories, devices, etc covered by the specifications and/or noted on the contract drawings shall be new and unused and be U L listed for their intended use

B. All references to manufacturer's or supplier's model numbers and other pertinent information herein is intended to establish a minimum standard of quality, performance and features required All equipment proposed as an EQUAL to that specified shall COMPLETELY conform to the specifications herein

C. Equipment of other manufacturer's or supplier's may be considered as an equal to that specified provided that completely marked and identified catalog sheets of all proposed equipment is provided to the architect/ engineer for review ten (10) days prior to the date of bid for evaluation In addition, a list of the contractor's qualifications and any exceptions to the specifications must be provided for review Approval for any such substitution of equipment must be obtained in writing from the architect/engineer five (5) days prior to bid

D. Provide the following manufacturers:
1. Notifier NFS2-3030
2. others acceptable by Dallas ISD pre-approval

1.4 GENERAL REQUIREMENTS

A. Contractor Qualifications:
1. The equipment supplier shall be an authorized and designated representative of the Fire Alarm Manufacturer to sell, install, and service the proposed manufacturer's equipment
2. The equipment supplier and installing contractor shall be licensed by the State Fire Marshall to sell, install, and service fire alarm systems as required by Article 5 43-2 of the Texas Insurance Code
3. The installing contractor and/or equipment supplier shall have on his staff a minimum of three (3) installation superintendents who are licensed by the State Fire Marshall's office for such purpose and under whose supervision installation, final connections, and check out will take place as required by the Texas Insurance Code
4. The installing contractor or equipment supplier shall have on staff a minimum of one (1) certified NICET Level III state licensed fire alarm planner under whose supervision system design shall take place
5. The installing contractor shall provide 24 hour, 365 days per year emergency service with qualified and state licensed service technicians
6. The installing contractor shall have been actively engaged in the business of selling, installing, and servicing fire alarm systems for at least ten (10) years

1.5 SUBMITTALS

A. The installing contractor and/or equipment manufacturer shall provide complete and detailed shop drawings and include:
1. Control panel configuration including wiring and interconnection schematics
2. Complete point to point wiring diagram showing terminal connections to all system devices
3. Riser wiring diagram and associated zoning/addressing configurations with associated conduit sizes
4. Complete floor plan drawings locating all devices associated with the fire alarm system Floor plan drawings shall include conduit and wiring routing complete with conduit sizing and number of conductors by type Floor plans shall be on AutoCAD v 12
5. Factory data sheets on each piece of equipment to be used and so marked as to model, dimensions, size, voltage, and configuration
6. Detailed system description in this specification format describing system functions and operation All specification variations and deviations shall be clearly noted and marked
7. Complete Bill of Material for reference
8. Programming matrix defining all input/output functions and zoning
9. Power supply and battery calculations.
10. Written certification from the manufacturer stating that the distributor is authorized to sell, service and install the proposed fire alarm system.

B. All submittal data will be in bound form with contractor's name, supplier's name, project name, and state fire alarm license number adequately identified

C. Only basic equipment devices have been shown on the contract drawings Specific wiring between equipment/devices has not been shown It is the contractor’s responsibility to submit for approval the COMPLETE ENGINEERED system configuration and layout showing all devices, wiring, conduit, and locations along with other required information as specified herein

1.6 COORDINATION

A. It shall be the responsibility of the installing contractor to coordinate all requirements surrounding installation of the fire alarm system with all trades including, but, not exclusive of: electrical contractor, sprinkler contractor, and HVAC/controls contractor and intercom system. Adequate coordination shall be provided to insure proper installation and interface to all peripheral items required to interact with the fire alarm and communication system to provide a complete and functional life safety system.

PART 2 - PRODUCTS

2.1 SYSTEM FUNCTIONAL OPERATION

A. ALARM DETECTION

1. When a fire alarm condition is detected via the main fire control panel by any of the system alarm initiating devices, the following functions shall occur:
   a. The system common alarm LED on the CPU Module shall flash The internal audible trouble device shall sound Acknowledging the alarm condition shall silence the audible trouble device and revert the flashing common alarm LED's to a steady state
   b. An 640 character back-lit LCD Display shall indicate all applicable information associated with the alarm condition including: zone, device type, device location, and time of alarm Location and zoning messages shall be custom field programmed to respective premises
   c. Appropriate status change messages shall be transmitted to the system printer
   d. Any remote annunciator LCD display associated with the alarm zone shall be activated as herein specified
   e. The remote signaling or municipal tie connection shall be activated relaying the alarm signal to an approved central station (central station connection and service provided by Owner)
   f. All automatic events programmed to the alarm point shall be executed and the associated indicating devices and/or outputs activated
   g. Alarm tones shall sound on the floor of incidence, floor above and floor below Upon expiration of the alert tone, a digitized predetermined voice evacuation message shall be automatically transmitted to the effected floors The system shall have the capability to generate multiple distinct digital messages as determined by event initiated programs
   h. Flash all strobe lights (visual signals) on the fire floor, floor above, and floor below
   i. Activate the stair pressurization fans.
   j. Recall elevators to ground floor as specified herein, or to the alternate floor if the alarm condition originates on the ground floor.
   k. Unlock all stair tower doors.
2. Elevator lobbies shall be provided with smoke detectors, identified as individual points. Upon activation of both of the detectors associated with an elevator lobby, all elevators shall be automatically recalled to the ground floor. In the event of a fire on the ground floor, all elevators shall be automatically recalled to the 1st terminus floor above the ground floor served by the respective elevator bank.
3. Activation of the heat detector at the top of each elevator shaft and elevator machine room shall activate a shunt trip.
4. All designated "non-silenceable" auxiliary control functions shall remain in operation (even upon silencing of audible alarms) until such time as the control panel is cleared and reset manually (i.e. fan control outputs, central station interface, elevator recall interface, etc.).
5. In addition, remote annunciators shall be located where indicated. The annunciators shall duplicate the control panel alarm status indicators (for selected system zones/points) and in addition, annunciate any system trouble conditions and operate as herein specified.
6. Manual activation of a smoke exhaust damper switch shall close all smoke exhaust dampers on all floors except floor switch indicates. (Dampers are normally open).
7. Manual activation of smoke exhaust fan start switch shall turn on smoke exhaust fan in penthouse.

2.2 ALARM VERIFICATION

A. ALARM VERIFICATION shall be field programmed for each respective detector Global verification will not be acceptable The verification sequence is activated after a "check" procedure and the panel will wait a field programmable delay period (0-50 seconds) then proceed to re-sample the detector for continued presence of smoke If the alarm condition still exists or a non-verified device is actuated during the verification period, the system will then initiate all alarm sequences specified herein The system shall incorporate the ability to log in memory the number of verification events that have occurred for each selected device

2.3 SYSTEM TROUBLE DETECTION

A. When a trouble condition is detected by the CPU, one of the system initiating alarm or SLC circuits, the following functions shall immediately occur:
1. The system trouble LED on the CPU module shall flash and the internal audible trouble device shall sound Acknowledgment of the trouble condition shall silence the audible trouble device and cause all trouble LED's to illuminate steady
2. The 640 character alphanumeric LCD annunciator shall display all applicable information via the alphanumeric display associated with the respective trouble condition and its location
3. Appropriate status change/messages shall be transmitted to the system printer
4. The system common trouble indicator on associated remote annunciators shall be illuminated as specified herein
5. Appropriate status change messages shall be transmitted to the system printer

2.4 ZONING

A. The system shall have the inherent capability to employ "Intelligent" smoke detectors and addressable interface devices capable of being recognized and annunciated at the main control panel on an individual basis. All zoning/device location information shall be totally field programmable to exact job requirements as approved by the architect/engineer.

B. The system shall utilize remote transponder panels for distributed voice communications, notification appliance circuits, and auxiliary control output circuits. Remote transponder panels shall communicate with the main CPU via the SLC data loop and be capable of being intermixed on the same loop as intelligent smoke detection and control modules

2.5 FIRE ALARM CONTROL PANEL

A. The control panel shall be modular in design utilizing DISTRIBUTED solid state MICROPROCESSORS and be capable of future expansion. The microprocessor based CPU shall be completely FIELD PROGRAMMABLE CPU module shall provide for programmable non-volatile RAM memory utilizing integral lithium based memory IC chips. All circuitry shall be U L listed for power-limited application.

B. Central Processing Unit Module (CPU)
1. The CPU shall contain and execute all custom time control functions or control-by-event programs for specified events. Time control events/programs shall be automatically overridden by priority fire alarm events. All programs shall be held in non-volatile programmable RAM memory and shall not be lost even if both system primary and secondary power failure occurs.
2. The system shall include a trouble reminder feature to alert operating personnel to the continued presence of system trouble conditions.

C. Display Interface Board
1. The DIA shall provide an 960-character back-lit, Multilingual, Liquid Crystal Display (LCD). It shall provide Light-Emitting Diodes (LED's) for AC POWER; SYSTEM ALARM; SYSTEM TROUBLE; DISPLAY TROUBLE; and DISABLE.
2. The DIA shall provide a 23-key membrane keypad with control capability to command all system functions, status readouts, manual control action, and entry of any alphabetic or numeric information. The keypad shall include means to enter multiple five digit passwords to prevent unauthorized manual control or programming.

D. Control Switches
1. Acknowledge/step Switch
2. Signal Silence Switch
3. System Reset Switch

4. System Test Switch
5. Lamp Test

E. Serial Interface Board (SIB)
1. The SIB shall provide the following interfaces:
2. Two ports for CRT devices (RS-232c)
3. Two ports for remote printer devices (RS-232c)
4. One port for supervised remote LED annunciators (RS-485)

F. Loop Controller
1. The Loop Controller shall communicate and provide power to all devices on its loop over a single pair of wires. Each signaling line circuit shall provide the capability to support up to 159 smoke detectors and 159 monitor and control modules. The Loop Controller shall receive digital/ANALOG information from all "intelligent" detectors and shall process this information to determine normal, alarm, trouble, and sensitivity conditions. The analog information may be used for automatic test and determination of maintenance requirements. The Loop Controller module shall individually monitor all "intelligent" detectors for sensitivity variation initiating a trouble condition should detector sensitivity "drift" become excessive. The system control unit shall have the capability to remotely read each detectors sensitivity, and if need be, electronically adjust the detector sensitivity as required for existing conditions within U.L. recommended limits. In addition, the system shall incorporate a "day/night" sensitivity feature.

G. Non-Lock Walk Test
1. The system shall include a special non-lock "walk test" mode. The walk test mode can be initiated by loop, software zone, or globally as field selected. The following reports shall be capable of being generated:
   a. General results of all walk tested devices
   b. Report all un-programmed devices installed
   c. Report all programmed devices not installed
   d. Report all devices not tested

H. Automatic Detector Test
1. The system shall include a special automatic detector test feature which permits reading and adjustment of the sensitivity of all intelligent detectors from the main control panel. In addition, the automatic test feature shall also permit the functional testing of any "intelligent" detector or addressable interface device individually from the main control panel. An automatic detector test shall occur automatically fourteen times each twenty-four hour period or be initiated manually from the FACP as desired. Automatic detector test sequencing shall be terminated upon receipt of a true alarm condition.

I. Special System Reports
1. The system shall have the ability to generate and print, upon command, system and point status reports. Selection of 'system' read status provides the operator with global system programming information. Selection of 'point' read status provides the operator with selected individual point programming data.

J. Field Programming
1. The system shall be 100% field programmable and shall NOT require replacement of memory IC's. Systems requiring factory programming/re-programming OR REPLACEMENT OF MEMORY I.C. CHIPS shall not be acceptable. All programs shall be stored in non-volatile RAM memory. Programming shall be accomplished only after entering an appropriate and pre-selected five digit password security code. System programming mode shall not require the system to be taken off-line nor prohibit the system from performing its normal operations and routines. The system shall be capable of revising/changing programmed functions or system expansion at anytime subsequent to initialization as described herein without factory modifications or factory programming. Field programming via the use of external computers may be considered provided programming can be accomplished on-site and the owner permanently furnished with required programming apparatus and software as part of this contract.

K. Event History

1. The main fire alarm control panel shall have the resident ability to store a minimum of 1,000 events as well as a separate 1,000 event alarm-only file in chronological order of occurrence. Event history shall include all system alarms, troubles, operator actions, unverified alarms, circuit/point alterations, and component failures. Events shall be time and date stamped. Events shall be stored in non-volatile buffer memory. Access to history buffer shall be secured via five digit password security code. Systems not employing event history memory storage shall be required to furnish a printer/recorder for recording system events.

L. Power Supply
1. The power supply shall provide all control panel and peripheral power needs with filtered power as well as regulated 24VDC power for external audio-visual devices. The audio-visual power may be increased as needed by adding additional modular expansion power supplies. All power supplies shall be designed to meet U.L. and NFPA requirements for POWER-LIMITED operation on all external signaling lines, including initiating circuits and indicating circuits.
2. Input power shall be 120VAC 60Hz. The power supply shall provide internal supervised batteries and automatic charger. The power supply shall provide both positive and negative ground fault supervision, battery/charger fail condition, A.C. power fail indicators. The power supply shall also provide supervision of modular expansion power supplies as may be required.

M. Remote Signalling Communicator
1. Include internal integral dialers with control panel. In addition, provide AES 7707P-88-ULP-M IntelliNet 2.0 Fire Subscriber to communicate with district central station. Provide 12 months monitoring service as part of install.

N. Mass Notification
1. FACP shall have inte
2. Provide panic buttons as directed by owner.

2.6 VOICE COMMUNICATIONS

A. The voice communications panel shall be modular in design utilizing solid state MICROPROCESSOR circuitry.

B. Communications Controls: The communications control panel shall incorporate the following controls and indicators:
1. All call
2. General alarm
3. Audio trouble LED
4. AUDIO LEVEL LED
5. Manual tone/MESSAGE select switches with LED indicators
6. Communications zone select switches and select indicators
7. Communications monitor speaker with volume control
8. Dynamic paging microphone

C. Paging
1. The microprocessor based one way paging system shall be provided with a means to selectively activate voice, tones or digitized messages to any or all zones in the system via electronic membrane touch-pad controls. In addition, visual indication by zone will be provided
2. Each audio/speaker circuit will be totally supervised for opens, shorts or grounds with direct shorts prohibiting selection of the respective zone. All audio circuits shall be POWER LIMITED. Each speaker zone shall be provided with an amber trouble LED for circuit trouble conditions and an active/on LED indicator.
3. Alarm/Paging zones shall be provided as follows:
a. One zone each level/floor
b. One zone each stairwell
c. One zone each elevator bank (to include all elevator cabs in respective bank)
d. One zone for Penthouse Equipment Room.

D. Alarm Electronics
1. The voice communications center shall be a microprocessor based, supervised, multi-function, audio generator The communications generator shall contain:
a. Independent Voice communications CPU
b. Non-volatile RAM memory

c. One custom digitized message circuits
d. Up to four selectable tone generator/oscillators
e. Each sub-circuit of the communications center shall be fully supervised and failure of any tone oscillator or digital message generator shall revert the system to the default standby generator.

2. The system shall be provided with a custom field programmable digitized message Mechanical tape decks/drives shall be deemed unacceptable
3. The system shall be capable of amplifier capacity and expansion as required Each amplifier shall be continuously monitored electronically for proper output level Each unit shall be equipped with diagnostic indicators Each amplifier shall provide 120 watts of 25 VRMS of power. Each unit shall be equipped with its own individual power/pilot LED, audio input trouble LED, battery input trouble LED, and amplifier trouble/fail LED Transfer from any faulty amplifier to the standby unit shall be fully automatic Provide amplification for 1 watts per speaker plus 35% spare capacity
4. The fire alarm alert tone shall be a slow whoop tone with standby default tone in the event the primary oscillator fails Transfer to default tone shall also be automatic upon failure of any digitized voice message

2.7 REMOTE TRANSPONDER PANELS

A. Remote transponder/control panels shall be distributed remotely throughout the facility as indicated on the drawings. Transponders shall be modular in design and provide input/output interface between all field devices/equipment and main system CPU. All functions of the transponder unit(s) shall be FIELD PROGRAMMABLE via the main system CPU and incorporate non-volatile RAM memory. Each unit shall be capable of operating independently in default mode should communication with the main CPU be disrupted

B. The transponder shall include a resident microprocessor based CPU The local CPU shall provide each transponder with common status indicators and transponder control Each CPU module shall include local silence, reset, trouble display, lamp test, and reset capability

C. Transponders shall be provided with zone alarm indicating modules as required Each module shall provide style Y notification appliance circuits Each notification circuit shall be capable of being field programmed as conventional alarm, audio, and/or telephone circuits Output circuits shall be POWER LIMITED Each zone shall be equipped with a status and trouble LED indicator Each alarm notification circuit/zone shall be field programmable for silenceable or non-silenceable operation

D. Transponders shall be provided with auxiliary output/control relay modules as required Each module shall provide multiple SPDT field programmable output circuits Designated fan control circuits shall be provided with software assignable manual control switch as herein specified Each circuit shall be equipped with an individual status LED indicator

E. The power supply shall provide all control panel and peripheral power needs with filtered power as well as regulated 24VDC power for external audio-visual devices The audio-visual power may be increased as needed by adding additional modular expansion power supplies All power supplies shall be designed to meet U L and NFPA requirements for POWER-LIMITED operation on all external signaling lines, including initiating circuits and indicating circuits

F. Provide 120VAC, 20 amp, 60Hz dedicated emergency circuit. The power supply shall provide internal supervised batteries and automatic charger. The power supply shall provide both positive and negative ground fault supervision, battery/charger fail condition, A.C. power fail indicators.

G. Each transponder shall provide a minimum of 1 watts of audio amplification per speaker plus 35% spare capacity

2.8 FIELD DEVICES

A. Multi Criteria Smoke Detectors :
1. Intelligent multi criteria Smoke and Thermal Detection.
2. Intelligent multi criteria Smoke and CO Detection
3. Intelligent multi criteria Smoke, Thermal and CO Detection.

4. The intelligent multi criteria detectors shall be an addressable device that is designed to monitor a minimum of photoelectric and thermal technologies, photoelectric and CO technologies and photoelectric, thermal and CO technologies in a single sensing device. The design shall include the ability to adapt to its environment by utilizing a built-in microprocessor to determine its environment and choose the appropriate sensing settings. The detector design shall allow a wide sensitivity window, no less than 1 to 4% per foot obscuration. This detector shall utilize advanced electronics that react to slow smoldering fires and thermal properties all within a single sensing device.
5. The microprocessor design shall be capable of selecting the appropriate sensitivity levels based on the environment type it is in (office, manufacturing, kitchen etc.) and then have the ability to automatically change the setting as the environment changes (as walls are moved or as the occupancy changes).
6. It shall also include the inherent ability to distinguish between a fire condition and a false alarm condition by examining the characteristics of the CO, thermal and smoke sensing chambers and comparing them to a database of actual fire and deceptive phenomena.
7. The detector shall be semi-flush ceiling mounted and be provided with modular detector head with twist-lock base.

B. Intelligent Duct Detector
1. Duct mounted "intelligent" photoelectric smoke detectors shall be provided where shown on the drawings. Detectors shall operate on the same principles and exhibit the same basic characteristics as area type "intelligent" photoelectric smoke sensors. The detector shall operate in air velocities of 100 FPM to 4,000 FPM. Each detector shall interface directly to the system SLC loop without the requirement of interface zone modules.
2. The unit shall consist of a clear molded plastic enclosure with integral conduit knockouts. The unit shall be provided with clear faceplate cover to provide visual viewing of detector/sensor for monitoring sensor operation and chamber condition. The duct housing shall be provided with gasket seals to insure proper seating of the housing to the associated ductwork. Each unit's sampling tubes shall extend the width of the duct and be provided with porosity filters to reduce sensor/chamber contamination. Detectors shall be installed per NFPA 90A, and be listed with the fire alarm control panel. A remote LED shall be located on the corridor ceiling adjacent to the respective detector where detectors are not plainly visible or concealed from view.
3. Duct detectors shall be powered through fire alarm system and shall not require independent line voltage circuits for any operation condition

C. Intelligent Thermal Detectors
1. Fixed temperature, thermal detectors shall be provided where indicated on the drawings The detectors shall use dual electronic thermostats to measure temperature levels in the chamber and shall, on command from the control panel, send data to the panel representing the analog temperature level
2. The detectors shall provide dual alarm and power/status LED's Status LED's shall flash under normal conditions, indicating that the detector is operational and in regular communication with the control panel Both LED's may be placed into steady illumination by the control panel, indicating that an alarm condition has been detected An output connection shall also be provided in the base to connect an external remote alarm LED
3. The detector shall be semi-flush ceiling mounted and be provided with modular detector head with twist-lock base

D. Addressable Manual Stations
1. Manual pull stations shall be provided where indicated on the drawings
2. Manual stations shall be designed for semi-flush mounting on standard electrical box The station shall be constructed of hi-impact red molded Lexan with instructions for station operation in raised white letters Stations shall be of the dual action type
3. In gymnasiums, provide all pulls tations with integral-horn protectors

E. Monitor Module
1. Addressable single and dual monitor modules shall be provided where required to interface to contact alarm devices The monitor module shall be used to connect a supervised zone of conventional initiating devices to an intelligent SLC loop

F. Control Module

1. Control/relay modules shall be provided where required to provide audible alarm interface and/or relay control interface The control module shall be used to connect a supervised zone of conventional indicating devices to an intelligent loop The zone may be wired class A or class B - field selected The control module may be optionally wired as dry contact (form C) relay
2. A status LED shall be provided which shall flash under normal conditions, indicating that the control module is operational and in regular communication with the control panel The LED shall illuminate steady when the device is actuated via the fire alarm control panel

G. Remote LCD Alpha-Numeric Annunciators
1. Provide where indicated on the drawings, 640 character remote LCD alpha-numeric annunciator or approved equal to annunciate all system events and duplicate the displayed status at the main FACP. The annunciator shall be a backlit eighty-character LCD display and operate via the system RS485 or RS232 serial output terminal from the main FACP. The LCD display shall automatically illuminate upon receipt of an alarm or trouble condition. The illumination source shall extinguish during normal/standby mode to conserve power. The unit shall operate from FACP 24VDC power and function during system power failure while the system resides on standby batteries. The remote LCD annunciator shall include:
   a. Integral time-date clock
   b. Time-date select switch
   c. Time-date/contrast adjust
   d. Display/step switch
   e. System reset
   f. System silence
   g. System acknowledge
   h. Integral trouble buzzer
   i. Point enable/disable capability
   j. Full QWERTY keypad for system programming.
2. Annunciator shall upon command display the first system alarm, last alarm, and system alarm count. The unit shall be equipped with an integral lamp test feature. The unit shall be semi flush mounted where shown.

H. Speakers
1. Speakers shall be listed under U.L. standard 1480, meet all specifications of the Life Safety Code and be capable of reproducing both tone alerts and voice communication instructions. Speakers shall be Genesis GCHFWF-7 Speakers and shall have built in matching transformer, field selectable multiple power taps and circuitry for speaker/line supervision. Speakers shall be provided with screw terminal connection points.
2. Speakers shall be 7" square or round with textured white decorative grill. Speakers shall be tapped to produce a minimum sound-pressure level of 87 dBA at 10 feet. Speakers shall be wall or ceiling mounted as located on the drawings.

I. Speakers with Integral Strobe Light
1. Speakers shall be listed under U.L. standard 1480, meet all specifications of the Life Safety Code and be capable of reproducing both tone alerts and voice communication instructions. Speakers/strobe units shall be Genesis GCHFWF-S7VMC Series. Speakers shall have built in matching transformer, field selectable multiple power taps and circuitry for speaker/line supervision. Speakers shall be provided with screw terminal connection points. Speaker/Strobes shall be white. Each speaker/strobe shall be equipped with an integral high intensity visual alarms shall be Xenon strobe type producing a minimum of 15 candela on a 24 VDC limited energy supervised circuit. Each strobe light shall be capable of providing multi candela output. Alarm devices shall be designated to be wall or ceiling mounted as indicated on the drawings. Signals shall operate in unison with audible alarm appliances. High intensity visual signals shall be of solid state low current design and listed to U.L. Standard 1971. All strobe lights shall be synchronized.

J. High Intensity Visual Signals
1. Strobe lights where shown on the drawings. High intensity visual signals shall be installed where shown on the drawings and as may be required by the Americans with Disabilities Act (Public Law 101-336), Texas Accessibility Standards and NFPA 72, Chapter 6. Strobe lights shall be white.

2. High intensity visual alarms shall be Xenon strobe type producing a minimum of 15 candela on a 24 VDC limited energy supervised circuit. Each strobe light shall be capable of providing multi candela output. Alarm devices shall be designated to be wall or ceiling mounted as indicated on the drawings. Signals shall operate in unison with audible alarm appliances. High intensity visual signals shall be of solid state low current design and listed to U.L. Standard 1971. All strobe lights shall be synchronized.

K. Electronic audio visual devices Electronic Audio Visual Devices
1. Audible/Visual alarm devices shall be electronic horn/strobe units, to be located where indicated on the drawings. Electronic device shall not contain any vibrating electro-mechanical solenoids or contacts for reliability and performance. Electro-mechanical devices shall not be considered as equal. Units shall operate at 24VDC and be polarized supervised. Each unit shall provide a choice of three difference audible tones capable of being field selected. Preferred alarm signals shall be a pulsing tone producing a sound pressure level of 91 dBA. The visual device shall use Xenon strobe type producing a minimum of 75 candela on a 24 VDC limited energy supervised circuit and meet the requirements of ADA. Strobe unit shall automatically flash upon operation of the horn. Horn/strobe unit shall be provided in textured white finish and be flush mounted. Refer to floor plans for candela intensity required. All strobe lights shall be synchronized.

L. Sprinkler Waterflow Switch
1. Sprinkler waterflow switches shall be installed where indicated on the drawings. Each unit shall contain one set of SPDT alarm contacts. Waterflow switches shall be provided and installed by the fire protection contractor, and connected by the fire alarm contractor.

M. Sprinkler Valve Supervisory Switch
1. Sprinkler valve supervisory switches shall be installed on each valve as indicated on the drawings. Each unit shall contain on set of SPDT contacts. Sprinkler valve supervisory switches shall be provided, installed, and adjusted by the fire protection contractor, and connected by the fire alarm contractor.

N. Auxiliary AHU Relays
1. Relays shall be provided for HVAC and AHU control and interface. Relays shall be heavy duty type and rated up to 10 amps at 24 VDC, 60 HZ. Relays shall be provided with NEMA I dust cover assembly and be provided with SPDT contacts as well as activated LED indicator. All interface relays shall be connected to a supervised notification appliance circuit.

O. Field Charging Power Supplies
1. Provide power supplies with battery backup as required. Provide emergency 120 volt 20 amp dedicated circuit to each power supply.

P. Door Hold Opens
1. 24V DC, serviced through fire alarm power supplies. Line Voltage operation is not acceptable.

Q. Mass Notification Panic Buttons
1. Provide Mass Notification Panic Buttons in corridors and elevator lobbies as shown in drawings and directed by DISD.

PART 3 - EXECUTION

3.1 DESIGN CRITERIA

A. The contractor shall provide drawings for Owner, Engineer and Fire Marshall’s approval.

B. Drawings shall be prepared by a state licensed alarm planning superintendent.

C. Drawings shall comply with all local, state and federal code. These include but not limited to N.E.C., U.L., NFPA, Etc.

D. Locate the fire alarm control panel in the day room unless otherwise directed by Owner.

E. Locate a remote annunciator in the Fire Command Room.

F. Additional items required above minimum codes include the following:
1. Pull Stations – All exits including exit stair wells on multi story buildings and at the FACP.

2. Smoke Detectors – Paths of egress, electrical rooms, mechanical rooms, MDF, IDF, storage rooms, top of stairs, elevator machine room, top of elevator shaft, above each fire alarm panel and remote power supplies terminal cabinets.
3. Duct type smoke detectors – all air handling units over 2000 CFM in duct work or return air paths.
4. Heat Detectors – Shops, kitchens, coffee bars, central plants, boiler room and truck bays.
5. Flow switches – Sprinkler riser.
6. Horn - throughout the building.
7. Strobes – throughout the building.
8. Remote Power supplies: Locate in mechanical rooms, electrical rooms, MDF or other areas approved by Owner.
9. Smoke Detectors with low frequency sounder bases in all sleeping rooms.
10. Monitor Fire Pump.

3.2 INSTALLATION

A. Wiring:
1. All wiring shall be in accordance with NFPA 72 and the National Electrical Code, Local Codes, and article 760 of NFPA Standard 70 All wiring sizes shall conform to recommendations of the equipment manufacturer, and as indicated on the engineered shop drawings
2. Limited energy FPLP wire shall be installed provided such wire is U.L. Listed to U.L. TEST 910 for such applications and is of the low smoke producing fluorocarbon type and complies with NEC Article 760 if so approved by the local authority having jurisdiction.
3. All wiring for SLC signaling circuits shall be of the twisted, low capacitance type to guard against outside RF and EMF interference and induced noise
4. Provide CTC 2 hour fire rated cable for all risers When not insulated a 2 hour chase or in non sprinkled areas
5. All wiring shall be run in a supervised fashion (i e no branch wiring or dog-legged wiring) per NFPA requirements such that any wiring disarrangement will initiate the appropriate trouble signals via the main control panel per NFPA and U L requirements
6. Wiring splices shall be kept to a minimum with required splices to be made in designated terminal boxes or at field device junction boxes Transposing or color code changes of wiring will not be permitted End-of-line supervisory devices shall be installed with the last device on the respective circuit Said device shall be appropriately marked designating it as the terminating device on the respective circuit
7. No A C wiring or any other wiring shall be run in the same conduit as fire alarm wiring

B. Open Wiring
1. Systems utilizing open wiring techniques with low smoke plenum cable
2. Support wire clear of knock out panels, access panels, and maintenance spaces for equipment Wire and cable shall be run using wire management techniques supporting cable as close as possible to within one foot of the floor or roof rafters Wire supports shall be directly fastened to the structure on a maximum of five foot centers Wire routing shall be parallel and perpendicular to building lines The wire and cable shall be secured with tie wraps or carrier wire Sagging in excess of three inches will not be allowed nor will bending of the supporting ring structure

C. Conduit/Raceway
1. Conduit and raceway system shall be installed in the garage areas

D. Minimum Wire Sizes Shall Be As Follows:
1. Signaling Line Circuits: 18 AWG Twisted (Low Capacitance)
2. Notification Appliance Circuits: 14 AWG
3. Relay Control Circuits: 18 AWG
4. Speaker Circuits: 16 AWG Twisted
5. Telephone Circuits: 18 AWG Twisted/Shielded

E. All wire shall be plenum rated.

3.3 TEST AND REPORTS

A. A state licensed and factory trained technical representative of the manufacturer shall supervise the final control panel connections and testing of the system Upon completion of the acceptance tests, the owner and/or his representatives shall be instructed in the proper operation of the system Instruction shall be 4 hours minimum

B. The installing contractor shall functionally test each and every device in the entire system for proper operation and response In addition, each circuit in the system shall be fully tested for wiring supervision Any items found not properly installed or non-functioning shall be replaced or repaired and re-tested

C. The installing contractor shall provide a complete written report on the functional test of the entire system A copy of the test report shall be provided with maintenance manuals The test report shall be signed and dated by the licensed fire alarm superintendent responsible for supervising the final system test and checkout

D. The installing contractor's fire alarm superintendent shall test the entire system in the presence of the local authorities having jurisdiction The contractor shall be responsible for making any changes, adjustments, or corrections as may be required by the local authorities

E. It is the intent of these specifications and of the architect/engineer that a continued program of system maintenance be continued by the owner in compliance with NFPA Standard 72, Chapter 7 It is mandatory that the installing contractor shall provide such services and make available these services to the owner upon completion of the project

3.4 WARRANTY

A. The fire alarm system, including labor and material, shall be free from defects in workmanship and materials, under normal use and service, for a period of Five (5) years from the date of acceptance or beneficial occupancy, whichever shall occur first Any equipment or workmanship shown to be defective shall be repaired, replaced or adjusted during normal working hours at no cost to the owner

B. The equipment manufacturer shall be represented by a local service organization and the name of such shall be furnished to the Owner, Architect, and Engineer

3.5 SPARE CAPACITY

A. Contractor shall provide the following equipment to the district for attic stock. Bid pricing shall include an allowance for labor and materials to install equipment listed below.

B. 10% of all field devices
1. One SLC Loop Card
2. One CPU
3. One 24AT Control Module
4. One Remote Power Supply

3.6 FLOOR PLANS

A. Provide a 1/16" = 1'-0" floor plan on each floor showing all devices and zoning Zoning shall correspond to the zone on the fire alarm control panel The floor plans shall be framed with a glass cover and located by the fire alarm control panel and by the remote annunciator Provide a sample for approval

END OF SECTION

SECTION 31 10 00 - SITE PREPARATION AND DEMOLITION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. This Section includes furnishing all equipment, materials, and labor for the preparation of this site and removal of existing pavement, trees and underground utilities as shown by the construction documents.

B. Location and protection of utilities.

C. Site Clearing.

1.2 RELATED SECTIONS

A. SECTION 31 22 00 – EARTHWORK

B. SECTION 31 25 00 – EROSION CONTROL

1.3 SUBMITTALS

A. As required by DIVISION 1 requirements.

1.4 QUALITY CONTROL TESTING

A. As required by DIVISION 1 requirements.

1.5 PROJECT CONDITIONS

A. It shall be the responsibility of the Contractor to obtain a temporary water meter and temporary sanitary sewer facilities for use during construction.

B. Provide erosion and sedimentation controls as shown on the drawings and maintain for the duration of the project. Provide routine maintenance as required to maintain the integrity of controls and protection measures and remove any accumulations of mud, silt and debris, which would jeopardize the integrity of the control measures. Refer to drawings for details.

C. Contractor shall exercise care during operations to confine dust to the immediate work area and shall employ dust control measures to ensure adequate dust control throughout demolition and construction operations.

D. The use of explosives is prohibited.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 PROTECTION OF EXISTING ACTIVE UTILITIES

A. The Contractor shall field verify and coordinate with Owner the location and depths of existing active utilities service lines within the construction limits and shall protect all such utilities from damage during construction operations. Damage to existing utilities to remain shall be repaired at the Contractor's expense for re-establishing the utilities to their pre-damaged condition.

3.2 PROTECTION OF EXISTING ON AND OFF-SITE PAVING

A. The Contractor shall protect all adjacent on and off-site paving and appurtenances from damage. Any damage shall be repaired at the Contractor's expense.

3.3 SITE CLEARING

A. Contractor shall remove all trees as shown on the plans. Trees less than six (6) inches in calipers and shrubs located within the construction area shall also be removed. Trees located within and/or adjacent to the area of construction shall be protected per the plans. Contractor shall remove all grasses and topsoil to a minimum depth of four (4) inches.

B. Contractor shall remove all pavements, concrete and brick pavers, and curb and gutter as shown on the plans.

C. Contractor shall remove light standards, bases and foundations to full depth, as shown on the plans. Existing water and gas lines shall be cut and plugged. Existing public meters and public fire hydrants shall be returned to the local governing authority or disposed of at no additional cost to Owner.

D. Exposed subgrade shall be proof rolled with at least a 15-ton pneumatic roller to detect weak soil support areas. All weak soil areas, utility trenches and excavated areas shall be filled and compacted per SECTION 31 22 00.

3.4 FINAL CLEANUP

A. Remove all traces of demolished items from the site work area and rough grade all areas that have been disturbed.

B. All removed items shall be legally disposed of off-site at no additional cost to Owner.

END OF SECTION 31 10 00

SECTION 31 22 00 - EARTHWORK

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes operations required for the excavation of materials on site, compaction of natural or improved subgrades, finish grading, disposal of excess or unsuitable materials, and other required operations. Earthwork shall conform with dimensions and typical sections shown, and within lines and grades established on Drawings.

1.2 RELATED SECTIONS

A. SECTION 31 10 00 – SITE PREPARATION AND DEMOLITION

B. SECTION 32 13 13 – CONCRETE PAVING

1.3 REFERENCES

A. ASTM International (ASTM)

1. ASTM D1557 – Test for Moisture-Density Characteristics of Soil Using Modified Effort
2. ASTM D2487 – Classification of Soils for Engineering Purposes (Unified Soil Classification)
3. ASTM D2922 – Test for Density of Soil and Soil-Aggregate in Place by Nuclear Method
4. ASTM D3017 – Test for Water Content of Soil and Rock in Place by Nuclear Method
5. ASTM D4318 – Test for Liquid Limit, Plastic Limit and Plasticity Index of Soils
6. ASTM G51 – Test for Measuring pH of Soil for Use in Corrosion Testing
7. ASTM G57 – Test for Field Measurement of Soil Resistivity

1.4 EXISTING UTILITIES

A. Where pipes, ducts and structures are encountered in the excavation but are not shown on the Drawings, immediately notify the Architect.

1.5 DEFINITIONS

A. Classification: Earthwork materials are classified in accordance with definitions in this Article.

B. General Site Fill: If additional soil is required to achieve the elevations shown on the drawings, it shall be the Contractor’s responsibility to obtain the needed soil from an approved source. Excess soil may be utilized on-site in areas designated by Owner; otherwise, the Contractor shall legally dispose excess soil off-site at no additional cost to Owner.

C. Select Fill: Additional soil beneath sidewalk, pavements, foundations, and other structures required to achieve the elevations shown on the drawing. Selecting fill material shall be as required by the Geotechnical report.

D. Subgrade: Consists of that portion of the surface on which a compacted fill, backfill, pavement or topsoil is placed.

E. Borrow: Material taken from approved off-site sources to make up any deficit of excavated material. Obtain from area that is normally dry and well drained. Borrow does not include topsoil.

F. Finish Grading: Operations required for smoothing disturbed areas that are not overlaid with pavement.

G. Excavation: Excavation of every description and of whatever substances encountered within the limits of the project to the lines and grades indicated on the Drawings.

H. Compaction: Compaction of soil materials shall be measured as a percent of Standard Proctor density as determined in the laboratory by the ASTM D689 and measured in the field by ASTM D2922 and ASTM D3017.

1.6 SUBMITTALS

A. As required by DIVISION 1 requirements.

B. Submit laboratory testing reports for each soil borrow source used to supply general fill and select fill materials.

1.7 QUALITY CONTROL TESTING

A. As required by DIVISION 1 requirements.

B. The Owner may engage a qualified independent testing agency to perform field inspections and tests, and to prepare test reports. When such testing indicates that Contractor's work does not comply with the specified requirements, additional testing shall be performed by the Owner's testing agency at no additional cost to the Owner to determine compliance of corrected Work with the specified requirements.

PART 2 - PRODUCTS

2.1 SELECT FILL

A. Select fill material shall be clayey sand or sandy clay having a liquid limit (LL) of 35 percent or less and a plasticity index (PI) not less than 4 or greater than 15 and contain no more than 0.5 percent fibrous organic materials, by weight. The select fill shall contain no deleterious material and shall be compacted to a dry density of at least 95 percent of Standard Proctor by ASTM D698 and a moisture content within minus one (-1) and to plus three (+3) percent of optimum moisture.

B. Obtain select fill material from a source that meets the requirements of the Geotechnical Report.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Objective: As shown on the Drawings, excavate to lines, grades and elevations required for subsequent construction. All excavation shall be made in such manner as to permit all surfaces to be brought to final line and grade within plus or minus 0.1 foot. Over excavation shall be restored at no additional cost to the Owner. Finished grades consistently high or low will not be acceptable and shall be corrected at no additional cost to the Owner.

B. Drainage: During excavation, maintain grades as required to maintain drainage; or, as directed by the Architect, install temporary drains or drainage ditches to intercept or divert surface water and prevent interference or delay of the work.

C. Stockpiling: If at time of excavation it is not possible to place material in the proper section of permanent construction, stockpile the material in Architect approved areas for later use.

D. Stone or Rock: Stone or rock fragments greater than 6" will not be allowed in fills or embankments. Stones or rock fragments larger than 2 inches in their greatest dimension will not be permitted in top 6 inches of subgrade.

3.2 SUBGRADE PREPARATION

A. Surface vegetation, existing pavements, and other deleterious materials shall be stripped in accordance with SECTION 31 10 00.

B. Subgrades for Pavements: After final subgrade elevation is achieved, the exposed surface of the pavement subgrade soil should be scarified to a depth of 6 inches and mixed with a minimum of 7 percent hydrated lime (by dry soil weight) in conformance with TxDOT Standard Specifications Item 260. Assuming an in-place unit weight of 100 pcf for the pavement subgrade soils, this percentage of lime equates to about 32 lbs of lime per sq yard of treated subgrade. The actual amount of lime required should be confirmed by additional laboratory tests (ASTM C 977 Appendix XI) prior to construction. The soil-lime mixture should be compacted to at least 95 percent of standard Proctor maximum dry density (ASTM D 698) and within a range of 0 to 4 percentage points above the mixture's optimum moisture content.

C. Fill Soil Subgrades: The exposed in-situ soil shall be proof-rolled using heavy rubber-tired construction equipment, e.g., 20-ton loaded tandem-axle dump truck. Approved on-site clays can be used for pavement and subgrade fill. Soil shall be free of organic materials and other debris, and rock fragments greater than 2-1/2 inches. Fill shall be placed in maximum 8-inch loose lifts and compacted to at least 95% Standard Proctor maximum laboratory dry density as determined by ASTM D 698 at a moisture content within minus one (-1) and to plus three (+3) percent of optimum moisture

D. Only on-site soils shall be used to fine grade the subgrade – sand shall not be permitted. After fine grading the subgrade, the subgrade moisture content and density shall be maintained until paving is completed. Water and/or re-compact the subgrade as necessary to restore the required moisture and density levels, and to provide a tight, non-yielding subgrade.

3.3 PLACING FILL AND BACKFILL

A. Examination of Subgrade: Do not place fill on any part of the subgrade until Owner has accepted the subgrade preparation.

B. Removing Debris: During the dumping and spreading process, remove all roots, stones and debris that are uncovered in the fill material.

C. Spreading Fill and Backfill: After dumping, spread the material in horizontal layers over the entire fill area. The thickness of each layer before compaction shall not exceed 8 inches. Maintain positive drainage throughout construction. The combined excavation and fill placing operation shall be such that the material when compacted in the fill will be blended sufficiently to secure the best practicable degree of compaction. The suitability of the materials shall be subject to approval of the Owner. After each layer of fill has been spread to the proper depth, it shall be thoroughly manipulated with a disc plow or other suitable and approved equipment until the material is uniformly mixed, pulverized and brought to uniform approved moisture content.

D. Attaining Proper Bond: If, in the opinion of the Owner, the compacted surface of a layer is too smooth to bond with succeeding layers, loosen the surface by harrowing or other approved method before continuing the work.

3.4 MOISTURE CONTROL

A. Intent: The required density is desired on the wet side of the natural moisture content in order to limit post construction swelling of the clay soils.

B. Adjustment: If the moisture content is too high, adjust to within the specified limits by spreading the material and permitting it to dry. Assist the drying process by disking or harrowing if necessary. When the material is too dry, sprinkle each layer with water. Work the moisture into the soil by harrowing or other approved method.

3.5 COMPACTION

A. Rough Grade: Compact each layer of fill material with suitable equipment as necessary to achieve an in-place soil density of at least 95% Standard Proctor maximum laboratory dry density as determined by ASTM D698 and a moisture content within minus one (-1) and to plus three (+3) percent of optimum moisture.

1. Field moisture-density of compacted soil layers will be determined by the Owner's quality control testing laboratory. Additional laboratory testing may be performed to monitor any changes in the soil moisture-density relationship and adjust field testing accordingly.

B. Finish Grade: Place and lightly compact topsoil to achieve finish grades.

3.6 MATERIAL DISPOSAL

A. Excess Excavation Material (soil material free of trees, stumps, logs, brush, roots, rubbish and other objectionable matter which has been accepted by Owner): Remove excess excavated material from the construction site before Pre-final Inspection.

B. Waste Material (material including trees, stumps, logs, brush, roots, rubbish and other objectionable matter which has not been accepted by Owner): Remove waste material from the project site before final Inspection. Legally dispose of material at a licensed site or with written and notarized permission from the property owner for a private disposal site. Pay for all costs associated with waste material removal and disposal.

3.7 TESTING

A. Laboratory Testing and Inspection Services: As specified in DIVISION 1.

B. The Owner may employ a geotechnical laboratory testing agency to monitor soil quality and compaction of fill during construction. The laboratory testing agency will adhere to the following testing procedures:

1. Inspect and test each lift of select fill material. Do not proceed until test results for previously completed work verify compliance with requirements.
2. Field density and moisture tests will be performed by the nuclear method in accordance with ASTM D2922 and ASTM D3017.
3. When field in-place density and moisture tests are performed using nuclear methods, the moisture/density gages will be checked and calibrated to correlate to laboratory density and moisture values as determined by ASTM D689 at the beginning of each work period.
4. Perform at least one field in-place moisture and density test for every 2,500 square feet of compacted fill per lift, but in no case fewer than five tests for any given lift.

C. Fill material that does not pass field moisture/density testing shall be scarified, watered if necessary, reworked and re-compacted at no additional cost to the Owner. Soil sampling and laboratory testing associated with re-testing of soil materials that are reworked to correct non-compliance with the specified requirements shall not be an additional cost to the Owner.

D. Soil sampling and laboratory testing associated with identification of acceptable borrow sources shall not be an additional cost to the Owner.

END OF SECTION 31 22 00

SECTION 312333 – TRENCH EXCAVATION

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes furnishing all the labor, equipment and materials for trench excavation of water system, storm sewer, sanitary sewer system and all other miscellaneous utility piping.

1.2 RELATED SECTIONS

A. SECTION 311000 – SITE PREPARATION AND DEMOLITION

B. SECTION 312334 – TRENCH BACKFILL

C. SECTION 312335 – TRENCH SAFETY SYSTEM

D. SECTION 331000 – WATER UTILITIES

E. SECTION 333000 – SANITARY SEWERAGE UTILITIES

F. SECTION 334000 – STORM DRAINAGE UTILITIES

1.3 SUBMITTALS

A. Procedures for Submittals: DIVISION 1.

B. Submit laboratory testing reports for each type of excavated or imported soil to be used for trench backfill specified in SECTION 312334.

1.4 QUALITY CONTROL TESTING

A. Laboratory Testing and Inspection Services: As specified in DIVISION 1.

B. Sampling and laboratory testing of excavated or imported soils to determine Atterberg Limits and moisture-density compaction characteristics.

1.5 SEQUENCING AND SCHEDULING

A. Demolition: Complete applicable work specified in SECTION 311000, prior to excavating.

B. Lines and grades to be established by someone under the supervision of a Professional Registered Land Surveyor and who is experienced in laying out utility lines.

C. Trench Support: Install and maintain the trench safety systems as specified in SECTION 312335.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 GENERAL

A. Excavate to lines, grades, and dimensions show as necessary to accomplish Work. Unless otherwise noted in the drawings, excavate to within tolerance of plus or minus 0.1 foot. Allow for forms, working space, granular base, topsoil, and similar items, wherever applicable. Trim to neat lines where concrete is to be deposited against earth.

B. Do not over-excavate without written authorization of the Architect.

3.2 UNCLASSIFIED EXCAVATION

A. Excavation is unclassified. Complete all excavation regardless of the type, nature or condition of the materials encountered.

3.3 TRENCH EXCAVATION

A. Cut banks of pipe trench as nearly vertical as practical. Remove stones as necessary to avoid point bearing. Over-excavate wet or unstable soil from the trench bottom to permit construction of a more stable bed for pipe. Over-excavation shall be filed and tamped with clean dry sand or other approved bedding material to the specified grade.

B. Dig the trench to the proper width as shown on the Drawings. If the trench width below the top of pipe is wider than specified, install additional bedding at no additional cost to the Owner.

C. Accurately grade the trench bottom to provide proper bedding as required.

D. If any excavation is carried beyond the lines and grades required or authorized, fill such space with concrete or other suitable material as directed by Owner at no additional cost to the Owner.

3.4 DEWATERING

A. At no additional cost to the Owner, provide and maintain on-site all necessary equipment, pumps and appurtenances for ensuring that all excavated trenches shall be dewatered prior to and during the installation of any pipe bedding and/or pipe material and until backfill is complete.

3.5 DISPOSAL OF EXCAVATED MATERIAL

A. Disposal of excavated soils shall be performed in a legal manner and be removed from the site unless needed.

B. Disposal of debris resulting from removal of subsurface utilities shall be as specified in SECTION 311000.

END OF SECTION 312333

SECTION 312334 – TRENCH BACKFILL

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section includes furnishing all labor, materials, and equipment for trench backfilling for site utilities with appurtenances, which occur five feet (5') outside of all building structures.

1.2 RELATED SECTIONS

A. SECTION 311000 – SITE PREPARATION AND DEMOLITION

B. SECTION 312200 - EARTHWORK

C. SECTION 331000 – WATER UTILITIES

D. SECTION 333000 – SANITARY SEWERAGE UTILITIES

E. SECTION 334000 – STORM DRAINAGE UTILITIES

1.3 REFERENCES

A. ASTM C33 – Grading Requirements for Coarse Aggregates

B. ASTM D424 – Test for Plastic Limit and Plasticity Index of Soils

C. ASTM D698 – Test for Moisture-Density Characteristics of Soils Using Standard Effort

D. ASTM D1557 – Test for Moisture-Density Characteristics of Soil Using Modified Effort

E. ASTM D2922 – Test for Density of Soil and Soil-Aggregate in Place by Nuclear Method

F. ASTM D3017 – Test for Water Content of Soil and Rock in Place by Nuclear Method

G. ASTM D4318 – Test for Liquid Limit, Plastic Limit and Plasticity Index of Soils

1.4 SUBMITTALS

A. Procedures for Submittals: DIVISION 1.

B. Submit laboratory testing reports for each type of excavated or imported soil to be used for trench backfill specified in this Section.

C. Submit pipe bedding material product data, including material supplier, borrow source identification, and laboratory soil classification and particle gradation analyses.

1.5 QUALITY CONTROL TESTING

A. Comply with the provisions of DIVISION 1.

B. The Owner may engage a qualified independent testing agency to perform field inspections and tests, and to prepare test reports. When such testing indicates that Contractor's work does not comply with the specified requirements, additional testing shall be performed by the Owner's testing agency at no additional cost to the Owner to determine compliance of corrected Work with the specified requirements.

PART 2 - PRODUCTS

2.1 PIPE BEDDING

A. Pipe bedding material for water, sewer and storm drainage lines shall be installed per the plans.

B. Pipe shall be backfilled with a crushed stone to 12 inches above the top of pipe. Backfill material shall have a liquid limit (LL) of no greater than 35 and a plasticity index (PI) of no greater than 10. Backfill material shall be graded as follows:

Passing 2 in. sieve	100%
Passing ½-inch sieve	50 to 85%
Passing No. 4 sieve	20 to 65%
Passing No. 100 sieve	0 to 5%

2.2 BACKFILL MATERIAL

A. Under Non-Structural Areas: The backfill material placed above the crushed stone bedding shall consist of Select Fill material, meeting the requirements of SECTION 312200.

B. Under Structural Areas: The backfill material placed above the crushed stone bedding shall consist of cement stabilized sand consisting of 1-1/2 sack mix or with flowable fill.

PART 3 - EXECUTION

3.1 GENERAL

A. Grade as necessary to prevent surface water from flowing into trenches or other excavations.

B. Pipe Zone: The pipe zone is defined as including the pipe bedding, backfill to one-half the pipe diameter (the springline) and the initial backfill to 12 inches above the top of the pipe or as otherwise shown on the drawings.

C. Pipe Bedding: Pipe bedding material shall be installed within the pipe zone per the plans.

D. Water in Excavation: Take such precautions as are necessary to keep the work free from ground or surface water. Pumps of adequate capacity or other approved method shall be provided to remove water from the trench in such a manner that it will not interfere with the progress of the work or the proper placing of other work. Ground or surface water will not be allowed to drain into or be pumped into an existing sanitary sewer system. If the work includes connection to an existing sanitary sewer, a temporary watertight plug must be installed and maintained within the pipe for the duration of the contract and bedding material interrupted in a manner approved by the Architect to isolate new construction from the existing system. All costs of handling the water shall be included in the bid and at no additional cost to the Owner.

3.2 UTILITY INSTALLATION

A. Limit clear space on either side of the pipe and below the pipe to the dimensions shown on the drawings. Above the pipe zone, cut as wide as necessary to sheet and brace and properly perform the work. Provide select fill per the drawings.

B. Excavation for Appurtenances: Excavate sufficiently for manholes, utility pull boxes, and similar structures to leave at least 2 feet clear between the outer surfaces and the embankment of timber that may be used to hold and protect the banks. Any over-depth excavation below such appurtenances not directed will be considered unauthorized and will be refilled with sand, gravel, or concrete as directed at no additional cost to the Owner.

3.3 BACKFILLING UNDER NON-STRUCTURAL AREAS

A. The Contractor is not to leave an open trench longer than 200 linear feet on a daily basis.

B. Do not backfill trenches to a point greater than 2 feet above top of pipe until all required pressure tests are performed and utility systems as installed conform to the requirements of appropriate sections. Joints or sewer and water piping shall remain exposed until acceptance of the pressure and leakage tests. Backfill trenches to ground surface with material as specified. Re-open trenches improperly backfilled to depth required for proper compaction. Refill and re-compact as specified, or otherwise correct the condition in a manner approved by Owner.

C. Open Areas

1. In the pipe zone, place backfill evenly and carefully around, under and over pipe in layers no thicker than 6 inches. Compact with mechanical hand tampers to 90% density of Standard Proctor maximum dry density, as determined by ASTM D698, until there is a cover of not less than 1 foot over utility lines. Use backfill material as called for on the drawings. Take special care not to damage pipe wrapping or coating.
2. Above the pipe zone, deposit Low-Plasticity Cohesive Soils in 8 inch layers. The soils shall have a liquid limit (LL) of 35 percent or less and a plasticity index (PI) not less than 5 nor greater than 15. Compact each layer to 90% Standard Proctor maximum dry density as determined by ASTM D698 at -1 to +3 percentage points of optimum moisture content.
3. All forms, lumber, trash and debris shall be removed from manholes and other utility structures. Backfill for manholes, utility pull boxes, and other utility structures shall be placed symmetrically on all sides in layers no thicker than 8 inches. Each layer shall be compacted to 90% of Standard Proctor maximum dry density as determined by ASTM D698.

3.4 BACKFILLING UNDER STRUCTURAL AREAS

A. The Contractor is not to leave an open trench longer than 200 linear feet on a daily basis.

B. Do not backfill trenches to a point greater than 2 feet above top of pipe until all required pressure tests are performed and utility systems as installed conform to the requirements of appropriate sections. Joints or sewer and water piping shall remain exposed until acceptance of the pressure and leakage tests. Backfill trenches to ground surface with material as specified. Re-open trenches improperly backfilled to depth required for proper compaction. Refill and re-compact as specified, or otherwise correct the condition in a manner approved by Owner.

C. Pavement Areas

1. In the pipe zone, deposit backfill material as specified on the drawings in layers 6 inches or less. Compact each layer to 95% of Standard Proctor (ASTM D698) maximum laboratory dry density within plus or minus 2 percentage points.
2. Above the pipe zone, backfill with cement-stabilized sand using a 1½-sack mix or flowable fill. Deposit backfill in 6-inch layers.
3. For manholes and other appurtenances within the pavement area, backfill with [select fill material to the subgrade elevation – *or* – cement-stabilized sand using a 1½-sack mix or flowable fill]. Backfill shall be placed in 6-inch layers and compacted to 95% density according to ASTM D698.

3.5 TESTING

A. Comply with the provisions of DIVISION 1.

B. The Owner may employ a geotechnical laboratory testing agency to monitor soil quality and compaction of fill during construction. The laboratory testing agency will adhere to the following testing procedures:

1. Inspect and test each lift of trench backfill material. Work shall not proceed until test results for previously completed work verify compliance with requirements.
2. Field density and moisture tests will be performed in accordance with ASTM D698.
3. When field in-place density and moisture tests are performed using nuclear methods, the moisture/density gages will be checked and calibrated to correlate to laboratory density and moisture values as determined by ASTM D698, as applicable, at the beginning of each work period.
4. Perform at least one field in-place moisture and density test for every 100 linear feet of trench per lift of backfill, but in no case fewer than three tests for any given lift.

C. Settling: Where settling occurs, remove finished surfacing, fill with additional approved material, compact and reconstruct surfacing.

D. Trench backfill that does not pass field moisture/density testing shall be scarified, watered if necessary, reworked and re-compacted at no additional cost to the Owner. Soil sampling and laboratory testing associated with re-testing of soil materials that are reworked to correct non-compliance with the specified requirements shall not be an additional cost to the Owner.

END OF SECTION 312334

SECTION 312335 – TRENCH SAFETY SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section specifies furnishing all equipment, materials, and labor for a trench safety system meeting appropriate requirements established in Occupational Safety and Health Administration (OSHA) Safety and Health Regulations, Part 1926, Subpart P - Excavations, Trenching and Shoring.

1.2 RELATED SECTIONS

A. SECTION 311000 - SITE PREPARATION AND DEMOLITION

B. SECTION 312333 - TRENCH EXCAVATION

C. SECTION 312334 - TRENCH BACKFILL

1.3 REFERENCES

A. AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM)

1. A36 – Specification for Structural Steel.
2. A328 – Specification for Steel Sheet Piling.
3. A588 – Specification for High-Strength, Low-Alloy Structural Steel.

B. American Welding Society (AWS)

1. D1.1 – Structural Welding Code.

C. United States Department of Labor Occupational Safety and Health Administration (OSHA). Part 1926, Subpart P, Code of Federal Regulations.

1.4 SUBMITTALS

A. Procedures for Submittals: DIVISION 1.

B. Submit drawings showing the design and details of proposed sheeting, shoring and bracing, and the proposed sequence of excavation and backfill to Owner for review.

PART 2 - PRODUCTS

2.1 TIMBER

A. Trench sheeting materials shall be a minimum of 2” in thickness, solid and sound, free from weakening defects such as loose knots and splits.

2.2 STEEL SHEET PILING

A. Steel sheet piling shall conform to the following specifications:

1. ASTM A328
2. ASTM A572, Grade 50

B. Steel for stringers and cross braces shall conform to ASTM A588.

2.3 TRENCH BOXES

A. Portable trench boxes shall be constructed of steel conforming to ASTM A36.

PART 3 - EXECUTION

3.1 GENERAL

A. Trench safety system shall be constructed, installed and maintained in accordance with the OSHA regulations and to the design prepared by the Contractor's Registered Professional Engineer to prevent death or injury to personnel or damage to structures in or near these trench excavations.

B. Contractor's Registered Professional Engineer shall be licensed in the State of Texas.

3.2 INSTALLATION

A. Installation of trench safety system shall meet OSHA regulations and the Contractor's Registered Professional Engineer's requirements.

3.3 SUPERVISION

A. Provide competent supervisory personnel at each trench while work is in progress to ensure Contractor's methods, procedures, equipment and materials pertaining to the safety systems in this item are sufficient to meet requirements of OSHA regulations.

3.4 MAINTENANCE OF SAFETY SYSTEM

A. The safety system shall be maintained in the condition required by the OSHA regulations or as specified by the Contractor's Registered Professional Engineer.

B. Take all necessary precautions to ensure the safety systems are not damaged during their use.

3.5 INSPECTION

A. Make daily inspection of trench safety system to ensure that the system meets OSHA requirements.

3.6 REMOVAL

A. Bed and backfill pipe to a point at least one foot above top of pipe prior to removal of any portion of trench safety system, but in no case allow construction personnel or other persons in the trench unless the trench conditions comply with OSHA requirements.

END OF SECTION 312335

SECTION 31 25 00 - EROSION CONTROL

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. Furnish all the necessary materials, labor, tools, equipment, and other incidentals required to design, install, maintain, and remove after construction all temporary erosion control devices shown in accordance with the Storm Water Pollution Prevention Plan. The purpose of erosion control is to prevent sediment-laden runoff from leaving the construction area at any time.

B. Establish permanent or temporary grass, as necessary to prevent erosion during construction.

1.2 RELATED SECTIONS

A. SECTION 31 10 00 – SITE DEMOLITION AND DEMOLITION

B. SECTION 31 22 00 – EARTHWORK

1.3 SUBMITTALS

A. Procedures for Submittals: DIVISION 1.

1.4 REFERENCE STANDARDS

A. American Society for Testing and Materials, ASTM.

B. American North Central Texas Council of Governments (NCTCOG) – Standard Specification for Public Works Construction.

C. American United States Environmental Protection Agency (EPA) Document No. EPA 832/R-92-008 (September 1992).

1.5 TYPES OF EROSION CONTROL

A. Organic Filter Tube: The purpose of a filter tube is to slow the flow of sediment-laden runoff from disturbed areas. Sediment and other pollutants are filtered out as the water flows through the tube and organic media. Unless otherwise noted, the filter tube shall have a minimum diameter of twelve (12) inches.

B. Stabilized Construction Entrance: The purpose of constructing a temporary stabilized construction entrance is to prevent sediment from leaving the project site and becoming a nuisance on a paved street. Install a temporary stabilized construction engrrance at any point where traffic will be entering or leaving a construction site to a paved surface, thus greatly reducing or eliminating the tracking or flow of sediment onto the paved surface.

C. Silte Fence: A silt fence serves the purpose to intercept and detain water borne sediment from unprotected areas to a limited extent. Silt Fences are the most common means of erosion control used.

PART 2 - PRODUCTS

2.1 ORGANIC FILTER TUBE

A. Chipped site vegetation, composted mulch or wood-based mulch with particle size of fine (1/4” to 1/2") and coarse grades with no particulate sizes exceeding 3” in length. The mixture ratio should be or may include greater fraction of coarser blend materials (1:2) (fine: coarse).

2.2 STABILIZED CONSTRUCTION ENTRANCE

A. Use clean, open graded, 3” to 6” diameter crushed concrete or concrete modular unit (CMU).

2.1 SILT FENCE

A. Use silt fence fabric of nylon reinforced polypropylene fabric conforming to NTCOG Item 2.24.4. Provide galvanized steel fence posts according to NTCOG Item 2.8.2(b)(2). Use woven wire support of W1.4 x W1.4, 4 inches x 4 inches, zinc-coated steel woven wire fence conforming to ASTM A116. Standard 2 inch x 2 inch chain link fence is acceptable as well as other welded steel fabrics consisting of equal or greater gauge wire and equal or smaller spacing.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Silt Fence:

1. Installation on Soil: Set posts a minimum of 1 foot deep and space not more than 6 feet on center. Cut a 6-inch wide trench 6 inches deep at the toe of the fence and backfill with earth or gravel. Overlap fabric a minimum of 3 feet and join such that no leakage or bypass occurs.
2. Installation on Pavement: Weigh fabric with rock on the upstream side to prevent flow from seeping under the fence.
3. Make inspection weekly and after each major storm event. Repair or replace promptly as needed.
4. Remove and dispose of silt when it reaches a depth of half the height of the fence. (Replace fence if damaged due to silt build-up).

B. Organic Filter Tube:

1. Place tubes on slopes less than 5% or at the bottom of steeper slopes, less than or equal to 3:1 up to 25 ft. long. Areas with greater flows or where maximum sediment control is desired, a larger diameter of tube should be should be used. If a slope exceeds 4:1, it may be necessary to stake tube at 6 ft. to 8 ft. intervals.
2. Tube diameter shall be a minimum of 10 inches to 12 inches, or as specified on plans.

C. Stabilized Construction Entrance

1. The minimum length of the stabilized entrance is 30 feet for work that is less than 150 feet from the paved surface and at least 50 feet for all other cases. Thickness is 6 inches. The width cannot be less than the full width of all points of ingress and egress.
2. When necessary clean all vehicles to remove sediment before they enter onto a paved area. Remove all sediment spilled, dropped, washed or tracked onto the paved surface immediately.
3. Properly grade the entrance or incorporate a drainage swale to prevent runoff from leaving the construction site.

3.2 MAINTENANCE AND REMOVAL

A. The Contractor is responsible for maintaining all erosion control devices and activities during the course of construction. The Owner or Owner's Designated Agent has the discretion to inspect the site periodically and if any deficiencies are found, the Contractor must correct to his/her satisfaction.

B. Watering for establishing vegetation of all disturbed areas shall be continued during construction until the project is accepted.

C. Prior to final acceptance of the project, the Contractor is to vegetate all disturbed areas within the project's construction limits.

D. Once vegetated areas are established and agreed to by the Engineer, the Contractor shall remove all erosion control measures and dispose of all accumulated trapped silt from the site. Additionally, the Contractor shall restore the site to its original condition, or the condition shown on the Contract Drawings.

END OF SECTION 31 25 00

SECTION 31 31 16 - TERMITE CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Soil treatment with termiticide.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of termite control product.
   1. Include the EPA-Registered Label for termiticide products.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Product Certificates: For termite control products, from manufacturer.

C. Soil Treatment Application Report: After application of termiticide is completed, submit report for Owner's records and include the following:
   1. Date and time of application.
   2. Moisture content of soil before application.
   3. Termiticide brand name and manufacturer.
   4. Quantity of undiluted termiticide used.
   5. Dilutions, methods, volumes used, and rates of application.
   6. Areas of application.
   7. Water source for application.

D. Wood Treatment Application Report: After application of termiticide is completed, submit report for Owner's records and include the following:
   1. Date and time of application.
   2. Quantity of undiluted termiticide used.
   3. Dilutions, methods, volumes used, and rates of application.
   4. Areas of application.

E. Research/Evaluation Reports: For metal mesh barrier system.

F. Warranties: Sample of special warranties.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: A specialist who is licensed with a minimum of five years documented experience according to regulations of authorities having jurisdiction to apply termite control treatment and products in jurisdiction where Project is located, and who employs workers trained and approved by manufacturer to install manufacturer's products.

B. Regulatory Requirements: Formulate and apply termiticides and termiticide devices according to the EPA-Registered Label.

C. Source Limitations: Obtain termite control products from single source from single manufacturer.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: To ensure penetration, do not treat soil that is water saturated or frozen. Do not treat soil while precipitation is occurring. Comply with requirements of the EPA-Registered Label and requirements of authorities having jurisdiction.

B. Coordinate soil treatment application with excavating, filling, grading, and concreting operations. Treat soil under footings, grade beams, and ground-supported slabs before construction.

1.7 WARRANTY

A. Soil Treatment Special Warranty: Manufacturer's standard form, signed by Applicator and Contractor, certifying that termite control work, consisting of applied soil termiticide treatment, will prevent infestation of subterranean termites. If subterranean termite activity or damage, including damage to any structure is discovered during warranty period, re-treat soil and repair or replace damage caused by termite infestation.
   1. Coverage to include, but are not limited to the following:
      a. Repairs to structure and contents damaged.
      b. Costs incurred to re-treat and re-warrant.
   2. Warranty Period: Five years from date of Substantial Completion.
      a. Inspect and provide annual report for the five years following substantial completion.

1.8 MAINTENANCE SERVICE

A. Continuing Service: Beginning at Substantial Completion, provide 12 months' continuing service including monitoring, inspection, and re-treatment for occurrences of termite activity. Provide a standard continuing service agreement. State services, obligations, conditions, terms for agreement period, and terms for future renewal options.

PART 2 - PRODUCTS

2.1 SOIL TREATMENT

A. Termiticide: Provide an EPA-Registered termiticide, complying with requirements of authorities having jurisdiction, in an aqueous solution formulated to prevent termite infestation. Provide quantity required for application at the label volume and rate for the maximum termiticide concentration allowed for each specific use, according to product's EPA-Registered Label.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. BASF Corporation, Agricultural Products; Termidor.
      b. Bayer Environmental Science; Premise 75.
      c. FMC Corporation, Agricultural Products Group; .
      d. Syngenta; .
   2. Service Life of Treatment: Soil treatment termiticide that is effective for not less than five years against infestation of subterranean termites.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Applicator present, for compliance with requirements for moisture content of soil per termiticide label requirements, interfaces with earthwork, slab and foundation work, landscaping, utility installation, and other conditions affecting performance of termite control.

B. Proceed with application only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. General: Comply with the most stringent requirements of authorities having jurisdiction and with manufacturer's written instructions for preparation before beginning application of termite control treatment. Remove all extraneous sources of wood cellulose and other edible materials such as wood debris, tree stumps and roots, stakes, formwork, and construction waste wood from soil within and around foundations.

B. Soil Treatment Preparation: Remove foreign matter and impermeable soil materials that could decrease treatment effectiveness on areas to be treated. Loosen, rake, and level soil to be treated except previously compacted areas under slabs and footings. Termiticides may be applied before placing compacted fill under slabs if recommended in writing by termiticide manufacturer.

1. Fit filling hose connected to water source at the site with a backflow preventer, complying with requirements of authorities having jurisdiction.

3.3 APPLICATION, GENERAL

A. General: Comply with the most stringent requirements of authorities having jurisdiction and with manufacturer's EPA-Registered Label for products.

B. Apply prior to vapor/air barrier installation.

C. Termite control shall include but not limited to area under slab on grade, under mud slab and crawl space, both sides of foundation surfaces, and all soil within 10’ of building perimeter for a 4 feet depth under slabs.

D. At foundation walls apply toxicant prior to finish grading work outside foundations.

E. Apply extra treatment to structure penetration surfaces such as pipe or ducts, and soil penetrations such as grounding rods or posts.

3.4 APPLYING SOIL TREATMENT

A. Application: Mix soil treatment termiticide solution to a uniform consistency. Provide quantity required for application at the label volume and rate for the maximum specified concentration of termiticide, according to manufacturer's EPA-Registered Label, to the following so that a continuous horizontal and vertical termiticidal barrier or treated zone is established around and under building construction. Distribute treatment evenly.
   1. Slabs-on-Grade and Basement Slabs: Under ground-supported slab construction, including footings, building slabs, and attached slabs as an overall treatment. Treat soil materials before concrete footings and slabs are placed.
   2. Foundations: Adjacent soil, including soil along the entire inside perimeter of foundation walls; along both sides of interior partition walls; around plumbing pipes and electric conduit penetrating the slab; around interior column footers, piers, and chimney bases; and along the entire outside perimeter, from grade to bottom of footing. Avoid soil washout around footings.
   3. Crawlspaces: Soil under and adjacent to foundations as previously indicated. Treat adjacent areas including around entrance platform, porches, and equipment bases. Apply overall treatment only where attached concrete platform and porches are on fill or ground.
   4. Masonry: Treat voids.
   5. Penetrations: At expansion joints, control joints, and areas where slabs will be penetrated.

B. Avoid disturbance of treated soil after application. Keep off treated areas until completely dry.

C. Protect termiticide solution, dispersed in treated soils and fills, from being diluted until ground-supported slabs are installed. Use waterproof barrier according to EPA-Registered Label instructions.

D. Post warning signs in areas of application.

E. Reapply soil treatment solution to areas disturbed by subsequent excavation, grading, landscaping, or other construction activities following application.

END OF SECTION

SECTION 31 32 13 - LIME STABILIZATION

PART 1 - GENERAL

1.1 DESCRIPTION

A. Furnish all labor, materials and equipment necessary for preparation and treatment of subgrade by addition of lime slurry; mixing and compacting to required lines, grades and typical sections. Minimum amount of lime shall be 32 pounds per square yard of area to be treated.

1.2 DELIVERY, STORAGE AND HANDLING

A. Store and handle lime in weatherproof containers, bins, or buildings. Protect lime from any dampness or moisture until distribution on subgrade.

B. Weigh lime furnished in trucks on approved scales.

C. Lime furnished in bags to bear manufacture's certified weight. Bags varying more than 5+/- percent from average bag weight shall be rejected.

1.3 REFERENCES

A. ASTM D698-78 - Moisture Density Relations of Soils (Standard).

B. Geotechnical Report

1.4 SUBMITTALS

A. Comply with DIVISION 1.

PART 2 - PRODUCTS

2.1 HYDRATE LIME (DRY)

A. Hydrated Lime (dry) a dry material consisting essentially of calcium dioxide ($Ca(OH)_2$).

B. Hydrated lime shall conform to the following requirements as to chemical composition:

Hydrate Alkalinity, percent by weight $Ca(OH)_2$	min. 90.0%
Unhydrated lime content, percent by weight CaO	max. 5.0%
"Free Water" content, percent by weight H_2O	Max. 4.0%

2.2 HYDRATED LIME (SLURRY)

A. Hydrated lime slurry shall be a pumpable suspension of solids in water.

B. The "solids content" of the lime slurry shall have a hydrate alkalinity calcium dioxide ($Ca(OH)_2$) of not less than 90 percent by weight.

C. Water. Type B, commercial lime slurry, shall conform to one of the following three grades:

1. Grade 1, The “dry solids contents” shall be at 31% by weight of the slurry.
2. Grade 2, The “dry solids contents” shall be at 35% by weight of the slurry.
3. Grade 3, The “dry solids contents” shall be at 46% by weight of the slurry.

PART 3 - EXECUTION

3.1 PLACEMENT OF LIME

A. Subgrade shall be stabilized by adding seven percent (7%) lime (32lb/sq.yd.). The determination of the type and quantity of the lime stabilization shall be determined by the geotechnical engineer.

B. Place lime only on areas where mixing operations can be completed in same workday.

1. Dry placing method

a. The lime shall be distributed by a spreader and distributed at a uniform rate and in such a manner as to reduce the scattering of lime by wind.
b. Lime shall not be applied when wind conditions, in the opinion of the Architect, are such that blowing lime becomes objectionable to pedestrians or dangerous to traffic.
c. Spread lime uniformly over subgrade by slurry placing methods described herein.
d. The material shall be sprinkled as approved by the Architect.

2. Slurry placing

a. Mix lime with water in trucks and place mixture using approved distributor.
b. Make successive passes over measured section of application area until proper lime content has been secured.
c. Furnish truck with approved agitator, which will keep lime and water uniformly mixed. Do not change grade of mixture without prior approval.

3.2 MIXING

A. Obtain uniform mixture and moisture content.

B. First Mixing: Thoroughly mix soil and lime to required depth, using approved pulver-type road mixer. Mix until homogeneous, friable mixture of lime and soil is obtained, free of clods or lumps. Add water by sprinkling until proper moisture content is obtained, then cure for at least 48 hours. Keep moist during curing period prior to final mix.

C. Final Mixing: Uniformly mix, after test results indicate proper curing, using approved pulver-type road mixer. Reduce all clods and lumps by pulverization methods. A minimum of at least 60% or greater of the stabilized material shall pass a No. 4 sieve.

D. Required amount of water necessary to provide optimum moisture shall be added uniformly and mixed thoroughly with lime and soil.

3.3 COMPACTION

A. Begin compaction immediately after final mixing. Maintain moisture content to achieve compaction. Where total compacted thickness is to be greater than eight inches, spread and compact material in two or more approximately equal layers with each layer having a compacted thickness of 6 inches. Uniformly compact for entire required depth using approved tamping rollers. Compact treated material in such a manner that it will not be mixed with underlying subgrade material. Correct all irregularities or

weak spots immediately by replacing material and re-compacting. Maintain surface in smooth condition until base course is placed. Stabilized subgrade shall be compacted to at least 95 percent of Standard Proctor (ASTM D698) maximum laboratory dry density and to a moisture content within 0 and 4 percent optimum moisture content. Use pneumatic-type roller for final surface rolling.

B. The completed section shall be moist-cured until placement of pavement. Pavement shall be placed within four (4) days of final compaction. During this time, the section shall not be opened to vehicular traffic.

3.4 TESTING

A. Requirements and procedures shall be as per DIVISION 1.

B. Make one test for every 5,000 square feet (minimum) of stabilized area completed.

C. The number of dry bags per square yard or the gallons of liquid slurry used per square yard shall be reported and monitored by the testing laboratory during placement.

END OF SECTION 31 32 13

SECTION 31 63 29 - DRILLED CONCRETE PIERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 01 Specification sections, apply to work of this section.

B. Information concerning a sub-surface soil investigation by the Owner's Geotechnical Engineer is available and will be furnished by the Owner upon request. The contractor may use the data included therein for his general information only. The Architect/Engineer is not responsible for the accuracy or applicability of the data therein.

C. Related Requirements:
   1. Specification 03 10 00 "Concrete Forming and Accessories" for forming associated with cast-in-place concrete.
   2. Specification 03 20 00 "Concrete Reinforcing" for reinforcement for cast-in-place concrete.
   3. Specification 03 30 00 "Cast-in-Place Concrete" for cast-in-place concrete and related products.

1.2 SUMMARY

A. Definitions:

   1. Casing: Steel cylinder used to resist earth and water pressures, to serve as concrete form, and to protect personnel.
   2. Dry Method: A method of pier installation in which concrete is placed in the dry. Casing may or may not be used to maintain sidewall stability.
   3. Owner's Representative: The Architect, Structural Engineer, or Geotechnical Engineer authorized to act on behalf of the Owner.
   4. Owner's Representative - Geotechnical Engineer: The Geotechnical Engineer specifically authorized to carry out the responsibilities defined in this specification.
   5. Probe hole: A 1.6 to 2.5 inch diameter hole usually drilled by air percussion methods to a required depth below the pier bottom. The Geotechnical Engineer feels the probe hole by lowering and raising a hooked rod. The size and amount of seams found enables the determination of the soundness of the subsurface formation.
   6. Slurry Displacement Method: Method of drilling and concreting in which controlled slurry consisting of water, with or without additives such as bentonite, attapulgite, or polymer, is used to stabilize the hole. The slurry may be used either to maintain the stability of the uncased drilled pier hole or to allow concrete placement when water seepage into a drilled pier hole is too severe to permit concreting in the dry or both.
   7. Tremie method: Procedure for placing concrete under water or slurry using a watertight steel pipe or tube to place concrete without washing out cement fines.

B. The Drilling Contractor shall furnish all labor, materials, services, equipment (including temporary casings and/or dewatering where required), and shall install all piers at the locations and depths shown on the drawings or as otherwise directed by the Owner's Geotechnical Engineer. Installation methods compatible with the design may be used if acceptable to the Owner's Geotechnical Engineer. Methods that are not compatible with the design shall be excluded from consideration.

C. The Drilling Contractor shall furnish and place all reinforcing steel, dowels, and anchor bolts that are shown on the drawings to be embedded in the pier.

D. The Drilling Contractor shall furnish all materials and labor as required to perform the load tests as specified herein and on the drawings.

E. The General Contractor shall provide all necessary excavation, sheeting and bracing or other adequate maintenance of excavation banks, suitable runways and ramps as necessary for access of pier drilling, control of ground and surface water as necessary to keep the work area sufficiently

dry, suitable access roads for movement of equipment and materials to and from pier locations, field layout required for pier work including setting and maintaining a location stake for each pier and giving cut-off grades on all piers, removal and replacement of all overhead and underground obstructions as required, and coordination of all concrete ordering and delivery.

1.3 REFERENCES

A. Reference Standards

1. Comply with all provisions of the following codes and specifications:

    5) ASTM D 4380.
    6) ASTM D 4381.
    7) ASTM D 4972.

1.4 ADMINISTRATIVE REQUIREMENTS

A. The Contractor is responsible for quality control, including workmanship and materials furnished by his subcontractors and suppliers.
B. The Drilling Contractor shall cooperate with all testing and inspection personnel employed to perform field quality control tests and inspections.
C. Pre-installation Conference:

1. At least 7 days prior to beginning pier installation, the Contractor shall conduct a meeting to review the proposed excavation, inspection, and concrete and reinforcement placement methods and procedures to produce pier construction of the required quality. Also review requirements for submittals, status of coordinating work and availability of materials. Establish work progress schedule and procedures for bearing surface inspection, materials testing, and certifications. The Contractor shall send a pre-installation conference agenda to all attendees 7 days prior to the scheduled date of the conference.
2. The Contractor shall require responsible representatives of every party who is concerned with the concrete work to attend the conference, including but not limited to the following:
    1) Contractor's Superintendent.
    2) Laboratory responsible for field material testing.
    3) Drilling Subcontractor.
    4) Ready-Mix Concrete Producer.
    5) Geotechnical Engineer.
    6) Owner's and Architect's/Engineer's Representative.
3. Minutes of the meeting shall be recorded, typed and printed by the Contractor and distributed by him to all parties concerned within 5 days of the meeting. One copy of the minutes shall be transmitted to the following for information purposes:
    1) Owner's Representative.
    2) Architect.
    3) Engineer-of-Record.
4. The Engineer shall be present at the conference. The Contractor shall notify the Engineer at least 7 days prior to the scheduled date of the conference.

1.5 SUBMITTALS

A. Concrete Mix Design: Submit concrete mix designs suitable for method of concrete placement for Engineer and Owner's Testing Laboratory approval prior to pier installation.

B. Drilling Records: The Contractor and the Owner's Geotechnical Engineer or other authorized inspector shall each submit copies of the drilling record for each pier to the Architect/Engineer immediately after drilling. The reports shall indicate the name of the job, name of Contractor, and name of drilling superintendent. For each pier installed, the report shall indicate the following information:

1. Pier number and location.
2. Pier shaft diameter.
3. Bottom elevation.
4. Top elevation.
5. Pier length.
6. Theoretical volume of concrete in pier.
7. Actual volume of concrete placed.
8. Reinforcing steel size and depth actually placed.
9. Drilling start and finish time.
10. Concreting start and finish time.
11. Variation from specified tolerances including surveyed location and plumbness.
12. Construction method (dry method, casing method, or slurry displacement method).
13. Groundwater conditions (rate of water infiltration and depth of water in hole prior to concreting for dry piers; water elevation in hole for wet piers).
14. Elevation of top and bottom of any casing left in place.
15. Description of temporary or permanent casing (including purpose, diameter, wall thickness and length).
16. Description and elevation of any obstructions encountered and whether removal was obtained.
17. Description of pier bottom including amount and extent of loose material.

18. Method of concrete placement.
19. Any difficulties encountered in drilling or concreting operations.
20. Any deviations from specifications.
21. For piers founded in rock, also record elevation at which rock was encountered, depth of socket, and record of any rock core samples made.

Reports prepared by the Owner's Geotechnical Engineer or authorized inspector shall be compiled and signed by a licensed professional engineer in the state where the project is located. Reports prepared by the Contractor shall be compiled and signed by the drilling superintendent.

C. Shop Drawings:

1. Reinforcing Steel: Submit shop drawings for all drilled pier and pier cap reinforcing steel.
2. Installation Method: Submit detailed procedures of the installation method, including (where applicable) type and number of drilling rigs and equipment, casing size and length, casing removal method, drilling fluid type, dewatering method, concrete placement, and reinforcing steel securing and placement.
3. Steel Casings: Submit shop drawings for size, wall thickness, length, and grade of permanent steel casings required. Show all splices and methods of splicing.
4. Load Test Frame: Submit shop drawings of the load test frame sealed by a registered professional engineer in the state where the project is located.

D. Product Data: Submit manufacturer's product data with application and installation instructions for proprietary materials and items.

E. Load Test Reports: The Owner's Geotechnical Engineer shall submit copies of test reports for each load test immediately after completion of tests. The report shall include pier load test capacity, compressive test reports of the pier concrete, tabular and graphical presentation of gross and net settlement of the pier top, pier data as prescribed in the previous section, and specific recommendations for production pier installation.

F. Qualification Data:

1. Submit qualification data for firms and persons specified in the article entitled “Qualifications” to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
2. Submit Welding Procedure Specifications (WPS) in accordance with ANSI/AWS D1.1 for all welded joints in steel casing. Submit test reports showing successful passage of qualification tests for all non-prequalified WPSs.
3. Provide certification that welders to be employed in work have satisfactorily passed AWS qualification tests as specified in section 1.05-B. If recertification of welders is required, retesting will be at Contractor's responsibility.

G. Alternates: The Drilling Contractor shall submit his bid based on the specifications as written without exceptions. He may submit bids for alternates to the specifications or modifications to the design, load test program, or installation specifications for consideration by the Owner’s Representative and the Owner.

H. Post Construction Survey: After completion of pier placement, the Contractor shall provide the Owner’s Representative with an as-built survey showing the actual locations of the piers at the top elevations. This survey shall show the plumbness of vertical piers, and all abandoned piers and their replacements. No construction of superstructures shall commence until this survey has been reviewed and accepted by the Owner’s Representative. In order to facilitate the progress of the Work, the Contractor shall submit partial pier surveys for approval as the Work proceeds.

1.6 QUALITY ASSURANCE

A. Drilled piers shall be installed by a specialty Drilling Contractor with suitable equipment, competent personnel, and a reputation of satisfactorily performing the work. The Contractor shall

have a minimum of 5 years successful experience and a minimum of 5 successful installations on projects of a similar size and scope to this project and of using similar installation methods as may be anticipated for this project. Evidence of compliance with this section shall be submitted to the Architect/Engineer prior to entering into a contract for the work.

B. Codes and Standards: The Drilling Contractor shall comply with the provisions of the following codes, specifications, and standards, except where more stringent requirements are shown or specified:

1. ACI 301, “Specifications for Structural Concrete for Buildings.”
2. ACI 117, “Specifications for Tolerances for Concrete Construction and Materials.”
3. ACI 336.1, “Specification for the Construction of Drilled Piers.”
4. CRSI, “Manual of Standard Practice”.
5. ANSI/AWS D1.1, “Structural Welding Code - Steel.”
6. ANSI/AWS D1.4, “Structural Welding Code – Reinforcing Steel.”
7. In addition, all applicable building code and local regulations shall be followed. In case of conflict, the strictest interpretation shall govern.

C. Survey Work:

1. The General Contractor shall employ a qualified and licensed professional engineer/land surveyor to perform all surveys, layouts and measurements for drilled pier work including the layout of anchor rods and/or reinforcing steel dowels embedded in drilled piers. The surveyor shall conduct the layout work for each drilled pier to the lines and levels required prior to beginning excavation and shall make actual in-place measurements of each drilled pier plan location, shaft diameter, bottom and top elevations and deviations from specified tolerances.
2. The surveyor shall record and submit all information pertinent to each drilled pier and cooperate with other testing and inspection personnel to provide data for all required reports.

D. Testing Laboratory Requirements: See Testing Laboratory section of the specifications for required tests and inspections to be performed by the Testing Laboratory and Geotechnical Engineer.

1. Inspection or testing by the Owner does not relieve the Contractor of his responsibility to perform the Work in accordance with the Contract Documents.

1.7 JOB CONDITIONS

A. Site Information:

1. Data on indicated subsurface conditions are not intended as representations or warranties of continuity of such conditions. It is expressly understood that Owner will not be responsible for interpretations or conclusions drawn therefrom by the Contractor. The data are made available for convenience of the Contractor.
2. The Contractor may make additional test borings and other exploratory operations at no additional cost to the Owner.
3. The Contractor shall inspect the site prior to drilling operations and shall determine any constraints to the work presented by the existing surface conditions and report them to the Owner’s Representative.

B. Protection of Existing Structures: Locate all existing underground structures and utilities that are to remain in service during construction. Protect above-ground structures, underground utilities and other construction from damage caused by drilling operations. Report any conflicts between drilling work and underground utilities and structures to the Owner’s Representative and do not proceed with the work until the conflict is resolved.

C. Survey of Existing Structures: Record and report to Architect/Engineer surveyed elevation benchmarks on structures where directed by the Owner’s Representative before commencing

work, when structures are adjacent to drilling operations. Record and report elevation of each benchmark at least twice a day while drilling is in progress. Should benchmark readings indicate displacement, halt drilling operations until corrective action has been provided and is acceptable to the Owner's Representative and the Owner.

PART 2 - PRODUCTS

2.1 CONCRETE

A. Concrete shall be as specified in the "Cast-in-Place Concrete" section of the specifications, in the general notes, and on the drawings, with the additional requirements specified below:

B. Maximum Aggregate Size: Provide maximum aggregate size of three quarters of minimum clear spacing between individual reinforcing bars or bundles of bars, with 1 1/2" maximum.

C. Water Reducing Admixtures: Where required by mix design, use water-reducing admixtures in strict compliance with manufacturers directions. Admixtures to increase cement dispersion, or provide increased workability for low-slump concrete may be used at contractor's option. Use admixtures in the amounts as recommended by manufacturer for climatic conditions prevailing at time of placing concrete. Adjust quantities of admixtures as required to maintain quality control.

D. Slump Limits: Proportion concrete to have a slump that is suitable for the placement process used. The mix must remain fluid throughout the concrete placement time and during extraction of any temporary casing. Provide a minimum 6" slump concrete with retarder for temporarily cased piers at time of pulling casing.

2.2 REINFORCING STEEL

A. See "Concrete Reinforcing Steel" section of the specifications.

B. Reinforcing Support and Positioning Devices: Devices made of non-corrosive material that support and align reinforcing steel within the shaft and that provide the appropriate side and bottom cover to the reinforcing steel. Acceptable manufacturers include:

1. Pieresearch.
2. Aztec, a Dayton-Superior Company.
3. Foundation Technologies, Inc.

2.3 STEEL CASING

A. Steel casing shall conform to ASTM A 283, Grade C or ASTM A 36.

B. Corrugated steel casing shall conform to ASTM A 929.

2.4 GROUT

A. Grout used for filling annular void outside permanent casings shall be sand cement grout consisting of Portland cement (ASTM C 150 Type I or III), sand (ASTM C 33), and water. Proportions by weight shall be one part cement, 2 1/4 to 2 1/2 parts sand, and the minimum amount of water required to obtain a workable mix but not exceeding a water-cement ratio of 1.0. The grout mix shall be suitable for the method of installation, whether by gravity feed of by pumping under pressure.

2.5 CONCRETE MIXING

A. Ready Mix Concrete: Comply with the requirements of ASTM C 94.

B. Hot Weather Concreting: The maximum acceptable concrete temperature at the truck discharge point shall be 95°F. Refer to Hot Weather Concreting Practices specified in "Cast-in-Place Concrete" section of the specifications for required hot weather concreting practices.

C. Cold Weather Concreting Practices: Refer to the "Cast-in-Place Concrete" section of the specifications for cold weather concreting practices and the conditions under which they are to be followed.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Requirements:

1. Excavate holes for drilled piers to dimensions and required bearing strata or elevations as shown on the drawings unless directed otherwise in the field by the Owner's Geotechnical Engineer.
2. Maintain sidewall stability during drilling. If sidewall instability is encountered that the Owner's Representative considers excessive, the Contractor shall use alternate drilling methods such as temporary casing or slurry displacement method.
3. Excavate holes for closely spaced piers and those occurring in fragile or sand stratas only after adjacent holes are filled with concrete and allowed to set a minimum of 6 hours or longer as required for concrete to harden unless temporary casing to maintain sidewall stability is used.
4. Drilled pier design dimensions and depths shown on the drawings shall be considered minimums and are based on bearing and/or friction in assumed strata. If bearing stratum is not capable of maintaining the assumed capacity, the foundation system shall be revised as directed by the Owner's Geotechnical Engineer and Owner's Representative. Revisions will be paid for in accordance with contract conditions relative to changes in the work. Refer to drawings for design bearing pressures, skin friction values, or pier load capacity.
5. Remove loose material and free water from the bottom of the shaft. The bearing surface should be essentially flat within a tolerance of 1 vertical to 12 horizontal or with one step that is less than one-quarter of the diameter of the bearing area.
6. Explore the bearing stratum of each pier with a probe hole to a minimum depth equal to the diameter of the bearing area below the bottom of the pier, unless waived by the Geotechnical Engineer.

B. Equipment:

1. Provide adequate equipment so work is expedited to the fullest extent possible. Use equipment fully capable of excavating shafts to depths, diameters, and sizes indicated, and within the specified tolerances. Maintain equipment in satisfactory operating condition and provide sufficient quantity of equipment to maintain the projected schedule of the Work.
2. Using bits or augers with a power-driven rotary-type rig, a shaft of a diameter specified on the drawings shall be excavated from the ground surface to a depth as specified on the drawings or as ordered by the Owner's Geotechnical Engineer.

C. Obstructions:

1. If rocks, boulders, or other unforeseen obstructions are encountered which cannot be removed by standard drilled pier excavation methods, and if such obstructions are not indicated by available sub-surface data, removal of such obstructions will be paid for in accordance with the terms of the Contract relative to changes in the Work.
2. Remove such obstructions by hand labor using air-powered tools or by other safe methods recognized in the construction industry. Standard drilled pier excavation methods include the use of core barrels with pier drilling equipment.
3. The work of this Section includes demolition and removal of rock, boulders, concrete, masonry, and other subsurface obstructions that are indicated by the Contract Documents, or by the available subsurface exploration data, and such work will not be considered a change in the Work.

D. Overexcavation: No payment will be made for extra length or greater diameter of drilled piers when they are installed to a greater depth or are larger than required unless authorized by the Owner's Geotechnical Engineer. Overexcavated drilled piers will be measured and paid for in accordance with the original design or authorized design depth and diameter.

E. Excavated Material:

1. Deposit and spread excavated material on site observing proper placement and compaction requirements.

2. Remove excavated material and dispose of it off site.

3.2 DEWATERING

A. Provide and maintain pumping equipment to keep excavations free of water before placing concrete. An excavation is considered dry if the water rises at a rate of less than 1/4 inch per minute and the height of water at the bottom of the pier does not exceed two inches at the time of concrete placement.

B. Dewater in a manner that will not create subsidence or ground loss that might adversely affect the Work or existing adjacent structures. Should the dewatering system employed involve pumping inside the pier, extreme caution shall be used to prevent an unbalanced water head from causing a "blowout", bottom heave, or "quick" condition that could disturb the proposed bearing stratum or surrounding soil strata.

C. The dewatering method shall be submitted for review and approval of the Owner's Geotechnical Engineer.

D. Conduct water to general site run-off ditches and disposal areas with discharge lines. Provide ditching as required to conduct water to site drainage facilities.

E. If excessive water and/or sidewall instability is encountered and drilling operations must be halted, consult with Geotechnical Engineer and Owner’s Representative before using alternate methods of construction.

3.3 TEMPORARY STEEL CASINGS

A. Requirements:

1. Provide temporary casing at locations as directed by the Geotechnical Engineer where the soil will not stand without support or where sloughing of the sides of shafts may seriously delay or endanger the satisfactory completion of excavation and placement of concrete. Also provide temporary casing at locations as directed by the Geotechnical Engineer to seal off the inflow of water into the excavation.
2. The Contractor shall have immediately available for use on the job an ample supply of casing for each size that will be required for use in the shafts and shall provide additional amounts, as required, to ensure the orderly progress of the job.
3. Such casing may be in short pieces but with jointing devices of sufficient strength that assembled sections of casing may be pulled complete as concrete is placed, or immediately thereafter. Provide casing of sufficient strength to withstand handling stresses, concrete pressure, and surrounding earth and/or fluid pressures. Make diameter of excavation in relation to diameter of casing such as to create a minimum of void space outside of casing. Provide casing with a minimum outside diameter equal to normal outside diameter of drilled foundations.

B. Delivery, Handling, and Storage of Casing

1. Deliver casing to site in undamaged condition.
2. Handle and protect casing to maintain diameter within plus or minus two percent.

C. Casing Withdrawal: Unless otherwise approved by the Owner’s Representative, all temporary casing shall be removed from shafts as concrete is placed or immediately thereafter, and in such a manner as to prevent sloughing material from dropping to the bottoms of shafts or falling on top of freshly placed concrete. Casings shall be pulled in a single continuous smooth operation without sudden jerks or impact. Maintain head of concrete above the bottom of the casing that exceeds the soil and water pressure at all times during casing withdrawal. Do not vibrate concrete internally before the casing is withdrawn. A vibratory casing extractor may be used. Do not withdraw casing after the concrete has attained initial set. The casing withdrawal and concreting operations shall be observed by the Geotechnical Engineer.

3.4 DRILLED PIERS IN ROCK

A. Requirement: Provide drilled piers socketed into rock as shown on the drawings or as directed by the Owner's Geotechnical Engineer.

B. Classification of Rock: Rock is defined as material which cannot be drilled with a conventional earth auger or underreaming tool, and requires use of special rock augers, core barrels, air tools, blasting, or other methods of hand excavation. Earth seams, rock fragments, and voids included in rock excavation area will be considered rock for full volume of shaft from initial contact with rock for pay purposes. The work of this section includes demolition and removal of rock, boulders, concrete, masonry, and other subsurface obstructions that are clearly indicated by contract documents, or by available subsurface exploration data, and such work will not be considered a change in work.

3.5 REINFORCING STEEL PLACEMENT

A. Before placing, clean reinforcing steel and dowels of loose rust, scale, dirt, grease and other material that could reduce or destroy bond.

B. Fabricate and erect reinforcing cages in shafts as one continuous unit using inner ring reinforcing guide. Place reinforcement accurately and symmetrically about axis of hole and hold securely in position during concrete placement. The Contractor shall verify depths of drilled piers prior to cutting and tying reinforcing steel cages. Reinforcing steel shall be delivered to the site in standard 60-foot lengths and cut as required. Splice no more than 50% of the bars at any one location, alternating spliced and unspliced bars in a symmetrical pattern. Splices shall be class B tension lap splice for columns. Tension splice and mechanical end bearing compression splices for #14 and #18 bars unless noted otherwise on the drawings. See drawings for additional splice information. The Contractor shall be responsible for adding additional reinforcing steel ties or spirals as required to ensure stability of cage and maintenance of shape and configuration as required for proper lifting, handling, and placement.

C. Provide cover to reinforcing steel of not less than 3 inches where exposed to soil and not less than 4 inches in temporarily cased piers. Provide spacer devices to maintain side and bottom cover. Devices shall be installed in accordance with manufacturer’s instructions.

D. Permissible reinforcing steel upward vertical movement during casing withdrawal shall be no greater than 6 inches. Downward movement should not exceed 6 inches for every 20 feet of shaft length.

E. Use templates to set anchor bolts, leveling plates and other accessories furnished under work of other sections. A qualified and licensed Engineer/Land Surveyor shall determine the plan location and elevation of such devices. Provide spacers (capable of sliding on any temporary casings required), blocking and holding devices to maintain required position during concrete placement.

F. The General Contractor shall protect exposed ends of dowels and anchor bolts from mechanical damage and exposure to weather by wrapping and taping with polyethylene or other suitable material.

3.6 CONCRETE PLACEMENT

A. General:

1. Fill drilled piers with concrete immediately after inspection and approval by the Geotechnical Engineer or other authorized inspector. Use protection sheets (cut out to receive concrete) over excavation openings, extending at least 12" beyond edge. Complete the excavation and concrete placement in uncased excavations before the end of the workday unless the Architect/Engineer and Geotechnical Engineer grants permission to do otherwise in writing.
2. Place concrete continuously and in a smooth flow without segregating the mixed materials.
3. Place concrete by means of bottom discharge bucket, flexible drop chute, elephant trunk hopper, concrete pump, or tremie. Free fall of concrete may be used if provided for in concrete mix design and provided it is directed through a hopper or chute such that fall is

down center of shaft without hitting sides or reinforcing steel. Free fall of concrete is not permitted for depths greater than the smaller of 20 times the shaft diameter or 60 feet.

4. Place concrete in-the-dry if at all possible. If water occurs, and it is impracticable to dewater drilled pier excavation, and reasonable attempts to seal off water flow have failed, allow water level to attain its normal level and place concrete by tremie method or by concrete pumping. Other methods of depositing concrete underwater may only be used if approved by Architect/Engineer.
5. Stop concrete placement at cut-off elevation shown, screed level, and apply a scoured, rough finish. Where cut-off elevation is above ground elevation, form top section above grade and extend shaft to required elevation.
6. Provide mechanical vibration for consolidation of at least top 5' of each shaft but only after any temporary casing is pulled or when casing is permanent.
7. Interrupted placing operations of over one hour duration will require a cold joint installation as follows. Leave resulting shaft surface approximately level. At resumption of concrete placing, clean off surface laitance, roughen as required, and slush with a 1-to-1 cement grout or commercial bonding agent before remainder of concrete is placed. Intentional cold joints will not be permitted.
8. Concrete shall not be placed in adjacent drilled piers located within three center-to-center shaft diameters of each other until concrete has cured a minimum of 6 hours.
9. Aluminum pipe or equipment shall not be used for placing concrete.

B. Tremie Method:

1. The drilled shafts shall be filled with concrete by the use of a tremie or concrete pump, sealed at the bottom, extending from above the ground surface to the bottom of the drilled shaft. Inspection of the empty tremie on the bottom may be requested of the Contractor by the Owner's authorized inspector. With the sealed tremie on the bottom of the shaft, the tube shall be filled to the top extending above the ground. The filled tremie shall be picked up approximately one (1) foot off the bottom of the shaft to allow the weight of the concrete to displace the seal at the bottom of the tremie. At no time is the tremie to be pulled to such a height as to clear the surface of the concrete already placed in the shaft. All concrete shall be poured through the now open tremie with care taken to maintain a sufficient head of concrete to completely displace all water and suspended cuttings of material and to provide sufficient pressure so as to prevent reduction in pile diameter by earth pressure on the fresh concrete. The concrete in each pile shall be carried above cut-off elevation and then dipped out while fresh to cut-off elevation.
2. All concrete shall be deposited through the tremie or pumpline so as to provide a continuous flow, without aggregate segregation, from bottom to top of pile. The production and delivery of the ready-mixed concrete shall be such that not more than 45 minutes shall elapse between the depositing of successive batches of concrete to ensure a monolithic unit of concrete. No deviation from this method will be acceptable.
3. Should the surface of the concrete in the shaft be breached by the tremie or pumpline, the tube shall immediately be withdrawn from the hole, re-sealed and re-lowered below the surface of the concrete, and pouring operations re-started. Should the Owner's authorized inspector deem it necessary, the Contractor shall instead retrieve the reinforcing steel cage, redrill the shaft to reopen the hole, and begin the concreting operations from the bottom of the pier shaft.
4. If the Owner's authorized inspector has reason to suspect that the concrete was breached by the tremie or pumpline or that the pier, for any other reason, may contain extraneous material or otherwise fail the specifications, he may order the pier cored for inspection and/or testing. If the core recovery and/or test results indicate non-compliance with the specifications, the Contractor shall bear the expense of the investigation and/or testing and shall also, at no cost to the Owner, install proper additional construction as required by the Architect/Engineer. Should the investigation and/or testing indicate compliance with the specifications the Owner shall bear the cost of such investigation and/or testing.

C. Hot and Cold Weather Placement: Refer to Part II.

3.7 SLURRY DISPLACEMENT METHOD

A. General:

1. The slurry displacement method of construction may be employed only if approved by the Geotechnical Engineer. The excavation shall be carried to final depth with the hole stabilized using drilling fluid of a minimum density acceptable to the Geotechnical Engineer. The drilling fluid may be reused, but it shall be treated, if necessary, to remove the granular material that is in suspension. Care shall be taken in the drilling to avoid caving or sloughing. The bottom of the hole shall be cleaned with a clean-out bucket or other appropriate tool. Type and proposed density of drilling fluid shall be submitted for approval by the Owner's Geotechnical Engineer.
2. Each finished shaft shall consist of a continuous column of concrete extending from the required top elevation to the required bearing surface, having firm contact against the vertical and horizontal surface of the earth surrounding it.
3. Shaft drilling and concrete placement shall be sequenced to prevent damage to adjacent shaft or shaft excavations.

B. Definitions

1. Slurry displacement method (SDM): Drilling, concreting, or drilling and concreting where slurry is used to stabilize the hole. The slurry may be used (a) for the maintenance of the stability of the unlined drilled shaft element; (b) to assist the drilling or insertion of casing as part of the shaft construction; or (c) to allow acceptable concrete placement when water seepage into a drilled shaft is too severe to permit concreting in the "dry."
2. Slurry or drilling fluid - water or prepared drilling mud properly mixed with water. The drilling fluid shall be treated as necessary to conform to the requirements given in Table 1.
3. Mud - pulverized solids used as the basic ingredient for making a water-based slurry.

C. Excavation

1. Shaft excavation shall be to the elevations and to the diameters shown on the Engineer's drawings. Bottom elevations are minimum depths. Shafts may be extended only at the approval of the Geotechnical Engineer.
2. Use methods and equipment for shaft excavation that leave the side of the hole and bottom free of loose material that would prevent intimate contact of the concrete with firm, undisturbed soil or rock. If loose or unacceptable material is present, reclean the hole to the satisfaction of the Geotechnical Engineer.
3. Use drilling tools and excavation procedures that minimize excessive negative pressure and avoid disturbance of the surrounding material in the excavations. Raise and lower the drilling tool in the hole at a rate that does not swirl the slurry and affect the stability of the hole.
4. At the completion of excavation and again before the start of concrete placement, clean the drilled-shaft bottom with an air-lift or recirculation system or a cleanout bucket equipped with a one-way flap gate that prevents spoils in the bucket from reentering the shaft.
5. For piers designed without end bearing, the accumulated sediment at the bottom of the pier, measured by sounding with a weighted tape just prior to concreting, shall be less than 6 inches. If greater, reclean the hole to the satisfaction of the Geotechnical Engineer.
6. All spoil and excavated materials shall be kept away from each open shaft excavation to avoid contamination of the excavation after final cleanout.
7. Excavated materials shall be stockpiled or disposed of in areas designated by the Owner's representative.
8. Excavated materials temporarily placed at other locations for the convenience of the Contractor will be allowed only with written approval of the Owner's representative and shall finally be removed and placed within designated disposal areas.

D. PROVISIONS FOR OBSERVATION

1. The Contractor shall cooperate with the Owner and design team to ensure the expeditious and safe observation of the shaft excavations.
2. If the Geotechnical Engineer determines that the material at the bottom of any excavation is unsatisfactory, additional excavation or other corrective action shall be made as directed by the Geotechnical Engineer.
3. If additional excavation is required, the shaft bottom shall be drilled again and observed as described above. This procedure shall be repeated until a bearing material is reached that is approved by the Geotechnical Engineer.

E. SLURRY REQUIREMENTS

1. The mud slurry shall consist of a stable colloidal suspension of pulverized solids thoroughly mixed with water so that the properties specified in Table 1 are maintained. Attapulgite and bentonite shall meet API Specification 13A, Section 3, "Oil-Well Drilling-Fluid Material" dated March 1981. The type of mud used will depend on the subsurface conditions and mixing water character. The water used to mix the slurry shall be clean, drinkable, fresh water, obtained from sources approved by the Owner's Representative. Any physical or chemical treatment to the water or slurry that is considered necessary to have the slurry meet the specifications is the responsibility of the drilled shaft contractor. A written certificate shall be supplied to the Architect/Engineer by the mud supplier specifying the quality and yield for each shipment of mud received. A test report from the supplier giving the physical and chemical properties of the mud shall be supplied to the Architect/Engineer at the start of the work.
2. Water may be used in place of mixed mud slurry, subject to the approval of the Geotechnical Engineer on a pier-by-pier basis except for end bearing piers.
3. For shafts with endbearing greater than or equal to 25% of the total allowable capacity as shown on the structural drawings, the mud slurry sand content shall be limited to 4%.
4. The mud slurry shall be mixed in mud tanks on-site or arrive at the site premixed. The mud slurry shall be mixed, stored, and transported using equipment made for these purposes. Combining or mixing slurry in the shaft shall be not permitted.
5. The in-hole slurry shall meet the specifications prior to concreting. Replace or clean, recirculate, and remove sand from, the slurry to maintain the required slurry properties. Recycling of slurry is permitted provided that the recycled slurry satisfies the specified requirements. Submit to the Owner’s Representative a written record of test results for each drilled pier.
6. The Contractor shall perform testing of the slurry according to the test methods prescribed in Table 1 and shall record the results for quality control purposes. Provide all field test equipment as required. The drilled-pier contractor shall have available at the site a slurry sampler capable of obtaining slurry samples at any depth within the drilled pier excavation. Slurry shall be sampled and tested in the mud tank and from samples recovered within 1 ft. from the bottom of each drilled shaft.

7. Consult with the Geotechnical Engineer for any adjustments that may be needed to this table to suit local conditions.

TABLE 1

SLURRY SPECIFICATIONS

Item to be Measured	Range of Results at 20°C	Test Method
Density, (pcf)** For slurry 1 ft from pier bottom		ASTM D 4380 (Mud Balance)
Mineral Slurries		
a. No end bearing	85 Max.	
b. With end bearing	70 Max.	
Polymer Slurry	64 Max.	
Marsh Funnel Viscosity, (sec./qt)		API-RP13B-1* Section 2
a. Mineral Slurry	25 to 60	(Marsh funnel & CUP)
b. Polymer Slurry	40 to 90	
Sand Content by Volume (%), before concreting, for slurry 1 ft from pier bottom		ASTM D 4381 (Sand screen set)
Mineral Slurries		
a. No end bearing	20 Max.	
b. With end bearing	4 Max.	
Polymer Slurry	1 Max.	
pH, during excavation	7 to 12	ASTM D 4972

* Reference Test Method is American Petroleum Institute (API), Spec. 13B, Eighth Edition, April 1980, issued by American Petroleum Institute - Production Department - 211 N. Ervay, Suite 1700, Dallas, Texas 75201.

** The density of the mud slurry shall not be less than what is needed to drill the shaft.

F. Installation Method

1. Where pre-drilled piers are to be installed below the groundwater level or in caving and sloughing soils, and the procedure is approved by the Geotechnical Engineer and the Owner's Representative, use a premixed mud slurry to stabilize the excavation. Maintain the slurry level in the excavation above any unstable zones a sufficient distance to prevent caving or sloughing of those zones but no less than 5 feet above the groundwater level.
2. Set temporary surface casing to contain the slurry, unless waived by the Owner's Representative.

G. Concreting Method

1. Concreting of the drilled pier shall be completed the same day that the excavation is complete. If this is not possible, the excavation will be required to be redrilled, cleaned, and slurry tested before concreting.
2. Place concrete by tremie method or by pumping. Use tremie or pump pipes made of steel and with watertight joints. Use tremie pipe with a minimum diameter of 8 inches or pump pipe with a minimum diameter of 4 inches.
3. Use a capped or pig-plugged tremie or pump pipe inserted and seated in the excavation at the bottom of the pier prior to commencement of the concrete placement.
4. If a capped pipe is used, use tremie or pump pipe with a seal consisting of a bottom plate, or a device acceptable to the Geotechnical Engineer, that seals the bottom of the pipe until the pipe reaches the hole bottom. Place enough concrete in the pipe to prevent the flow of slurry into the tremie pipe when it is lifted off the bottom.
5. If a pig is used, set the open tremie pipe loosely on the bottom. Insert the pig at the top and then place concrete pushing the pig ahead, separating the concrete from the slurry. Take care to ensure that the pig is properly sized to fit in the pipe, and keep the concrete separate from the slurry so that all slurry is expelled from the pipe during the initial charging process. When the pipe is fully filled with concrete, lift the pipe off the bottom the minimum amount needed to start the concrete flowing. Once concrete flow has started, place concrete into tremie at a fast enough rate to maintain a positive head of concrete inside pipe relative to slurry level outside pipe.
6. Embed tremie of pump pipe sufficiently in concrete to maintain seal throughout concrete placement to prevent re-entry of slurry suspension into the pipe. Provide minimum embedment of 5 feet. If the seal is lost, withdraw pipe, replace the seal, and re-start tremie using a capped tremie or capped pump pipe.
7. Displace out of the pier or remove from the pier the first portion of concrete that comes to the top of the pier that contains concrete contaminated with slurry until acceptable concrete is visible. Add or remove concrete to specified cutoff level.
8. Raise or lower the tremie pipe in an acceptable manner that does not break the seal and does not cause channelization or segregation.
9. Pump the displaced slurry to holding tanks. Do not allow slurry to spill onto or contaminate the site. Do not use excavated slurry pits, unless accepted by the Owner's Representative.
10. Do not use aluminum pipe or equivalent for placing concrete.
11. Measure and report actual volume of concrete placed and theoretical volume versus depth at depth intervals not exceeding the shaft diameter.

3.8 CONSTRUCTION TOLERANCES

A. Plan Location: The tolerance on plan location for the top of the drilled pier shall not be more than 1/24 of the pier diameter or 3" in any direction, whichever is less. If the as-installed shaft is larger than required, the center of the shaft may be taken as the center of a shaft having the required area that lies wholly within the as-installed shaft.

B. Plumbness: Permissible tolerance for plumbness shall be 1.5% of the length. The centers of the top and bottom may be taken as the center of the required area that lies wholly within the as-installed area.

C. Bottom Area: The bottom of the pier shall be essentially horizontal within a tolerance of 1 vertical to 12 horizontal with the area of the bottom bearing not less than 98% of that specified on the drawings.

D. Top Area: The Contractor shall remove excess concrete at the top of the pier beyond the limits of the pier diameter. The pier top diameter shall be the same diameter as the shaft below. Piers extending above the ground surface shall be formed.

E. Concrete Cut-Off Elevation: Concrete cut-off elevation at the pier top shall be plus one inch to minus three inches.

F. Battered Piers: Battered piers shall be installed within 5% of the length from the specified inclination.

G. Anchorage Embedment Tolerance: Vertical and horizontal deviation from design location for individual anchorage components embedded in the pier shall not exceed ± 0.5 inches.

H. If any of the above tolerances are exceeded, the Architect/Engineer shall immediately be notified to evaluate the eccentricity in the pier and recommend corrective measures. The cost of re-engineering and corrective construction shall be borne by the Contractor.

3.9 PERMANENT STEEL CASINGS

A. Requirement: Provide permanent steel casings where shown on the drawings of sufficient strength to withstand handling stresses, concrete pressure, and surrounding earth and/or fluid pressures. Provide casings with minimum outside diameter equal to nominal outside diameter of shaft. Wall thickness shown on the drawings is a minimum required for design purposes. The Contractor is responsible for increasing thickness as required for the installation process.

B. Steel Pipe Casings: Provide steel pipe casings as shown on the drawings delivered in sections of any convenient length. Connect sections by continuous complete penetration welds performed according to AWS standards by certified welders during placement into drilled pier shaft excavation. Splice location and details shall be submitted for approval on steel pipe casing shop drawings.

1. Design bottom edge of lowest casing section to provide cutting shoe for penetrating into rock strata and affecting water seal.

C. Corrugated Steel Casings: Provide corrugated steel casings formed of galvanized or bituminous-coated steel sheets. Corrugated steel casings may be delivered in any convenient section of panel, with sections or panels field connected in accordance with manufacturer's instructions.

D. Installation: Install permanent steel casing as excavation work progresses to ensure stability of drilled pier shaft walls. Remove and replace or repair casings which are damaged during installation and which could impair strength or efficiency of completed drilled pier.

E. Fill the void space between permanent casing and shaft excavation or between permanent liner and temporary casing with fluid grout by means of grout pipe and pump pressure as required to achieve uniform void filling.

3.10 INSPECTIONS AND TESTS FOR DRILLED PIER EXCAVATIONS

A. Verification of Design: Bottom elevations, bearing and/or skin friction capacities and lengths of drilled piers as shown on the drawings are estimated from available subsurface data. Actual elevations, pier lengths, and bearing and/or skin friction capacities will be determined by the Geotechnical Engineer from conditions found in the excavations.

1. For piers bearing on rock, a rock core shall be taken for a depth equal to one pier diameter below the bottom of the pier for observation and possible testing by the Geotechnical Engineer to confirm rock quality below the bearing elevation.

B. Notification of Architect/Engineer: If field conditions differ from the data and design recommendations outlined in the Geotechnical Report, the Geotechnical Engineer shall notify the Architect/Engineer immediately.

C. Additional Tests: Additional tests may be required by the Geotechnical Engineer to determine new design criteria. Such tests shall be made as quickly as possible so as not to delay the concreting operations any longer than absolutely required.

D. Observation Requirements: Each drilled pier shall be inspected by the authorized inspector and approved prior to placement of concrete.

E. Cooperation with Testing and Inspection Personnel: The Contractor shall provide facilities as required to assist in the inspection and testing of the excavations, and cooperate with the inspecting and testing personnel to expedite the work.

F. Notification of Observer: The Contractor shall notify the authorized observer at least twelve hours prior to the time the excavation will be ready for inspection. Drilled shaft installation shall not proceed without the authorized observer on site.

G. Personnel Safety: The Contractor shall provide gas testing equipment, protective cage, or temporary casing or shoring of proper diameter, length, and thickness, and all other safety equipment required by law for inspection and testing of drilled piers and to protect workmen and inspectors during hand belling or other operations necessitating entry into shaft.

3.11 APPROVAL BY THE GEOTECHNICAL ENGINEER

A. Approval by the Owner's Geotechnical Engineer is required on all pier installation criteria and his decision and judgment on pier length, rejection of piers, additional piers required, and all other pier installation and capacity questions shall be final.

3.12 CONTRACT BASIS

A. Basis of Bids: Bids shall be based on number of drilled piers, design length from top elevation to bottom of shaft and diameter of shaft, as shown on drawings. The bid price shall include cost for temporary casing of excavation that may be required.

B. Basis for Payment: Payment for drilled piers will be made on actual net volume of drilled piers in place and accepted. The actual length and shaft diameter may vary to coincide with elevation where satisfactory bearing or friction strata is encountered, and with actual bearing value of bearing strata determined by testing services, and with stability and characteristics of soil strata. Adjustments will be made on net variation of total quantities, based on design dimensions for shafts.

1. There will be no additional compensation for excavation, concrete fill, reinforcing, casings, or other costs due to unauthorized overexcavating shafts. Overexcavated piers will be measured and paid for in accordance with required design or authorized depth. No payment will be made for rejected drilled piers.
2. Prices quoted shall include full compensation for labor, temporary casing, materials, tools, equipment, and incidentals required for excavation, trimming, shoring, casings, dewatering, reinforcement, concrete, and other items for complete installation.

C. Unit Prices: Unit prices for the following items, as set forth in contract conditions, will apply in event additions to or deductions from work are required and authorized by written order from Architect/Engineer to Contractor.

1. Soil excavation, including temporary casing if required: cost per cu. yd.
2. Soil excavation by slurry method: cost per cu. yd.
3. Rock excavation: cost per cu. yd.
4. Permanent steel casings, installed: cost per lin. ft.
5. Reinforcing steel and dowels, installed : cost per lb.
6. Concrete: cost per cu. yd.

END OF SECTION

SECTION 32 13 13 - CONCRETE PAVING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Furnish all labor and materials necessary for forming and placing reinforced concrete pavement to the lines and grades shown on the drawings associated with this project.

7. C1549 – Test Method for Determination of Solar Reflectance Near Ambient Temperature Using a Portable Solar Reflectometer.
8. D1751 – Preformed Expansion Joint Fillers for Concrete and Structural Construction

B. City of Dallas Department of Public Works Standard Construction Details (251D-1)

1.4 SUBMITTALS

A. Procedures for Submittals: DIVISION 1.

B. Submit concrete mix designs for each class of concrete, including historical data for the concrete mix used in the same geographical area where the project is located.

1.5 QUALITY CONTROL TESTING

A. Comply with the provisions of DIVISION 1.

B. The Owner may engage a qualified independent testing agency to perform field inspections and tests, and to prepare test reports. When such testing indicates that Contractor's work does not comply with the specified requirements, additional testing shall be performed by the Owner's testing agency at no additional cost to the Owner to determine compliance of corrected Work with the specified requirements.

PART 2 - PRODUCTS

2.1 PORTLAND CEMENT CONCRETE

A. Classification and mix design shall be as follows:

1. Concrete strength shall be designed to produce a 3600 psi minimum compressive strength at 28 days, unless otherwise shown on the Drawings.
2. Maximum size of aggregates 1-1/2 inches.
3. Slump shall range from 1-1/2 to 4 inches.
4. Air entrainment concrete mixture shall have an air content by volume of 4.5 percent plus or minus 1.5 percent.
5. Concrete shall be mixed conforming with ASTM C94.
6. The concrete mix shall be designed by a commercial testing laboratory, and submitted for approval.
7. The use of Type III cement shall not be permitted without written permission from the Engineer when Type III cement is not shown on the Drawings.

2.2 REINFORCEMENT

A. Reinforcing steel shall meet the specifications of ASTM A615, Grade 60. Bars shall be deformed billet steel free of defects.

2.3 BOARD FILLER

A. Materials shall be as shown on the Drawings.

B. Board filler shall be free of defects, which will impair their usefulness as expansion joint fillers.

2.4 PREFORMED BITUMINOUS EXPANSION BOARD

A. Preformed bituminous boards shall meet the specifications for ASTM D1751.

2.5 PAVEMENT JOINT SEALING MATERIAL

A. Cold applied joint sealants, two part urethane (self leveling) sealant equal to “Sonolastic Paving Joint Sealant” by Sonneborn, “Urexpan NR-200” by Pecora, or “THC-900” by Tremco, or equal.

2.6 DEFORMED CONTRACTION JOINT METAL STRIPS

A. Deformed contraction joint metal strips shall be 28 ga. steel, galvanized 1.25 oz. per square foot or heavier and meet the specifications of ASTM A525.

2.7 CURING COMPOUND

A. Curing compound shall conform to the specifications if ASTM C309, Type 2, white pigmented.

2.8 LOAD TRANSMISSION DEVICES FOR EXPANSION AND CONTRACTION JOINTS

A. Load Transmission devices shall be as detailed on plans and conform to the properties specified in ASTM A615, Grade 60 steel.

2.9 STEEL DOWEL BARS

A. Steel dowel bars and steel reinforcement shall be deformed or smooth bars conform on properties to ASTM A615 Grade 60. Unless otherwise shown on the plans, all reinforcing steel shall be deformed bars, all dowel bars at joints shall be smooth bars, and all curb dowels shall be deformed bars.

PART 3 - CONSTRUCTION

3.1 PAVEMENT

A. Placing and removing forms.

1. Forms shall be of wood or metal, properly treated to insure concrete does not adhere to the forms, straight, clean, free from warp or defect, and of sufficient depth. The forms shall be so placed that when each form section will be firmly in contact for its whole length and base width and exactly at the established grade. Any subgrade under the forms below established grade shall be corrected using suitable material, placed, sprinkled, and rolled. Forms shall be securely staked and tightly joined and keyed to prevent displacement. Sufficient stability of forms to support equipment operated thereon and to withstand its vibration without springing shall be required. Forms shall remain in place not less than 24 hours after concrete is placed.

B. If the slip form method of paving is used, the equipment shall meet the following requirements:

1. Side Forms. Side forms shall be of metal except as otherwise provided herein and shall be of approved cross section. The length of form sections shall not be less than 10 feet, and each section shall provide for staking in position with not less than three (3) pins. Forms shall be of ample strength and shall be provided with adequate devices to secure them in place so the forms will withstand, without visible springing or settlement, the impact and vibration of the spreading and finishing machinery. In no case shall the base of the form be less than eight (8) inches wide for a form depth of eight (8) inches or more in height. The forms shall be free from warps, bends or kinks, and shall be sufficiently true to provide a reasonably straight edge on the concrete. The top of each form section, when tested with a straight edge, shall conform to the requirements specified for the surface of the completed pavement. A sufficient number of forms shall be provided for satisfactory prosecution of the work.
2. Flexible or curved forms of wood or metal of proper radius shall be used for curves of 100 foot radius or less.
3. The preferred depth of the form shall be equal to the required edge thickness of the pavement. Forms with depth greater or less than the required edge thickness of the pavement will be permitted provided the difference between the form depth and the edge thickness is not greater than two (2) inches, and further provided that:

    a. Forms of a depth greater than the pavement edge may be used if the supporting material is planed to construct a form trench.
    b. Forms of a depth less than the pavement edge shall be brought to the required edge thickness by securely attaching metal strips or wood shims of approved section to the full width and length of the base of the form.

4. Curb Forms. Outside curb forms shall be of wood or metal of a section satisfactory to the Engineer, straight, free of warp, and shall be of a depth at least equal to the depth of the curb. They shall be securely mounted on the paving forms and maintained in true position during the placing of the concrete. Inside curb forms, if required, shall be of approved material and of such design as to provide the curb required and shall be rigidly attached to the outside curbs forms.

C. Joints in Concrete Pavement.

1. Joints shall be constructed in the pavement slab at locations and according to details as shown on the Drawings. Sealants shall be installed per manufactures recommendations. Stakes, braces,

brackets or other devices shall be used as necessary to keep the entire joint assembly in true vertical and horizontal position.

2. All construction joints shall be saw cut as soon as the concrete will support the combined weights of the cutting equipment and the operator but no more than four (4) hours after the concrete is poured.
3. When prefabricated plastic strips are used to form joints, they shall be placed after the concrete surface has been leveled and before the finishing is completed. The strips shall be of a type specifically manufactured for the purpose of forming joints in concrete pavement and to the dimensions as required to form the specified joints. The strips shall be removed after the concrete has set per the manufacturer's recommendations. Any blemishes caused by the removal of the strips shall be repaired immediately using approved methods.

D. Tie Bars and Load Transmission Devices.

1. Shall be accurately placed as shown on Drawings and held securely (parallel to pavement surface and perpendicular to joint) during placing and finishing of pavement.

E. Expansion Joints.

1. Shall be constructed with board filler and sealed at top. Board filler must be perpendicular to plane of concrete slab. Alignment of joint shall not vary more than 1/4 inch in 10 feet.

F. Concrete Placing and Finishing.

1. Concrete not placed as herein prescribed within 90 minutes after mixing shall be rejected.
2. Concrete shall not be placed when temperature is below 40°F and falling, but may be placed when the temperature is above 35°F and rising, the temperature being taken in the shade and away from artificial heat.
3. Concrete shall be consolidated by a mechanical vibrator to remove all voids. Special care shall be exercised in placing and spading concrete against forms and at all joints to prevent the forming of honeycombs and voids and to prevent displacement of steel reinforcements and load transmission devices.
4. The concrete shall be struck off with an approved strike-off screed to such elevation that when consolidated and finished, the surface of pavement shall conform to the required section and grade. In no case shall the maximum ordinate from a 10-foot straight edge to the pavement be greater than 1/8 inch.
5. The strike template shall be moved forward with a combined transverse and longitudinal motion in the direction the work is progressing, maintaining the template in contact with the forms, and maintaining a slight excess of material on front of the cutting edge.
6. After completion of a strike-off, consolidation and transverse screeding, a hand-operated longitudinal float shall be operated to test and level the surface to the required grade.
7. Workmen shall operate the float from approved bridges riding in the forms and spanning the pavement. The longitudinal float shall be held in contact with the surface and parallel to the centerline, and operated with short longitudinal strokes while being passed from one side of the pavement to the other. If contact with the pavement is not made at all points, additional concrete shall be placed if required, and screeded, and the float shall be used to produce a satisfactory surface. After a section has been smoothed so that the float maintains contact with the surface at all points being passed from one side to the other, the bridges may be moved forward half the length of the float, and the operations repeated.
8. After completion of the straightedge testing, a pass with a burlap drag shall be made as soon as construction operations permit and before the water sheen has disappeared from the surface. As many passes of the drag as required to produce the desired surface texture shall follow this.
9. After completion of dragging and about the time the concrete becomes hard, the edge of the slab and joints shall be left smooth and true to line.

G. Curing.

1. Concrete pavement shall be cured by protecting it against excessive loss of moisture for a period of not less than 72 hours from the beginning of curing operation. Immediately after finishing operations have been completed, the entire surface of the newly laid concrete shall be covered and cured. Special care should be exercised to keep spraying curing compound out of pavement joints.

3.2 APPLICATION OF JOINT SEALING COMPOUND

A. Joints shall be thoroughly cleaned of loose scale, dirt, dust and curing compound. When necessary, existing joint material shall be removed to the depth as shown on the plans.

B. Joints shall be filled to the full depth of the joint opening. Pouring shall be done in a neat and workman like manner to give satisfactory results. The sealer shall be installed per manufacturer's recommendation. The joint sealant shall be below the top of the pavement surface.

3.3 FIELD QUALITY CONTROL TESTING

A. Concrete Test Specimens

1. A laboratory testing agency for the tests will be selected and paid for by the Owner. A laboratory technician will prepare the necessary concrete test cylinders.
2. Test cylinders for compressive strength tests will be taken and cured in accordance with ASTM C31 and tested in accordance with ASTM C39. At least 3 cylinders shall be made for each day for each 100 cy of concrete, or fraction thereof, placed.
3. Concrete pavement that does not meet the specified requirements based on the laboratory compressive strength tests shall be removed, replaced, and re-tested at no additional cost to the Owner.

B. Testing of Concrete Surface

1. After finishing is complete and while the concrete is still workable, the surface shall be tested for trueness with an approved 10-foot steel straightedge. The straightedge shall be operated from one side of the pavement placed parallel to the pavement center line and passed across the slab to reveal any high spots or depressions. The straightedge shall be advanced along the pavement in successive stages of not more than ½ its length. A tolerance of 1/8" in 10 feet shall be met. Any correction of the surface required shall be accomplished by adding concrete if required and by operating the longitudinal float over the area. The surface test with straightedge shall then be repeated.

3.4 OPENING PAVEMENT TO TRAFFIC

A. The pavement shall be closed to all traffic, including vehicles of the Contractor, until the concrete is at least 7 days old or has attained a minimum average of 2,000 psi compressive strength. Repair any damage to the pavement prior to acceptance by Owner at no additional cost to the Owner. This does not relieve the Contractor from the normal liabilities and maintenance responsibilities, implied or otherwise, for the pavement or other items.

END OF SECTION 32 13 13

SECTION 321723 – PAVEMENT MARKINGS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Furnish labor, materials and equipment required for providing pavement markings as shown on the Drawings.

1.2 RELATED SECTIONS

A. SECTION 321313 – CONCRETE PAVING

1.3 SUBMITTALS

A. Procedures for Submittals: DIVISION 1.

B. Submit product data demonstrating compliance with the specified requirements.

C. Submit manufacturer's recommended instructions for application of pavement marking paint.

1.4 ENVIRONMENTAL CONDITIONS

A. Do not apply detectable warning when temperature is below 35 deg F or above 88 deg F.

B. Do not apply marking paint when weather is windy, foggy or rain, or ambient or pavement temperature is below 50 deg F or above 110 deg F, or when relative humidity is above 85%; nor, when such conditions are anticipated during 8 hours after application.

PART 2 - PRODUCTS

2.1 MARKING PAINT

A. All pavement striping and markings, other than fire lanes, shall be Alkyd Thermoplastic by DPI Thermoplastic.

B. Fire lane striping and markings shall be "Gorilla" Hi-performance Acrylic Zone Marking Paint, by Aexcel Corporation, Mentor, Ohio; www.aexcelcorp.com/msds.asp?Cat=1&sCat=15

C. Or equal.

PART 3 - EXECUTION

3.1 INSPECTION AND PREPARATION

A. Locate marking as required by Drawings. Provide qualified technician to supervise equipment and application of markings.

B. Lay out markings, using guideline, template, and forms.

C. Thoroughly clean surfaces free of soil, sand, gravel, oil and other foreign materials.

D. Allow surfaces to cure before painting, as required by manufacturer.

3.2 APPLICATION

A. Apply pavement marking paint in accordance with the manufacturer's recommended instructions.

B. Apply marking paint straight and even, and in accordance with layout.

3.3 CLEANING

A. Clean spills and spatters in accordance with the manufacturer's recommended instructions.

B. Remove overspray from surfaces other than those requiring marking paint.

END OF SECTION 321723

SECTION 32 84 00 - LANDSCAPE IRRIGATION SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. Furnish all work and materials, appliances, tools, equipment, facilities, transportation, and services necessary for and incidental to performing all operations in connection with the installation of underground sprinkler irrigation system complete, as shown on drawings and/or specified herein. When the term "Contractor" is used in this section, it shall refer to the irrigation Subcontractor.

1.2 REFERENCES

A. Texas Commission on Environmental Quality (TCEQ) – current requirements and guidelines for landscape irrigation design and specifications.

B. Dallas Independent School District (DISD) - Technical Design Guidelines (TDG) – current edition.

C. City of Dallas Article X Landscape Ordinance or any applicable Planned Development (PD).

1. Exception for relocation of existing DISD parking lot required to comply with landscape ordinance: variance to ten (10) foot buffer strip. Notify DISD designated representative immediately. Policy is to request a variance to allow existing irrigation to remain without modification.

1.3 CODES/PERMITS

A. All work under this section shall comply with the provisions of these Specifications, as illustrated on the accompanying drawings, or as directed by the Owner and shall satisfy all applicable local codes, ordinances, or regulations of the governing bodies and all authorities having jurisdiction over this Project.

B. Installation of equipment and materials shall be done in accordance with requirements of the National Electrical Code, City Plumbing Code, and standard plumbing procedures. The drawings and these Specifications are intended to comply with all the necessary rules and regulations; however, some discrepancies may occur, the Contractor shall immediately notify the Owner's Authorized Representative in writing of the discrepancies and apply for an interpretation. Should the discovery and notification occur after the execution of a contract, any additional work required for compliance with the regulations shall be paid for as covered by these Contract documents.

C. The Contractor shall give all necessary notices, obtain all permits, and pay all costs in connection with his work; file with all governmental departments having jurisdiction; obtain all required certificates of inspection for his work and deliver to the Owner.

D. The Contractor shall include in the work any labor, materials, services, apparatus, or drawings in order to comply with all applicable laws, ordinances, rules, and regulations whether or not shown on the drawings and/or specified.

E. The installation of the irrigation system shall be made by an individual or firm duly licensed under Article No. 8751 VTCS, Titled "Licensed Irrigators Act", S.B. No. 259 as passed by the 66th Texas Legislature.

1.4 GENERAL REQUIREMENTS

A. New Schools: Irrigation to be considered for the "front" yard(s), or street frontages, and athletic fields for the campus. Unless local code requires entire site to be irrigated.

B. Renovation Projects: To be discussed directly with the Dallas ISD-M&O during Schematic Design / STB phase. Preliminary approach to include front yards, street frontages and athletic fields.

C. Coordination and final review of irrigation plans and specifications to occur with the Dallas ISD-M&O at the Design Development and 95% CD stage.

D. Architect to provide the Dallas ISD-M&O with estimated water usage for landscaped areas with recreational fields calculated separately.

1.5 DESIGN REQUIREMENTS

A. Irrigation System:
1. Connectivity: Controller to have Ethernet connection for inclusion in the building management and control system (BMCS).
2. Components: System to include the following components at a minimum:
a. Master valve and two (2) inch flow sensor.
b. Lightening protection for system.
c. Sufficient flow for two (2) zones to operate simultaneously.
d. Controller zone chart.
e. Bubblers at trees and large shrubs.
3. Construction Documents: Comply with and reference all applicable codes including but not limited to ball valve and backflow preventers, meter monitoring requirements, and water conservation codes.

B. Hose Bibs Connectors:
1. Location: Building perimeter, no more than one hundred (100) feet apart.
2. Type: Keyed type, freeze resistant, flush mounted in a lockable box.
3. Provide underground water line with quick-couplers in boxes with lockable covers at grade.

C. Quick-Couplers:
1. To include a ball shut off valve three (3) feet to four (4) feet from each quick-coupler location and within eighteen (18) inches of mainline supply.
2. Must accept one (1) inch hose.
3. Located constant flow quick-couplers:
a. Ball Fields: Behind home plate and behind pitcher’s mound.
b. Along football field sidelines near the fifty (50) yard line.
c. All sidewalk and pavement areas to have at least one (1), four (4) inch sleeve with two (2) pull strings at each irrigation crossing.

1.6 QUALITY ASSURANCE

A. The Contractor shall warranty material and workmanship for one (1) year after final acceptance including repair and replacement of defective materials, workmanship, and repair of backfill settlement.

1.7 SUBMITTALS

A. The Contractor shall submit shop drawings or manufacturer's "cut sheet" for each type of sprinkler head, pipe, controller, valves, check valve assemblies, valve boxes, wire, conduit, fittings, and all other types of fixtures and equipment proposed to install on the job. The submittal shall include the manufacturer's name, model number, equipment capacity, and manufacturer's installation recommendation, if applicable, for each proposed item.

B. No partial submittal will be accepted, and submittals shall be neatly bound into a brochure and logically organized. After the submittal has been approved, substitutions will not be allowed except by written consent of the Owner’s Authorized Representative.

C. Shop drawings shall be provided, upon request, for any special custom fabrication or coordination with other trades.

1.8 “APPROVED EQUAL” SUBSTITUTIONS

A. Where items on the plans are specified by a manufacturer's brand name and catalog number, followed by the phrase "or approved equal". This is not intended to unduly restrict competitive procurements or bidding but is done to assure a minimum standard of quality which is believed to be best for the item specified and to match existing equipment.

1.9 EXISTING UTILITIES

A. Locations and elevations of various utilities included with the scope of this work have been obtained from the most reliable sources available and should serve as a general guide without guarantee to accuracy. The Contractor shall examine the Site and verify to his own satisfaction the locations and elevation of all utilities and availability of utilities and services required. The Contractor shall inform himself as to their relation to the work and the submission of bids shall be deemed as evidence thereof. The Contractor shall repair at his own expense, and to the satisfaction of the Owner, for damage to any utility shown or not shown on the plans.

B. Should utilities not shown on the plans be found during excavations, Contractor shall promptly notify the Owner for instructions as to further action.

C. Contractor shall make necessary adjustments in the layout as may be required to connect to existing stub-outs, should such stub- outs not be located exactly as shown and as may be required to work around existing work, at no increase in cost to the Owner. All such work will be recorded on record drawings and turned over to the Owner prior to final acceptance.

1.10 ELECTRICAL POWER

A. Electric power shall be provided within five (5) feet of each controller location by the G.C. The irrigation contractor shall provide final hardwire connection.

1.11 WATER FOR TESTING

A. Unless noted otherwise on the plans or elsewhere, furnish all water necessary for testing, flushing, and jetting.

1.12 BORINGS, SLEEVES AND ELECTRICAL CONDUITS

A. Sleeves and electrical conduits are the responsibility of the Irrigation Contractor to install prior to paving or related construction and should be installed as noted on the drawings and specifications. Contractors shall be responsible for locating all sleeves and conduits at no additional cost to the Authority.

B. Borings under existing paving will be required where noted on the drawings and shall be provided at no additional cost to the Owner. Borings shall be a minimum of eighteen (18) inch depth and new pipes shall be incased in PVC sleeves as noted on the plans.

1.13 RECORD DRAWINGS

A. Record dimensioned locations and depths for each of the following:
   1. Point of connection.
   2. Sprinkler pressure line routing (provide dimensions for each 100 lineal feet (maximum) along each routing, and for each change in directions).
   3. Gate valves.
   4. Sprinkler control valves (buried only).
   5. Control wire routing.
   6. Other related items as may be directed by the Owner’s Authorized Representative.

B. Locate all dimensions from two (2) permanent points (buildings, monuments, sidewalks, curbs, or pavements).

C. Record all changes which are made from the Contract drawings, including changes in the pressure and non-pressure lines.

D. Record all required information on a set of reproducible drawing files.

E. Maintain information daily. Keep Contract drawings at the Worksite at all times and available for review by the Owner’s representative.

1.14 CONTROLLER CHARTS

A. Do not prepare charts until record drawings have been approved by the Owner's representative.

B. Provide one (1) controller chart for each automatic controller installed.

1. Chart may be a reproduction of the record drawing, if the scale permits fitting within the controller door. If photo reduction prints are required, keep reduction to maximum size possible to retain full legibility.

2. Chart shall be blackline print of the actual system, showing the area covered by that controller.

C. Identify the area of coverage of each remote-control valve, using a distinctly different pastel color, drawn over the entire area of coverage.

D. Following approval of charts by the Owner's representative, they shall be hermetically sealed between two (2) layers of 20 mil. thick plastic sheet (laminated).

E. Charts must be completed and approved prior to final acceptance of the irrigation system.

1.15 OPERATION AND MAINTENANCE MANUALS

A. Prepare and deliver to the Owner within ten (10) calendar days prior to completion of construction, three (3) hard cover binders with three (3) rings containing the following information:

1. Index sheet, stating Irrigation Contractor's name, address, telephone number, and name of person to contact.

2. Equipment list providing the following for each item of equipment installed under this contract:

a. Manufacturer's name.

b. Make and model number.

c. Name and address of local manufacturer's representative.

d. Spare parts list in detail.

3. Guarantee statement - Duration of guarantee period.

4. Copy of the Irrigation Installation Certification Letter.

5. Water Schedule: Recommended programs for watering by season shall state watering times and frequencies of each irrigation zone. Water schedule shall be based on the local ET (evapotranspiration) rate.

B. Provide descriptions of all installed materials and systems in sufficient detail to permit maintenance personnel to understand, operate, and maintain the equipment.

C. It is the responsibility of the Licensed Irrigation Contractor to demonstrate that final installed sprinkler system will operate according to intent of originally designed and specified system. If Licensed Irrigation Contractor notes any problems in head spacing or potential coverage, it is his responsibility to notify the Owner in writing, before proceeding with work. Licensed Irrigation Contractor guarantees 100% coverage of all areas to be irrigated.

1.16 EQUIPMENT TO BE FURNISHED – SPARE PARTS

A. Supply as part of this contract the following tools:

1. Two (2) sets of sprinkler wrenches for adjusting, cleaning or disassembling each type of sprinkler and two (2) each of any special tools required for any other equipment.

2. Four (4) pop-up spray heads of each type and four (4) nozzles of each type installed.

3. Four (4) rotary heads of each type installed.

4. Two (2) quick coupling keys with hose swivels, hose bibs/garden valves to match size installed.

5. Two (2) valve keys each for operating cast iron and brass gate valves.

6. Two (2) keys for automatic controller lock.

B. The above-mentioned equipment shall be turned over to the Owner via a signed transmittal at the conclusion of the project. Before final inspection, verification that materials have been provided will occur.

1.17 GUARANTEE

A. The guarantee for the sprinkler irrigation system shall be included in the operations and maintenance manual.

GUARANTEE FOR SPRINKLER IRRIGATION SYSTEM

We hereby guarantee that the sprinkler irrigation system we have furnished and installed is free from defects in materials and workmanship, and that work has been completed in accordance with the contract documents, ordinary wear and tear and unusual abuse, or neglect excepted. We agree to repair or replace any defects in material or workmanship which may develop during the period of one (1) year from date of acceptance (substantial completion) and also to repair or replacing of such defects at no additional cost to the Owner. We shall make such repairs or replacements within a reasonable time, as determined by the Owner, after receipt of written notice. In the event of our failure to make such repairs or replacements within a reasonable time after receipt of written notice from the Owner, we authorize the Owner to proceed to have said repairs or replacements made at our expense and we will pay the costs and charges therefore upon demand.

Project:

Location:

Signed:

Address:

Phone:

Date of Acceptance:

1.18 CHECKLIST

A. Provide a signed and dated checklist and deliver to the Owner’s representative prior to final acceptance of the work.

B. Use the following format:

1. Plumbing permits: if none required, so note.
2. Material approvals: approved by and date.
3. Pressure line tests: by whom and date.
4. Record Drawings: received by and date.
5. Controller charts: received by and date.
6. Materials furnished: received by and date.
7. Operation and maintenance manuals: received by and date.
8. System and equipment operation instructions: received by and date.
9. Manufacturer's warranties if required: received by and date.
10. Written guarantee: See 1.15 above; received by and date.
11. Lowering of heads in lawn areas: if incomplete, so state.

1.19 WARRANTY AND MAINTENANCE

A. Maintenance during warranty shall include, but not necessarily be limited to, the following:

1. Adjustment of sprinkler height and plumb to compensate for settlement and/or plant growth.
2. Backfilling of all trenches.
3. Adjustment of head coverage (arc of spray) as necessary.
4. Unstopping heads plugged by foreign material.
5. Adjustment of controller as necessary to insure proper sequence and watering time.
6. All maintenance necessary to keep the system in good operating order. Repair of damage caused by vandals, other contractors or weather conditions shall be considered extra to these specifications.

B. Warranty and maintenance after final acceptance does not include alterations as necessitated by re-landscaping, re-grading, addition of trees or the addition and/or changes in sidewalks, walls, driveways, etc.

C. Maintenance shall continue for one (1) month after final acceptance to allow for adjustments, repair and scheduling.

PART 2 - PRODUCTS

2.1 GENERAL

A. Unless otherwise noted on the plans, all materials shall be new and unused. The irrigation equipment catalog numbers used for reference in these Specifications are to establish minimum quality standards. Substitution will require Dallas ISD approval.

2.2 POLYVINYL CHLORIDE PIPE (PVC PIPE)

PVC pipe manufactured in accordance with ASTM Standards noted herein.

A. Marking and Identification: PVC pipe shall be continuously and permanently marked with following information: Manufacturer's name, size, type of pipe, and material, SDR number, Product Standard number, and the NSF (National Sanitation Foundation) Seal.

B. Pressure mainline piping for sizes one (1) inch and larger, shall be PVC Schedule 40.

C. PVC pipe shall be made from an NSF approved Type I, Grade II, PVC compound conforming to ASTM resin specification D1785-68. All pipe must meet requirements as set forth in Federal Specification PS-21-70, with an appropriate standard dimension (S.D.R.) (Solvent-weld pipe).

D. PVC solvent-weld fittings shall be of the same material as the PVC pipe specified and compatible with PVC pipe furnished. Solvent weld type fittings shall be Schedule 40, 1-2, II-I NSF approved conforming to ASTM test procedure D2466.

E. Solvent cement and primer for PVC solvent-weld pipe and fittings shall be of type and installation methods prescribed by the manufacturer.

F. Pipe sleeves: Shall be as noted on the plans.

2.3 FLEXIBLE PVC TUBING

A. All flexible PVC tugging shall be I.P.S. heavy wall hose made from rigid PVC material.

B. Hose shall meet or exceed schedule 80 wall thickness and shall comply with ASTM D2287 and tested in accordance with ASTM D1598.

C. Hose shall be tested at 200 PSI static pressure for two (2) hours and a quick burst rating of a minimum of 400 PSI.

2.4 SWING JOINTS AND NIPPLES

A. Install threaded and gasketed schedule 80 PVC 3-way swing joints and nipples.

B. The unit shall contain o-ring seals at all elbow connections.

2.5 MANUAL VALVES

A. Gate valves three (3) inches and smaller shall be USA made, 200 pound W.O.G., highest grade cast bronze gate valve with screw-in bonnet, nonrising stem and solid wedge disc, threaded ends and a cast iron handwheel, manufactured by Nibco or Dallas ISD approved equal.

B. Isolation valves shall be Nibco schedule 80 PVC ball valves with union connection at both ends of valve sized same main line or Dallas ISD approved equal.

C. All valves shall have wheel handles unless cross handles are called for on the plan.

2.6 QUICK COUPLING VALVES

A. Quick coupling valves shall have a brass one-piece (cast) body designed for working pressure of 150 PSI operable with quick coupler key, and with a purple, (NP) cover.

B. The valve shall accept a single lug three-quarter (3/4) inch bronze valve key for operation unless noted otherwise.

2.7 CONTROL WIRING

A. Connections between the automatic controllers and the electric control valves shall be made with UF-B UL PVC double insulated, two (2) conductor solid core wire, (Maxi-Wire) #14, under 30 VAC RMS using a National Electric Code Class II circuit. Install in accordance with valve manufacturer's specifications and system design.

B. Conductor shall be soft drawn, annealed solid copper conforming to ASTM 33.

C. Conductor insulation shall be 4/64-inch thick polyvinyl chloride (PVC), conforming to UL Standard #493 for thermoplastic-insulated style UF, rated at 60 degrees C.

D. The two (2) insulated conductors are laid in a parallel and encased in a single oter jacket of 3/64-inch thick, high density, sunlight resistant polyethylene conforming to ICEA S-61-402 and NEMA WC5, having a minimum wall thickness of 0.045-inch.

E. Conductor shall be one (1) red, one (1) black.

F. All wire insulation shall be intact and free of nicks and cuts.

G. For runs greater than 4,000 feet, larger wire may be used provided it conforms to controller manufacturer's specifications for both material specification and installation.

H. Underground splice kit shall be 3M DBR-6 or approved equal, water-tight, dry splice connector or approved equal. All wire splices shall be protected by a valve box. No splices shall be installed on runs less than 500 feet.

I. Where control wire leaves mainline, install in Schedule 40 PVC conduit.

2.8 AUTOMATIC CONTROLLER(S)

A. BaseLine BaseStation 3200R or Dallas ISD approved equal controller with ethernet connection to be completed with BaseLine BaseManager system. Ethernet connection to initiate at the MDF cabinet and terminate inside the irrigation controller cabinet with a RJ 45 connector. Cable to be CAT5 or newer. Provide lockable, weatherproof metal cabinet. Verify intent with Dallas ISD prior to final install of this portion of the system.

B. Automatic controllers shall be of size and type to accommodate system design. Final location of automatic controllers shall be approved by Dallas ISD-M&O.

C. Unless otherwise indicated, the 120 volt electrical power for the controller is available at the site. The final electrical hook-up shall be the responsibility of the Irrigation Contractor. Controller to be hard wired. Plug-in connection is not allowed.

D. Flow sensor(s), bicoder(s), surge protector(s) and biosensor(s) to be compatible with BaseLine system.

2.9 VALVE BOXES

A. Manual Valves: ten (10) inch box, Carson Industries or Ametek, with green bolt down cover. Use extensions where required.

B. Electrical Control Valves: Standard rectangular box, Carson Industries or Ametek, with green bolt down cover or Dallas ISD approved equal. Install extension sleeves as required.

C. Backflow Preventer: Pump Guard Box. Box shall be sized to fit required backflow preventer by minimum of six (6) inches on each end.

2.10 SPRINKLER HEADS

A. Sprinkler heads are specified on the drawings.

B. Sprinkler heads in lawn area as specified on plan.

1. Pop-up heads twelve (12) and six (6) inches
2. Spray adjustable nozzles.
3. Adjustable rotor heads 3/4-inch female inlet NPT.
4. Spray heads 1/2-inch female inlet NPT.
5. Approved Manufacturer: Hunter or Dallas ISD approved equal.

C. All sprinkler heads shall be of the same size, type, and deliver the same rate of precipitation with the diameter (or radius) of throw and discharge as to accommodate designed system and/or specified in these special provisions.

D. All sprinkler heads of the same type shall be of the same manufacturer.

E. The sprinkler body and all related parts shall be plastic cycolac or polycarbonate. They shall have a spring retraction for positive return action of the pop-up nozzle.

F. The spring for retraction and the adjustable nozzle screw shall be made of corrosion resistant materials.

G. Ensure that Sprinkler head at the building perimeter are pointed away from the building so not to stain materials.

2.11 ROTARY HEADS

A. Rotary pop-up sprinklers shall be in-line combination type with positive drive by means of a water-driven gear motor.

B. Nozzles shall be readily accessible without removing the upper head assembly.

2.12 SLEEVES

A. Definition: a pipe within another pipe for carrying water will be installed.

B. Wire sleeve: a pipe used to carry low voltage irrigation wires for operation of electric control valves.

C. All sleeves shall be Schedule 40. Size shall be equal to twice (2 times) the diameter of the pipe or combination of pipes enclosed within the sleeve.

2.13 ACCESSORIES

A. Connections for PVC and Metal Pipe: for all threaded connections between PVC and metal pipe use Heavy Duty Rectorseal thread sealing paste with virgin Teflon No. 100 as manufactured by Rectorseal Corporation or Dallas ISD approved equal. Apply in accordance with manufacturer's instructions.

B. Drainage Fill: 1/2-inch washed pea gravel.

C. Sand Layer: Washed sand.

2.14 DRIP TUBE WITH PRESSURE COMPENSATING EMITTERS (Only if required by TCEQ and with approval from Dallas ISD-M&O)

Drip tube shall be of the manufacturer and model as noted on the plans. Pressure compensating emitters with internal check valves are required unless noted otherwise.

A. Barbed Insert Fittings:

1. All barbed insert fittings shall be constructed of molded, ultra-violet-resistant plastic having nominal inside dimension (I.D.) of 0.24 inch.
2. Each fitting shall have a minimum of two (2) ridges or barbs per outlet with a raised barb nearest the fitting outlet. All fittings shall be of one (1) manufacturer and shall be available in one (1) of the following end configurations:
    a. Barbed insert fittings, or
    b. Male pipe threads (MPT) with barbed insert fittings, or
    c. Female pipe threads (FPT) with barbed insert fittings.

2.15 ELECTRIC REMOTE-CONTROL VALVES

A. Electric remote-control valves shall have plastic bodies and covers and shall be globe-type diaphragm valves of normally closed design. The valves are specified on the drawings.

B. Operation shall be accomplished by means of integrally mounted heavy-duty 24-V solenoid complying with National Electrical Code, Class II Circuit. Solenoid coil shall be potted in epoxy resin within a plastic coated stainless steel housing. Solenoids shall be completely waterproof, suitable for direct underground burial.

C. A flow stem adjustment shall be included in each valve.

2.16 BACKFLOW PREVENTER

A. An approved backflow prevention device is required, as noted on the plans. The device shall include all materials as required by the local municipality and shall be inspected accordingly.

2.17 TEMPERATURE SENSORS/ RAIN SENSORS (as part of BaseLine BaseStation) – ref. plans.

PART 3 - EXECUTION

3.1 PROJECT CONDITIONS

A. Sleeves and Conduits: Installed by Contractor as indicated on Drawings. Do not use as main or lateral lines.

B. Contractor shall verify on-site pressure is adequate for a proper installation. Contractor shall submit letter certifying that on-site pressure exceeds design pressure by 10%.

1. If on-site pressure does not exceed design pressure by 10%, contact Owner's Representative for resolution. If construction work is started prior to receiving certification letter, Contractor assumes all costs for changes required to meet on-site pressure requirements.
2. If on-site pressure exceeds design pressure by greater than 10%, Contractor shall install a pressure regulator.

C. Site Utilities: Determine locations of underground utilities, including but not limited to, site lighting, cable, telephone, and irrigation lines prior to commencement of work. Perform all work in a manner which will avoid possible damage. Do not permit heavy equipment or trucks to damage utilities. Hand excavate or use air-spade technology, as required to minimize possibility of damage to underground utilities.

D. Contractor Responsibility: The Contractor shall not willfully install the irrigation system as shown on the drawings when it is obvious in the field that obstructions, grade differences or discrepancies in equipment usage, area dimensions or water pressure exist that might not have been considered in the engineering. Such obstructions or differences shall be brought to the attention of the Owner's Representative in writing. In the event this notification is not performed, the Contractor shall assume full responsibility for any revision necessary.

E. Staking: Before installation is started, place a stake or flag where each sprinkler and valve box is to be located, in accordance with drawing. Staking shall be approved by the Owner's Authorized Representative before proceeding.

F. Piping Layout: Piping layout is diagrammatic. Route piping around existing trees and root zones in such a manner as to avoid damage to plantings. Do not dig within the ball of newly planted trees or shrubs.

G. In areas where trees are present, trenches will be adjusted on site to provide a minimum clearance of four (4) times the trunk diameter of the tree (at its base) between any tree and any trench.

H. Contractor is responsible for protecting all existing trees, plants, lawns, and other features designated to remain.

I. Provide and install a dedicated irrigation meter and backflow preventer for the irrigation system water supply.

J. Design Pressure: (Unless System Designer proposes differently)

1. Design Static Pressure: 52.6 PSI.
2. Spray Zone: 30 PSI.
3. Rotary Zone: 40 PSI.
4. Tree Bubbler Zone: 30 PSI.

K. All material and equipment shall be delivered to the Worksite in unbroken reels, cartons or other packaging to demonstrate that such material is new and of a quality and grade in keeping with the intent of these Specifications.

L. Acceptance of Substrate: Contractor shall automatically assume the responsibility for any unacceptable finished work caused by substrate conditions.

M. Damages: Contractor shall be responsible for any and/or all damages that might occur during the project to utilities and related items. In addition, Contractor agrees to promptly make any repairs or pay damages whichever Dallas ISD prefers, should damages occur. Contractor shall locate all utilities.

3.2 EXCAVATION AND TRENCHING

A. The Contractor shall perform all excavation to the depth indicated in these Specifications and Contract drawings. The banks of trenches shall be kept as nearly vertical as practicable. Trenches shall be wide enough to allow a minimum of four (4) inches between parallel pipelines or electrical wiring.

B. Where rock excavation is required, or where stones are encountered in the bottom of the trench that would create a concentrated pressure on the pipe, the rock or stones shall be removed to a depth of six (6) inches minimum below the trench depth indicated. The over depth rock excavation and all excess trench excavation shall be backfilled with loose, moist earth or sand, thoroughly tamped.

C. Whenever wet or otherwise unstable soil that is incapable of properly supporting the pipe is encountered in the trench bottom, such shall be removed to a depth and length required, and the trench backfilled to trench bottom grade as hereinafter specified, with coarse sand, fine gravel or other suitable material.

D. Bottom of trench grade shall be continued past ground surface deviations to avoid air pockets and low collection points in the line. The minimum cover specifications shall govern regardless of variations in ground surface profile and the occasional deeper excavation required at banks and other field conditions. Excavation shall be such that a uniform trench grade variation will occur in all cases where variations are necessary.

E. Trench excavation shall comprise the satisfactory removal and disposition of all materials and shall include all shoring and sheeting required to protect the excavation and to safeguard employees.

F. During excavation, material suitable for backfilling shall be stockpiled in an orderly manner a sufficient distance back from edge of trenches to avoid overloading and prevent slides or cave-ins. Material unsuitable for backfilling shall be wasted as directed by the Owner's Authorized Representative. When excavated material is of a rocky nature and the topsoil or any other layer of excavated material is suitable for pipe bedding and backfill in the vicinity of the pipe, such material shall be separately stockpiled for use in such bedding and pipe backfill operations, unless satisfactory imported material is used.

G. All excavations and backfill shall be unclassified and covered in the basic bid. No additional compensation will be allowed for rock encountered.

H. Restore all surfaces, existing underground installations, etc., damaged or cut as a result of the excavations to their original conditions in a manner acceptable to the Owner's Authorized Representative.

3.3 PIPE INSTALLATION

A. Sprinkler Mains: Sprinkler mains are that portion of piping from water source to electric valves. This portion of piping is subject to surges since it is a closed portion of the sprinkler system. Sprinkler mains shall be installed in a trench with a minimum of eighteen (18) inches of cover.

B. Lateral Piping: Lateral piping is that portion of piping from electrical valve to sprinkler heads. This portion of piping is not subject to surges since it is an "open end" portion of the sprinkler system. Lateral piping shall be installed in a trench with a minimum of twelve (12) inches of cover.

3.4 PVC PIPE AND FITTING ASSEMBLY

A. Solvent: Use only solvent recommended by manufacturer to make solvent-welded joints following standards noted herein. Thoroughly clean pipe and fittings of dirt, dust, and moisture with an approved PVC primer before applying solvent.

B. PVC to Metal Connection: Work metal connections first. Use a non-hardening pipe dope such as Permatex No. 2 or "Teflon" tape on threaded PVC to metal joints. Use only light wrench pressure.

C. Threaded PVC Connections: Where required, use threaded PVC adapters into which pipe may be welded.

D. Remove lumber, rubbish, and rocks from trenches. Provide firm, uniform bearing for entire length of each pipeline to prevent uneven settlement. Wedging or blocking of pipe will not be permitted. Remove foreign matter or dirt from inside of pipe before welding and keep piping clean during and after laying pipe.

E. PVC pipe shall not be installed where there is water in the trench, nor shall PVC pipe be laid when temperature is 40 deg. F or below or when rain is imminent. PVC pipe will expand and contract as the temperature changes. Therefore, pipe shall be snaked from side to side of trench bottom to allow for expansion and contraction.

3.5 HYDROSTATIC TESTS

A. Pressure Test: After the pipe is laid, the joints completed, and the trench partially backfilled, leaving the joints exposed for examination, the newly laid mainline pipe or any valved section of main pressure line piping shall, unless otherwise specified, be subjected for four (4) hours to a hydrostatic pressure test of normal city water pressure. Each valve shall be opened and closed during the test. Enclosed pipe, joints, fittings, and valves shall be carefully examined during the partially open trench test. Joints showing visible leakage shall be replaced or remade, as necessary. Cracked or defective pipe, joints, fittings, or valves discovered in consequence of this pressure test shall be repeated until the test results are satisfactory.

B. All replacement and repair shall be at contractor's cost. Notify the Owner's Authorized Representative at least three (3) days before tests are scheduled to be conducted.

3.6 CONTROL WIRE INSTALLATION

A. Refer to 2.7 for related information.

B. All control wires shall be installed at least eighteen (18) inches deep. Contractor shall obtain Dallas ISD-M&O approval for wire routing when installed in a separate ditch. Control wires may be installed in a common ditch with piping, however wires must be installed a minimum of four (4) inches below or to one (1) side of piping.

C. All wire passing under existing or future paving, sidewalk, construction, etc., shall be encased in PVC conduit extending at least two (2) feet beyond edges of paving, sidewalks, or construction.

3.7 POP-UP SPRAY BUBBLER HEADS

A. Provide heads and nozzles as specified and install in locations as shown on the Contract Drawings.

B. Pop-up spray heads shall be installed with connections to rigid PVC pipe as detailed on the Contract drawings. Rotary heads shall be installed on a double swing joint connected to the lateral pipe as detailed on the drawings.

C. Heads shall be installed with underside of flange flush with the finished grade.

D. Contractor will be required to adjust heads as necessary after establishment of grass or other plant material.

3.8 DRIP EQUIPMENT (Only if required and with approval from DISD Representative)

A. Drip tube can be installed in one (1) of the following methods:

1. Over-excavation: Over-excavate the entire area to a depth of two (2) inches to four (4) inches below finish grade. Plant all specimen trees and shrubs fifteen (15) gallon size and larger, then place drip tube at the row spacing interval indicated on the plans.
2. Pipe Pulling: Where ground disruption is to be minimized, pneumatic tire, pipe-pulling machinery shall be used. Potholes shall be used at the ends of each run for making connection to supply and exhaust headers of rigid PVC pipe or polyethylene pipe.
3. Trenching: Hand or mechanically trench to the pipe depth indicated on the plans or in these specifications and backfill flush with finish grade. Avoid mechanically trenching within the dripline of existing trees. Hand-trench around existing tree roots when roots of two (2) inches and larger are encountered. Remove all rock one and one-half (1½) inch and larger when excavating and remove from site. Do not backfill trenches with rock that will come in direct contact with tubing or rigid PVC piping.

B. Placement of Rigid PVC Piping: Install pipe in a serpentine (snaked) manner to allow for expansion and contraction in trench before backfilling. Install pipes at temperatures over 40°F. Pipe markings shall face upward out of the trench whenever possible.

C. Drip tube: Drip tube can be installed with the water outlets facing up, down, or sideways. In irregular areas, some water outlets could end up too close to fixed improvements and may have to be capped off with a dripper plug ring.

D. Cover: Install underground piping horizontally and as evenly as possible to a maximum depth of 4 inches, unless otherwise specified. (Typical pipe depth is two (2) inches in shrub beds, four (4) inches in turf unless periodic aeration is anticipated, and then pipe depth should be lowered to six (6) inches.)

E. Barbed Insert Fittings: Connect drip tube to barbed insert fittings by pushing the tubing on and over both barbs of the fitting until the tubing has seated against another piece of tubing or has butted against another portion of the barbed fitting. For water pressures in excess of the 30 psi, or the maximum stated system pressure for the drip tube, whichever is less, use stainless steel clamps.

F. Clamping: When design-operating pressure exceeds 30 psi, or maximum stated system pressure for the drip tube, whichever is less, stainless steel pipe clamps shall be used. Slip clamps over tubing before slipping tubing over barbed insert fitting. Place clamp between the first and second ridge of the barbed fittings and crimp the "ear" of the clamp tightly. Crimp the "ear" twice to ensure proper seating.

3.9 QUICK COUPLING VALVES

A. Quick coupling valves shall be installed with the underside of flange flush with the finished grade.

B. Quick coupling valves shall be installed on a swing joint assembly as detailed on the drawings.

C. Under the warranty, the Contractor shall return after grass is established and adjust valves and valve boxes to proper grade.

3.10 MANUAL VALVES

A. Manual valves shall be sized and located where shown on the Contract drawings.

B. Valve boxes shall be adjusted to be flush with finished grade. The Contractor will be required to adjust after establishment of grass.

C. Valve boxes shall be properly supported and of sufficient construction that tractors and mowers crossing over the boxes will not push boxes down and crush the pipe, valve, or box.

3.11 VALVE AND VALVE BOX PLACEMENT

A. All manual, electric, and quick coupling valves shall be in boxes as specified in Paragraph 2.7 of this section and shall be set with a minimum of six (6) inches of space between their top surface and the bottom of the valve box. The base of the box shall be filled with pea gravel as shown on plan.

B. Valves shall be fully opened and fully closed to ensure that all parts are in operating condition.

C. Valve boxes shall be set plumb, vertical, and concentric with the valve stem.

D. Any valve box which has moved from this required position so as to prevent the use of the operating wheel of the valve shall be reset by the Contractor at his own expense.

3.12 AUTOMATIC CONTROLLER: Final location of automatic controllers shall be approved by Dallas ISD-M&O.

3.13 ELECTRIC REMOTE-CONTROL VALVES

A. Remote control valves shall be located and sized as shown on the plans. All electrical connections shall be made when the weather is dry with connection kits as specified in Paragraph 2.15 of this section in strict accordance with manufacturer's recommended procedures.

B. All remote-control valves shall be installed in a horizontal position, in accordance to the manufacturer's published installation instructions.

C. It shall be the responsibility of the Contractor to furnish and install the proper size wire on each of the low voltage circuits from the master control center to the various electric remote-control valves.

D. Consideration shall be given to each circuit for allowance of voltage drop and economy consistent with accepted practices of electrical installation. Under no circumstances shall the voltage of any branch circuit be reduced more than proper due to length of run exceeding the maximum allowable for the wire size used.

3.14 BACKFILL AND COMPACTION

A. After system is operating and required tests and inspections have been made, the trenches shall be carefully backfilled with the excavated materials approved for backfilling, consisting of earth, loam, sandy clay, sand, gravel, soft shale, or other approved materials, free from large clods of earth or stone. Rock, broken concrete, or pavement, and large boulders shall not be used as backfill material. The backfill shall be thoroughly compacted and evened with the adjacent soil level.

B. Compact trenches in areas to be planted by thoroughly flooding the backfill. Compact all other areas by flooding or hand tamping. The jetting process may be used in areas when flooding.

C. Backfill for all trenches, regardless of the type of pipe covered, shall be compacted to a minimum of 90% density.

D. Any trenches improperly backfilled, or where settlement occurs, shall be reopened to the depth required for compaction, then refilled and compacted with the surface restored to the required grade and left in a completed surface condition as described above.

E. Specifically tamp backfill under heads and around the flange of heads for one (1) foot by a suitable means after trench backfill has dried from flooding to prevent heads loosening in the ground.

3.15 FINAL ADJUSTMENT

A. After installation has been completed, make final adjustment of sprinkler system prior to Owner's Authorized Representative's final inspection.

B. Completely flush system to remove debris from lines by removing nozzle from heads on ends of lines and turning on system.

C. Check sprinklers for proper operation and proper alignment for direction of throw.

D. Check each section for operating pressure and balance to other sections by use of flow adjustment on top of each valve.

E. Check nozzles for proper coverage. Prevailing wind conditions may indicate that arc or angle of spray should be other than as shown on drawings. In this case, change nozzles to provide correct coverage and furnish record data to Owner's Authorized Representative with each change.

F. After system is thoroughly flushed and ready for operation, each section of sprinklers shall be adjusted to control pressure at heads. Use the following method, one (1) section at a time:

1. Remove last head on section and install a temporary riser above grade. Install tee with pressure gauge attached on top of riser and re-install head with nipple onto tee.
2. Correct operating pressure at last head of each section as follows: Spray and rotor heads - 30-35 psi.
3. After replacing head, at grade, tamp thoroughly around head.
4. Drip zone valve pressure regulating devices shall be set at not to exceed 40 psi.

3.16 CLEAN-UP

A. The Worksite shall be thoroughly cleaned of all waste materials and all unused or salvaged materials, equipment, tools, etc.

B. After completion of the work, areas disturbed shall be leveled and the Worksite shall be raked clean and left in an orderly condition.

END OF SECTION

SECTION 32 92 00 - TURF AND GRASSES

PART 1 – GENERAL

1.1 DESCRIPTION

A. Furnish all work and materials, appliances, tools, equipment, facilities, transportation, and services necessary for and incidental to performing all operations in connection with the installation of the sod.

1.2 SUMMARY

A. Work Includes:
1. Soils Test/Analysis Report of existing site soils.
2. Providing and installing manufactured topsoil.
3. Providing and installing organic compost.
4. Initial removal of weeds on site.
5. Tilling/spike harrowing/ripping/breaking-up/shattering of compacted site soils.
6. Soil preparation and tilling topsoil and compost into existing rough graded subbase soils.
7. Hand or deep-tine aerifier mixing organic compost into existing soil at root zone of existing trees to remain.
8. Fine grading and removal of debris.
9. Germinating weeds for second eradication prior to sodding.
10. Hand removal or raking away of dead weeds.
11. Sodding of grass as designated on landscape plans.
12. Providing temporary irrigation (if necessary to establish).
13. Establishment of grass.

1.3 REFERENCES

A. Codes and regulations of the jurisdictional authorities.
B. Reference Codes and Standards (current standards):
1. AASHTO: M140.
2. ASTM: C33/C33M, C51.
3. ASTM: D6459, D6566, D6567, D7322, D7367.
4. U.S. Department of Agriculture and Texas Department of Agriculture
5. Federal Seed Act.

1.4 QUALITY ASSURANCE

A. Qualifications:
1. Manufacturer: Company specializing in manufacturing Products specified with minimum seven (7) years documented experience.
2. Installer: Company specializing in performing the Work of this Section with minimum seven (7) years documented experience.
B. Inspections:
1. Make written request for inspection after sodding operations have been completed. Such inspection is for the purpose of establishing the Maintenance Period.
2. Submit written requests for inspections to the Owner’s Authorized Representative at least seven (7) days prior to anticipated inspection date.

1.5 SUBMITTALS

A. Submit the following for approval in accordance with contract related submittals in a single package to the Owner’s Authorized Representative no less than sixty (60) days prior to installation.

B. All delivery receipts and copies of invoices for materials used for this work shall be subject to checking by the Owner's Authorized Representative. The Contractor shall offer proof of materials' compliance to the specifications to the Owner's Authorized Representative prior to installation. Various samples, certificates, and specifications of seed, and other materials shall be submitted for approval as required by subsequent sections of this specification and Section 32 9300. The Contractor should submit the following certification to the Owner's Authorized Representative prior to installation.

1. Sod: Certified, each delivery bearing a certification tag and label as required by law.
2. Sources: No less than sixty (60) days prior to installation, notify Owner and Owner's Authorized Representative in writing of source of seed required for the project.
3. Soil as used for Manufactured Topsoil: Submit a one (1) gallon sample along with documentation for Soil Test/ Analysis Report.
4. Manufactured Topsoil: Submit a one (1) gallon sample for spreading along with manufacturer's product data and laboratory analysis report with Solvita® Compost Maturity Test results for compost components of this manufacturer's mix.
5. Mature Organic Compost: Submit a one (1) gallon sample for spreading as specified in Section 2.6 along with Solvita® Compost Maturity Test results.
6. Organic Fertilizer: Copy of product information labeled with manufacturer's name and address and chemical analysis.
7. Organic Herbicide: Copy of product information labeled with manufacturer's name and address and chemical analysis. Submit manufacturer's information or cut sheets on products.
8. Organic Fungicide: Copy of product information labeled with manufacturer's name and address and chemical analysis. Submit manufacturer's information or cut sheets on products.
9. Organic Insecticide(s): Copy of product information labeled with manufacturer's name and address and chemical analysis. Submit manufacturer's information or cut sheets on products.

C. Work Schedule: The sodding of grass must occur at stipulated times. Also, time periods are specified to achieve an acceptable stand. Therefore, the Contractor must submit a schedule for the work of this section so that the grass can achieve full coverage as specified by the contract completion date. The schedule must be submitted no less than sixty (60) days prior to installation for review and approval of the Owner's Authorized Representative, Architect and Owner's Authorized Representative. Refer to Subsection 1.12.

D. Submit Maintenance Instructions upon final acceptance. Refer to Subsection 3.6, Paragraph K.

E. Special Warranty: Submit written special warranty registered with manufacturer as specified in this Section.

F. Provide documentation and testing of existing site soils and screened soil as used in the manufactured topsoil by means of a Chemical Soil Test/Analysis Report with recommendations for organic amendments (not chemical based) to soils for landscape turf grasses, aesthetic planting with ornamentals and native plants (not agricultural crops) for determination or adjustment of required amendments.

G. Provide existing site soils testing, as noted above, at two (2) predetermined/approved locations on site per approval by Owner's Authorized Representative and Landscape Architect. Provide testing at least sixty (60) days prior to soil preparation.

1. Approved Chemical Testing Laboratories:
   a. Perry Agricultural Laboratory, mailing address: P.O. Box 418, or shipping address: 15241 Pike 138, Bowling Green, MO 63334, phone: (573-324-2931), www.perryaglab.com. (Equivalent tests as noted above – minimum – Standard Albrecht Test.)
   b. Approved equivalent laboratory to match parameters and report recommendations as approved by Owner's Authorized Representative.

H. Provide documentation and testing of compost materials as specified in Parts 2 and 3 of this section.

1.6 SELECTION AND ORDERING OF PLANTING MATERIALS

A. Documentation: Submit documentation no less than sixty (60) days prior to installation that all materials have been ordered.

B. Unavailable Materials: If proof is submitted that any of the materials specified is not obtainable, a proposal will be considered for use of the nearest equivalent variety with corresponding adjustment of Contract price. Substantiate such proof in writing no less than sixty (60) days prior to installation.

C. Special Conditions: The above provisions shall not relieve Contractor of the responsibility for obtaining specified materials in advance if special growing conditions or other arrangements must be made in order to supply specified materials.

1.7 JOB CONDITIONS AND PROVISIONS

A. Carefully maintain all site benchmarks, layout points and other points established by other contractors. If destroyed, replacement will be by this Contractor.

B. Coordinate all work of this Section with other on-site contractors and the Owner. Give advance notice on sequencing of this work so not to affect the operations of other contractors.

C. All turf grass work shall be performed under the direct supervision of a superintendent and laborers thoroughly experienced with the work of this Section and who shall be at the project site for the duration of the work.

D. No turf grass work shall take place during inclement weather or when the ground conditions are, in the opinion of the Owner's Authorized Representative, not in a condition to be properly worked.

E. No turf grass operations shall occur earlier than April 15th nor later than August 30th. If sod is to be installed from October 15th to March 15th, then provide temporary installation of cereal rye grass for winter establishment. Remove cereal rye grass prior to April 15th and install sod.

F. Erect barricades, snow fencing, hire temporary watchmen or whatever is deemed necessary by the Contractor to totally protect all turf grasses until one hundred (100%) percent established.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Materials and supplies are subject to inspection and sampling for testing. Allow no seed, fertilizer, straw, or other agronomic materials or supplies on Work site other than those for the Project.

1. Sod:

a. Deliver sod to job within twelve (12) hours after being cut; place sod within twenty (20) hours after being cut. Allow sod only eight (8) hours maximum on site.

b. Prior to and after delivery during wet weather, allow sod to dry to the extent that will prevent tearing during handling and laying. During dry weather, water sod to ensure its vitality and prevent dropping of the soil in handling.

c. Analysis of purity and germination tag.

d. Certification tag.

B. Organic Biological Fertilizer: Labeled with manufacturer's name and address, guaranteed analysis, including nutrient and its derived source, listing of potential acidity, and any toxic materials.

C. Organic Biological Fungicide: Labeled with manufacturer's name and address and analysis, warnings, safety instructions, and application requirements.

D. Organic Herbicide: Labeled with manufacturer's name and address and analysis, warnings, safety instructions, and application requirements.

E. Organic Insecticide: Labeled with manufacturer's name and address and analysis, warnings, safety instructions, and application requirements.

1.9 PROJECT CONDITIONS OR SITE CONDITIONS

A. Verify and examine site conditions with the Owner's Authorized Representative. Proceed when official notice is given to the Contractor that the work site is ready.

B. Proceed with tree protection prior to any mobilization, staging, site work, demolition, or grading.

1.10 SEQUENCING

A. Coordinate grading, soil preparation and other related units of Work specified in other Sections to ensure that grass sod can be supported and installed as indicated.

B. Coordinate with General Contractor for construction sequencing.

1.11 SCHEDULING

A. Submit a proposed work schedule to the Owner for approval no less than sixty (60) days prior to start of installation. After approval, no modification shall be made to this schedule without written authorization by the Owner or Owner's Authorized Representative. List anticipated start and stop dates for each segment of work up to and including final acceptance.

B. In general, the work shall proceed as rapidly as the site becomes available, consistent with normal seasonal limitations for turf grass work.

C. Establishment Period: The grass must be fully, one hundred (100%) percent established by the contract completion date. The Contractor shall allow for a minimum of one hundred (100) days to establish the grasses.

PART 2 – PRODUCTS

2.1 SOD FOR TURF

A. Well-rooted certified sod, at least eighteen (18) months old.

1. Front Yard Areas and areas disturbed by proposed construction.
   'Tiffway 419' Bermudagrass (Cynodon dactylon var.)
   Cultivar to be approved by Landscape Architect based on availability per submittal by Contractor.
2. Grassed football, soccer, baseball and softball fields (existing or proposed)
   Latitude 36® Bermudagrass (Cynodon dactylon var.)
   Cultivar to be approved by Landscape Architect based on availability per submittal by Contractor.

B. Sod and attached soil free from any noxious weeds such as quack grass, garlic, Johnson grass, dallisgrass, nutsedge, Canada thistle, and other turf weeds.

C. Mowed in production field to height of not more than two and one-half (2-1/2) inches within five (5) days prior to lifting.

D. DO NOT use any sod grown with mesh netting due to tripper issues with children. Sod with netting will be rejected.

E. Machine cut in sections not less than two and one-half (2-1/2) feet in length nor less than twelve (12) inches in width and to a depth equal to growth of fibrous roots, uniform soil thickness of three-quarter (3/4) inch, plus or minus one-quarter (1/4) inch. Measurement for thickness to exclude top growth and thatch.

F. Cut in sections or strips for pallets strong enough to support its' own weight and retain size and shape when suspended vertically from firm grasp on upper ten (10) percent of section. Small, irregular or broken pieces of sod are prohibited.

2.2 MANUFACTURED TOPSOIL

A. Containing approximately twenty-five (25) percent organic matter as determined by the topsoil composition tests.

B. Compost will meet requirements of 2.3 D. for Solvita® Compost Maturity value of 7 or higher.

C. Soil shall be very fine native silt screened to be free of sticks, stones, roots, and other debris and objectionable materials. Soil may be as from screened lake dredging. Screened soil shall be subject to the approval of the Owner's Authorized Representative based on visual and tactile inspection.

D. Sand shall be a deep sand excavated from below fifteen (15) feet to ensure it is free of nutsedge, and screened or screened cushion (sharp) sand from sands available in this region.

E. Manufactured topsoil as blended from soil, deep sand (screened cushion sand) and organic compost. Manufactured topsoil handled too wet or soggy is not acceptable. Soils supporting growth of noxious weeds, as defined by the Kansas Seed Law, or undesirable weeds, are not acceptable. Manufactured topsoil containing dallisgrass and nutgrass (nutsedge) will be rejected.

F. Physical properties as follows:

1. Clay: between 0 and 10 percent
2. Screened Soil: between 13 to 17 percent
3. Sand: between 55 to 65 percent
4. Mature Compost (Organic matter): approximately 25 percent of total dry weight
5. pH: 7.2 to 8.7

G. Acceptable Manufactured Topsoil Mix: Enriched Top Soil™ – a precisely measured mixture of Professional Compost, screened native soil and screened sharp sand, pH from 7.5 to 8.7, as supplied by Soil Building Systems, 2101 Walnut Hill Lane, Dallas, Texas 75229, (972-831-8181), attention: Baron Ablon, or equivalent meeting all composition and compost maturity as determined by the Owner's Authorized Representative.

2.3 COMPOST - Professional Compost or Mature Organic Compost – 100% plant based

A. Compost: shall be compost for mix above that is fully finished compost that has been produced by aerobic (biological) decomposition of organic matter and meets or exceeds the requirements set forth by the United States Department of Agriculture, the United States Composting Council (USCC), and State composting requirements.

B. Compost feedstock shall include fully composted cotton burrs, local grass trimmings, leaves, brush and processed wood fiber and shall add an average of 1.1 lbs. N^1, 0.13 lbs. P^1, and 0.8 lbs. K^1 of pure consumable organic nutrients per one (100) square feet for each inch depth added plus minerals and trace elements. Compost shall not include food waste, stable waste, treated lumber, pallets, pine bark, raw manure or mushroom compost waste. Compost shall not include any man-made materials or chemicals. Do not use mixed municipal solid waste compost since it varies from season to season. Ensure compost does not contain any visible inorganic refuse, other physical contaminants, or any substance considered to be harmful to plant growth.

C. The compost must be turned a minimum of five (5) times and not achieve a temperature greater than 160 degrees Fahrenheit. Each turning cycle should not be shorter than fourteen (14) days minimum. Compost shall be completely composted for a minimum of six to twelve (6 - 12) months. Particle Sizes 97% will pass through a one-half (1/2) inch screen, 99%+ will pass through a three-quarter (3/4) inch screen.

D. Compost material shall have no pungent smell, but rather an earthy smell. Supporting documentation should be made available upon request. The contractor is obligated to provide testing of the compost at the supplier's yard and at the job site for quality assurance.

Acceptable Professional compost is as supplied by: Soil Building Systems, 2101 Walnut Hill Lane, Dallas, Texas 75229, (972-831-8181), attention: Baron Ablon, or equivalent as determined by the Owner's Authorized Representative.

Table 1

Physical Requirements for Compost

pH: 7.9 – 8.9
Maturity: germination and vigor greater than 90% in accordance with TMECC 05.05-A, "Germination and Vigor"
Solvita® Compost Maturity Index: value of 7 or higher in accordance with TMECC 05.08-E

E. The contractor is obligated to provide testing of the compost at the supplier's yard and at the job site for quality assurance.

F. TESTING OF THE COMPOST AT THE JOB SITE

NOTE: Contractor is advised to test the designated compost stockpile at the supplier's yard prior to loading to ensure the designated pile passes the compost maturity test. If the compost does not pass the test at the jobsite, it will be rejected.

1. Use Solvita® Compost Maturity Test Kit or approved equal. Solvita® test kit shall be recently purchased and shall be stored in a refrigerator protected from heat until use at the site. (The two parameters which Solvita® measures (CO2 / NH3) are the mostly frequently cited factors that correlate closely with maturity and potential phytotoxicity. Ammonia is also an odorous aerosol toxicant and is a potential worker hazard at agrocultural and compost facilities.) Provide Compost maturity test results to measure both carbon-dioxide (CO2) and ammonia (NH3) evolution and provide a Maturity Index value, useful or compost quality evaluation. Compost maturity test is TMECC Test #05-08A.
2. Provide results to Owner's Authorized Representative at the job site.
3. Physical inspection of the material shall be performed at the same time by the Owner's Authorized Representative.
4. Owner's Authorized Representative has the right to reject the material if it does not meet the above parameters.

2.4 PRE-EMERGENCE - ORGANIC HERBICIDE – for initial weed eradication on site prior to sod installation.

A. Chemical Herbicides will not be used due to detrimental effects on the soils and due to runoff effects to the site detention basin and into the storm system.

B. Organic herbicide will be used to remove weeds prior to turf grass installation.

C. Use of any herbicide is to be of limited nature because of the potential to damage the viability of the soil and therefore the retardation of future plant growth.

D. Non-selective post emergence herbicide: Ammonium Nonanoate – 40%, AXXE® Broad Spectrum Herbicide, OMRI listed, as manufactured by BioSafe Systems, LLC, 22 Meadow Street, East Hartford, CT 06108, (888-273-3088).

E. Supplier: San Jacinto Environmental Supplies, Houston, TX (713-957-0909), local representative: Lanse Fullinwider, cell: (214-534-2317), or other suppliers.

F. Nonselective organic herbicide, such as Agricultural grade (20%) vinegar or 20% vinegar based product mixed with citrus oil.

2.5 ORGANIC BIOLOGICAL FERTILIZER: to build soil structure within urban environment. Synthetic fertilizers will not be used due to runoff issues and per iSWM (Integrated Storm Water Management) best practices.

A. Homogenous, granulated all organic biological fertilizer containing soil microbes, endo & ecto mycorrhizal fungi, vitamins, minerals, plant hormones, stimulators, essential carbon and protein: MicroLife Multi-Purpose 6-2-4 All Organic Biological Fertilizer.

B. Manufacturer/Supplier: San Jacinto Environmental Supplies, (713) 957-0909, local representative: Lanse Fullinwider, cell: (214-534-2317), or equivalent product as approved by the Owner's Authorized Representative or Landscape Architect.

C. See 3.4 for application rates of product to amended soils.

2.6 ORGANIC FUNGICIDES

A. As needed for specific conditions.

B. No chemical fungicides shall be used.

C. MicroGro Granular Root Protector - Biological Fungicide as supplied by San Jacinto Environmental Supplies, Houston, TX (713) 957-0909, local representative: Lanse Fullinwider, cell: (214-534-2317), or available locally at Southwest Wholesale Nursery, Lewisville, TX, or equivalent product as approved by the Owner's Authorized Representative or Landscape Architect.

D. Contractor shall recommend products for submittal and approval by the Owner's Authorized Representative or Landscape Architect depending on final plant selections and their susceptibility to certain fungi.

2.7 ORGANIC INSECTICIDE - FIRE ANTS

A. Fire Ant Bait:

1. PayBack® Fire Ant Bait with Conserve® Insecticide (spinosad 0.015%) granular form as manufactured by Southern Agricultural Insecticides, Inc., Palmetto, FL 34220, (941-722-3285).

2. Ferti-lome Come and Get It! Fire Ant Killer with Conserve® Insecticide (spinosad 0.015%) granular form as manufactured by Ferti-lome – Voluntary Purchasing Groups, Inc., 230 FM 87, Bonham, TX 75418.

B. Dusting Powder: Perma-Guard® Commercial Insecticide D-20 (pyrethrins 0.02%, technical piperonyl butoxide 1.0%, silicon dioxide from diatomaceous earth 88.0%) as manufactured by Perma-Guard, Inc., Albuquerque, NM 87102, (505-243-1460), or equivalent product as approved by the Owner's Authorized Representative or Landscape Architect.

2.8 WATER

A. Potable. Available on site. Applied and monitored by Contractor to establish seed and sod areas.

B. Keep seed and sod moist with watering schedules to promote deep roots and to prevent runoff. Part of the site will be watered by permanent underground irrigation systems. Overwatering of planting areas should not occur. Refer to irrigation plans.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Verify that field measurements, surfaces, substrates and conditions are as required, and ready to receive Work.

1. Verify that all areas to receive turf grasses are clear of stones larger than one (1) inch diameter, weeds, debris and other extraneous materials.
2. Verify that rough grades are left below finish grades in order to accommodate the following work, the addition of stockpiled/manufactured topsoil, soil amendments and sod (if sod is shown on the plans). The top of sod with amended soil after settlement shall meet the finished grade as shown in the grading plans. Report all variations in writing.

B. Soil Moisture:

Inadequate Moisture: Do not commence work of this section when soil moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in air or that clods will not break readily. Apply water, as necessary, to bring soil to an optimum moisture content for planting.

C. By beginning Work, Contractor accepts conditions and assumes responsibility for correcting unsuitable conditions encountered at no additional cost to the owner.

3.2 PREPARATION

A. Examine rough grade, verify elevations noted on the Drawings, observe the conditions under which work is to be performed, and notify Owner's Authorized Representative of unsatisfactory conditions. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to the Owner's Authorized Representative. Beginning of installation means acceptance of existing site conditions.

B. Thoroughly rip/disrupt/break-up/shatter the soil to a minimum depth of eight (8) inches, preferably deeper due to typical construction site compaction areas of site and areas outside of existing tree drip line/critical root zone (CRZ). Only lightly scarify the soils (about two (2) inches) where tree roots are present. Re-compact to industry standards using a standard gill or comparable piece of equipment.

C. Remove non-soil materials and construction debris such as wood, rock, brick, cement, pipe, sheetrock, metal, paint, plastic, glass, etc. and unacceptable clays, then re-grade subsoil to established grades for proper drainage.

D. Tilling/spike-harrowing/ripping/disrupting/breaking-up/shattering of the soils should occur prior to irrigation line installation. If the turf grass sprinkler system has already been installed, then it will be necessary to stake heads and to take necessary measures to prevent damage to the system.

E. Remove foreign materials and undesirable plants and their roots. Do not bury foreign material beneath areas to be sodded. Remove contaminated subsoil.

F. Insure positive drainage away from building and all planting areas adjacent to the building. Insure positive drainage at all turf grass areas. Maintain lines, levels, profiles and contours. Make changes in grade gradual. Blend slopes into level areas.

G. Unless it has rained at least one (1) inch within twenty-four (24) hours prior to planting, water turf grass areas thoroughly to provide a moist, not wet, bed before planting.

3.3 AREAS OF APPROVAL

A. Delineate the area scheduled for sodding on the site using the drawing to scale the shape and size of the planting area.

B. The Owner's Authorized Representative shall approve the area delineated to receive sod prior to planting.

3.4 PREPARING SOIL & FINE GRADING

A. Note: During hauling operations, keep walkway and roadway surfaces clean. Promptly remove compost or other material.

B. Per the soil analysis report, determine if additional organic amendments are to be integrated into the soil preparation for plant health and horticultural suitability. Coordinate addition of amendments with the soil preparation as noted below. If no further soil amendments are required, then soil preparation shall be as noted below.

C. Weed removal:

1. If site has been freshly graded, compacted or disturbed due to construction efforts and placement of manufactured topsoil, water site for minimum two (2) weeks to encourage weed germination and growth. (If site was graded more than two (2) weeks prior, watering is not needed to encourage weed growth.)
2. Area scheduled for grass: Totally remove all grasses and weeds, unless directed otherwise by Owner's Authorized Representative. Apply organic herbicide to thoroughly exterminate existing grasses, weeds, or other vegetation (unless noted on the drawing or in the field by the Owner's Authorized Representative for protection) in area scheduled to receive turf grass for grasses.
3. Clear and remove these existing weeds upon organic herbicide's completed action by grubbing off all plant parts and roots to at least one and one-half (1.5) inch below the surface of the soil.
4. In area adjacent to existing trees to remain lightly scarify the soil to remove seedlings and other ground vegetation to a depth not to exceed one and one-half (1.5) inches. Keep all scarification a minimum of eight (8) feet from the base of all existing trees. If exposed roots are on the surface of the soil DO NOT SCARIFY.

D. Remove branches, roots, weeds, rocks, trash and other material foreign in nature from the existing stockpiled topsoil prior to placing stockpiled topsoil or use manufactured topsoil if no suitable stockpiled topsoil material is available. If pulling from a stockpile, push weed growth off top and pull from the lower inside portion of the pile where weed seeds have been heated and are less likely to germinate. Amend stockpiled topsoil to provide organic matter as per 2.3.

E. Once subsoil is lightly but firmly re-compacted, spread topsoil over areas to be sodded to a depth which will produce a two (2) inch depth minimum after natural settlement and will conform to finish lines, grades and elevations. Add this soil from the outside of the site in, so the subsoil and topsoil create an interface (mingled) layer instead of two (2) distinct layers with the possibility of a pan layer being generated.

F. Do not drive over re-graded/scarified subsoil clays - dump topsoil on the outside of the site and with a tractor/dozer push topsoil onto scarified clays. Make equipment ride on top of topsoil as this will allow topsoil to partially mix with subsoil clays creating an interface layer instead of a compacted pan layer.

G. Fine grade, level and scarify with a weighted spike harrow, spike float drag, or by hand raking. Leave no depressions, ruts, soft spots or humps. Finish to lines or elevations shown and parallel to proposed finished grade, as approved. Maintain positive drainage on site. Remove rocks, clods, weeds, trash or debris from area to be sodded. Remove rocks and other foreign materials one (1) inch or greater in any dimension. Legally dispose debris off site.

H. Place and spread compost over topsoil to depth which will produce a one-half (1/2) inch depth after natural settlement and will conform to finish lines, grades and elevations.

I. Spread organic biological fertilizer at rate of twenty (20) pounds per one thousand (1,000) square feet over top of spread compost.

J. Till or disk topsoil and compost with organic biological fertilizer to five (5) inch minimum depth into existing subsoil to eliminate slip-plane between the three (3) materials and to prepare an acceptable bed for sod. Make a minimum of one (1) pass to break up clods and integrate compost evenly into the existing soil. Penetration of soil to a depth of five (5) inches is desired to encourage dormant seed grass and weed growth. Do not till if soil is wet.

K. Under adjacent existing trees, place and spread compost over area to depth which will produce a one (1) inch depth after natural settlement and will conform to finish lines, grades and elevations. Hand rake mix compost into native soil to two (2) inch depth to eliminate slip-plane between the materials and to prepare an acceptable bed for sod. Make a minimum of one (1) pass to break up clods and integrate compost evenly into the existing soil.

L. If soil or weather conditions are unsuitable, cease compost operations. Resume compost operations when proper conditions prevail.

M. Compact amended soil with lawn roller to final compacted thickness as approved.

N. Second (2^{nd}) weed and grass removal in areas scheduled for - sodded grass: Water the tilled and fine graded areas to receive grass three (3) weeks prior to sodding to encourage additional disturbed weed and native grass germination and growth. Apply an organic herbicide to thoroughly exterminate existing grasses, weeds, or other vegetation (unless noted on the drawing or in the field by the Owner's Authorized Representative for protection) in areas scheduled to receive sodded grasses. Totally remove all grasses and weeds, unless directed otherwise by Owner's Authorized Representative.

O. If weeds should germinate prior to sodding, hand pull or re-apply organic herbicide by wick method to eradicate weeds, but do not injure grass.

3.5 SODDING

A. After soil preparation (Section 3.4) is approved by the Owner's Authorized Representative, commence with sodding.

B. Scope of work:

1. Refer to the plans for the location of areas to receive sod.
2. Prepare soils per 3.4 and install sod in areas disturbed by renovation construction.
3. Prepare soils per 3.4 and install sod on entire grounds of project with new construction.
4. Install a minimum of two (2) feet of new sod along each side of new or renovated walkways in sodded areas. Refer to plans for extents of sod if greater than two (2) feet.
5. Sod will also be required in areas designated for turf grass that exceed 4:1 slope, unless noted otherwise on the drawings.
6. Delineate areas to receive sod and receive approval for area by Owner's Authorized Representative prior to planting.

C. Laying Sod:

1. Time frame for laying sod is from April 15 to October 15.
2. Extend or reduce specified period for laying sod as approved and as necessitated by weather and soil conditions.
3. Final selection of sod: As approved.
4. Do not lay sod when sodding area is muddy or frozen nor when sod is frozen. When soil surface is hot or dry, wet soil to a depth of two (2) inches, six (6) to eight (8) hours prior to sodding.
5. Lift sod from trucks or storage piles and place by hand with close joints and no overlapping. When Beck Roll of sod is used, lay as specified and in accordance with the supplier's instructions.
6. Lay first row of sod in straight line. Place subsequent rows parallel to and tightly against each other. Stagger lateral joints to promote more uniform growth and strength. Do not stretch sod. On slopes, lay sod parallel to contours of slope.
7. Peg sod placed on slopes 2:1 or greater. Peg each strip or section of sod with at least two stakes not more than two (2) feet apart. Use stakes one-half (½) inch by one (1) inch by twelve (12) inches driven flush with top of sod so that roots are in contact with topsoil.
8. Water sod immediately to prevent excessive drying during progress of work. Sod which dries out will be rejected.
9. Roll entire area as sodding is completed in one section so that sod is without surface irregularities, such as depressions and high spots.
10. Irrigate immediately after rolling to wet underside of sod and one (1) inch of soil immediately below.
11. For athletic fields (if applicable), the sod must be laid to be without bumps, dips or unlevel areas. Continue to level and proof roll field to meet Owner's or Owner's Authorized Representative's approval.

3.6 ESTABLISHMENT PERIOD AND REPLACEMENT

A. The establishment period for sodding of grasses shall commence at installation and continue throughout the construction period until final acceptance by the Owner's Authorized Representative.

B. Maintain sodding and incidental work by performing the following and other operations of care necessary for promotion of growth so that work is in an approved condition throughout establishment period; uniform in color, quality, and coverage; and free of weeds, insects, diseases, surface damage, and other imperfections.

1. Watering: Provide labor and materials for establishment watering.
   a. First two (2) weeks: Perform watering daily to keep sod beds continuously moist and to maintain moist topsoil to a depth of at least four (4) inches. Water during heat of day to help prevent wilting. Water with frequent, light watering and avoid runoff or puddling. Water may be needed more than once a day depending on weather conditions. Water to insure germination and root growth for resodding work.
   b. Remaining weeks: Perform watering weekly, decreasing frequency and increasing amount per application to encourage deep root growth.

      Recommended schedule:

1) Next four (4) weeks: Perform watering to provide two (2) soil-wetting events to a depth of four (4) inches per each week.

2) Remainder of growing season: March to November, water to provide two (2) soil-wetting events to a depth of six (6) inches per each month.

3) In prolonged drought, over six (6) weeks in summer with no rain, irrigate once every five (5) to six (6) weeks to keep the dormant turf alive, but not trigger “green-up”, unless more regular watering is desired to keep the turf green.

C. Eliminate weeds that emerge as soon as they appear, in a timely fashion mechanically and/or with an herbicide to prevent establishment and resodding. Use an herbicide that will not injure the newly sodded grass and apply according to manufacturer's recommendations. The Contractor should allow for a minimum of two (2) herbicide applications of areas scheduled for grasses during the establishment period.

D. Mowing: Turf solid sod grass areas.

1. Mow grass when it reaches a height of four (4) inches. Do not mow until sod is firmly rooted and securely in place. Mow to height of two (2) inches at first cutting. Thereafter, do not remove more than one third (1/3) of grass leaf at any cutting and mow only to enhance root growth.

E. Rolling and reshaping: Roll to maintain uniform surface. Roll to eliminate uneven places in sod. Reshape soil surface to maintain positive drainage. Resod to provide one hundred (100%) percent coverage.

F. Applying organic biological fertilizer:

1. MicroLife Multi-Purpose 6-2-4 All Organic Biological Fertilizer, as supplied by San Jacinto Environmental Supplies, (713) 957-0909.
2. Rate: Twenty (20) pounds per one thousand (1,000) square feet of turf area.
3. Application:
   a. March
   b. June
   c. October

G. For high-use turf grass areas with heavy foot traffic, additionally top dress with one-half (1/2) inch organic compost in the fall plus aeration to open the compacted soils.

H. Applying organic herbicides, organic fungicides and/or organic insecticides:

1. Apply as needed to insure one hundred (100%) percent coverage of turf grass that is weed, disease and pest free.
2. Apply in spray form by certified applicator.
   a. Do not apply when temperature exceeds 80 deg. F. or during periods of drought.
3. Treat fire ant mounds as they appear with approved organic materials.

I. Replacing sodding:

1. Replace sodded areas that are dead or are in an unhealthy, unsightly, or badly impaired condition as soon as possible during specified planting seasons.
2. Replace sod with same variety as noted for application per 2.1.
3. Make such replacements in the same manner as specified for original sodding.

J. Coordinate watering schedules with other plantings during installation and until final acceptance. DO NOT overwater as this will promote weeds.

K. Maintenance Instructions: Submit one (1) electronic copy and two (2) copies of typewritten instructions recommending procedures to be established by the Owner for the maintenance of grasses for one (1) full year. Submit one (1) set of instructions to Owner’s Authorized Representative for approval. Submit two (2) copies of revised instructions prior to expiration of Contractor's maintenance period(s) required under the contract.

3.7 FIELD QUALITY CONTROL

A. Owner will engage an independent testing and inspecting agency to perform field inspections and tests and to prepare test reports.

1. Testing agency will conduct and interpret tests and state in each report whether tested Work complies with or deviates from requirements.

B. Correct deficiencies in or remove and replace that inspections and test reports indicate do not comply with specified requirements.

C. Additional testing, at Contractor's expense, will be performed to determine compliance of corrected Work with specified requirements.

3.8 CLEANING

A. Daily removal of rubbish and debris caused by this work from the site.

B. Keep site clean during maintenance period.

3.9 PROTECTION

A. Turf grass areas shall be protected against damage from the time work is started until the date of acceptance by the Owner’s Authorized Representative. The moving of heavy equipment or materials over turf grass areas shall be done on planks if necessary.

3.10 INSPECTIONS

A. Make written request for inspection after areas have been sodded.

B. Submit request for inspection to Owner’s Authorized Representative at least two (2) days prior to anticipated inspection date.

3.11 FINAL ACCEPTANCE

A. Due to seasonal requirements, final acceptance of this section may not coincide with that of the remaining contract work.

B. Request inspection for final acceptance at least ten (10) calendar days before the end of the establishment period.

C. Final acceptance shall be considered the time at which warm season turf grass areas are 100% established, and weed, pest and disease free with complete lush cover and no exposed soil areas showing. Weeds shall not occupy more than 2% of any 40’x40’ test area.

D. Replace rejected sodded areas as specified so that repair or replacement is rooted and established prior to approval.

3.12 WARRANTY

A. In accordance with the General Provisions warranty for grasses shall be valid for one (1) year after final acceptance. Replace dead materials and materials not in vigorous, thriving condition as soon as weather permits. Re-sod areas where grasses have not established. The opinion of the Owner’s Authorized Representative as to what constitutes a dead stand of grass shall be final.

B. Replace grasses with same kind as originally planted at no cost to the Owner. Provide one (1) year warranty on replacement plants. Plants should be replaced at start of next season. Protect irrigation system, other piping conduit, or other work during replacement. Repair any damage immediately.

C. Warranty excludes replacement of plants after final acceptance because of injury by storm, drought, drowning, hail, freeze, insects, or diseases. Warranty excludes replacement of plants due to negligence, over watering, or improper maintenance by the Owner or Owner's maintenance contractor.

D. Plants will be guaranteed to be true to species, variety or cultivar as specified.

TABLE 32 92 00-1

This chart indicates minimum length of time by which material samples must be submitted for approval before intended use and minimum quantity of each. Usable samples will be returned.

ITEM	TIME	QUANTITY	COMMENT
SOD	7 days	3 square feet	Each variety specified
ORGANIC COMPOST	7 days	1 gallon bag	Organic finished compost
ORGANIC HERBICIDE	7 days	1/2 pint	Unopened container
ORGANIC FERTILIZER	14 days	1 quart	Provide sample
ORGANIC FUNGICIDE	14 days	1 quart	Provide sample
SCREENED SOIL	14 days	1 gallon bag	
MANUFACTURED TOPSOIL	14 days	1 gallon bag	
OTHER MATERIAL	7 days	As directed or as approved.	

END OF SECTION

SECTION 32 93 00 – LANDSCAPING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Furnish all work and materials, appliances, tools, equipment, facilities, transportation, and services necessary for and incidental to performing all operations in connection with the installation of the landscape.

1.2 SUMMARY

A. Work includes:
1. Providing complete landscaping as shown.
2. Excavation of plant pits.
3. Percolation test and drainage of tree pits in lawn and planter beds.
4. Eliminating weeds – minimal two treatments.
5. Provide spike harrowing/ripping of compacted soils for beds.
6. Providing plant materials and related items.
7. Providing manufactured or stockpiled topsoil.
8. Providing expanded shale.
9. Providing organic professional compost.
10. Providing organic biological fertilizer.
11. Providing planting mix for specific site planters (if applicable).
12. Bed preparation and planting.
13. Providing weed barrier for planting beds.
14. Providing mulches for planting beds areas.
15. Providing tree anchoring frame.
16. Providing steel edging with stakes.
17. Providing organic herbicide and organic fungicide.
18. Providing organic insecticides.
19. Finished grading of planting areas.
20. Watering with water-wise practices to establish and not over-water plants.
21. Warranty and replacements.

B. Alternates: Refer to Division 1 Section "Alternates" for description of Work in this Section affected by alternates.

1.3 REFERENCES

A. The following Codes, Regulations, Reference Standards, and Specifications apply to work included in this Section and Section 329300.
1. Codes and regulations of the jurisdictional authorities.
2. "REFERENCE CODES AND STANDARDS":
a. AASHTO: M288.
b. ASTM: A6, C33/C33M-18.
c. American Standard for Nursery Stock, Edition approved April 14, 2014 by American Nursery and Landscape Association (ANSI Z60.1-2014) - plant materials.
d. Hortus Third, 1976 - Cornell University - plant nomenclature.

B. Observation at growing site does not preclude right of rejection at the Worksite. Plants damaged in transit or at the Worksite shall be rejected.

C. Personnel: Perform work only with qualified personnel familiar with required landscaping methods and materials.

1.4 DEFINITIONS

A. Weeds: Any plant not specified on the drawings or accepted as a substitute.

1.5 QUALITY ASSURANCE

A. Source quality control: Furnish certificates of inspection of landscape materials, to accompany shipments, as required by governmental authorities or as requested for inspection by Owner. Comply with applicable federal, state, county and local regulations governing landscape materials.

B. Growing location: Furnish certificates showing where materials have been grown or balled and burlapped.

C. Qualifications:

1. Manufacturer: Company specializing in manufacturing Products specified with minimum seven (7) years documented experience.

2. Installer: Company specializing in performing the Work of this Section with minimum seven (7) years documented experience installing projects of similar size and scope. The Landscape Contractor shall furnish a list of references or previous work experience as requested by the Owner. The Landscape Contractor shall employ only skilled personnel and provide adequate supervision.

D. Mockups: Contractor shall provide three (3) foot x three (3) foot representative mockups of each type of bed preparation for approval by the Owner's Authorized Representative and the Landscape Architect to show compliance with Section 3 – Execution. Mock-ups that do not conform to the drawings, specs, and manufacturer's recommendations will be rejected. An in-place mock-up sample may be acceptable. By installing an in-place mock-up, the Contractor accepts the risk and bears the cost of removing and replacing rejected samples. Contractor shall receive final approval from the Owner's Authorized Representative prior to commencing balance of work.

1.6 SUBMITTALS

A. Provide representative quantities (1 gallon plastic bag or container) of manufactured topsoil, expanded shale, organic compost, planter mix, and rustic cut mulch. Samples shall be approved by Owner's Authorized Representative prior to installation. Attach product name, address of manufacturer and/or supplier and appropriate literature and composition of material or gradation for each sample. Literature or Product Data shall consist of manufacturer's current specifications, with catalog cuts, data sheets and installation instructions. Samples shall be submitted no less than sixty (60) days prior to installation.

1. Organic Biological Fertilizers: Copy of each products information labeled with manufacturer's name and address and analysis. Submit manufacturer's information or cut sheets on products.

2. Organic Herbicide: Copy of product information labeled with manufacturer's name and address and analysis. Submit manufacturer's information or cut sheets on products.

3. Organic Fungicide: Copy of product information labeled with manufacturer's name and address and analysis. Submit manufacturer's information or cut sheets on products.

4. Organic Insecticide(s): Copy of each products information labeled with manufacturer's name and address and analysis. Submit manufacturer's information or cut sheets on products.

5. Edging: Manufacturer's literature and 12" long sample.

6. Tree Anchoring Frame: Copy of product information labeled with manufacturer's name and address. Submit manufacturer's information or cut sheets on products.

7. Weed Barrier - Recycled Newsprint Roll Stock Paper: Manufacturer's literature and 12" square sample.

B. Plant Material Samples: Submit documentation no less than sixty (60) days prior to installation that all plant materials have been located and are ready to be secured. Arrange specific review procedure of plant materials at time of submission. Submittals and review shall be organized as follows:

1. Preliminary Review: Submit representative photographs for review of all plant materials in the required sizes and in available quantity at no less than sixty (60) working days prior to shipment to the site.

2. Submittal shall include each of these items per plant: 1) a minimum of one (1) high quality color bond image or 2) one (1) color digital image. Include one (1) set for each plant type and size required for the project. The 8-1/2" x 11" sheet/image is to include the name and address of the supplier, size of the plant in the picture and Botanical and English name of the plant and variety/cultivar name. Digital submittals are preferred due to expediting time and for reduction in the carbon footprint.

3. Tree photographs shall include a person or device to determine scale, and shall include two (2) photographs of each tree type or group. The two (2) photographs shall be taken at approximately 90 degrees from each other. One (1) additional photograph shall be taken at the base of each tree to show root flare and root conditions at the soil surrounding the roof flare.
4. Provide any additional tree groups and specimen photographs as required to illustrate the quality and/or quantity of material.
5. Poor quality photographs, photographs that are not in color, not labeled, or photographs which do not adequately represent the plant material will be rejected.
6. Photograph Acceptance and Nursery Review: Acceptance of material through photographs/digital images does not preclude rejection of unsatisfactory material upon delivery. The Owner's Authorized Representative reserves the right to refuse review from photographs or at the grower if, in his judgment suitable material or sufficient quantities are not available. Contractor shall insure a sufficient quantity of plants will be available whenever trips are arranged to a nursery for the purposes of tagging material for the project.
7. Specific sources of materials may be listed in the plant schedule for availability, size, quality control of plant character and for matching of specific plant growing conditions.
8. Unavailable Material: If proof is submitted that any plant specified is not obtainable, a proposal will be considered for use of the nearest equivalent size or variety with corresponding adjustment of Contract price. Substantiate such proof in writing no less than sixty (60) days prior to installation.

C. Sources: Within at least sixty (60) days prior to delivery to site, notify Owner and Owner's Authorized Representative in writing of source of plant material and bed preparation materials required for the project. This data is to be furnished in addition to representative samples.

D. Special Warranty: Submit written special warranty registered with manufacturer as specified in this Section.

E. Provide documentation and testing of compost materials as specified in Parts 2 and 3 of this Section.

F. Maintenance Instructions: Submit two (2) copies of typewritten and one (1) electronic copy of instructions for one (1) full year. Submit to Owner's Authorized Representative for approval. Submit two (2) copies and one (1) electronic copy of revised instructions prior to expiration of Contractor's maintenance period(s) required under the contract.

1.7 PROJECT CONDITIONS OR SITE CONDITIONS

A. Verify and examine site conditions with the Owner's Authorized Representative. Proceed when official notice is given to the Contractor that the Work site is ready. Proceed with and complete the landscape work as rapidly as portions of the site become available.

B. Planting Restrictions: Perform actual planting only when weather and soil conditions are suitable in accordance with locally accepted practice. Do not install plant life when ambient temperatures may drop below 35 degrees F or above 100 degrees F. Commence landscaping work when the Site is free of rocks and debris. All planting areas to be left at depth per drawing details/sections from finished grade by others for landscape contractor to add soil amendments.

C. Protection:
1. Do not move equipment over existing or newly placed paving without approval of Owner's Authorized Representative.
2. Provide road-boarding to protect paving.
3. Protect paving, structures and any other site improvement from damage, with protection boards, ramps, and protective sheeting.

D. Utilities:
1. Determine locations of underground utilities and perform work in a manner which is intended to avoid possible damage. Hand excavate, where required, to minimize possibility of damage to underground utilities.
2. Coordinate work with Owner's Authorized Representative to prevent damage to existing underground sprinkler (irrigation) system at trees.
3. Water is available on site. Refer to irrigation system drawings for proposed underground irrigation system.

1.8 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver packaged materials in sealed containers showing weight, analysis and name of manufacturer, supplier or grower. Protect materials from deterioration during delivery and while stored at the site.

B. Storage: Store products with protection from weather or other conditions which would damage or impair the effectiveness of the product. Protect metal containers from sun during summer months with temperatures above 80 degrees F.

C. Preparation of Plant Materials:

1. Balled and Burlapped (B&B) Plants: Dig and prepare shipment in a manner intended to protect roots. foliage and branches from damage and protect the shape, and future development.

2. Container Grown Plants: Prepare shipment in a manner intended to protect roots, foliage and branches from damage, and protect the shape for future development.

3. Plants should bear label from the grower certifying genus and species. Labels should be securely attached and waterproof bearing legible designation of botanical and common name. Plants not labeled may be rejected.

D. Deliver trees, shrubs and other plants after preparation for planting have been completed and plant immediately.

E. Damage: Protect plant material in transit and at the site. Material not properly protected and which is damaged will be rejected.

F. Unloading, Handling and Staging of Trees:

1. Staging systems shall be prepared in advance to adequately hold trees above ground for optimum tree health prior to planting. Many times, even with the best planning and coordination, trees cannot be planted when they are delivered.

2. Use extreme caution when handling trees. Use a strap cradle, adequate for weight and size of tree and root ball, attached to the root ball to unload and move trees. Strapping and wire baskets can break or loosen. Never move, lift, or handle by attaching to or by putting pressure on the trunk. Be very careful not to damage or scar trunks and branches.

3. Prior to unloading, proper moisture shall be maintained in root balls. Trucks shall be staged in the shade prior to unloading. Unloading time shall be no more than two (2) hours per trunk.

4. Immediately after unloading, no more than one hour after unloading, stand the trees up to reduce risk of sun scald. Properly staged trees shall be standing, untied and spaced.

5. Remove cardboard trunk protector within forty-eight (48) hours of trees being stood upright to reduce the risk of damage.

6. Monitor moisture in the root ball by probing the soil with a soil probe and manage supplemental irrigation accordingly. Be careful not to over or under irrigate.

7. During cold weather periods, root balls must be protected from freezing temperatures.

8. Storage is at Contractor’s own risk.

G. Handling of Plant Materials:

1. Do not deliver plants until the site conditions are ready for planting. If planting is delayed, heel-in bare rooted or freshly dug plants in a bed containing adequate mulch to keep roots moist. Separate bundles and trim roots, if long or damaged, using sharp pruning shears. Place plants in flats, pots, or other containers in a sheltered spot protected from sun, wind and mechanical damage and keep roots moist. Storage is at Contractor's own risk.

2. Do not lift or handle any plants by tops, stems or trunks at any time. Do not bind or handle plants with wire or rope at any time.

1.9 MOCK-UPS

A. Mockups of bed preparation shall be provided on site in two (2) locations with Owner and Owner’s Authorized Representatives to show compliance with Section 3 – Execution.

B. Coordinate with General Contractor for sequencing of mock-ups to demonstrate soil preparation for planting beds. Mockup may be part of installed area if it shows compliance with Section 3 – Execution.

C. Contractor shall demonstrate installation of the weed barrier with mulch topdressing prior to planting.

D. Refer to Section 3.2 Site Preparation.

1.10 SEQUENCING

A. Coordinate rough and landscape grading, soil preparation, irrigation, and other related units of Work specified in other Sections to ensure that plant material can be supported and installed as indicated.

1.11 SCHEDULING

A. Submit a proposed work schedule to the Owner's Authorized Representative for approval at least sixty (60) days prior to start of work under this Section. After approval, no modification shall be made to this schedule without written authorization by the Owner.

B. In general, the work shall proceed as rapidly as the site becomes available, consistent with normal seasonal limitations for planting work.

1.12 WARRANTY

A. General: Warranties specified in this Section shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.

B. In accordance with the General Provisions, warranty for plants and trees shall be valid for one (1) year after final acceptance. Replace dead materials and materials not in vigorous, thriving condition as soon as weather permits. The opinion of the Owner's Authorized Representative as to what constitutes a dead plant shall be final.

C. Replace dead trees or trees not in vigorous, thriving condition as soon as weather permits. Replace trees, which have partially died thereby damaging shape, size, or symmetry. The opinion of the Owner's Authorized Representative as to what constitutes a dead plant shall be final.

D. Replace plants and trees with same kind and size as originally planted at no cost to the Owner. Provide one (1) year warranty on replacement plants. Trees should be replaced at start of next planting or digging season. In such cases, remove dead trees immediately. Protect irrigation system, other piping conduit, or other work during replacement. Repair any damage immediately.

E. Warranty excludes replacement of plants after final acceptance because of injury by storm, drought, drowning, hail, freeze, insects, or diseases.

F. Plants will be guaranteed to be true to species, variety or cultivar as specified.

G. Warranty: Warrant that all shrubs and groundcover planted under this Contract will be healthy and in flourishing condition of active growth one (1) year from date of Substantial Completion.

H. Replacements: As soon as weather conditions permit, replace, without cost to Owner all dead plants and all plants not in a vigorous, thriving condition, as determined by Owner's Authorized Representative during and at the end of Warranty Period.

1.13 REPLACEMENTS

A. General:

1. Plant materials exhibiting conditions which are determined as being unacceptable due to workmanship by the Contractor shall be repaired and/or replaced at no additional cost to the Owner.

2. Closely match replacements to adjacent specimens of the same species. Apply all requirements of this Specification to all replacements.

B. Replacement Quantities: Contractor shall be held responsible for a maximum of two (2) replacements for each failed tree and shrub, and same area of groundcover and perennial planting after final acceptance during the Warranty Period.

PART 2 - PRODUCTS

2.1 PLANTS

A. General: Provide healthy, field-grown ball and burlapped plants or nursery-grown container and boxed plants, well-formed No. 1 grade from a recognized, local nursery, and of the species and variety shown on the drawings, well-developed branches conforming to and complying with the last edition of American Standard for Nursery Stock, Edition approved May 12, 2004 by American Nursery and Landscape Association (ANSI Z60.1-2004). Listed plant heights are from tops of root balls to nominal tops of plants.

B. Provide only healthy, vigorous stock, grown under climatic conditions similar to conditions in the locality of the project and free of disease, insects, eggs, larvae, and defects such as knots, sun-scald, injuries, abrasions, or disfigurement. Plants will have been grown within a two hundred and fifty (250) mile radius of the site.

C. Vigor: Plants shall be sound, healthy and vigorous, well branched and densely foliated when in leaf. They shall be free of disease, insect pests, eggs, or larvae. They shall have healthy, well-developed, vigorous and fibrous root systems. Plants shall be free from physical damage or adverse conditions which would prevent thriving growth.

D. Container and Boxed Stock material:

1. Verify that all container stock has been grown in the containers in which delivered for at least six (6) months, but not over two (2) years.
2. Plants shall have a root ball size of minimum of ten (10) inches in diameter for each one (1) inch caliper, measured six (6) inches above root ball.
3. Root system development:
    a. Samples must prove to be free of kinked, circling or girdling roots and with no evidence of a pot-bound condition.
    b. Trees shall have been grown in heavy or heavy clay soil and irrigated with drip irrigation. Loose potting soils are not acceptable since root mass will flex with trunk sway and allow potential overturn of tree.
    c. Field grown plants recently planted into containers will be accepted if roots have developed into new soils.
4. Root flare of plant material shall be visible at nursery prior to delivery, and after transplanting into the landscape.
5. Root balls shall not be cracked or broken prior to shipment.
6. Do not remove self-locking tags prior to delivery to site.
7. Remove all weeds and other invasive plants from the base of the nursery plant’s root container prior to delivery to site.

E. Nursery grown B&B material:

1. Plants shall have a root ball size of minimum of ten (10) inches in diameter for each one (1) inch caliper, measured six (6) inches above root ball.
2. Root system development:
    a. All named cultivars shall be own root clones; no grafted or bud-grafted trees will be accepted.
    b. 100% mechanically root-pruned at least once and transplanted a minimum of three (3) times during the first three (3) years of the tree’s life.
    c. Trees shall have been grown in heavy clay soil and irrigated with drip irrigation.
    d. Plants shall be well healed in for a minimum of thirty (30) days with a flush of new roots at the edge of the burlap prior to shipping. Recently dug plants will not be accepted.
    e. Trees shall have no girdling roots, have no “J” shaped roots, and the trunk flare shall be visible.
3. Ensure balls are firm, neat, slightly tapered, and well burlapped.
4. Root balls shall not be cracked or broken prior to shipment.
5. Root flare of plant material must be above ground and visible at nursery before harvest, prior to delivery, before planting, and after transplanting into the landscape.
6. Root liner grown trees shall have been planted such that their root flare is visible above the finished grade of the liner. No buried tree flares will be submitted or accepted.
7. Do not remove self-locking tags prior to delivery to site.
8. Remove all weeds and other invasive plants from the base of the nursery plant’s root ball prior to delivery to site.

F. Shade and Ornamental Trees - Canopy development:

1. No. 1 grade nursery stock healthy, vigorous, full-branched, well-shaped, trunk diameter, and height requirements as specified
2. There shall be a strong central leader to the top of the canopy. The tip of the leader on the main trunk must be intact and it’s terminal bud must be the highest part of the tree.

3. No branch can have a diameter greater than 2/3 the trunk diameter measured directly above the branch crotch. The tree will have no inclusions or co-dominant branches.
4. The tree crown shall be structurally uniform. Branches shall be evenly distributed around the trunk. The crown shall be full of foliage which is evenly distributed around the tree.
5. Trees that have had branches tipped or cropped will not be accepted.
6. Provide trees with full rounded crowns, meeting height and spread standards after pruning. No flat sided trees or trees with open areas on any side will be acceptable. Trees shall be consistently superior in form and branching, and typical of the growth habit of their species unless otherwise specified.

G. Tree Caliper Measurement Requirements: for a single stem tree, the diameter (caliper) of the trunk shall be measured twelve (12) inches above the top of the root ball for a tree having a diameter up to and including eight (8) inches, and measured at four and one-half (4.5) feet (Datum Breast Height - DBH) above the top of the root ball for a tree having a diameter of more than eight (8) inches. For multi-stem trees, the diameter of the trunk measured at the narrowest point below branching when branching occurs higher than twelve (12) inches above the top of the root ball. When branching occurs at or lower than twelve (12) inches above the top of the root ball, caliper means the diameter of the largest stem plus the average diameter of the remaining stems, measured at four and one-half (4.5) feet (DBH) above the top of the root ball.

H. Shrubs, ornamental grasses, yuccas, hesperaloe, opuntia, groundcovers and perennials: Nursery grown, healthy, vigorous, of normal habit of growth for species, free from disease, insect eggs, and larvae. Specified sizes are before pruning and measured with branches in normal position. Plants to be well rooted and established in the container.

I. Plants shall conform to the sizes and quality notes in the plant list and/or as indicated, with the exception of that larger plants than those specified may be used if approved by the Owner's Authorized Representative. Use of larger plants shall not increase the contract price. Specified sizes shall be after pruning, and plants shall be measured with their branches in normal position.

J. Pruning: Do not prune plants before delivery. If pruning is necessary, prune with direction from Owner's Authorized Representative (Landscape Architect).

K. Plant protection during shipping: Wrap canopy of plants prior to loading to ensure that branch structures are protected, and that wind damage is minimized. Shrubs and smaller plant material will be handled and loaded to protect character and form of each plant. Removal of protection strapping and wrapping shall be handled with care to prevent damage to the plant material once it is delivered to the site. Damaged materials will be subject to rejection.

L. Upon delivery to site:
1. Reject trees with cracked, lose or broken balls when frame or burlap is removed at time of planting.
2. Trees will be individually approved or rejected by the Owner's Authorized Representative on site.
3. Trees: Free of physical damage such as scrapes, bark abrasions, or split branches.
4. Trees for planting adjacent to sidewalk shall be pruned and branched up to seven (7) foot height above the finished grade of the sidewalk or accessible surface for pedestrian clearances as directed by the Owner's Authorized Representative.

2.2 MANUFACTURED TOPSOIL – Refer to Section 32 92 00 – 2.2.

2.3 EXPANDED SHALE

A. Expanded Shale: shall be rotary kiln expanded shale and clay lightweight aggregate as manufactured and supplied by Arcosa Lightweight Arlington, TX (817-635-8541), local representative: Eric Nelson, cell (817-635-8541) or equivalent as determined by the Owner's Authorized Representative.

2.4 COMPOST - Professional Compost - 100% plant based - Refer to Section 32 92 00 – 2.3.

2.5 PLANTER MIX – for raised planters (if applicable)

A. Moderately Pervious Container Soil Mix (modified):
1. pH in the neutral range, moderately draining, perpetually loose in texture, holds sufficient moisture to adequately supply the vegetation without excessive leeching of transient nutrients.
2. Composition: mix of pH Balanced Compost, expanded shale, soil and sand blend. Mix will be modified slightly as follows*: reduce pH Balanced Compost by 10%, increase fine aggregates by 10%.*

B. As processed and supplied by Soil Building Systems, Dallas, Texas, (972-831-8181), attention: Baron Ablon, or equivalent as approved by the Owner's Authorized Representative.

2.6 PRE-EMERGENCE AND POST-EMERGENCE FOR WEED REMOVAL - ORGANIC HERBICIDE AND HAND PULLING - Refer to Section 32 92 00 – 2.4.

2.7 ORGANIC BIOLOGICAL FERTILIZER – Refer to Section 32 92 00 – 2.5.

2.8 MISCELLANEOUS PLANTING MATERIALS

A. Wrapping Material: Do not use!

B. Tree Paint: Do not use!

2.9 WEED BARRIER AND TOPDRESSING

A. Weed Barrier for Planting Areas: Recycled roll stock newsprint paper as manufactured in the U.S. Available: Global Industrial at (1-888-978-7759), www.globalindustrial.com; or Uline (1-800-958-5463) / (1-800-295-5510), www.uline.com; or Pack Secure at (1-888-511-7225), www.packsecure.com, or equivalent product as determined by the Owner's Authorized Representative.

B. Mulch for Planting Beds and Tree Watering Wells at Turf – material screened to not exceed eight (8) inches:

1. Rustic Cut Hardwood – native hardwoods; free of: man-made foreign material, lumber, treated materials, woodmill sawdust or pine bark; hammer mill processed, decomposed - heat sterilized two (2) times to remove latent weed seeds, aged for minimum two (2) to four (4) months, screened to remove fines. No soft green or unprocessed materials allowed. 96% of material will pass through a one (1) inch screen with additional screening down to three-eighths (3/8) inch, 98% of material will not exceed eight (8) inches in length. Material shall have no pungent odors, but will have an earthy smell. As processed and supplied by Soil Building Systems, 2101 Walnut Hill Lane, Dallas, TX 75229 (972-831-8181), attention: Baron Ablon.
2. Tree Mulch (once ground native hardwood mulch) custom screened material to match properties of mulch noted above and to not exceed eight (8) inches in length.
    a. Product must have been heat sterilized (2) times to remove latent weed seeds.
    b. Aged for minimum two (2) months.
    c. No soft green or unprocessed materials allowed.
    d. As custom processed and supplied by Living Earth (LETCO), Dallas, TX, if determined to be an equivalent by the Owner's Authorized Representative.

2.10 ANCHORING FRAME FOR ORNAMENTAL AND SHADE TREES

A. For anchoring of tree root balls in planting bed areas and native grass areas.

B. Re-bar anchoring ring with three (3) six (6) inch U brackets, color: natural metal or painted, and three (3) separate anchors with S-hook and tightening strap.

C. Anchoring rings to have two (2) cuts per ring, four (4) total, for fail-points.

D. Below Grade Safety Stakes (ground anchors) as manufactured by Tree Stake Solutions, local representative: Jeff Tuley, (903-676-6143), www.treestakesolutions.com, or equivalent as approved by the Owner's Authorized Representative.

Item #	Description
15-BG	10-15 gal. or 17" root ball with 3 – V68 Anchors
30-BG	20-30 gal. or 22" root ball with 3 – V68 Anchors
45/65BG	45-65 gal. or 27-30" root ball with 3 – V68 Anchors
100-BG	95-100 gal. or 36" root ball with 3 – V68 Anchors
150-BG	150 gal. or 42" root ball with 3 – V68 Anchors
200-BG	200 gal. or 48" root ball with 3 – V88 Anchors

2.11 EDGING

A. Steel Edging: 1/8” x 4”, color: black, interlocking sections, installed with 12” steel stakes.

B. Option for Safety (if requested/allowed by DISD):

Aluminum Edging: Permaloc CleanLine, 3/16” x 4”, mill finish, with rolled top edge for safety, with twelve (12) inch stakes, as manufactured by Permaloc Corporation, 13505 Barry Street, Holland Michigan 49424, (800-356-9660), www.permaloc.com.

2.12 ORGANIC FUNGICIDES – Refer to Section 32 92 00 – 2.6.

2.13 ORGANIC INSECTICIDES

A. Soft Bodied Insects (aphids, mites, thrips, white flies, lace bugs, etc.):

1. EcoSMART® Organic Insecticides as manufactured by a division of the Kittrich® Corporation, Atlanta, GA 30336, (714-736-1011).
2. Neem Oil.

B. Scale: Use 2 ounces of Orange Oil mixed with 1 ounce of Neem Oil to a gallon of water. Spray weekly for 3 weeks.

C. Caterpillars, Army Worms, Sod Webworms: Use Bacillus Thuringiensis (BT) biological agent.

D. Chinch Bugs:

1. EcoSMART® Granular, as manufactured by a division of the Kittrich® Corporation, Atlanta, GA 30336, (714-736-1011).

2.14 ORGANIC INSECTICIDE - FIRE ANTS – Refer to Section 32 92 00 – 2.7.

2.15 WATER

A. Potable. Available on site. Refer to the irrigation specifications and plans. Truck or other means of watering shall be required to establish native grass areas behind the sidewalks where no existing or temporary irrigation system exists.

2.16 MACHINERY AND EQUIPMENT

A. Machinery requirements listed under this Section are NOT intended to be restrictive of specific manufacturers or models, unless so stated. Specific mention of the manufacturers is intended as a guide to illustrate the final product of the maintenance operations desired. All equipment used shall be and maintained in top working condition at all times.

B. Pruning and grinding tools shall be maintained in safe, working condition, cutting edges shall be sharp at all times.

C. Fertilizer and insecticide spreaders (for organic products) shall be of the hand-held or cyclone type. Vehicle-mounted or push cyclone spreaders shall be allowed. Spreaders shall be in a safe working condition at all times.

D. Insecticide and fungicide sprayers (for organic products) shall be of the hand-held, backpack, or vehicle-mounted type. Sprayers shall be in a safe working condition at all times.

E. The Contractor shall be responsible for any grade, plant material (native grass, trees, shrubs, etc.), or hardscape amenity (fence, pavement, arbor, steel edging, stone wall, etc.) damage caused by the spreader or sprayer and the application process.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Verify that field measurements, surfaces, substrates and conditions are as required, and ready to receive Work.

1. Verify that all planting areas are clear of stones larger than one (1) inch diameter, weeds, debris and other extraneous materials.

2. Verify that grades are within one (1) inch plus or minus of the required finished grades. Report all variations in writing.

B. Soil Moisture:

Inadequate Moisture: Do not commence work of this section when soil moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in air or that clods will not break readily. Apply water, as necessary, to bring soil to an optimum moisture content for planting.

C. By beginning Work, Contractor accepts conditions and assumes responsibility for correcting unsuitable conditions encountered at no additional cost to the owner.

3.2 SITE PREPARATION

A. Coordinate with General Contractor for scheduling and sequencing of installation of planting bed areas to ensure that the areas are protected from construction sediment runoff.

B. Examine rough excavated grade/subgrade for planting areas and verify conditions under which work is to be performed. Do not proceed with work until all grading and related work is completed in a satisfactory manner so that the landscape installation can proceed. All lumps, clods, and debris over two (2) inches in diameter shall be removed from the Worksite. Delineate bed areas and receive approval from Owner's Authorized Representative prior to starting work. Beginning of installation means acceptance of existing site conditions.

3.3 BED PREPARATION AT PLANTING BED AREAS

A. Ensure rough grading of planting beds is provided to grade elevation to allow for amendment installation and drainage for positive surface flow for runoff.

B. Coordinate for irrigation installation to allow for plant placement and for height of heads relative to finished topdressed beds.

C. Weed and invasive vegetation removal:

1. Organic Herbicide: Treat weeds and invasive vegetation with organic herbicide to eradicate any material growing after rough grading for beds.

D. Thoroughly clear and remove the existing weeds and grass roots upon organic herbicide's completed action by grubbing off all plant parts and root systems to depth to allow for proposed planting bed soil amendments and topdressing, and to prevent re-growth of removed plant.

E. Thoroughly till/rip/disrupt/break-up/shatter the soil to a minimum depth of ten (10) inches due to typical construction site compaction. Re-compact to industry standards using a standard gill or comparable piece of equipment. Remove non-soil materials and construction debris such as wood, rock, brick, cement, pipe, sheetrock, metal, paint, plastic, glass, etc. and unacceptable clays, then re-grade subsoil to established grades for proper drainage of planting beds.

F. Tilling/spike harrowing/ripping/disrupting/breaking-up/shattering of the soils should occur prior to irrigation line installation. If the turf grass sprinkler system has already been installed, then it will be necessary to stake heads and to take necessary measures to prevent damage to the system.

G. Upon delivery of topsoil and planting amendments, ensure that the material is protected and is not contaminated with any materials or soils on the site prior to installation.

H. Delineate bed areas and receive approval from Owner's Authorized Representative prior to starting work.

I. Open bed areas to receive shrubs, groundcover, ornamental grass and perennials to be prepared as follows to provide a stratified bed mix:

1. Install two (2) inches (settled depth) of manufactured topsoil.
2. Till to depth of eight (8) inches to mix topsoil thoroughly with native disrupted soil.
3. Install three (3) inches (settled depth) of expanded shale.
4. Till to a depth of eight (8) inches to mix additives thoroughly with topsoil/native soil.
5. Install three (3) inches (settled depth) of organic compost.
6. Apply organic biological fertilizer at rate per manufacturer's recommendations for bed preparation at forty (40) lbs. per one thousand (1,000) square feet.
7. Till compost and organic biological fertilizer to a depth of eight (8) inches to stratify into shale/soil mix.

J. Set beds to finished grade of media to allow for topdressing installation depth.

K. Coordinate installation and placement of irrigation mainline at edge of bed to ensure that they are clear of tree root ball installation and do not impede planting. Lateral irrigation lines for bubblers, drip irrigation (if allowed/required) and spray heads shall be provided per irrigation plans.

L. Water beds to promote germination of dormant weeds and grasses, if media has been contaminated or mixed with soils containing native weed seeds prior to installation in planter beds.

M. Treat weeds in bed with application of organic herbicide.

N. Remove weeds after organic herbicide treatment period by hand digging.

3.4 BED PREPARATION AT RAISED PLANTERS (if applicable)

A. Protect finish and integrity of inside of waterproofed architectural planter walls. Do not use any sharp tools when working in this planter area.

B. Protect subdrainage system (piping and other drainage media) as designed per Civil or Architectural.

C. Install Planter Mix (modified) per 2.5 in six (6) inch water compacted and hand tamped layers to remove air pockets and to ensure that there is no settlement.

D. Apply organic biological fertilizer (MicroLife 6-2-4) at rate per manufacturer's recommendations for bed preparation at forty (40) lbs. per one thousand (1,000) square feet. Rake into surface of soil mix.

E. Coordinate and install irrigation system in bed at depth allowing for mulch topdressing or other materials and plants to be installed.

3.5 PLANT PREPARATION AT HOLDING AREA PRIOR TO INSTALLATION AT BED AREAS

A. Contractor shall remove excess soils from the top of tree root balls or containerized trees to ensure that the natural tapered root flare is fully visible and exposed. Trim and remove all circling, girdling and spider roots away from the root flare and dispose. Taper top of root ball from flare.

B. Contractor shall completely remove all weeds, vines or plant seedlings, including their root system, growing at top of container or on top of the root ball to ensure that these invasive non-specified plants do not gain foothold to establish in the planting beds and cause additional maintenance to remove.

C. Removal and disposal of all weeds, vines or plant seedlings shall occur prior to any plant moving for installation or placement in the planting beds.

3.6 TOP DRESSING PLANTING BEDS

A. After finished grade has been approved, top dress parking lot shrub screening bed areas first with eight (8) rolled layers of recycled roll-stock newsprint paper, as specified in 2.9 A., to provide a weed barrier.

B. Then top dress bed areas with rustic cut hardwood mulch to a depth of three (3) inches compacted depth.

C. In planting beds, this top dressing occurs prior to plant installation. Delay this operation until near final acceptance.

D. Top dressing must achieve specified depth to attain final acceptance.

E. Hold mulches back to expose the flare of the plant, once the plant is installed, or tree trunk at the root ball if in planting bed.

3.7 PLANTING OF PLANTING BEDS

A. After topdressing has been installed Contractor shall mark proposed locations for plants with contractor spray paint or lay out plants over top of topdressing at required spacing. Obtain approval from Owner's Authorized Representative.

B. The Owner's Authorized Representative reserves right to interchange or shift locations of plants prior to planting.

C. Once sprayed locations have been approved by Owner's Authorized Representative, pull back topdressing layer of mulch to expose the area of newsprint where the plant will be located.

D. Carefully cut cross-shaped slits to provide an opening for the plant. Roll/pull back the cut paper for plant installation.

E. Plant in pits two (2) times greater in diameter than root balls or container diameter. Remove all burlap, ropes, wires and strings from the rootball prior to planting.

F. Remove the container from the prepared plant.

G. Score the root ball vertically at four (4) equal points around the edge prior to planting.

H. Plant shrub/large ornamental grass/groundcover such that top of the root ball at the flare of the plant is one and one half (1 1/2) inch above finished grade of the recycled roll stock newsprint paper (weed barrier) for plants in 2 gallon and up sized containers, and one (1) inch above the top of the weed barrier for plants in containers 1 gallon and smaller.

I. Backfill to depths of root balls with planting media. Carefully settle by watering to prevent air pockets. Water in thoroughly.

J. Fold the cut back sections up to the root flare of the plant and pull compost/mulch topdressing back to cover the newsprint.

K. Hold mulch back to keep the root flare exposed and to keep moisture away from foliage base and prevent yellowing.

L. Carefully prune plants to remove dead or broken branches and hand-rake bed areas to smooth even surfaces.

3.8 TREE PLACEMENT AND PROXIMITY TO BUILDING WALLS & PERMANENT STRUCTURES

A. Criteria for tree distance based on trees full height and canopy spread at full maturity:

1. Large trees: Minimum of twenty-five (25) feet.
2. Small trees: Minimum of fifteen (15) feet.

3.9 TREE PIT PERCOLATION TESTING

A. For all Canopy Shade and Ornamental Trees locations:

1. Stake locations for approval by Owner's Authorized Representative prior to excavation.
2. Percolation test for trees in planting beds and turf beds: After approval of tree locations, excavate pit and perform percolation test. The pit shall be the same depth as the height of the root ball or slightly less so that the root ball sits approximately two (2) inches above surrounding grade. The pit shall be dug square so that the pits are twelve (12) inches or more greater in diameter than root balls for trees in planter beds and two (2) times the diameter of the root ball for trees in turf areas.
3. Fill excavated pits with water and wait until next day. If the water level has not dropped at least six (6) inches within twelve (12) to twenty-four (24) hours, then notify the Owner's Authorized Representative. An Owner's Authorized Representative must be present to monitor and record the results of the percolation test.
4. If tree pit does not drain in the required time, then provide one of these below two (2) options for final direction based on approval by the Owner's Authorize Representative:
    a. Provide an augured drain pit at one of the tree pits to determine if a permeable layer can be achieved to allow the required drain down time.
    b. If the above cannot be achieved, then raise the tree planter pits such that the top of tree's root flare and root ball is six (6) inches above finished grade.

3.10 CANOPY AND ORNAMENTAL TREE PLANTING

A. General Planting Requirements for all Canopy Shade and Ornamental Trees:

1. Prepare trees: Remove all girdling roots, circling roots, spider roots, excess soil and other vegetative weeds or vines completely from the top of the root ball to expose the tree's natural root flare top of the root ball for installation.
2. Handling trees: Use extreme caution. Use a strap cradle (adequate for weight and size of root ball) attached to root ball to unload and move trees. Strapping and wire basket can break or loosen.
3. Never move, lift or handle by attaching to or by putting pressure on the trunk. Be certain that equipment, including straps, chains, and cradles, are rated for the weights of the trees being lifted.
4. Face tree to give best appearance and to allow for required branching height clearance above walks and streets. Provide branching orientation turned to provide for best growth pattern to prevent conflict with vehicles or adjacent structures. Receive approval from the Owner's Authorized Representative or Landscape Architect prior to final installation to prevent further handling or damage to the root system.
5. Handle tree only by root ball.
6. Maintain tree in a straight and plumb position.

7. After above items have been completed, remove synthetic wrap, cardboard packaging, and cut/remove the wire basket down to the bottom of the tree pit. Remove the burlap from the top portions of the root ball.
8. Position tree anchoring frame over top of root ball and install ground anchors to align to frame above. Connect anchoring hooks and adjust tree to ensure it is plumb and anchored securely to the subgrade per manufacturer's directions prior to starting backfill. Refer to tree anchoring details for further information.
9. Backfill the lower portion against the root ball as noted per specific requirements of B. and C. below.
10. Saturate the planting hole with water after backfilling is one half (½) complete to aid removal of air from the backfill.
11. After initial backfill, watering, and the tree is plumb, then add backfill to just below the top horizontal wire ring, saturate planting hole and adjust root ball, if necessary, to make tree straight and plumb.
12. Backfill remaining balance of fill at top of root ball as noted per B. and C. below.
13. Remove all remaining shipping straps, tags, tapes, ties, stakes and other items from the trunk and canopy of the tree.
14. Provide watering dam at the edge of the tree's drip line/canopy edge to keep the tree's root flare fully exposed.
15. If rock is encountered:
    a. Owner's Representative may select alternative location. Location shall not impede visibility triangles.
    b. Rock shall be jack-hammered and removed to a minimum of six (6) inches below the plant if an alternative location cannot be selected and tree drainage pits shall be installed.

B. Canopy Shade and Ornamental Trees in Planting Beds:
1. Excavate square tree pits twelve (12) inches greater in diameter than root balls or container diameter.
2. Rip bottom and sides of pit to break up construction compaction, and then recompact bottom only by hand.
3. Place tree directly into excavated pit such that the trunk flare will be two (2) inches above surrounding finished grade in planter bed. Refer to planting details for cross-section of tree planters.
4. Backfill the lower portion of tree pit to not more than one half (½) the depth of the root ball with excavated native soils.
5. Saturate the planting hole with water after backfilling is one half (½) complete to aid removal of air from the backfill.
6. After initial backfill, watering, and the tree is plumb, then add backfill to nine (9) inches below finished grade, saturate planting hole and adjust root ball, if necessary, to make tree straight and plumb.
7. Backfill the top nine (9) inches with adjacent amended planting media blended with two (2) ounces of organic biological fertilizer per each five (5) gallon increment in tree root ball size and thoroughly saturate top backfill layer with water to aid removal of air pockets. Ensure that the top backfill is held two (2) inches down.
8. Provide top dressing per 3.6 for planting beds.

C. Canopy Shade and Ornamental Trees in Turf Areas:
1. Till soil to ten (10) inch depth within ten (10) foot radius of tree for trees in existing turf areas.
2. Excavate and plant tree in square pits two (2) times greater in diameter than root balls or container diameter.
3. Rip bottom and sides of pit to break up construction compaction, and then recompact bottom only by hand.
4. Place tree directly into excavated pit such that the trunk root flare will be two (2) inches above surrounding finished grade in turf area. Refer to planting details for cross-section of tree planters.
5. Backfill the lower portion of tree pit to not more than one half (½) the depth of the root ball with excavated native soils.
6. Saturate the planting hole with water after backfilling is one half (½) complete to aid removal of air from the backfill.
7. After initial backfill, watering, and the tree is plumb, then add backfill to nine (9) inches below finished grade, saturate planting hole and adjust root ball, if necessary, to make tree straight and plumb.

8. Backfill the top nine (9) inches with adjacent amended planting media blended with two (2) ounces of organic biological fertilizer per each five (5) gallon increment in tree root ball size and thoroughly saturate top backfill layer with water to aid removal of air pockets. Ensure that the top backfill is held two (2) inches down.
9. Topdressing – See 3.13 below.

3.11 TREE SAUCERS

A. Form a watering saucer around each new tree per construction drawings. Keep root flare exposed and keep watering saucer at edges of tree root ball. Saucer shall be no higher than three (3) inches.
B. Contractor is responsible for deep watering trees a minimum of once (1) per week until final acceptance and as needed to promote growth.

3.12 TREE ROOT BALL ANCHORING

A. Anchor trees prior to backfilling to ensure ground anchors are firmly into existing subbase.
B. Anchor all trees as detailed and per manufacturer's requirements.
C. Take precautions during staking operation to prevent damage or injury to roots and irrigation or other underground utility lines.

3.13 TOPDRESSING TREES IN TURF AREAS

A. After watering dam has been approved, top dress root zone area first with eight (8) rolled layers of recycled roll-stock newsprint paper, as specified in 2.9 A., to provide a weed barrier.
B. Then top dress tree root balls with rustic cut mulch to a compacted depth of three (3) inches.
C. Top dressing must achieve specified depth to attain final acceptance.
D. Hold mulches back minimum of six (6) inches to expose the flare of the tree trunk at the root ball.

3.14 PRUNING OF NEW TREES

A. Prune trees to preserve natural character of plant. Remove sucker growth, broken or badly bruised branches, and crossed branches.
B. Thin native trees heavier than nursery grown plants.
C. When directed by the Owner’s Authorized Representative, remove approximately one-third of wood by thinning. Do not cut back terminal branches.

3.15 EDGING

A. Provide edging where noted on Drawings on-grade at interface of turf bed to planting bed.
B. On-grade: Set edging as indicated in true lines as designed with top of edging two (2) to three (3) inches above finish grade prior to installation of sod or mulch. Receive approval from Owner’s Authorized Representative for layout of edging prior to installation. Refer to details for additional requirements.

3.16 NEW TREES

A. Trees shall be continuously and routinely inspected for distress caused by construction activities. Notify Owner’s Authorized Representative at first sign of distress.
B. Any Fire Ant mounds around or on top of a new or protected tree root zone shall be treated immediately and the mound removed physically. Do not allow the mound to build on the tree trunk as this will cover the tree root flare and possibly cause injury or death. Insure that any chemical application to the Fire Ant mound is safe for application atop tree root zones.
C. Trees: Pruning will be carried out by experienced pruning personnel.
1. Receive approval in the field for extent of pruning from Owner’s Authorized Representative.
2. Sterilize pruning tools between individual plants, especially in the genus Quercus.
3. Raise limbs to an acceptable height as approved by the Owner’s Authorized Representative. Raise limbs to seven (7) foot height for trees within ten (10) feet of sidewalk.
4. No weed-eaters or edgers are to be used within fifteen (15) inches of any tree. Should the need for trimming be necessary within fifteen (15) inches of any tree, it shall be done so by hand trimming only.

D. Remove dead wood, broken branches, mistletoe and suckers from trees as needed. Thin prune by removing no more than twenty (20) percent of growth. Sterilize pruning tools between individual plants to keep down spread of disease.

E. Spray paint all wounds of plants of the genus Quercus as soon as possible. Spray paint deliberate wounds on genus Quercus within one (1) hour and accidental wounds due to storms, etc. as soon as possible. Wounds on other species shall be allowed to compartmentalize naturally, unless determined otherwise by Owner's Authorized Representative or Arborist. Refer to Section 01 56 39 – 2.1 for acceptable wound paint.

F. Remove all remaining tags, straps, flags, ties, etc. from trees.

G. Dispose of all waste and removed material off site per requirements of local codes.

3.17 WEED REMOVAL

A. Contractor shall hand-remove foreign grass, weeds and immature weeds prior to formation of seed heads.

B. Contractor shall monitor and remove weeds, with root systems, from top of nursery grown plants to prevent competition for plant growth.

C. Remove all poison ivy or other native vines, with root systems, from bases of tree's root balls.

D. Contractor shall obtain prior approval from the Owner's Authorized Representative before applying the approved organic herbicides. Read and follow all label directions.

E. The Contractor shall be held solely responsible for plant loss due to the application of organic herbicides. Any loss of plant material shall be replaced at Contractor's sole expense and all plant replacements shall be of the same species and size of the existing plant materials.

F. Hand weeding or plant specific application of organic herbicide shall be used during plant establishment.

3.18 DEEP ROOT WATERING

A. Deep root water all existing trees to remain within the construction limits of the project once every two (2) weeks during the summer and once (1) a month during the winter, during the duration of the project and until final acceptance. This should be adjusted to the amount of rain. However, unless it has rained at least one-half (1/2) inch since the last watering, continue to deep root water. Complete deep root watering by filling each tree saucer three (3) times and letting it percolate dry.

B. Water new plantings to provide optimum soil moisture level for plant germination and root development and not to exceed watering requirements.

3.19 PLANT CARE UNTIL FINAL ACCEPTANCE

A. Water: When irrigation system is not operational, provide necessary hoses and other watering equipment required to complete landscaping.

B. Maintain plantings and trees by watering, cultivating, weeding, raking, fertilizing, controlling diseases and pests, cleaning, and replacing plants as necessary to keep landscape in a vigorous, healthy condition as needed until final acceptance. Maintenance until final acceptance includes but is not limited to the following:

1. Watering Trees: Tree balls to be kept moistened to the depth of the tree ball.
2. Weeding: Remove weeds and foreign grass over plant areas at least once (1) a week.
3. Cultivating: Gently cultivate bed areas to a depth of approximately three (3) inches once (1) a month. Care should be taken not to damage plant roots.
4. Mowing and Edging; Refer to Section 32 92 00.
5. Application of approved organic insecticides, organic herbicides and organic fungicides shall be in accordance with manufacturer's instructions per Owner and Owner's Authorized Representative approval. Remedy damage from use of insecticides.
6. Trimming and pruning includes only removal of dead or broken branches, and treatment of pruned areas and other wounds. Do not shear any plants.
7. Disease control.
8. Maintenance of temporary BMP's to prevent washout, siltation, or damage to planting beds (if applicable).
9. Tree straightening: Best for the health of the trees to wait until dormancy to straighten or reset the trees that have started to root into the backfill. Straighten by carefully digging out around the root ball, attaching seat belt strap to the part of the wire basket that is still intact around the root ball, and lifting with appropriate equipment, or adjusting the anchoring straps for the tree anchoring frame. Never pull, push or put pressure on the trunk. Then repeat applicable planting instructions 3.10.

C. Coordinate watering schedules during installation and until final acceptance. Provide deep root watering to keep root balls moist on newly installed trees at a minimum of once (1) every two (2) weeks during summer months or as weather conditions indicate.

D. Maintenance Instructions: Submit two (2) hard copies and one (1) electronic copy of typewritten instructions recommending procedures to be established by the Owner for the maintenance of landscape prior to expiration of Contractor's maintenance period(s) required under the contract. Submit to Owner's Authorized Representative for approval.

3.20 CLEAN-UP

A. Keep premises neat and orderly including organization of storage areas.

B. Remove trash and debris from excavated planting areas, preparing beds, or planting plants from Work site daily as work progresses.

C. Clean faces of building, walls, and other architectural features to remove sediments.

D. Keep paved areas clean by sweeping or hosing.

3.21 SITE ENVIRONMENTAL PROCEDURES

A. Waste Management: Comply with requirements of local codes for recycling and reusing waste.

B. Waste Disposal: Disposal of waste, including accessories and used items, by recycling or reusing waste to the extent practical. When washing containers for recycling, do not permit runoff to enter storm drains or sewer systems or penetrate soils.

3.22 FINAL ACCEPTANCE

A. Due to seasonal requirements, final acceptance of this section may not coincide with that of the remaining contract work.

B. Request inspection for final acceptance at least ten (10) calendar days before the end of the plant care and maintenance as described in 3.19.

C. Final acceptance shall be considered the time at which planting, related work and clean-up are one hundred (100%) percent completed.

END OF SECTION

SECTION 331000 – WATER UTILITIES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Furnish labor, materials and equipment necessary for the construction of domestic water and fire services.

1.2 RELATED SECTIONS

A. SECTION 312333 – TRENCH EXCAVATION

B. SECTION 312334 – TRENCH BACKFILL

C. SECTION 312335 – TRENCH SAFETY SYSTEM

1.3 APPLICABLE STANDARDS

A. ASTM International (ASTM):

1. ASTM B88 – Specification for Seamless Copper Water Tube
2. ASTM D1784 – Specification for Rigid PolyVinyl Chloride (PVC) Compounds and Chlorinated PolyVinyl Chloride (CPVC) Compounds
3. ASTM D2241 – Specification for PolyVinyl Chloride (PVC) Pressure-Rated Pipe (SDR Series)
4. ASTM D3139 – Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals
5. ASTM F645 – Guide for Selection, Design, and Installation of Thermoplastic Water Pressure Piping Systems

B. American Water Works Association (AWWA):

1. AWWA C105 – Polyethylene Encasement for Ductile-Iron Pipe Systems
2. AWWA C110 – Ductile-Iron and Gray-Iron Fittings, 3 Inches through 48 Inches, for water and other liquids
3. AWWA C509 – Resilient Seated Gate Valves, 3 Inches through 12 Inches NPS, for water systems
4. AWWA C502 – Dry-Barrel Fire Hydrants
5. AWWA C550 – Protective Interior Coatings for Valves and Hydrants
6. AWWA C605 – Underground Installation of Polyvinyl Chloride (PVC) Pressure Pipe and Fittings for Water
7. AWWA C651 – Disinfecting Water Mains
8. AWWA C900 – PolyVinyl Chloride (PVC) Pressure Pipe, 4 Inches through 12 Inches for Water
9. AWWA C909 – PolyVinyl Chloride (PVC) Pressure Pipe, 6 Inches through 16 Inches for Water.

C. Regulatory Requirements: Texas Commission on Environmental Quality (TCEQ), Title 30 Texas Administrative Code (TAC), Chapter 290, “Public Drinking Water”.

1. Rule §290.38 Definitions
2. Rule §290.39 General Provisions
3. Rule §290.44 Water Distribution

D. Regulatory Requirements: Texas Commission on Environmental Quality (TCEQ), Title 31 Texas Administrative Code (TAC), Chapter 317, “Design Criteria for Sewage Systems”.

E. Rule §317.13 Appendix E -- Separation Distances

F. NSF International NSF/ANSI 61 Drinking Water System Components – Health Effects

G. National Fire Protection Association (NFPA) NFPA 24 Installation of Private Fire Service Mains and Their Appurtenances

H. ASME International ASME B16.22 Wrought Copper and Copper Alloy Solder Joint Pressure Fittings

I. "The Copper Tube Handbook", by the Copper Development Association, Inc. (CDA), latest edition.

1.4 SUBMITTALS

A. Procedures for Submittals: DIVISION 1

B. Product Data: Manufacturer's product data sheets.

C. Certificates: Manufacturer's certificates attesting compliance with applicable specifications for grades, types, classes, and other properties of pipe, fitting, valves, valve boxes, and fire hydrants.

D. Shop drawings showing any deviations to the location and arrangement of water service and fire service piping systems.

E. Test Reports: Provide two (2) copies of each field quality control tests including, but not limited to hydrostatic tests, bacteriological tests, infiltration/exfiltration tests, mandrel tests, video camera test, flow test, etc.

F. Contractor is to accurately record installation of piping systems with appurtenances and present the information to Owner at the completion of the project as "Project Record Drawings".

1.5 QUALITY ASSURANCE

A. Comply with the provisions of DIVISION 1.

B. Comply with AWWA Standards for public drinking water.

C. Comply with the provisions of 30 TAC Chapter 290, Rules §290.38, §290.39, and §290.44 for installation and testing of potable water pipes and piping systems.

D. Comply with the provisions of 30 TAC Chapter 317, Rule §317.13 for location of water mains near sanitary sewer mains.

E. Comply with NSF 61 for potable water pipes and piping systems.

F. Comply with NFPA 24 for fire service pipes, piping systems, and related products.

G. Provide listing and/or approval stamp, label or other marking on piping and specialties made to specified standards.

PART 2 - PRODUCTS

2.1 POLYVINYL CHLORIDE (PVC) PIPE

A. PVC Water Pipe, 4" through 12": AWWA C900, Class 150, DR-18.

B. PVC Fireline Pipe, 4" through 12": AWWA C900, Class 200, DR-14.

C. PVC Water Pipe, 2" through 4": ASTM 2241, SDR-26, PVC 1120, PVC 1220 or PVC 2120. Joints shall be flexible elastomeric seals for plastic pressure pipe in accordance with ASTM D3139.

D. PVC Water Pipe shall bear NSF seal of approval and shall be pressure class 150 PSI.

E. Pipe shall be furnished with bell and spigot joint with rubber gasket joint meeting the standards specified by AWWA C111-72 (ANSI A21.11), or its latest revision. Spigot ends shall be beveled and reference marked to facilitate joining and insure propert seating depth.

2.2 FITTINGS

A. Buried Fittings: Ductile Iron compact type with push-on joints complying with ANSI A21.53/AWWA C153, or standard fittings complying with AWWA C110. Use mechanical joints with retainer glands where required for complete system. For potable water systems, ductile iron fittings shall bear the NSF seal and be marked for potable water use.

B. Rating: Fittings working pressure rated to 250 psi.

C. Wrapping: Buried ductile iron fittings wrapped with 8-mil polyethylene encasement, AWWA C105.

2.3 COPPER TUBING

A. Copper Tubing (1/2" through 2") shall comply with ASTM B88, Type K, drawn, temper. Fittings shall be wrought copper solder-joint pressure-type complying with ASME B16.22.

2.4 VALVES AND HYDRANTS

A. Gate Valves:

1. "A-2360 Series Resilient Wedge Gate Valves", by Mueller Company, Decatur, Illinois; http://www.muellercompany.com.
2. American Flow Control "Series 2500 Resilient Wedge Valves", by American Cast Iron Pipe Company, Birmingham, Alabama; http://www.acipco.com/afc/.
3. "200 Series Resilient Wedge Gate Valves", by Matco-Norca, http://www.matco-norca.com
4. All shall be provided with an "open left", counter clockwise, wrench nut.

B. Valve Boxes:

1. Products by Tyler Pipe/Utilities Division, Tyler, Texas; http://www.tylerpipe.com/
2. Products by American Flow Control, American Cast Iron Pipe Company, Birmingham, Alabama; http://www.acipco.com/afc/.

C. Fire Hydrants:

1. "Super Centurion Fire Hydrant", by Mueller Company, Decatur, Illinois; http://www.muellercompany.com.
2. American Flow Control "5¼" American Darling B-84-B" by American Cast Iron Pipe Company, Birmingham, Alabama; http://www.acipco.com/afc/.

PART 3 - EXECUTION

3.1 GENERAL

A. Some water mains and valves are existing. Field verify location and depth of existing water utilities. Valve boxes shall be adjusted to the new finish grades.

B. Provide for a surveyor to stake the accurate locations of proposed piping system including pipe alignment, valves, and all other appurtenances.

C. Do not lay pipe in water, or when trench or weather are unsuitable for work. Keep water out of trench until jointing is complete and bedding is placed to top of pipe. When work is not in progress, close ends of pipe and fittings securely so that no trench water, earth or other substance will enter pipes or fittings.

D. Pay for and obtain all permits for work in public right-of-way and connecting to public facilities.

3.2 WATER SYSTEM INSTALLATION

A. General Locations and Arrangements: The Drawings indicate general locations and arrangements of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction losses, expansion, pump sizes, and other design considerations. Minor variations in the piping system layout are permissible and, at times, unavoidable. However, significant deviations to the piping system layout as shown on the Drawings, shall not be acceptable unless such deviations are approved by the Engineer.

B. Install PVC water pipe in accordance with AWWA C605.

C. Install pipe true to alignments and grades shown on the Drawings, free of sags and unspecified bends.

D. Do not exceed pipe manufacturer’s recommended deflection limits from straight line or grade when laying pipe on horizontal curves, vertical curves, or offsets. If alignment requires deflections in excess of these limitations, install manufactured bends or cut pipe into shorter lengths to provide angular deflections within the manufacturer’s limits.

E. Pipe joints.

1. Joints for PVC water pipe shall be gasketed using flexible elastomeric seals.
2. Make push-on joints in accordance with manufacturer’s recommendations.
3. Install piping with restrained joints at horizontal and vertical changes in direction. Use restrained-joint piping and thrust blocks. Use anchors, tie-rods, clamps, or other supports where necessary.
4. When joining dissimilar piping materials, use couplings or adapters compatible with both piping materials, outside diameter, system working pressure, and manufactured specifically for the intended use.
5. Install mechanical joints in accordance with manufacturer’s recommendations.

F. Install fittings for changes in direction and branch connections.

G. Wrap all ductile iron fittings and valves in polyethylene sheet in accordance with AWWA C105.

H. Anchorage or Fittings - Thrust Block: Anchor tees, bends and plugged, valved or capped ends of lines of water mains. Place blocks so that the joints will be accessible for inspection and repair.

I. Install components with pressure rating equal to or greater than system operating pressure.

J. Bury piping with a depth of cover, as measured from finish grade to top of pipe, not less than 48 inches.

K. Install blue plastic warning tape that reads "Caution Water Main" in black letters every 4 feet and shall be placed approximately 12” above the top of pipe prior to the placement of subsequent backfill layers.

L. Install 4” wide aluminum tape at 12” below grade with all water distribution piping.

3.3 VALVE INSTALLATION

A. General Application: Use mechanical-joint-end valves for 3-inch and larger underground installation. Use threaded- or flanged-end valves for installation in vaults. Use bronze corporation stops and valves, with ends compatible with piping, for 2½-inch and smaller installation.

B. Install underground valves with stem pointing up and with cast-iron box. Provide valve stem extensions so that operating nut is set within 18 inches of finish grade.

C. Bronze corporation stops and curb stops: Comply with manufacturer’s written instructions. Install underground curb stops with head pointed up and with cast-iron curb box.

3.4 FIRE HYDRANTS

A. Install fire hydrants and associated valves as shown on the Drawings and in accordance with NFPA 24.

B. Install each fire hydrant with a separate gate valve on fire lead from main, anchor with restrained joints or thrust blocks, and support in upright position.

C. Prior to installing valves or fire hydrants, remove foreign matter from within the valves. Inspect the valves in open and close position to verify that parts are in satisfactory working condition.

D. Place a concrete thrust block on fire hydrant shoe opposite pipe connection, set against vertical face of trench, to prevent hydrant from blowing off line. Do not block drain holes. If character of soil is such that fire hydrant cannot be securely wedged in this manner, provide restrained pipe joints.

E. Place a minimum of 5 cubic feet of gravel or crushed stone around base of fire hydrant to ensure drainage. Do not block drain holes. Compact backfill thoroughly around hydrant to grade line.

3.5 WATER SERVICES

A. Water Service Piping Materials.

1. For services 2½” and larger, use PVC water pipe for service and provide a wye fitting in the new main.
2. For services 2” and smaller, use copper tubing for service and tap new main with standard brass or stainless steel service saddle and corporation stop.

B. Install PVC water pipe in accordance with ASTM F645.

C. Install copper tubing in accordance with CDA’s “The Copper Tubing Handbook”.

D. Connect to water main and extend water service to building. Install water services after water mains have been pressure tested and disinfected. Make connection to building water piping systems when those systems are installed.

3.6 FIELD QUALITY CONTROL

A. Piping Tests: Conduct piping tests before joints are covered and after thrust blocks have hardened sufficiently. Fill pipeline 24 hours before testing and apply test pressure to stabilize system. Use only potable water.

B. Hydrostatic Tests:

1. Test at not less than 1.50 times working pressure for 2 hours.
2. Increase pressure in 50 psig increments and inspect each joint between increments. Hold at test pressure for one hour, then decrease to 0 psig. Slowly increase again to test pressure and hold for one more hour, then decrease to 0 psig. Repeat this testing cycle until the specified test pressure is tested, holding for 2 hours.
3. Maximum allowable leakage is 2 quarts per hour per 100 joints. Remake leaking joints with new materials and repeat test procedure until leakage is within the specified limits.

C. Prepare reports for testing activities, including locations of pipe tested, environmental conditions, test description, and test results.

3.7 DISINFECTION

A. Clean and disinfect water distribution piping system prior to making building connections and turning system over to Owner.

B. Purge new water distribution piping systems and parts of existing systems that have been altered, extended, or repaired before use.

C. Use purging and disinfecting procedures prescribed in AWWA C651.

D. Prepare reports for purging and disinfecting activities, including locations of pipe purged and disinfected, and description of procedures.

3.8 DISPOSAL OF WATER

A. Contractor shall coordinate the disposal of all domestic water, resulting from new construction, with the Owner prior to beginning work.

END OF SECTION 331000

SECTION 33 30 00 – SANITARY SEWERAGE UTILITIES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Complete sanitary sewers and appurtenances using construction techniques and materials as required by the construction plans and these Specifications.

3. ASTM C478 – Precast Reinforced Concrete Manhole Sections.
4. ASTM D1248 – Polyethylene Plastics Molding and Extrusion Materials.
5. ASTM D2241 – Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR-Series).
6. ASTM D2321 – Practice for Underground Installation of Plastic Gravity-Flow Sewers.
7. ASTM D3034 – Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings.
8. ASTM D3212 – Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.

B. American Water Works Association (AWWA)

1. AWWA C110 – Ductile Iron and Gray-Iron Fittings, 3 Inches through 48 Inches, for Water and Other Liquids.
2. AWWA C150 – PVC piping with 150 psi pressure rating.

C. Regulatory Requirements: Texas Commission on Environmental Quality (TCEQ), Title 31 Texas Administrative Code (TAC), Chapter 317, “Design Criteria for Sewage Systems”.

1. Rule §317.1 General Provisions
2. Rule §317.2 Sewage Collection System
3. Rule §317.13 Appendix E – Separation Distances

D. Regulatory Requirements: Texas Commission on Environmental Quality (TCEQ), Title 30 Texas Administrative Code (TAC), Chapter 290, “Public Drinking Water”.

1. Rule §290.44(e) Location of Waterlines

1.4 SUBMITTALS

A. Procedures for submittals: DIVISION 1.

B. Product Data: Manufacturer's product data sheets for iron castings and pipe material

C. Quality Control Submittals:

1. Certificates: Manufacturer's certificates attesting compliance with applicable specifications for grades, types, classes, strengths and thickness of pipe and fittings.
2. Certificates: Manufacturer's certificates attesting compliance with applicable specifications for precast manhole sections, joints, and pipe connectors.
3. Test Reports: Results of field quality control tests.

D. Contract Closeout Submittal:

1. Project Record Documents: Submit documents in accordance with DIVISION I. Accurately record actual location of each service connection to building and each manhole.

1.5 QUALITY ASSURANCE

A. Comply with the provisions of DIVISION 1.

B. Comply with the provisions of 30 TAC Chapter 317, Rule §317.1, §317.2, and §317.13.

C. Comply with the provisions of 30 TAC Chapter 290, Rule §290.44(e).

PART 2 - PRODUCTS

2.1 SANITARY SEWER PIPE

A. Polyvinyl Chloride Pipe (PVC):

1. For Gravity Sewer Main where required due to clearance from waterline: ASTM D2241 SDR-26 PVC pressure-rated pipe.
2. For Gravity Sewer Main elsewhere: ASTM D3034, SDR-35 PVC pipe and fittings, as applicable.

2.2 CLEANOUTS

A. Install in accordance with TCEQ and Drawings

2.3 SERVICE CONNECTIONS

A. Install in accordance with TCEQ and Drawings.

2.4 MANHOLES

A. Precast Concrete Manholes: Precast concrete manholes shall comply with ASTM C478. Joints for precast concrete manholes shall be rubber gaskets comply with ASTM C443.

B. Cast-in-place Concrete Manholes: Provide reinforced cast-in-place concrete with 28-day compressive strength of 3000 psi.

C. Iron Castings: Gray Cast Iron, ASTM A48, Class 20, free of imperfections, with holes in cover lean and free from plugs.

1. Machine bearing surfaces of manhole frames and covers to provide even bearing in any position in which the manhole cover is seated on the frame.
2. Cast the word “SEWER” on each manhole cover.
3. Provide bolt down pressure type covers with seal consisting of either a 1/16 in. copper gasket or 1/4 in. diameter neoprene O-ring gasket between cover and frame.

D. Pipe Connectors: Pipe connectors shall comply with ASTM C923. “Press-Wedge”, “Res-Seal”, or equal.

PART 3 - EXECUTION

3.1 PREPARATION

A. The Contractor is to provide a surveyor to stake locations of manholes, cleanouts and sanitary sewer main at a minimum 50-foot intervals.

3.2 EXCAVATION

A. Excavate for sanitary sewer systems as specified in SECTION 31 23 33.

3.3 PIPE INSTALLATION

A. Comply with ASTM D2321.

B. General:

1. Lay type, class, and size of pipe as scheduled on Drawings. Install piping in accordance with manufacturer’s installation instructions.
2. Protect pipe during handling against impact shocks and freefalls. Do not install damaged or defective pipe.
3. Keep pipe clean as work progresses. Keep interior of pipe clear of dirt and deleterious materials during installation.

C. Lay piping at lowest point of trench with spigot end pointing in direction of flow.

D. Lay each pipe firmly and true to line and grade, forming a closed concentric joint with the adjoining pipe and preventing sudden offsets of the flow line.

E. Make adjustments to line and grade scraping away or filling under the body of the pipe. Wedging to blocking under the pipe ends is prohibited.

F. When work is not in progress, close open ends of pipe and fittings to prevent water, earth or other substances from entering the pipe and fittings.

3.4 PIPE BEDDING - INSTALLATION

A. Provide bedding for all sizes and depths of sanitary sewer pipe as detailed on Drawings, and specified in SECTION 31 23 34.

3.5 SERVICE CONNECTIONS - INSTALLATION

A. Coordinate the exact location of all sanitary sewer connections with Drawings prepared by the Mechanical Engineer.

B. Locate far-side service connections and near-side service stubs as shown on Drawings.

1. Show actual locations of installed service connections on Project Record Drawings.

3.6 CLEANOUTS - INSTALLATION

A. Locate cleanouts as shown on Drawings.

1. Show actual location of installed cleanouts on Project Record Drawings.

3.7 MANHOLES - INSTALLATION

A. General: Manhole base shall be cast-on-site.

B. Installation Procedures

1. Make manhole cut-outs: Prepare excavation in a normal manner. Be sure excavation has been properly shored for safety. Mark manhole for pipe cut-outs. 90 degree marks are stenciled on the bottom of each manhole at the factory in order to locate the cut-out positions.
2. Pour concrete base: Pour concrete base in place in the trench. Make sure the concrete extends at least one foot from the outside wall of the manhole and a minimum of six inches above incoming lines. On the inside, the concrete will form a fully enclosed bench and invert area. Make sure the concrete is at least four inches above the incoming lines inside the manhole.
3. Set manhole: To lift the manhole, insert a 4" x 4" timber into the opening at the top of the manhole. Attach a rope or a chain to the timber and lift with backhoe or other lifting device. Set manhole into the wet concrete and insert to the required depth.
4. Backfill: Backfill with sand or stabilized soil of moderate compaction free from large stones or other debris. The backfill should be added in one foot lifts beginning at the manhole and working outward to avoid uneven lateral pressure.
5. Bring to grade: Use pre-cast concrete grade rings mortared in place to bring the manhole to grade level.

C. Encase manhole drop structure in mortar to form one continuous structure with the manhole.

3.8 BACKFILLING

A. Back fill sanitary sewerage excavations as specified in SECTION 31 23 34.

B. Green plastic warning tape that reads "Caution-Sanitary Sewer" in black letters every 4 feet shall be placed approximately 12” above the top of pipe prior to the placement of subsequent backfill layers.

C. Install detector tape with all sanitary sewer piping.

3.9 FIELD QUALITY CONTROL

A. General: During construction, perform leakage testing and displacement testing as work progresses. No more than 500 linear feet of installed sewer shall be allowed to remain untested. After backfilling and removing debris from each section of sewer line, conduct a line acceptance test under observation of the engineer. Follow all TCEQ requirements for testing.

B. Leakage Testing: Test the sanitary sewer lines in strict accordance with the following leakage test using low-pressure air. If the test results indicate an unacceptable installation, locate the source of leakage, correct the defect, and retest until the installation is proven satisfactory. Follow all TCEQ requirements for testing.

1. Minimum Requirements for Equipment:

   a. Control panel.
   b. Low-pressure air supply connected to control panel.
   c. Pneumatic plugs of acceptable size for diameter of pipe to be tested; capable of withstanding internal test pressure without leaking or requiring external bracing.
   d. Air hose from control panel to:
      (i) Air supply
      (ii) Pneumatic plugs
      (iii) Sealed Line for pressurizing
      (iv) Sealed line for monitoring internal pressure

2. Test Pneumatic Plugs: Test plugs before using in actual test installation.

   a. Place one length of pipe on ground and seal at both ends of pneumatic plugs to be checked.
   b. Pressurize plugs to 25 psig; then pressurize sealed pipe to 5 psig.
   c. Plugs are acceptable if they remain in place against the test pressure without external aids.

3. Compensating for Groundwater Pressure:

   a. Where groundwater exists, install a capped nipple at the same time the sewer line is placed. Use a ½-inch capped pipe nipple approximately 10 inches long. Make the installation through the manhole wall on top of the sewer line where the line enters the manhole.
   b. Immediately before performing the line acceptance test, remove the pipe cap, clear the pipe nipple with air pressure, and connect a clear plastic tube to pipe nipple. Support the tube vertically and allow water to rise in the tube. After the water stops rising, measure the height in feet of water over the invert of the pipe. Divide this height by 2.3 feet/psi to determine the groundwater pressure to be used in line testing.

4. Line Testing: After pneumatic plugs have been checked, place plugs in line at manhole and inflate plugs to 25 psig. Introduce low-pressure air into the sealed line until the internal air pressure reaches 4 psig greater than the groundwater pressure. Allow at least 2 minutes for air pressure to stabilize. If at least 3.5 psig over groundwater pressure is maintained, disconnect the air hose from the control panel to the air supply and measure the time of the pressure drop between 3.5 and 2.5 psig above groundwater pressure.

   a. The installation is acceptable if the air low rate does not exceed 0.003 cfm per square foot of internal pipe surface with an average test pressure of 3.0 psig greater than groundwater pressure.
   b. The line between manholes is within acceptable limits if the time for the 1 psig pressure drop is not less than the time listed below for pipe sizes indicated.

Pipe Diameter (in)	Minutes Pressure is Maintained
6	3.0
8	4.0
10	5.0
12	5.5
15	7.5
18	8.5
21	10.5
24	11.5
30	14.5
36	17.0

C. Test for Displacement of Sewers: Test plastic pipe sizes 6 inches through 30 inches for deflection by pulling a mandrel with an outside diameter equal to 95 percent of the base inside diameter of the pipe through the pipe after backfilling is complete. Base inside diameters for PVC pipe shall be as per pipe manufacturer's published data.

1. Mandrel shall be cylindrical in shape and constructed with at least seven evenly spaced arms or prongs. Mandrels with less arms will be rejected as not sufficiently accurate. Contact length of the mandrel's arms shall equal or exceed the nominal diameter of the sewer to be inspected.
2. Hand pull mandrel through all plastic sewer lines. Uncover sections of sewer not passing the mandrel and replace. Retest or replace sewer lines.
3. Inspection no earlier than 30 days after reaching final trench backfill grade, provided that the soil has thoroughly settled throughout the entire trench.

END OF SECTION 333000

SECTION 33 40 00 – STORM DRAINAGE UTILITIES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Provide the required material and workmanship for the installation of storm sewer pipe, culverts, grate inlets and appurtenances, including headwalls.

1.2 RELATED SECTIONS

A. SECTION 311000 - SITE PREPARATION AND DEMOLITION

B. SECTION 312333 - TRENCH EXCAVATION

C. SECTION 312334 - TRENCH BACKFILL

D. SECTION 312335 - TRENCH SAFETY SYSTEMS

E. SECTION 033100 – CAST-IN-PLACE CONCRETE

1.3 REFERENCES

A. ASTM C76 - Reinforced Concrete Culvert, Storm Drain and Sewer Pipe.

B. ASTM C433 – Joints for Circular Concrete Sewer and Culvert Pipe using Rubber Gaskets.

C. ASTM C850 / AASHTO M273 – Precast Reinforced Concrete Box Sections for Culverts, Storm Drains and Sewers

1.4 SUBMITTALS

A. Procedures for Submittals: DIVISION 1.

B. Pipe Certification: Manufacturer’s certifications that pipe meet the requirements of these specifications.

PART 2 - PRODUCTS

2.1 STORM SEWER PIPE

A. Reinforced Concrete Pipe: Provide reinforced concrete pipe, which conforms to ASTM C76, Class III Wall B.

B. Plastic Pipe:

1. Provide Rigid Poly (Vinyl Chloride) Schedule 40 pipe, which conforms with ASTM D1784 and ASTM D2466.

2.2 CONCRETE PIPE JOINT MATERIAL

A. Cold Compound Joints: For concrete pipe sections carrying rainfall runoff, furnish pipe joint material.

1. Cold-applied preformed plastic gasket. Plastic gasket shall be produced from blends of refined hydrocarbon resins and plasticizing compounds reinforced with inert material filler and shall contain no solvents, irritating fumes, or obnoxious odors.
2. Expanded cellular rubber gaskets. Expanded cellular rubber gaskets shall be produced from a blend of nitrile and vinyl polymers meeting the physical requirements of ASTM D1056, Class 2C1.

B. Rubber Gasket Joints: For concrete pipe sections subject to hydrostatic tests. Rubber Gasket shall be of the O-ring design and shall meet requirements of ASTM C443. Joint shall be installed per manufacturer's recommendation.

2.3 JUNCTION BOXES

A. Precast Concrete Junction Boxes: Precast concrete junction boxes shall comply with ASTM C850. Joints for precast concrete junction boxes shall be rubber gaskets complying with ASTM C443.

B. Cast-in-place Concrete Junction Boxes: Provide reinforced concrete with 28-day compressive strength of 3000 psi.

C. Iron Castings: Gray Cast Iron, ASTM A48, Class 20, free of imperfections, with holes in cover lean and free from plugs.

1. Machine bearing surfaces of manhole frames and covers to provide even bearing in any position in which the manhole cover is seated on the frame.
2. Cast the words "STORM SEWER" on each manhole cover.
3. Provide bolt down pressure type covers with seal consisting of either a 1/16 in. copper gasket or 1/4 in. diameter neoprene O-ring gasket between cover and frame.

D. Pipe Connectors: Pipe connectors shall comply with ASTM C923.

2.4 TRENCH DRAINS

A. Trench Drains: Dura Slope by NDS or approved equal. Trench drain grate shall be stainless steel and ADA compliant.

B. Trench drains shall be installed per manufacturer's recommendation.

PART 3 - EXECUTION

3.1 EXCAVATION, BACKFILLING AND COMPACTION

A. Excavation, backfill, and compaction of the trench shall be in accordance with Sections 31 23 33 - TRENCH EXCAVATION and 31 23 34 - TRENCH BACKFILL. Install detector tape with all storm sewer piping.

3.2 PIPE INSTALLATION

A. Pipe Sewers and Culverts: Do not place pipe until the excavation has been completed, the bottom of the trench shaped, proper bedding material placed, and the line and grade have been obtained. Lay pipe accurately to line and grade in a straight line with spigot end of the pipe pointing in the direction of flow. Fit pipes together and match them so that when laid, the pipe will form a sewer or culvert with smooth and

uniform invert except where there is a pipe size change, in which case, the crowns of the larger and smaller pipes shall be at the same elevation and a concrete collar used to make the connection, unless otherwise shown.

3.3 CONCRETE PIPE CULVERT JOINT INSTALLATION

A. The joint assembly shall be made according to the recommendations of the gasket manufacturer meeting ASTM C443. Water tight joints will be required.

3.4 HEADWALL AND INLET INSTALLATION

A. Construct all headwalls and inlets to line and grade and at locations shown. Construct in accordance with Section 03 31 00 – CAST-IN-PLACE CONCRETE, and as detailed in the Drawings. Neatly cut off all pipe leads at the appropriate face of the headwall, manhole or inlet wall and finish with mortar.

3.5 JUNCTION BOXES - INSTALLATION

A. Provide bottom or floor of precast base sections with minimum thickness of 12 inches, unless shown otherwise on Drawings. Bottom shall project no less than 6 inches beyond the outside walls of the base to form a flange intended to resist uplift.

B. Provide suitable cutouts no less than 6 inches above inside surface of the floor of the base.

C. Provide precast sections in accordance with the Drawings.

D. Invert channels shall be smooth, accurately shaped, and in accordance with the Drawings.

END OF SECTION 334000

SECTION 33 41 14 - LANDSCAPE DRAINAGE SYSTEM WITH BRIDGING STONE AND COARSE SAND MEDIA

PART 1 – GENERAL

1.1 DESCRIPTION

A. Furnish all work and materials, appliances, tools, equipment, facilities, transportation, and services necessary for and incidental to performing all operations in connection with the installation of the landscape drainage/underdrain system.

B. Conform to the requirements of the general conditions of the contract.

1.2 RELATED SECTIONS

A. Section 33 41 00 – Storm Utility Drainage Piping.

1.3 SUMMARY

A. Section Includes: Providing and installing landscape drainage/underdrain system.

1. Trenching and backfilling.
2. Providing and installing all pipe, including joints and fittings, cutting pipe to conform to structures and attaching to point of connection at storm line.
3. Providing and installing clean outs with solid wye or bend connection.
4. Providing and installing planter/atrium drains to point of connection at piping.
5. Providing and installing all underdrain pipe, solid and slotted/perforated, for underdrain system within drainage layer at edges of planting beds.
6. Providing and installing shade cloth.
7. Providing and installing drain gravel bridging stone and coarse sand media separating sand.

1.4 REFERENCES

A. Applicable Standards: Apply the current of latest edition of American Society for Testing and Materials (ASTM).

1. C 33: Specifications for Concrete Aggregates
2. C 131: Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
3. C 136: Method for Sieve Analysis of Fine and Course Aggregates
4. C 535: Test Method for Resistance to Degradation of Large-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine.
5. D 448: Standard Classification for Sizes of Aggregate for Road and Bridge Construction.
6. D 1785: Polyvinyl Chloride (PVC) Plastic pipe. Schedule 40, 80 and 120.
7. Standard and perforated Schedule 40 PVC pipe and fittings conforming to ASTM D 2729 sewer piping or D2665 DWV piping.
8. F 405: Standard Specification for Corrugated Polyethylene (PE) Pipe and Fittings.
9. F 949: Standard Specification for Poly (Vinyl Chloride) (PVD) Corrugated Sewer Pipe with a Smooth Interior and Fittings
10. Standard Specifications – North Central Texas Council of Governments and City of Dallas Building Code.

1.5 QUALITY ASSURANCE

A. General: Perform work in accordance with all applicable laws, codes and regulations required by the local city code, building code or university standards.

1.6 SUBMITTALS

A. Product Data: Submit manufacturer's latest catalog cuts and specifications for each specified product.

B. Samples:

1. Solid drain pipe: Manufacturer’s literature and twelve (12) inch piece of pipe.
2. Perforated Pipe: Manufacturer’s literature and twelve (12) inch piece of pipe.
3. Clean-outs: Manufacturer's literature and gray threaded sewer cap.
4. Atrium/Planter Drain: Manufacturer’s literature for each size.
5. Drain Gravel – Bridging Stone: Supplier's literature and one (1) gallon sample bag.
6. Coarse Sand Media Separating Sand: Supplier's literature and one (1) gallon sample bag.
7. Shade Cloth: Supplier’s literature and twelve (12) inch square piece of cloth.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver products in original factory unopened, undamaged packaging bearing identification of product, manufacturer, batch number, and expiration data, as applicable.

B. Store the product in a location protected from damage, construction activity, and precipitation in strict accordance with the manufacturer's recommendations.

C. Pipe: Cap openings against entry by foreign matter where required.

D. Damaged Materials: Remove all damaged materials and replace at no expense to Owner.

1.8 COORDINATION

A. Concealed Work: Verify and locate existing pipes, cast in place pipes for point of connection and structures to be coordinated with landscape drainage work. Review all available records and make all necessary explorations and excavations.

B. Field Measurements: Establish lines and levels for each drainage system and coordinate with other systems for prevent conflicts and maintain proper clearances.

C. Notification: Submit to Owner’s Authorized Representative written notification of all discrepancies in the Drawings or existing conditions which preclude successful installation of landscape drainage work as specified.

1.9 FINAL ACCEPTANCE

A. Review Date: Make a written request for review for Final Acceptance at least five days in advance.

B. Completion: Work will be accepted upon satisfactory completion of all landscape drainage work.

C. Responsibility: Upon Final Acceptance, Owner will assume responsibility for maintenance of the work.

PART 2 – MATERIALS

2.1 SOLID POLYVINYL CHLORIDE (PVC) PIPE AND FITTINGS

A. Marking and identification: Schedule 40 PVC pipe shall be continuously and permanently marked with the following information: manufacturer’s name, size, type of pipe and material, SDR number, product standard number and the National Sanitation Foundation (NSF) seal. Polyvinyl chloride pipe and fittings PVC 1120, conforming to ASTM D1785-76, sizes as shown on the Drawings.

B. Flexible PVC shall be made from virgin PVC material and shall comply with ASTM D2287.

C. Cleanout with Threaded Plug, color: Gray.

2.2 SLOTTED UNDERDRAIN PIPE AND FITTINGS – Refer to Civil for layout

A. Slotted/Perforated Pipe: Shall be equal to "ADS" Polyethylene N-12 smooth wall (double wall) perforated (SP) with fittings as manufactured by Advanced Drainage Systems, Inc. Perforations shall be slotted 120 degrees apart alternating corrugations. **No filter sock is to be used**. If equivalent product is available, submit for review and approval by Owner’s Authorized Representative.

2.3 ATRIUM/PLANTER DRAINS (if needed) – Refer to Civil for drain locations

A. Shall be polyethylene grate NDS #90 6" Atrium Grate, color: black, as manufactured by National Diversified Sales, Inc. (NDS), 851 N. Harvard Avenue, Lindsay, California 93247, (1-800-726-1994) or Local Representative: WWIP Corp. (214-920-8420) or equivalent as determined by Owner's Authorized Representative.

2.4 SHADE CLOTH FABRIC

A. Woven Shade Cloth and Anchor Pins: Shall be equal to DeWitt Woven Shade Cloth – WS 63 - 63% Black, 100% Polypropylene monofilament strands and anchor pins as manufactured by DeWitt, 905 S. Kingshighway, Sikeston, MO 63801, (800-888-9669), www.dewittcompany.com, or equivalent product as reviewed and approved by Owner's Authorized Representative.

2.5 BRIDGING STONE DRAIN GRAVEL AND COARSE SAND MEDIA SEPARATING SAND

A. In accordance with ASTM C33, C131, C136 and C535.

B. In accordance with the following additional requirements:

1. Drain Gravel - Bridging Stone - Size No. 8 Stone, locally available, angular, graded and screened with no fines per table below, washed to remove all silts and fines.

a. Material is available from Vulcan Materials Company, www.vulcanmaterials.com. Material called VMC D-Rock, Plant 4013-111, Weatherford Quarry, Product 27771 HMA AGG TYPE D. Meet gradation range as noted below.

ASTM No. 8 Grading Requirements

ASTM Sieve Size	Percent Passing by Weight
1/2 inch (12.5 mm)	100
3/8 inch (9.5 mm)	85-100
No. 4 (4.75 mm)	10-30
No. 8 (2.36 mm)	0-10
No. 16 (1.16 mm)	0-5

2. Coarse Sand Media Separating Sand – Clean, hard, washed, durable particles of natural or manufactured sand; free from frozen material and from injurious amounts of salt, alkali, vegetation matter, or other objectionable material.

a. Material is available from Vulcan Materials Company, www.vulcanmaterials.com., Plant 4013-111, Weatherford Quarry, Product 30931 Manufactured Sand. TxDOT Conc Fine Agg. Meet gradation range as noted below.

Coarse Sand Aggregate

Size Conforming to Grading Requirements

ASTM Sieve Size	Percent Passing by Weight
3/4 inch	100
#4	95-100
#50	25-60
#100	0-10
#200	0-5

PART 3 – EXECUTION

3.1 GENERAL

A. Existing Utilities: Where grade or alignment or pipe if obstructed by existing utility structures such as conduits, ducts or pipes, permanently support, relocate, remove or reconstruct the obstruction.

B. Deviations: Make no deviations from specified line or grade without written acceptance of change by Owner's Authorized Representative.

C. Verification: Verify rim elevations of area drains relative to adjacent walls prior to beginning of work.

3.2 TRENCHING AND BACKFILLING

A. When trench excavation encounters hardpan, rock, mud, quicksand, debris, or other unsuitable bedding material, trench shall be further excavated to a suitable limit as directed by Owner's Authorized Representative. Excavation shall then be backfilled with approved import material that will provide adequate pipe bedding. Import material will be cement stabilized sand for sections of solid PVC piping between tree pits, unless otherwise specified by Engineer.

1. Cement stabilized sand shall be used for backfilling around the solid PVC pipe and to twelve (12) inches above the top of the pipe. The remaining trench may be backfilled with excavated material, except that if said material is unsuitable for compaction, imported suitable material shall be used.

B. All trench backfill shall be compacted to (ninety-five (95%) percent) relative density per ASTM D698.

C. Excavation shall be backfilled with approved import material that will provide adequate pipe bedding. All trench backfill shall be compacted to (ninety-five (95%) percent) relative density per ASTM D698.

3.3 PIPE INSTALLATION

A. All pipe shall be installed and tested in accordance with the Standard Specifications prior to covering.

B. Solid polyvinyl chloride pipe and underdrain pipe shall be installed as detailed in the plans and in accordance with the manufacturer's current printed recommendations.

C. Insure all pipe has flow to discharge points or points of connection.

3.4 UNDERDRAIN SYSTEM

A. Excavate trench to depths and widths or install at edges of amended planting beds areas as shown on the Drawings.

B. Set underdrain pipe to proper elevations and maintain a continuous flow line between all points.

C. Install underdrain pipe permitting minor drift from side to side in trench and connect to solid PVC pipe installed where shown on drawings. Pitch pipe to connections at a gradient not less than 0.5 percent.

D. Tie underdrain pipe to points of connection at storm line.

E. Provide solid PVC pipe clean outs/extensions off underdrain pipe in direction of flow at maximum seventy-five (75) feet on center (min. fifty (50) feet on center) to six (6) inches above proposed surface finished grade of planting beds.

1. Cut to one (1) inch above finished grade of planting bed once topdressing is installed and cap with threaded sewer drain.

F. Install shade cloth along edges of excavated drainage layer per details to prevent horizontal siltation of drain gravel bridging stone and coarse sand media separating sand. Anchor pin the cloth to the sides of the excavated cell to retain in place while aggregates and underdrain pipe are being installed.

G. Install washed bridging stone drain gravel around underdrain pipe and over top of underdrain pipe to provide full three (3) inch depth around all sides of the pipe.

H. Install washed coarse sand media separating sand over top of bridging stone drain gravel to provide a full two (2) inch depth.

I. Coordinate installation of all underdrain materials in conjunction with excavation and amendments for planting beds.

J. Provide protection of underdrain system until planting media is installed.

K. Provide protection of underdrain system while installing irrigation.

L. For Planting Beds: Refer to Civil for pipe and planter drain locations for installation of subdrainage pipe at low points and trapped edges of planting and turf beds to prevent standing water over in situ saturated clay soils.

3.5 ATRIUM/PLANTER DRAINS (if required)

A. Install as shown on the Drawings and Details and in strict accordance with the manufacturer's current specifications.

B. At planters: Drainage piping lines to be minimum of 18” below top of finished grade to allow for planting depths.

C. Allow settlement of planting bed amendments, supplemental fill, and then adjust planter/atrium and lawn drains to elevation to ensure positive flow into the drain. Allow for approximately 2% surface slope towards drains.

D. Cut vertical drainpipe extension to finished grade elevation and install atrium/planter drain prior to topdressing installation.

3.6 CLEAN-UP

A. Keep all areas of work clean, neat and orderly at all times.

B. Upon completion of work, remove off the site all surplus materials, tools, equipment, rubbish, excess materials and debris resulting from the work.

END OF SECTION
