A. Protect windows from damage during construction operations. If damage occurs, remove and replace as required to provide windows in their original, undamaged condition.

1. In addition to breakage, damage includes but is not limited to crazing, cracking, fissures and delamination.

END OF SECTION

SECTION 08 7100
DOOR HARDWARE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Mechanical and electrified door hardware
2. Electronic access control system components

B. Section excludes:

1. Windows
2. Cabinets (casework), including locks in cabinets
3. Signage
4. Toilet accessories
5. Overhead doors

C. Related Sections:

1. Division 01 Section "Alternates" for alternates affecting this section.
2. Division 06 Section "Rough Carpentry"
3. Division 06 Section "Finish Carpentry"
4. Division 07 Section "Joint Sealants" for sealant requirements applicable to threshold installation specified in this section.
5. Division 08 Sections:
   a. "Metal Doors and Frames"
   b. "Flush Wood Doors"
   c. "Stile and Rail Wood Doors"
6. Division 26 "Electrical" sections for connections to electrical power system and for low-voltage wiring.
7. Division 28 "Electronic Safety and Security" sections for coordination with other components of electronic access control system and fire alarm system.

1.03 SUBMITTALS

A. General:

1. Submit in accordance with Conditions of Contract and Division 01 Submittal Procedures.
2. Prior to forwarding submittal:
   a. Review drawings and Sections from related trades to verify compatibility with specified hardware.
   b. Highlight, encircle, or otherwise specifically identify on submittals: deviations from Contract Documents, issues of incompatibility or other issues which may detrimentally affect the Work.

B. Action Submittals:

1. Product Data: Submit technical product data for each item of door hardware, installation instructions, maintenance of operating parts and finish, and other information necessary to show compliance with requirements.
2. Riser and Wiring Diagrams: After final approval of hardware schedule, submit details of electrified door hardware, indicating:
   a. Wiring Diagrams: For power, signal, and control wiring and including:
      1) Details of interface of electrified door hardware and building safety and security systems.
      2) Schematic diagram of systems that interface with electrified door hardware.
      3) Point-to-point wiring.
      4) Risers.

3. Samples for Verification: If requested by Architect, submit production sample of requested door hardware unit in finish indicated and tagged with full description for coordination with schedule.
   a. Samples will be returned to supplier. Units that are acceptable to Architect may, after final check of operations, be incorporated into Work, within limitations of key coordination requirements.

4. Door Hardware Schedule:

a. Submit concurrent with submissions of Product Data, Samples, and Shop Drawings. Coordinate submission of door hardware schedule with scheduling requirements of other work to facilitate fabrication of other work critical in Project construction schedule.
b. Submit under direct supervision of a Door Hardware Institute (DHI) certified Architectural Hardware Consultant (AHC) or Door Hardware Consultant (DHC) with hardware sets in vertical format as illustrated by Sequence of Format for the Hardware Schedule published by DHI.
c. Indicate complete designations of each item required for each opening, include:
    1) Door Index: door number, heading number, and Architect's hardware set number.
    2) Quantity, type, style, function, size, and finish of each hardware item.
    3) Name and manufacturer of each item.
    4) Fastenings and other pertinent information.
    5) Location of each hardware set cross-referenced to indications on Drawings.
    6) Explanation of all abbreviations, symbols, and codes contained in schedule.
    7) Mounting locations for hardware.
    8) Door and frame sizes and materials.
    9) Degree of door swing and handing.
    10) Operational Description of openings with electrified hardware covering egress, ingress (access), and fire/smoke alarm connections.

5. Key Schedule:
    a. After Keying Conference, provide keying schedule that includes levels of keying, explanations of key system's function, key symbols used, and door numbers controlled.
    b. Use ANSI/BHMA A156.28 "Recommended Practices for Keying Systems" as guideline for nomenclature, definitions, and approach for selecting optimal keying system.
    c. Provide 3 copies of keying schedule for review prepared and detailed in accordance with referenced DHI publication. Include schematic keying diagram and index each key to unique door designations.
    d. Index keying schedule by door number, keyset, hardware heading number, cross keying instructions, and special key stamping instructions.
    e. Provide one complete bitting list of key cuts and one key system schematic illustrating system usage and expansion. Forward bitting list, key cuts and key system schematic directly to Owner, by means as directed by Owner.
    f. Prepare key schedule by or under supervision of supplier, detailing Owner's final keying instructions for locks.

C. Informational Submittals:

1. Provide Qualification Data for Supplier, Installer and Architectural Hardware Consultant.
2. Provide Product Data:
    a. Certify that door hardware approved for use on types and sizes of labeled fire-rated doors complies with listed fire-rated door assemblies.
    b. Include warranties for specified door hardware.

D. Closeout Submittals:

1. Operations and Maintenance Data: Provide in accordance with Division 01 and include:
    a. Complete information on care, maintenance, and adjustment; data on repair and replacement parts, and information on preservation of finishes.
    b. Catalog pages for each product.
    c. Final approved hardware schedule edited to reflect conditions as installed.
    d. Final keying schedule

e. Copy of warranties including appropriate reference numbers for manufacturers to identify project.
f. As-installed wiring diagrams for each opening connected to power, both low voltage and 110 volts.

E. Inspection and Testing:

1. Submit written reports to the Owner and Authority Having Jurisdiction (AHJ) of the results of functional testing and inspection for:
   a. Fire door assemblies, in compliance with NFPA 80.
   b. Required egress door assemblies, in compliance with NFPA 101.

1.04 QUALITY ASSURANCE

A. Qualifications and Responsibilities:

1. Supplier: Recognized architectural hardware supplier with a minimum of 5 years documented experience supplying both mechanical and electromechanical door hardware similar in quantity, type, and quality to that indicated for this Project. Supplier to be recognized as a factory direct distributor by the manufacturer of the primary materials with a warehousing facility in the Project's vicinity. Supplier to have on staff, a certified Architectural Hardware Consultant (AHC) or Door Hardware Consultant (DHC) available to Owner, Architect, and Contractor, at reasonable times during the Work for consultation.
2. Installer: Qualified tradesperson skilled in the application of commercial grade hardware with experience installing door hardware similar in quantity, type, and quality as indicated for this Project.
3. Architectural Hardware Consultant: Person who is experienced in providing consulting services for door hardware installations that are comparable in material, design, and extent to that indicated for this Project and meets these requirements:
   a. For door hardware: DHI certified AHC or DHC.
   b. Can provide installation and technical data to Architect and other related subcontractors.
   c. Can inspect and verify components are in working order upon completion of installation.
   d. Capable of producing wiring diagram and coordinating installation of electrified hardware with Architect and electrical engineers.

4. Single Source Responsibility: Obtain each type of door hardware from single manufacturer.

B. Certifications:

1. Fire-Rated Door Openings:
   a. Provide door hardware for fire-rated openings that complies with NFPA 80 and requirements of authorities having jurisdiction.
   b. Provide only items of door hardware that are listed products tested by UL LLC, Intertek Testing Services, or other testing and inspecting organizations acceptable to authorities having jurisdiction for use on types and sizes of doors indicated, based on testing at positive pressure and according to NFPA 252 or UL 10C and in compliance with requirements of fire-rated door and door frame labels.

2. Smoke and Draft Control Door Assemblies:
   a. Provide door hardware that meets requirements of assemblies tested according to UL 1784 and installed in compliance with NFPA 105

b. Comply with the maximum air leakage of 0.3 cfm/sq. ft. (3 cu. m per minute/sq. m) at tested pressure differential of 0.3-inch wg (75 Pa) of water.

3. Electrified Door Hardware
   a. Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction.

4. Accessibility Requirements:
   a. Comply with governing accessibility regulations cited in "REFERENCES" article 087100, 1.02.D3 herein for door hardware on doors in an accessible route. This project must comply with all Federal Americans with Disability Act regulations and all Local Accessibility Regulations.

C. Pre-Installation Meetings

1. Keying Conference
   a. Incorporate keying conference decisions into final keying schedule after reviewing door hardware keying system including:
      1) Function of building, flow of traffic, purpose of each area, degree of security required, and plans for future expansion.
      2) Preliminary key system schematic diagram.
      3) Requirements for key control system.
      4) Requirements for access control.
      5) Address for delivery of keys.

2. Pre-installation Conference
   a. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
   b. Inspect and discuss preparatory work performed by other trades.
   c. Inspect and discuss electrical roughing-in for electrified door hardware.
   d. Review sequence of operation for each type of electrified door hardware.
   e. Review required testing, inspecting, and certifying procedures.
   f. Review questions or concerns related to proper installation and adjustment of door hardware.

3. Electrified Hardware Coordination Conference:
   a. Prior to ordering electrified hardware, schedule and hold meeting to coordinate door hardware with security, electrical, doors and frames, and other related suppliers.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Inventory door hardware on receipt and provide secure lock-up for hardware delivered to Project site. Promptly replace products damaged during shipping.

B. Tag each item or package separately with identification coordinated with final door hardware schedule, and include installation instructions, templates, and necessary fasteners with each item or package. Deliver each article of hardware in manufacturer's original packaging.

C. Maintain manufacturer-recommended environmental conditions throughout storage and installation periods.

D. Provide secure lock-up for door hardware delivered to Project. Control handling and installation of hardware items so that completion of Work will not be delayed by hardware losses both before and after installation.

E. Handle hardware in manner to avoid damage, marring, or scratching. Correct, replace or repair products damaged during Work. Protect products against malfunction due to paint, solvent, cleanser, or any chemical agent.

F. Deliver keys to manufacturer of key control system for subsequent delivery to Owner.

1.06 COORDINATION

A. Coordinate layout and installation of floor-recessed door hardware with floor construction. Cast anchoring inserts into concrete.

B. Installation Templates: Distribute for doors, frames, and other work specified to be factory or shop prepared. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing door hardware to comply with indicated requirements.

C. Security: Coordinate installation of door hardware, keying, and access control with Owner's security consultant.

D. Electrical System Roughing-In: Coordinate layout and installation of electrified door hardware with connections to power supplies and building safety and security systems.

1.07 WARRANTY

A. Manufacturer's standard form in which manufacturer agrees to repair or replace components of door hardware that fail in materials or workmanship within published warranty period.

1. Warranty does not cover damage or faulty operation due to improper installation, improper use or abuse.
2. Warranty Period: Beginning from date of Substantial Completion, for durations indicated in manufacturer's published listings.
    a. Mechanical Warranty
        1) Locks
            a) Schlage L Series: 10 years
        2) Exit Devices
            a) Von Duprin: 10 years
        3) Closers
            a) LCN 4000 Series: 30 years
        4) Automatic Operators
            a) LCN: 2 years
    b. Electrical Warranty
        1) Locks
            a) Schlage: 3 year
        2) Exit Devices
            a) Von Duprin: 3 year
        3) Closers
            a) LCN: 2 years

1.08 MAINTENANCE

A. Furnish complete set of special tools required for maintenance and adjustment of hardware, including changing of cylinders.

B. Turn over unused materials to Owner for maintenance purposes.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. The Owner requires use of certain products for their unique characteristics and project suitability to ensure continuity of existing and future performance and maintenance standards. After investigating available product offerings, the Awarding Authority has elected to prepare proprietary specifications. These products are specified with the notation: "No Substitute."

1. Where "No Substitute" is noted, submittals and substitution requests for other products will not be considered.

B. Approval of alternate manufacturers and/or products other than those listed as "Scheduled Manufacturer" or "Acceptable Manufacturers" in the individual article for the product category are only to be considered by official substitution request in accordance with section 01 25 00.

C. Approval of products from manufacturers indicated in "Acceptable Manufacturers" is contingent upon those products providing all functions and features and meeting all requirements of scheduled manufacturer's product.

D. Where specified hardware is not adaptable to finished shape or size of members requiring hardware, furnish suitable types having same operation and quality as type specified, subject to Architect's approval.

2.02 MATERIALS

A. Fabrication

1. Provide door hardware manufactured to comply with published templates generally prepared for machine, wood, and sheet metal screws. provide screws according to manufacturer’s recognized installation standards for application intended.
2. Finish exposed screws to match hardware finish, or, if exposed in surfaces of other work, to match finish of this other work including prepared for paint surfaces to receive painted finish.
3. Provide concealed fasteners wherever possible for hardware units exposed when door is closed. Coordinate with “Metal Doors and Frames”, “Flush Wood Doors”, “Stile and Rail Wood Doors” to ensure proper reinforcements. Advise the Architect where visible fasteners, such as thru bolts, are required.

B. Provide screws, bolts, expansion shields, drop plates and other devices necessary for hardware installation.

1. Where fasteners are exposed to view: Finish to match adjacent door hardware material.

C. Cable and Connectors:

1. Where scheduled in the hardware sets, provide each item of electrified hardware and wire harnesses with number and gage of wires enough to accommodate electric function of specified hardware.

2. Provide Molex connectors that plug directly into connectors from harnesses, electric locking and power transfer devices.
3. Provide through-door wire harness for each electrified locking device installed in a door and wire harness for each electrified hinge, electrified continuous hinge, electrified pivot, and electric power transfer for connection to power supplies.

2.03 HINGES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Ives 5BB series

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide hinges conforming to ANSI/BHMA A156.1.
2. Provide five knuckle, ball bearing hinges.
3. 1-3/4 inch (44 mm) thick doors, up to and including 36 inches (914 mm) wide:
   a. Exterior: Standard weight, bronze or stainless steel, 4-1/2 inches (114 mm) high
   b. Interior: Standard weight, steel, 4-1/2 inches (114 mm) high

4. 1-3/4 inch (44 mm) thick doors over 36 inches (914 mm) wide:
   a. Exterior: Heavy weight, bronze/stainless steel, 5 inches (127 mm) high
   b. Interior: Heavy weight, steel, 5 inches (127 mm) high

5. Adjust hinge width for door, frame, and wall conditions to allow proper degree of opening.
6. Provide three hinges per door leaf for doors 90 inches (2286 mm) or less in height, and one additional hinge for each 30 inches (762 mm) of additional door height.
7. Hinge Pins: Except as otherwise indicated, provide hinge pins as follows:
   a. Steel Hinges: Steel pins
   b. Non-Ferrous Hinges: Stainless steel pins
   c. Out-Swinging Exterior Doors: Non-removable pins
   d. Out-Swinging Interior Lockable Doors: Non-removable pins
   e. Interior Non-lockable Doors: Non-rising pins

8. Provide hinges with electrified options as scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware. Locate electric hinge at second hinge from bottom or nearest to electrified locking component. Provide mortar guard for each electrified hinge specified.

2.04 CONTINUOUS HINGES

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. Zero

B. Requirements:

1. Provide aluminum geared continuous hinges conforming to ANSI/BHMA A156.26, Grade 1.
2. Provide aluminum geared continuous hinges, where specified in the hardware sets, fabricated from 6063-T6 aluminum.
3. Provide split nylon bearings at each hinge knuckle for quiet, smooth, self-lubricating operation.
4. Provide hinges capable of supporting door weights up to 450 pounds, and successfully tested for 1,500,000 cycles.
5. On fire-rated doors, provide aluminum geared continuous hinges classified for use on rated doors by testing agency acceptable to authority having jurisdiction.
6. Provide aluminum geared continuous hinges with electrified option scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware.
7. Provide hinges 1 inch (25 mm) shorter in length than nominal height of door, unless otherwise noted or door details require shorter length and with symmetrical hole pattern.

2.05 ELECTRIC POWER TRANSFER

A. Manufacturers:

1. Scheduled Manufacturer and Product:
   a. Von Duprin EPT-10

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide power transfer with electrified options as scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware.
2. Locate electric power transfer per manufacturer's template and UL requirements, unless interference with operation of door or other hardware items.

2.06 DOOR CORDS

A. Manufacturers:

1. Scheduled Manufacturer and Product:
   a. Locknetics DC Series

2. Acceptable Manufacturers and Products:
   a. No Substitute

B. Requirements:

1. Provide door cords with electrified options as scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware.
2. Locate electric power transfer per manufacturer's template and UL requirements, unless interference with operation of door or other hardware items.

2.07 MORTISE LOCKS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Schlage L9000 series

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide mortise locks conforming to ANSI/BHMA A156.13 Series 1000, Grade 1, and UL Listed for 3-hour fire doors.
2. Indicators: Where specified, provide indicator window measuring a minimum 2-inch x 1/2 inch with 180-degree visibility. Provide messages color-coded with full text and/or symbols, as scheduled, for easy visibility.
3. Provide locks manufactured from heavy gauge steel, containing components of steel with a zinc dichromate plating for corrosion resistance.
4. Provide lock case that is multi-function and field reversible for handing without opening case. Cylinders: Refer to "KEYING" article, herein.
5. Provide locks with standard 2-3/4 inches (70 mm) backset with full 3/4 inch (19 mm) throw stainless steel mechanical anti-friction latchbolt. Provide deadbolt with full 1-inch (25 mm) throw, constructed of stainless steel.
6. Provide standard ASA strikes unless extended lip strikes are necessary to protect trim. Provide electrified options as scheduled in the hardware sets. Where scheduled, provide switches and sensors integrated into the locks and latches.
7. Provide motor based electrified locksets that comply with the following requirements:
   a. Universal input voltage – single chassis accepts 12 or 24VDC to allow for changes in the field without changing lock chassis.
   b. Fail Safe/Fail Secure – changing mode between electrically locked (fail safe) and electrically unlocked (fail secure) is field selectable without opening the lock case.
   c. Low maximum current draw – maximum 0.4 amps to allow for multiple locks on a single power supply.
   d. Low holding current – maximum 0.01 amps to produce minimal heat, eliminate “hot levers” in electrically locked applications, and to provide reliable operation in wood doors that provide minimal ventilation and air flow.
   e. Connections – provide quick-connect Molex system standard.

8. Lever Trim: Solid brass, bronze, or stainless steel, cast or forged in design specified, with wrought roses and external lever spring cages. Provide thru-bolted levers with 2-piece spindles.
   a. Lever Design: 17N.

2.08 DEADBOLTS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Schlage B600/B700/B800 Series

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide grade 1 deadbolt series conforming to ANSI/BHMA A156.
2. Cylinders: Refer to "KEYING" article, herein.

3. Provide deadbolts with standard 2-3/4 inches (70 mm) backset. Provide 2-3/8 inches (60 mm) where noted or if door or frame detail requires. Provide deadbolt with full 1-inch (25 mm) throw, constructed of steel alloy.
4. Provide manufacturer's standard strike.

2.09 EXIT DEVICES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Von Duprin 99 series

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide exit devices tested to ANSI/BHMA A156.3 Grade 1 and UL listed for Panic Exit or Fire Exit Hardware.
2. Cylinders: Refer to "KEYING" article, herein.
3. Provide grooved touchpad type exit devices, fabricated of brass, bronze, stainless steel, or aluminum, plated to standard architectural finishes to match balance of door hardware.
4. Touchpad must extend a minimum of one half of door width. No plastic inserts are allowed in touchpads.
5. Provide exit devices with deadlatching feature for security and for future addition of alarm kits and/or other electrified requirements.
6. Provide exit devices with weather resistant components that can withstand harsh conditions of various climates and corrosive cleaners used in outdoor pool environments.
7. Provide flush end caps for exit devices.
8. Provide exit devices with manufacturer's approved strikes.
9. Provide exit devices cut to door width and height. Install exit devices at height recommended by exit device manufacturer, allowable by governing building codes, and approved by Architect.
10. Mount mechanism case flush on face of doors or provide spacers to fill gaps behind devices. Where glass trim or molding projects off face of door, provide glass bead kits.
11. Provide cylinder or hex-key dogging as specified at non fire-rated openings.
12. Removable Mullions: 2 inches (51 mm) x 3 inches (76 mm) steel tube. Where scheduled as keyed removable mullion, provide type that can be removed by use of a keyed cylinder, which is self-locking when re-installed.
13. Provide factory drilled weep holes for exit devices used in full exterior application, highly corrosive areas, and where noted in hardware sets.
14. Provide electrified options as scheduled.
15. Top latch mounting: double- or single-tab mount for steel doors, face mount for aluminum doors eliminating requirement of tabs, and double tab mount for wood doors.
16. Provide exit devices with optional trim designs to match other lever and pull designs used on the project.
17. Special Options:
    a. SI
       1) Provide dogging indicators for visible indication of dogging status.
    b. XP
       1) Rim Exit Devices: where specified provide devices with non-tapered smart latchbolt with 90° latchbolt to strike engagement under stress and Static Load Resistance of 2000 pounds.

2.10 ACCESS CONTROL READER

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Schlage MT/MTK Series

2. Acceptable Manufacturers and Products:
   a. No Substitute

B. Requirements:

1. Provide access control card readers manufactured by a global company who is a recognized leader in the production of access control devices. Card reader manufactured for non-access control applications are not acceptable
2. Provide multi-technology contactless readers complying with ISO 14443.

2.11 ACCESS CONTROL PLATFORM

A. Manufacturers and Products:

1. Scheduled Manufacturer:
   a. Section by Div 28

2.12 POWER SUPPLIES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Section by Div 28

2.13 [FOR NEW CONSTRUCTION] CYLINDERS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Schlage Everest 29 R

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide cylinders/cores compliant with ANSI/BHMA A156.5; latest revision; cylinder face finished to match lockset; manufacturer’s series as indicated. Refer to “KEYING” article, herein.
2. Provide cylinders in the below-listed configuration(s), distributed throughout the Project as indicated.
   a. Patented Restricted Small Format: cylinder with small format interchangeable cores (SFIC) with restricted, patented keyway.

3. Patent Protection: Cylinders/cores requiring use of restricted, patented keys, patent protected.
4. Nickel silver bottom pins.

2.14 [FOR NEW CONSTRUCTION] KEYING

A. Scheduled System:

1. Existing factory registered system:
   a. Provide cylinders/cores keyed into Owner's existing factory registered keying system. Comply with guidelines in ANSI/BHMA A156.28, incorporating decisions made at keying conference.

B. Requirements:

1. Construction Keying:
   a. Replaceable Construction Cores.
      1) Provide temporary construction cores replaceable by permanent cores, furnished in accordance with the following requirements.
         a) 2 construction control keys
         b) 15 construction change (day) keys.
      2) Owner or Owner's Representative will replace temporary construction cores with permanent cores.
      3) Return construction cores to hardware supplier. Construction cores and keys to remain property of hardware supplier.

2. Permanent Keying:
   a. Provide permanent cylinders/cores keyed by the manufacturer according to the following key system.
      1) Master Keying system as directed by the Owner.
   b. Forward bitting list and keys separately from cylinders, by means as directed by Owner. Failure to comply with forwarding requirements will be cause for replacement of cylinders/cores involved at no additional cost to Owner.
   c. Provide keys with the following features:
      1) Material: Nickel silver; minimum thickness of .107-inch (2.3mm)
      2) Patent Protection: Keys and blanks protected by one or more utility patent(s).
      3) Geographically Exclusive: Where High Security or Security cylinders/cores are indicated, provide nationwide, geographically exclusive key system complying with the following restrictions.
   d. Identification:
      1) Mark permanent cylinders/cores and keys with applicable key set symbols for identification. Do not provide key set symbols marks with bitting codes.
      2) Identification stamping provisions must be approved by the Architect and Owner.
      3) Stamp cylinders/cores and keys with Owner's unique key system facility code as established by the manufacturer; Stamp permanent keys "DO NOT DUPLICATE" along with the "PATENTED" or patent number to enforce the patent protection. Do not include bitting within visual key control marks or codes.
      4) Failure to comply with stamping requirements will be cause for replacement of keys involved at no additional cost to Owner.
      5) Forward permanent cylinders/cores to Owner, separately from keys, by means as directed by Owner.
      6) Provide key collection envelopes, receipt cards, and index cards in quantity suitable to manage number of keys.
      7) Deliver keys with identifying tags to Owner by security shipment direct from manufacturer.
         a) Contact Lock Supervisor, David Davis.
         b) Phone: 214-762-3579
         c) Address: 3701 South Lamar Street, Dallas, TX 75215
   e. Quantity: Furnish in the following quantities.
      1) Permanent Control Keys: 2.

2) Master Keys to include all levels: 4 each.
3) Change (Day) Keys: 3 per cylinder/core that is keyed differently
4) Key Blanks: Quantity as determined in the keying meeting.

2.15 KEY CONTROL SYSTEM

A. Manufacturers:

1. Acceptable Manufacturers:
   a. Key Control
   b. Lund
   c. Telkee

B. Requirements:

1. Provide key control system, including envelopes, labels, tags with self-locking key clips, receipt forms, 3-way visible card index, temporary markers, permanent markers, and standard metal cabinet, all as recommended by system manufacturer, with capacity for 150% of number of locks required for Project.
   a. Provide complete cross index system set up by hardware supplier, and place keys on markers and hooks in cabinet as determined by final key schedule.
   b. Provide hinged-panel type cabinet for wall mounting.

2.16 DOOR CLOSERS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. LCN 4040XP series

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide door closers conforming to ANSI/BHMA A156.4 Grade 1 requirements by BHMA certified independent testing laboratory. ISO 9000 certify closers. Stamp units with date of manufacture code.
2. Provide door closers with fully hydraulic, full rack and pinion action with high strength cast iron cylinder, and full complement bearings at shaft.
3. Cylinder Body: 1-1/2-inch (38 mm) diameter piston with 5/8-inch (16 mm) diameter double heat-treated pinion journal. QR code with a direct link to maintenance instructions.
4. Hydraulic Fluid: Fireproof, passing requirements of UL10C, and requiring no seasonal closer adjustment for temperatures ranging from 120 degrees F to -30 degrees F.
5. Spring Power: Continuously adjustable over full range of closer sizes, and providing reduced opening force as required by accessibility codes and standards. Provide snap-on cover clip, with plastic covers, that secures cover to spring tube.
6. Hydraulic Regulation: By tamper-proof, non-critical valves, with separate adjustment for latch speed, general speed, and backcheck. Provide graphically labelled instructions on the closer body adjacent to each adjustment valve. Provide positive stop on reg valve that prevents reg screw from being backed out.
7. Provide closers with solid forged steel main arms and factory assembled heavy-duty forged forearms for parallel arm closers.
8. Pressure Relief Valve (PRV) Technology: Not permitted.

9. Finish for Closer Cylinders, Arms, Adapter Plates, and Metal Covers: Powder coating finish which has been certified to exceed 100 hours salt spray testing as described in ANSI Standard A156.4 and ASTM B117, or has special rust inhibitor (SRI).
10. Provide special templates, drop plates, mounting brackets, or adapters for arms as required for details, overhead stops, and other door hardware items interfering with closer mounting.

2.17 DOOR TRIM

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide push plates, push bars, pull plates, pulls, and hands-free reversible door pulls with diameter and length as scheduled.

2.18 PROTECTION PLATES

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide protection plates with a minimum of 0.050 inch (1 mm) thick, beveled four edges as scheduled. Furnish with sheet metal or wood screws, finished to match plates.
2. Sizes plates 2 inches (51 mm) less width of door on single doors, pairs of doors with a mullion, and doors with edge guards. Size plates 1 inch (25 mm) less width of door on pairs without a mullion or edge guards.
3. At fire rated doors, provide protection plates over 16 inches high with UL label.

2.19 OVERHEAD STOPS AND OVERHEAD STOP/HOLDERS

A. Manufacturers:

1. Scheduled Manufacturers:
   a. Glynn-Johnson 900/100 Series

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide overhead stop at any door where conditions do not allow for a wall stop or floor stop presents tripping hazard.

2.20 DOOR STOPS AND HOLDERS

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. No Substitute

B. Provide door stops at each door leaf:

1. Provide wall stops wherever possible. Provide concave type where lockset has a push button of thumbturn.
2. Where a wall stop cannot be used, provide universal floor stops.
3. Where wall or floor stop cannot be used, provide overhead stop.
4. Provide roller bumper where doors open into each other and overhead stop cannot be used.

2.21 THRESHOLDS, SEALS, DOOR SWEEPS, AUTOMATIC DOOR BOTTOMS, AND GASKETING

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Zero International

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide thresholds, weather-stripping, and gasketing systems as specified and per architectural details. Match finish of other items.
2. Smoke- and Draft-Control Door Assemblies: Where smoke- and draft-control door assemblies are required, provide door hardware that meets requirements of assemblies tested according to UL 1784 and installed in compliance with NFPA 105.
3. Provide door sweeps, seals, astragals, and auto door bottoms only of type where resilient or flexible seal strip is easily replaceable and readily available.
4. Size thresholds 1/2 inch (13 mm) high by 5 inches (127 mm) wide by door width unless otherwise specified in the hardware sets or detailed in the drawings.

2.22 SILENCERS

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:

a. No Substitute

B. Requirements:

1. Provide "push-in" type silencers for hollow metal or wood frames.
2. Provide one silencer per 30 inches (762 mm) of height on each single frame, and two for each pair frame.
3. Omit where gasketing is specified.

2.23 DOOR POSITION SWITCHES

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Schlage

2. Acceptable Manufacturers:
   a. No Substitute

B. Requirements:

1. Provide recessed or surface mounted type door position switches as specified.
2. Coordinate door and frame preparations with door and frame suppliers. If switches are being used with magnetic locking device, provide minimum of 4 inches (102 mm) between switch and magnetic locking device.

2.24 COAT HOOKS

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. No Substitute

B. Provide coat hooks as specified.

2.25 FINISHES

A. FINISH: BHMA 626/652 (US26D); EXCEPT:

1. Hinges at Exterior Doors: BHMA 630 (US32D)
2. Aluminum Geared Continuous Hinges: BHMA 628 (US28)
3. Push Plates, Pulls, and Push Bars: BHMA 630 (US32D)
4. Protection Plates: BHMA 630 (US32D)
5. Overhead Stops and Holders: BHMA 630 (US32D)
6. Door Closers: Powder Coat to Match
7. Wall Stops: BHMA 630 (US32D)
8. Latch Protectors: BHMA 630 (US32D)
9. Weatherstripping: Clear Anodized Aluminum
10. Thresholds: Mill Finish Aluminum

PART 3 - EXECUTION

3.01 EXAMINATION

A. Prior to installation of hardware, examine doors and frames, with Installer present, for compliance with requirements for installation tolerances, labeled fire-rated door assembly construction, wall and floor construction, and other conditions affecting performance. Verify doors, frames, and walls have been properly reinforced for hardware installation.

B. Examine roughing-in for electrical power systems to verify actual locations of wiring connections before electrified door hardware installation.

C. Submit a list of deficiencies in writing and proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Mount door hardware units at heights to comply with the following, unless otherwise indicated or required to comply with governing regulations.

1. Standard Steel Doors and Frames: ANSI/SDI A250.8.
2. Custom Steel Doors and Frames: HMMA 831.
3. Interior Architectural Wood Flush Doors: ANSI/WDMA I.S. 1A
4. Installation Guide for Doors and Hardware: DHI TDH-007-20

B. Install door hardware in accordance with NFPA 80, NFPA 101 and provide post-install inspection, testing as specified in section 1.03.E unless otherwise required to comply with governing regulations.

C. Install each hardware item in compliance with manufacturer's instructions and recommendations, using only fasteners provided by manufacturer.

D. Do not install surface mounted items until finishes have been completed on substrate. Protect all installed hardware during painting.

E. Set units level, plumb and true to line and location. Adjust and reinforce attachment substrate as necessary for proper installation and operation.

F. Drill and countersink units that are not factory prepared for anchorage fasteners. Space fasteners and anchors according to industry standards.

G. Install operating parts so they move freely and smoothly without binding, sticking, or excessive clearance.

H. Hinges: Install types and in quantities indicated in door hardware schedule but not fewer than quantity recommended by manufacturer for application indicated.

I. Exit Devices: Install exit devices with sex, nuts and bolts through all doors.

J. Lock Cylinders:

1. Install construction cores to secure building and areas during construction period.
2. Replace construction cores with permanent cores as indicated in keying section.

3. Furnish permanent cores to Owner for installation.

K. Wiring: Coordinate with Division 26, ELECTRICAL and Division 28 ELECTRONIC SAFETY AND SECURITY sections for:

1. Conduit, junction boxes and wire pulls.
2. Connections to and from power supplies to electrified hardware.
3. Connections to fire/smoke alarm system and smoke evacuation system.
4. Connection of wire to door position switches and wire runs to central room or area, as directed by Architect.
5. Connections to panel interface modules, controllers, and gateways.
6. Testing and labeling wires with Architect's opening number.

L. Key Control System: Tag keys and place them on markers and hooks in key control system cabinet, as determined by final keying schedule.

M. Door Closers: Mount closers on room side of corridor doors, inside of exterior doors, and stair side of stairway doors from corridors. Mount closers so they are not visible in corridors, lobbies and other public spaces unless approved by Architect.

N. Overhead Stops/Holders: Mount overhead stops/holders on room side of corridor doors, inside of exterior doors, and stair side of stairway doors.

O. Power Supplies: Locate power supplies as indicated or, if not indicated, above accessible ceilings or in equipment room, or alternate location as directed by Architect.

P. Thresholds: Set thresholds in full bed of exterior grade caulk complying with requirements specified in Division 07 Section "Joint Sealants."

Q. Stops: Provide floor stops for doors unless wall or other type stops are indicated in door hardware schedule. Do not mount floor stops where they may impede traffic or present tripping hazard.

R. Perimeter Gasketing: Apply to head and jamb, forming seal between door and frame.

S. Meeting Stile Gasketing: Fasten to meeting stiles, forming seal when doors are closed.

T. Door Bottoms and Sweeps: Apply to bottom of door, forming seal with threshold when door is closed.

3.03 ADJUSTING

A. Initial Adjustment: Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended. Adjust door control devices to compensate for final operation of heating and ventilating equipment and to comply with referenced accessibility requirements.

1. Spring Hinges: Adjust to achieve positive latching when door can close freely from an open position of 30 degrees.
2. Electric Strikes: Adjust horizontal and vertical alignment of keeper to properly engage lock bolt.
3. Door Closers: Adjust sweep period to comply with accessibility requirements and requirements of authorities having jurisdiction. Install all door closers with thru-bolts and adjust after HVAC is in operation.

B. Occupancy Adjustment: Approximately three to six months after date of Substantial Completion, examine and readjust each item of door hardware, including adjusting operating forces, as necessary to ensure function of doors and door hardware.

3.04 CLEANING AND PROTECTION

A. Clean adjacent surfaces soiled by door hardware installation.

B. Clean operating items per manufacturer's instructions to restore proper function and finish.

C. Provide final protection and maintain conditions that ensure door hardware is without damage or deterioration at time of Substantial Completion.

3.05 DOOR HARDWARE SCHEDULE

A. The intent of the hardware specification is to specify the hardware for interior and exterior doors, and to establish a type, continuity, and standard of quality. However, it is the door hardware supplier's responsibility to thoroughly review existing conditions, schedules, specifications, drawings, and other Contract Documents to verify the suitability of the hardware specified.

B. Discrepancies, conflicting hardware, and missing items are to be brought to the attention of the architect with corrections made prior to the bidding process. Omitted items not included in a hardware set should be scheduled with the appropriate additional hardware required for proper application.

C. Hardware items are referenced in the following hardware schedule. Refer to the above specifications for special features, options, cylinders/keying, and other requirements.

D. Hardware Sets:

Version 2

Legend:

END OF SECTION

SECTION 08 8000

GLAZING

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Glass and glazing materials for windows, doors, storefront and curtainwalls.

B. Glazing compounds and accessories.

1.02 RELATED SECTIONS

A. Section 07 9000 - Joint Sealers: Sealant and back-up material.

B. Section 08 1213 – Hollow Metal Doors and Frames: Glazing for doors.

C. Section 08 1416 – Flush Wood Doors: Glazing for doors.

C. Section 08 4113 – Aluminum-Framed Storefront: Glazing for storefronts.

D. Section 08 4413 – Glazed Aluminum Curtain Walls: Glazing for curtainwalls.

E. Section 08 5113 – Aluminum Windows: Glazing for aluminum windows.

1.03 REFERENCES

A. ASTM C 1036 - Standard Specification for Flat Glass; current edition.

B. ASTM C 1048 - Standard Specification for Heat-Treated Flat Glass--Kind HS, Kind FT Coated and Uncoated Glass; current edition.

C. ASTM C 1193 - Standard Guide for Use of Joint Sealants; current edition.

D. ASTM E 1300 - Standard Practice for Determining Load Resistance of Glass in Buildings; current edition.

E. GANA (GM) - GANA Glazing Manual; Glass Association of North America; current edition.

F. GANA (SM) - FGMA Sealant Manual; Glass Association of North America; current edition.

1.04 PERFORMANCE REQUIREMENTS

A. Provide glass and glazing materials for continuity of building enclosure vapor retarder and air barrier:
   1. In conjunction with materials described in Section 07 9200 and 08 4113.
   2. To utilize the inner pane of multiple pane sealed units for the continuity of the air barrier and vapor retarder seal.
   3. To maintain a continuous air barrier and vapor retarder throughout the glazed assembly from glass pane to heel bead of glazing sealant.

B. Select type and thickness of exterior glass to withstand dead loads and wind loads acting normal to plane of glass at design pressures calculated in accordance with applicable code.
   1. Use the procedure specified in ASTM E 1300 to determine glass type and thickness.
   2. Limit glass deflection to 1/200 or flexure limit of glass, whichever is less, with full recovery of glazing materials.
   3. Thicknesses listed are minimum.

1.05 SUBMITTALS

A. Product Data on Glass Types: Provide structural, physical and environmental characteristics, size limitations, and special handling or installation requirements.

B. Product Data on Glazing Compounds: Provide chemical, functional, and environmental characteristics, limitations, special application requirements. Identify available colors.

C. Samples of each glass type indicating color and tint properties.

D. Manufacturer's Certificate: Certify that glass meets or exceeds specified requirements.

1.06 QUALITY ASSURANCE

A. Perform Work in accordance with GANA Glazing Manual and FGMA Sealant Manual for glazing installation methods.

B. Installer Qualifications: Company specializing in performing the work of this section with minimum five years documented experience.

1.07 ENVIRONMENTAL REQUIREMENTS

A. Do not install glazing when ambient temperature is less than 50 degrees F.

B. Maintain minimum ambient temperature before, during and 24 hours after installation of glazing compounds.

1.08 WARRANTY

A. Provide a five (5) year warranty to include coverage for sealed glass units from seal failure, interpane dusting or misting, and replacement of same.

B. Provide a five (5) year warranty to include coverage for de-lamination of laminated glass and replacement of same.

C. The Warranties submitted under this Section shall not deprive the Owner of other rights or remedies that the Owner may have under other provisions of the Contract Documents and the laws of governing jurisdictions and is in addition to and runs concurrently with other warranties made by the Contractor under requirements of the Contract Documents.

PART 2 PRODUCTS

2.01 MATERIALS

A. Manufacturers:
1. Basis of Design: Guardian Glass; www.guardianglass.com
2. AFG Industries, Inc: www.afgglass.com.
3. Pilkington Building Products North America: http://buildingproducts.us.pilkington.com.
4. PPG Industries, Inc: www.ppg.com.
5. Viracon: www.viracon.com.
6. Basis of Design is provided to establish a standard of quality and configuration and is not intended to prevent the use of approved alternates.
75. Substitutions: Permitted under provisions of Section 01 6000 - Product Requirements.

B. Acid Etched Glass: #25 Guardian SatinDeco Acid-etched Glass, ¼-inch thick.

C. Spandrel Glass: #31 Guardian Sunguard Spandrel HT – Black.

B. Monolithic Clear Float Glass: Clear, annealed.
1. Comply with ASTM C 1036, Type I, transparent flat, Class 1 clear, Quality q3 glazing select, ¼-inch thick, minimum.

C. Safety Glass: Clear; tempered with horizontal tempering.
1. Comply with ASTM C 1048, Kind FT (Fully Tempered), Type II, transparent flat, Class 1, Quality Q-6, Form 3, ¼”-inch-thick minimum.

D. Insulating Glass Units: Nominal 1-inch-thick units (0.25”+0.5” air space +0.25”) double laminated insulating VE19-2M (STC 42).
   1. Comply with ASTM E2160 Standard Specification for Insulating Glass Unit Performance and Evaluation.
   2. The unit overall thickness tolerance shall be -1/16”/ +1/32”.
   3. Sealed insulating glass units to be double sealed with a primary seal of polyisobutylene and a secondary seal of silicone.
   4. Summer U Value – 0.29.
   5. SHGC – 0.25.
   6: Guardian Gray Float, #10 Superneutral 68 on Gray, coated #2 surface.

E. Glazing Tape: Closed cell polyvinyl chloride (PVC) foam, coiled on release paper over adhesive on two sides.

F. Silicone Sealant: One-part neutral curing silicone, medium modulus sealant, Type S, Grade NS, Class 25 with additional movement capable of 50 percent in both extension and compression. Dow Corning 795.
   1. Dow Corning 795.
   2. General Electric Silglaze-II 2800.
   3. Tremco Sprectrem 2.

G. Setting Blocks: Neoprene, EPDM or silicone tested for compatibility with glazing compound.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that openings for glazing are correctly sized and within tolerance.

B. Verify that surfaces of glazing channels or recesses are clean, free of obstructions that may impede moisture movement, weeps are clear, and ready to receive glazing.

3.02 PREPARATION

A. Clean contact surfaces with solvent and wipe dry.

B. Seal porous glazing channels or recesses with substrate compatible primer or sealer.

C. Prime surfaces scheduled to receive sealant.

D. Install sealants in accordance with ASTM C 1193 and FGMA Sealant Manual.

E. Install sealant in accordance with manufacturer's instructions.

3.03 INSTALLATION

A. Install glass in accordance with recommendations and procedures in GANA Glazing Manual and FGMA Sealant Manual.

B. Install glass in accordance with storefront frame manufacturer recommendations and instructions.

C. Install glass with lines or waves horizontal.

3.04 CLEANING

A. Remove glazing materials from finish surfaces.

B. Remove labels after Work is complete.

C. Clean glass and adjacent surfaces.

3.05 PROTECTION OF FINISHED WORK

A. After installation, mark pane with an 'X' by using removable plastic tape or paste; do not mark heat absorbing or reflective glass units.

END OF SECTION

SECTION 08 8723
SAFETY AND SECURITY FILMS

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Glazing film applied to existing and new glazing assemblies.

B. Wet Glaze Anchoring System.

C. New Glazing: Factory or shop install film to glazing before installation in frames.

D. Glazing assemblies to receive film are indicated on drawings.

1.02 RELATED REQUIREMENTS

A. Section 08 1113 - Hollow Metal Doors and Frames: New doors and windows with glazing to receive film.

B. Section 08 8000 - Glazing: New glazing to received film.

1.03 REFERENCE STANDARDS

A. 16 CFR 1201 - Safety Standard for Architectural Glazing Materials Current Edition.

B. ANSI Z97.1 - American National Standard for Safety Glazing Materials Used in Buildings - Safety Performance Specifications and Methods of Test 2015 (Reaffirmed 2020).

C. ASTM D 882 - Standard Test Method for Tensile Properties of Thin Plastic Sheeting.

D. ASTM D 1004 - Standard Test Method for Tear Resistance (Graves Tear) of Plastic Film and Sheeting.

E. ASTM D 1044 - Standard Method of Test for Resistance of Transparent Plastics to Surface Abrasion (Taber Abrader Test).

F. ASTM D 2582 - Standard Test Method for Puncture-Propagation Tear Resistance of Plastic Film and Thin Sheeting.

G. ASTM D 4830 - Standard Test Methods for Characterizing Thermoplastic Fabrics Used in Roofing and Waterproofing.

H. ASTM E 84 - Standard Method of Test for Surface Burning Characteristics of Building Materials.

I. ASTM E 308 - Standard Recommended Practice for Spectophotometry and Description of Color in CIE 1931 System.

J. ASTM E 903 - Standard Methods of Test for Solar Absorbance, Reflectance and Transmittance of Materials Using Integrating Spheres.

K. ASTM E 1886 - Standard Test Method for Performance of Exterior Windows, Curtain Walls, Doors, and Impact Protective Systems Impacted by Missile(s) and Exposed to Cyclic Pressure Differentials.

L. ASTM E 1996 - Standard Specification for Performance of Exterior Windows, Curtain Walls, Doors and Impact Protective Systems Impacted by Windborne Debris in Hurricanes.

M. Window 5.2 - A Computer Tool for Analyzing Window Thermal Performance; Lawrence Berkeley Laboratory.

N. ANSI Z97.1 - American National Standard for Safety Glazing Materials Used in Buildings - Safety Performance Specifications and Methods of Test.

O. Consumer Products Safety Commission 16 CFR, Part 1201 - Safety Standard for Ownerural Glazing Materials.

P GSA Standard Test for Glazing and Glazing Systems Subject to Airblast Loadings.

Q. ISO 16933, International Standard for Glass in Building: Explosion-resistant security glazing - Test and classification for arena air-blast testing.

R. Underwriters Laboratories Inc. (UL): UL 972 - Burglary Resisting Glazing Material.

1.04 SUBMITTALS

A. See Section 01 3000 - Administrative Requirements, for submittal procedures.

B. Product Data: Manufacturer's data sheets on each product to be used, including:
   1. Record of product certification for safety requirements.
   2. Preparation instructions and recommendations.
   3. Storage and handling requirements and recommendations.
   4. Installation methods.

C. Shop Drawings: Detailing installation of film, anchoring accessories, and sealant.

D. Samples: For each film product to be used, minimum size 4 inches (102 mm) by 6 inches (152 mm), representing actual product, color, and patterns.

E. Test Reports: Detailed reports of full-scale chamber tests to specified criteria, using assemblies identical to those required for this project.

F. Specimen Warranty.

1.05 PERFORMANCE REQUIREMENTS

A. Fire Performance: Surface burning characteristics when tested in accordance ASTM E 84:
   5. Flame Spread: 25, maximum.
   6. Smoke Developed: 450, maximum.

B. Abrasion Resistance: Film must have a surface coating that is resistant to abrasion such that, less than 5 percent increase of transmitted light haze will result in accordance with ASTM D 1044 using 50 cycles, 500 grams weight, and the CS10F Calbrase Wheel.

1.06 QUALITY ASSURANCE

A. Manufacturer Qualifications (SUBMIT WITH PROPOSAL): All primary products specified in this section will be supplied by a single manufacturer with a minimum of ten years experience.

B. Installer Qualifications (SUBMIT # 1 AND #2 WITH PROPOSAL): All products listed in this section are to be installed by a single installer with a minimum of five years demonstrated experience in installing products of the same type and scope as specified.
   1. Provide documentation that the installer is authorized by the Manufacturer to perform Work specified in this section.
   2. Provide a commercial building reference list of 5 properties where the installer has applied window film. This list will include the following information:
      a. Name of building.

b. The name and telephone number of a management contact.
c. Type of glass.
d. Type of film.
e. Amount of film installed.
f. Date of completion.

3. Provide a Glass Stress Analysis of the existing glass and proposed glass/film combination as recommended by the film manufacturer.
4. Provide an application analysis to determine available energy cost reduction and savings.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened packaging until ready for installation.

B. Store and dispose of hazardous materials, and materials contaminated by hazardous materials, in accordance with requirements of local authorities having jurisdiction.

1.08 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

1.09 WARRANTY

A. At project closeout, provide to Owner or Owners Representative an executed current copy of the manufacturer's 12 year warranty against manufacturing defect, outlining its terms, conditions, and exclusions from coverage.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Madico, Inc; Safety Shield 800 DG 45 PS SR : www.madico.com/#sle.

B. Subject to compliance with requirements, provide the named product or a comparable product by one of the following:

C. 3M Window Film, St. Paul, MN.

D. Armor Glass, San Diego, CA

E. Solar Gard, Saint-Gobain, Houston, TX

F. Substitutions: See Section 01 6000 - Product Requirements.

2.02 SAFETY AND SECURITY GLAZING FILM

A. Clear Safety and Security Window Film: 8 Mil Clear Safety and Security Window Film. Optically clear polyester film with a durable acrylic abrasion resistant coating over one surface and a pressure sensitive adhesive over the other. The film may be laminated to other clear polyester film layers to achieve the desired thickness of the film.
   1. Physical / Mechanical Performance Properties:
      a. Film Color: Clear.
      b. Tensile Strength (ÅSTM D 882): 30,000 psi.
      c. Break Strength (ASTM D 882) (Per Inch Width): 240 lbs.
      d. ASTM D 4830 Puncture Test: 141 lbs.
   2. Uniformity: No noticeable pin holes, streaks, thin spots, scratches, banding or other optical defects.

3. Variation in Total Transmission across the Width: Less than 2 percent over the average at any portion along the length.
4. Identification: Labeled as to Manufacturer as listed in this Section.
5. Solar Performance Properties: Film applied to 1/4 Inch (6.4 mm) thick clear glass.
    a. Visible Light Transmission (ASTM E 903) (Exterior): 13 percent.
    b. Visible Light Transmission (ASTM E 903) (Interior): 12 percent.
    c. Emissivity: .88.
    d. U-Factor (Winter): 1.11.
    e. Shading Coefficient: .87.
    f. Ultraviolet Light Blocked: Greater than 99 percent.
    g. Solar Heat Gain Coefficient (ÅSTM E 903): 0.74.
6. Windstorm Protection
    a. Film shall pass impact of Medium Large Missile "C" and withstand subsequent pressure cycling (per ASTMs E 1996 and E 1886) at 50 psf Design Pressure with use of Adhesive attachment system.
7. Bomb Blast Mitigation: Independent testing with results from high explosive arena blast testing.
    a. GSA Rating with minimum blast pressure and impulse of 7 psi and 36 psi.msec, respectively: “3B” (Low Hazard / High Protection).
    b. GSA Rating with minimum blast pressure and impulse of 11 psi and 55 psi.msec, respectively: “3B” (Low Hazard / High Protection).
8. Forced Entry Protection: Independent lab testing according to UL 972 protocol (Multiple Impact Test).
    a. Annealed Glass (1/4 inch) - Pass
    b. Tempered Glass (1/4 inch) - Pass

2.03 ATTACHMENT SYSTEMS

A. General: Subject to compliance with testing and performance requirements, provide the following perimeter attachment system.

B. Wet-glaze: 4-sided Wet Glaze Anchoring System to achieve a GSA level 3A performance condition (with SafetyShield 800 film) when tested to open range blast loads of 9.0 psi and 46.0 PSI-ms on monolithic annealed glass.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine glass and frames. Verify that existing conditions are adequate for proper application and performance of film.

B. Verify glass is not cracked, chipped, broken, or damaged.

C. Verify that frames are securely anchored and free of defects.

D. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.02 PREPARATION

A. Clean glass of dust, dirt, paint, oil, grease, mildew, mold, and other contaminants that would inhibit adhesion.

B. Immediately prior to applying film, thoroughly wash glass with neutral cleaning solution.

C. Protect adjacent surfaces.

D. Do not begin installation until substrates have been properly prepared.

3.03 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Cut film edges neatly and square at a uniform distance of 1/8 inch to 1/16 inch of window sealant. Use new blade tips after 3 to 4 cuts.

C. Spray the slip solution, composed of one capful of baby shampoo or dishwashing liquid to 1 gallon of water, on window glass and adhesive to facilitate proper positioning of film.

D. Apply film to glass and lightly spray film with slip solution.

E. Squeegee from top to bottom of window. Spray slip solution to film and squeegee a second time.

F. Bump film edge with lint-free towel wrapped around edge of a 5-way tool.

G. Upon completion of film application, allow 30 days for moisture from film installation to dry thoroughly, and to allow film to dry flat with no moisture dimples when viewed under normal viewing conditions.

3.04 CLEANING AND PROTECTION

A. Remove left over material and debris from Work area. Use necessary means to protect film before, during, and after installation.

B. Touch-up, repair or replace damaged products before Substantial Completion.

C. After application of film, wash film using common window cleaning solutions, including ammonia solutions, 30 days after application. Do not use abrasive type cleaning agents and bristle brushes to avoid scratching film. Use synthetic sponges or soft cloths.

END OF SECTION

SECTION 09 2116

GYPSUM BOARD ASSEMBLIES

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Metal stud wall framing.

B. Metal channel ceiling and suspended grid framing.

C. Gypsum wallboard.

D. Joint treatment and accessories.

E. Textured finish system.

1.02 REFERENCES

A. AISI SG-971 - Specification for the Design of Cold-Formed Steel Structural Members; current edition.

B. ASTM A 653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process; current edition.

C. ASTM C 36 - Standard Specification for Gypsum Wallboard; current edition.

1.03 SUBMITTALS

A. Shop Drawings:
   1. Show locations, fabrication, and installation of control and expansion joints, in accordance with Gypsum Association Standards unless otherwise approved by Architect in writing. Include plans, elevations, sections, details of components, and attachments to other units of Work. Indicate special details associated with acoustic seals.

B. Product Data: Provide data on metal framing, gypsum board, accessories, and joint finishing system.

C. Product Data: Provide manufacturer's data on partition head to structure connectors, showing compliance with requirements.

D. Submit keyed plan showing all control joints per 3.04 this specification section.

1.04 REGULATORY REQUIREMENTS

A. A. Performance Requirements: Fabricate and install systems as indicated but not less than that required to comply with ASTM C754 under the following conditions:

1. Gypsum board partitions:

a. Standard systems: Maximum deflection of L/240 of partition height.

b. Systems to receive water resistant gypsum board or backer board: Maximum deflection of L/360 of partition height.

2. Interior suspended ceilings and soffits: Maximum deflection of L/360 of distance between supports.

3. Exterior soffits (if shown): Withstand minimum positive and negative pressure of 20 psf with maximum deflection of L/360 of distance between supports.

4. TALL WALLS (partitions exceeding 30'-0")

a. Use double structural studs back-to-back 24 inches on center. Attach studs back-to-back with screws approximately 4 feet on center.

b. For 5-psf wind load, provide 20-gauge runner track. Fasteners shall have a capacity of 300 pounds in single shear and bearing.

c. For 10-psf wind load, provide 18-gauge runner track attached with fasteners with 400-pound single shear and bearing.

B. Fire Resistance Ratings: Where fire resistance classifications are indicated, provide materials and application procedures identical to those listed by UL or tested according to ASTM E119 for type of construction shown.

C. Acoustical Ratings: Where sound ratings are indicated, provide materials and application procedures identical to those tested by manufacturer to achieve Sound Transmission Class (STC) scheduled or indicated in accordance with ASTM E90.

D. Design framing systems in accordance with AISI S220 and ASTM C645, Section 10, unless otherwise indicated.

1.05 QUALITY ASSURANCE

A. Contractor is responsible for design, engineering and construction of the gypsum board assemblies, including framing. Contractor may increase framing gage, reduce stud spacing or flange width as required to carry loads and span dimensions. Depth of stud web may not be changed without Architect’s approval.

B. Perform in accordance with ASTM C 840. Comply with requirements of GA-600 for fire-rated assemblies.

C. Applicator Qualifications: Company specializing in performing gypsum board application and finishing, with minimum five years of documented experience.

D. Gypsum that becomes wet from spills, weather or mechanical failure shall be replaced by Contractor at no cost to Owner.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver material to site promptly without undue exposure to weather.

B. Deliver in manufacturer's unopened containers or bundles, fully identified with name, brand, type and grade.

C. Store above ground in dry, ventilated space. Protect materials from soiling, rusting and damage.

D. Store board to be directly applied to masonry walls at 70°F for 24 hours prior to installation.

E. Protect cold-formed metal framing from corrosion, deformation, and other damage during delivery, storage, and handling as required by AISI S202, "Code of Standard Practice for Cold- Formed Steel Framing."

F. Store gypsum boards off the ground, preferably on a platform or pallets, to avoid contact with water from the floor.

1.07 PROJECT CONDITIONS

A. Do not install gypsum board when the ambient temperature is below 40°F. Maintain a consistent temperature between 45°F and 60°F, and ensure proper ventilation to remove excess moisture.

B. For adhesive attachment and finishing of gypsum board, keep the ambient temperature above 55°F starting one week before installation or joint treatment, and continue until the joint treatment is fully applied and dried.

C. During cold weather, the building shall be heated while gypsum board and joint treatment are being applied.

1.08 WARRANTY

A. Warrant the work specified for one (1) year against becoming unserviceable or causing an objectionable appearance resulting from either defective or nonconforming materials or workmanship.

B. In addition, provide warranty from the manufacturer for the following products:
1. Exterior sheathing weathering warranty covering in-place exposure damage to exterior sheathing for twelve (12) months.
2. Exterior sheathing warranty against manufacturing defects for five (5) years.
3. Abuse Resistant Panel weathering warranty covering in-place exposure damage to sheathing for six (6) months.
4. Abuse Resistant Panel warranty against manufacturing defects for three (3) years.
5. Glass-mat sheathing weathering warranty covering in-place exposure damage to sheathing for three (3) months.
6. Glass-mat sheathing warranty against manufacturing defects for three (3) years.
7. Tile backer board warranty against manufacturing defects for 20 years.

PART 2 PRODUCTS

2.01 MANUFACTURERS

B. Manufacturers listed whose product meets or exceed the specifications may be used on the Project. Other manufacturers must have a minimum of five (5) years' experience manufacturing products meeting or exceeding the specifications and comply with Division 1 requirements regarding substitutions in order to be considered.

1. Gypsum Board and Related Products:
   a. G-P Gypsum Corp.
   b. Gold Bond Building Products Div., National Gypsum Co.
   c. Lafarge Gypsum
   d. United States Gypsum Co.
   e. Waterguard USA

2. Steel Framing and Furring:
   a. Clark Steel Framing Systems: www.clarksteel.com.
   b. Dale/Incor: www.daleincor.com.
   c. Dietrich Metal Framing, Inc: www.dietrichmetalframing.com.
   d. Marino-Ware: www.marinoware.com.

3. Aluminum Moldings:
   a. Fry Reglet Corporation
   b. MM Systems Corporation

2.02 STEEL FRAMING CEILINGS AND SOFFITS

B. Comply with ASTM C 754 for materials and sizes, unless otherwise indicated.

1. Protective Coating: Comply with AISI S220; ASTM A653/A653M, G40 (Z120) or equivalent corrosion resistance. A40 galvannealed products are not acceptable.
   a. Coating shall demonstrate equivalent corrosion resistance with an evaluation report acceptable to authorities having jurisdiction.

C. Hanger and Tie Wire: ASTM A 641, Class 1 zinc-coating, soft temper.

D. Hanger Rods: Mild steel, zinc coated.

E. Flat Hangers: Mild steel, zinc coated.

F. Angle-Type Hangers: Angles with legs not less than 7/8 inch wide, formed from 0.0296-inch-thick galvanized steel sheet per ASTM A 653, G 60 coating, with bolted connections and 5/16 inch diameter bolts.

G. Carrying Channels: ASTM C 754, shall be cold formed from steel with a 0.0538 inch (1.37 mm) minimum base metal thickness and 1/2 inch (12.7 mm) wide flanges, as follows:

1. Depth: 1-1/2 inches or other as noted on the drawings

H. Steel Studs for Furring Channels: AISI S220 and ASTM C645, Section 10.

1. Subject to compliance with requirements, provide ClarkDietrich; ProSTUD 25 gauge-equivalent (0.0150 inch) with Smart Edge technology, or comparable product.
2. Depth: 1-5/8 inches or other as noted on the drawings

I. Hat-Shaped, Rigid Furring Channels: AISI S220, hat-shaped, depth of 7/8 inch or

other as noted on the drawings.

1. Subject to compliance with requirements, provide ClarkDietrich; Hat-Shaped, Rigid Furring Channels, or comparable product.

J. Resilient Furring Channels: Manufacturer's standard product designed to reduce sound transmission, fabricated from steel sheet per AISI S220 to form 1/2 inch deep channel of the following configuration:

1. Subject to compliance with requirements, provide ClarkDietrich; Resilient Channel RCSD.
2. Single Leg Configuration: Asymmetric-shaped channel with face connected to a single flange by a single-slotted leg.

K. Grid Suspension System for Interior Ceilings: ASTM C 645, direct-hung system composed of main beams and interlocking cross furring members.

1. Products: Subject to compliance with requirements, provide the following:
   a. Armstrong World Industries, "Furring Systems/Drywall".
   b. Chicago Metallic Corp. "Drywall Furring 640 / Drywall Furring 660".
   c. USG Interiors, Inc. "Drywall Suspension System".

2.03 STEEL FRAMING FOR WALLS AND PARTITIONS

B. Provide steel framing members complying with the following:

1. Protective Coating: AISI S220, G40 (Z120), or equivalent corrosion resistance. A40 galvannealed products are not acceptable.
   a. Coating shall demonstrate equivalent corrosion resistance with an evaluation report acceptable to authorities having jurisdiction.

C. Steel Studs and Runners: AISI S220 and ASTM C645, Section 10.

1. Subject to compliance with requirements, provide ClarkDietrich; ProSTUD 25 gauge- equivalent (0.0150 inch) with Smart Edge technology, or comparable product.
2. Depth: As indicated on Drawings

D. Steel Runner Track at Curved Walls/Partitions: Steel sheet runner for non-structural curves, bends, variable radii and arches. Designed to provide higher strength capacity than conventional lighter gauge material by using a work-hardened steel base strip.

1. Subject to compliance with requirements, provide ClarkDietrich; 360TRAK, or comparable product.
2. Size: As indicated on Drawings or as required if not shown.

E. Hat-Shaped Rigid Furring Channels: AISI S220, hat-shaped, depth and minimum thickness of base (uncoated) metal as follows:

1. Subject to compliance with requirements, provide ClarkDietrich; Furring Channel, or comparable product.
2. Depth: 7/8" or as indicated on Drawings.

F. Resilient Furring Channels: Manufacturer's standard product designed to reduce sound transmission, fabricated from steel sheet per AISI S220 to form 1/2 inch deep channel of the following configuration.

1. Subject to compliance with requirements, provide ClarkDietrich; Resilient Channel RCSD.
2. Single Leg Configuration: Asymmetric-shaped channel with face connected to a single flange by a single-slotted leg.

G. Single Long-Leg Runner System: Manufacturer's top runner complying with AISI S220, with 2-inch (50.8 mm) deep flanges in thickness not less than indicated for studs, installed with studs friction fit into top runner and with continuous bridging or cold rolled channel with clip angles or ClarkDietrich Spazzer® 9200 Bridging and Bracing Bar located within 12 inches (305 mm) of the top of studs to provide lateral bracing.

H. Deflection Track: Steel sheet top runner manufactured to prevent cracking of finishes applied to interior partition framing resulting from deflection of structure above; in thickness not less than indicated for studs and in width to accommodate depth of studs.
1. Subject to compliance with requirements, provide ClarkDietrich; MaxTrak Slotted Deflection Track, or a comparable product or field assembled standard top track assembly compliant with movement requirements

I. Firestop Track: Top runner designed to allow partition had to move while maintaining integrity of assembly fire-resistance rating. Thickness not less than indicated for studs, and of width to accommodate depth ofstuds.
1. Subject to compliance with requirements, provide ClarkDietrich; BlazeFrame® (DSL2) Slotted Deflection Track, or a comparable product. OR
2. Field assembled standard top track assembly with appropriate fire protection and UL assembly classification.

J. Z-Shaped Furring Members: Manufacturer's standard Z-shaped furring members with slotted or nonslotted web, with minimum base metal (uncoated) thickness of 0.0179 inch, face flange of 1-1/4 inch, wall attachment flange of 3/4 inch, and of depth required to fit installation thickness indicated.
1. Subject to compliance with requirements, provide ClarkDietrich; Z-Furring Channel or comparable product.

K. Flat Strap and Backing Plate: Sheet for blocking or bracing in length and width as indicated, and with minimum base metal (uncoated) thickness as follows:
1. Thickness: As indicated on Drawings or as required if not shown.
2. Subject to compliance with requirements, provide ClarkDietrich; Danback Fire Treated Wood Backing Plate D16F or Danback Fire Treated Wood Backing Plate D24F.

L. Channel Bridging: 0.0538 inch base metal thickness, with minimum 1/2 inch wide flanges
1. Subject to compliance with requirements, provide ClarkDietrich; Spazzer® 9200 Bridging and Spacing Bar
2. Subject to compliance with requirements, provide ClarkDietrich; EasyClip™ U-Series Clip Angle U543 but not less than 1-1/2 by 1-1/2 inches, 0.0538 inch thick, galvanized steel.

M. Header/Sill System: Preformed, pre-engineered header/sill, minimum 20 gage, galvanized sheet steel for use at openings in metal stud wall systems.
1. Manufacturer: Subject to compliance with requirements, provide products by the following: Brady Construction Innovations, Inc. "Pro X Header" OR ClarkDietrich; ClarkDietrich; RedHeader PRO.

N. Column and Beam Wrap Fastener: SNAP-ON WALLBOARD CLIP as manufactured by Claw International, 5309 Hwy. 75 North, Suite 112 - Sioux City, IA 51108; Telephone: (712) 239- 7200; Fax: (712) 239-1196; website: www.theclaw.net.
1. The Claw: 1 1/2 inch thick x 2 inch wide x 2 3/8 inch (38 x 51 x 60 mm) long, galvanized steel, snap-on clip.

2. Support Angle: 25-gauge (No. 25 MSG) (0.0209-inch (0.531 mm) thick) galvanized steel angle with 1 1/2 inch (38 mm) legs. Length: 1 inch (25.4 mm) shorter than assembly length.
3. Screws: 1 inch (25.4 mm) and 1 5/8 inch (41 mm) self-drilling, self-tapping, Type 'S' steel.
4. Corner Bead: 26-gauge (No. 26 MSG) (0.0179-inch (0.455 mm) thick) galvanized steel angle with 1 1/4 inch (32 mm) legs.
5. Nails: 4d x 1 3/8 inch (35 mm) long.

O. Fasteners for Metal Framing: Provide fasteners of type, material, size, corrosion resistance, holding power and other properties required to fasten steel framing and furring member securely to substrates involved; comply with recommendations of gypsum board manufacturers for applications indicated.

P. (If indicated as required), Breakaway (Meltaway) Fire Wall Anchors: For double wall fire wall construction where IBC Section 706 requires fire walls to allow collapse of construction on either side without collapse of the wall. Anchors attaching the fire wall to CMU, concrete or steel must have the capability of providing structural performance, but "detach" during a fire.
1. All breakaway anchors shall be constructed of rolled zinc alloy 710 and have a melting point of 792 degrees.
2. Approved anchors shall be equal to Heckmann Breakaway Fire Wall Anchors #187, 274,189, 341-B, 394,196.
3. OPTION: ClarkDietrich aluminum breakaway clips, Aluminum Burn Clip (AB), are used as part of the H-Stud Area Separation Wall assembly, holds the Area Separation Wall assembly in place at the floor roof and truss line between adjacent units, and are designed to melt and break away when exposed to fire.

2.04 WALL BOARD MATERIALS

A. Manufacturers:
1. G-P Gypsum Corporation: www.gp.com.
2. National Gypsum Company: www.nationalgypsum.com.
3. USG Corporation: www.usg.com.
4. Substitutions: See Section 01 2500 Substitution Procedures for substitution procedures.

Q. **General**: Provide gypsum board of types indicated in maximum lengths available to minimize end-to-end butt joints.
1. Thickness: Provide gypsum board in thickness indicated, or if not otherwise indicated, in 5/8 inch thickness.
2. Provide Abuse-Resistant Gypsum Wallboard at ALL corridor, lobby or other "public" locations with gypsum board partitions below 8'-0" A.F.F., minimum.

R. **Gypsum Board**: USG 5/8" thick "Fire Code" Core Gypsum Panel, Type X (ASTM C 1396), SW, with U.L. rating and tapered edges. Provide panels 48" wide and in lengths as long as practical to minimize the number of joints. Metal stud partitions in all areas not mentioned below shall receive Gypsum Board. Provide Sag-resistant type for ceiling surfaces.

S. **Gypsum Backing Board for Multi-Layer Applications**: ASTM C 1396 or, where backing board is not available from manufacturer, gypsum wallboard, ASTM C 1396, of type, edge configuration and thickness indicated below, in maximum lengths available to minimize end- to-end joints. Type X for fire-resistant rated assemblies and

where indicated. Sag-resistant type for ceiling surfaces. Edges: Square, non-tapered, or V-tongue and groove. Thickness: 1/2" and 5/8", unless otherwise indicated.

T. **Abuse-Resistant Gypsum Wallboard**: ASTM C 1278/C 1278M and ASTM C 1396, of types, edge configuration and thickness indicated below without paper facing and with fiber mesh reinforced backing; in maximum lengths available to minimize end-to-end butt joints. Types: Regular, unless otherwise indicated. Thickness: 5/8", unless otherwise indicated.
   1. Manufacturer: Subject to compliance with requirements, provide products by the the following: USG "Fiberock VHI Abuse-Resistant Gypsum Fiber Interior Panels" or USG "Mold Tough AR Firecode Core"
   2. Refer to drawings for locations.

U. **Tile Backer Board in ALL WET AREAS**: Dens-Shield Tile Backer by Georgia Pacific or Fiberock Tile Backer by USG in compliance with ASTM C-1178 meeting mold-mildew-fungus resistance test ASTM D3273-94 with performance rating of 10. Provide panels 48" wide and in lengths as long as practical to minimize the number of joints. Metal stud partitions in areas where walls are likely to get wet shall receive Tile Backer Board. Metal stud partitions with ceramic tile in areas where walls are likely to get wet shall also receive Tile Backer Board. Examples of rooms or areas requiring Tile Backer Board include, but are not limited to: restrooms, janitor closets (within 4'-0" of mop sink), behind sinks, drinking fountains (min 2'-0" beyond each edge and above rim) showers and any other similar wet area or wet area with ceramic tile.

V. **Tile Backer Board in ALL NON-WET AREAS**: Moisture and Mold Resistant Gypsum Board: USG 5/8" Mold Tough "Fire Code" Core Gypsum Panel, Type X (ASTM C1396), SW, with UL rating. Provide panels 48" wide and in lengths as long as practical to minimize the number of joints. Metal stud partitions receiving ceramic tiles in areas where walls are not likely to get wet shall receive Moisture and Mold Resistant Gypsum Board. Examples of rooms or areas requiring Moisture and Mold Resistant Gypsum Board behind ceramic tile include, but are not limited to: corridors with ceramic tile finish.

W. **Gypsum Sheathing (Exterior wall sheathing)**: Fiberglass-Faced "Greenglass", 5/8", Type X (ASTM E119) as manufactured by Temple-Inland, "Dens-Glass Gold" glass mat gypsum sheathing board, 5/8" (ASTM C1177) or Securock Glass-Mat Sheathing as manufactured by
U.S. Gypsum.

F. Partition Head to Structure Connections: Partition Head To Structure Connections: Provide track fastened to structure with legs of minimum 3 inch length to accommodate for minimum 1 inch deflection for friction fit of studs cut short.

G. Between stud wall blocking: Type and size appropriate to stud spacing.

2.05 PARTITION CLOSURES

B. Provide extruded aluminum adjustable partition closures at all junctures of partitions with other construction as indicated.

C. Adjustable partition closures shall be spring loaded assemblies filled with acoustical batt insulation and with finish to match curtain wall system.

D. Manufacturers: Subject to compliance with requirements, provide the following: Gordon Inc., "Mullion Mate".

2.06 PARTITION END CAPS

B. Provide extruded aluminum partition end caps at all partition termination ends.

C. Provide at locations of all adjustable partition closures and other locations indicated. Finish to match curtain wall system.

D. Manufacturers: Subject to compliance with requirements, provide the following: Gordon Inc., "Series 910 Special Shapes".

2.07 TRIM ACCESSORIES

B. Provide manufacturer's standard trim accessories for gypsum board work, per ASTM C 1047. Provide with either knurled or perforated expanded flanges for nailing or stapling, and beaded for concealment of flanges, in joint compound.

C. Interior Trim Accessories: Provide corner beads, L-type edge trim-beads, U-type edge trim• beads, special L-kerf-type edge trim-beads, and one-piece control joint beads complying with the following requirements.

1. Materials: Formed metal complying with the following requirements.
   a. Sheet steel zinc coated by the hot dip process.
   b. Sheet steel zinc coated by the hot dip process or electrolytic process, or sheet steel coated with aluminum.
2. Shapes: As indicated below by reference to Figure 1 designations per ASTM C 1047.
   a. Corner bead on outside corners, unless otherwise indicated.
      1) Product: ClarkDietrich; 103 Deluxe Cornerbead or comparable product.
   b. L-bead with both face and back flanges; face flange formed to receive joint compound. Use L-beads for edge trim, unless otherwise indicated.
      1) Product: ClarkDietrich; Metal U-Trim M20A or comparable product.
   c. L-bead with face flange only; face flange formed to receive joint compound.
      1) Product: ClarkDietrich; Metal L-Trim M20B or comparable product.
   d. U-bead with face and back flanges; face flange formed to be left without application of joint compound. Use U-bead where indicated.
      1) Product: ClarkDietrich; Metal J-Trim M400 Series or comparable product.
   e. One piece control joint formed with V-shaped slot and removable strip covering slot opening.
      1) Product: ClarkDietrich; #093 Control Joint or comparable product.
3. Reveals: Extruded aluminum.
   a. Products: Fry Reglet Corporation "No. DRM-50-625".

D. BOTTOM OF DRYWALL PARTITIONS:

1. Drywall Moisture Protection Devices for bottom of drywall partitions
   PVC Water Protection Device installed at floor level of drywall partitions as manufactured by Waterguard-USA.
   www.Waterguard-USA.com or
   www.KeepsDrywallDry.com Phone number: (800-653-8785)

2. Sizes available:
   a. Non-Rated Walls: Height = 1/2” tall extruded PVC GDW moisture guard: installed continuously at floor level of all GDW throughout building.
   b. 1-Hour Fire Rated Walls: 1/2" tall extruded PVC GDW moisture guard: installed continuously at floor level of all 1-Hour Fire Rated walls.
   c. 2-Hour Fire Rated Walls: 1/2" tall extruded PVC GDW moisture guard: installed continuously at floor level of each layer of GDW on all 2-Hour Fire Rated walls. Once the wall assembly is constructed, place a bead of caulk (latex, acrylic, silicone, polymer, or similar materials-not necessarily listed "fire caulk") at floor level against the outer most layer of moisture guard.

E. Exterior Surface Trim and Accessories: Cornerbead, edge trim, control joints formed from sheet steel zinc coated by the hot dip process per ASTM C 1047, in shapes indicated below by reference to ASTM C 1047, Figure 1 Designations.
1. Cornerbead on outside corners, unless otherwise indicated.
   a. Product: ClarkDietrich; 103 Deluxe Cornerbead or comparable product.
2. Edge trim complying with shape LC-bead per Figure 1, unless otherwise indicated.
   a. Product: ClarkDietrich; Metal U-Trim M20A or comparable product.
3. One piece control joint formed with V-shaped slot and removable strip covering slot opening.
   a. Product: ClarkDietrich; #093 Control Joint or comparable product.

F. Exterior Surface Trim and Accessories: Cornerbead, edge trim, control joints formed from PVC conforming to ASTM D 1784.
1. Shapes: As indicated below by reference to Figure 1 designations per ASTM C 1047.
   a. Cornerbead on outside corners, unless otherwise indicated.
      1) Product: ClarkDietrich; Vinyl Corner Bead or comparable product.
   b. Edge trim complying with shape LC-bead per Figure 1, unless otherwise indicated.
      1) Product: ClarkDietrich; Vinyl "J" Beads or comparable product.
   c. One piece control joint formed with V-shaped slot and removable strip covering slot opening.
      1) Product: ClarkDietrich; Vinyl 093 Control Joint or comparable product.
2. Manufacturers:
   a. Alabama Metal industries Corp. (AMICO).
   b. Plastic Components, Inc.
   c. ClarkDietrich.

G. Soffit Reveals: Prefabricated, extruded aluminum reveals.
1. Manufacturer: Subject to compliance with requirements, provide the following: Fry Reglet Corp. "No. DRM-635-50".

H. Soffit Vents: Prefabricated, extruded aluminum soffit vent, with clear anodized finish.
1. Manufacturer: Subject to compliance with requirements, provide the following: Fry Reglet Corp. "Soffit Vent No. DCS-50-V-200".

2.08 JOINT TREATMENT MATERIALS

B. General: ASTM C 475; type recommended by manufacturer of sheet products and

joint treatment materials for application indicated, unless indicated otherwise.

C. Joint Tape: Paper reinforcing tape.
   1. Interior Gypsum Board: Paper reinforcing tape.
      a. Product: ClarkDietrich; Strait-Flex Butt-Tape, or comparable product.
   2. Exterior Gypsum Board: Paper reinforcing tape.
      a. Product: ClarkDietrich; Strait-Flex Butt-Tape, or comparable product.
   3. Mold and Mildew Resistant Backer Board: Glass mesh tape.

D. Setting Type Joint Compound: Factory prepackaged, job mixed chemical-hardening powder products for bedding and filling, formulated for uses indicated.
   1. For taping and filling only.
   2. For prefilling gypsum board joints.
   3. For filling joints and treating fasteners of water-resistant gypsum backing board behind base for ceramic tile.
   4. For filling joints and treating fasteners of mold and mildew resistant backing board behind base for ceramic tile.
   5. For filling joints and treating fasteners of gypsum base for veneer plaster.
   6. For topping compound, use sandable formulation.

E. Drying-Type Joint Compounds: Factory prepackaged vinyl-based products complying with the following requirements for formulation and intended use.
   1. Ready-Mix Formulation: Factory-mixed product.
   2. All-purpose compound formulated for use as both taping and topping compound (use for finish (third) coat only.)

F. Exterior Joint Compound: Special chemical-hardening-type for exterior application.

2.09 ACOUSTICAL SEALANT

B. Acoustical Sealant for Exposed and Concealed Joints: Manufacturer's standard non-sag, paintable, nonstaining latex sealant complying with ASTM C 834 and the following requirements.
   1. Product is effective in reducing airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies per ASTM E 90.

C. Products: Subject compliance with requirements, provide products by the following:
   1. Acoustical Sealant for Exposed and Concealed Joints:
      a. AC-20 FTR Acoustical and Insulation Sealant; Pecora Corp.
      b. Tremco Acoustical Sealant; Tremco, Inc.
      c. Sheetrock Acoustical Sealant; United States Gypsum Corp.

2.010 MISCELLANEOUS MATERIALS

B. General: Provide auxiliary materials for gypsum board work of type and grade recommended by gypsum board manufacturer.

C. Laminating Adhesive: Special adhesive or joint compound specifically recommended for laminating gypsum boards.

D. Spot Grout: ASTM C 475, setting-type joint compound for type recommended for spot grouting hollow metal door frames.

E. Gypsum Board Screws: ASTM C 1513
   1. Fastening gypsum board to steel members less than 0.033 inch thick.
   2. Fastening gypsum board to gypsum board.

F. Steel Drill Screws: ASTM C 1513, for fastening gypsum board to steel members.

G. Sound Attenuation Blankets: ASTM C 665, Type I (blankets without membrane facing), unfaced mineral fiber blanket insulation in thicknesses shown.
   1. Mineral-Fiber Type: Fibers manufactured from glass, slag wool, or rock wool.

H. Thermal Insulation: Material indicated below, of thickness and width to fill voids formed by Z• furring members:
   1. Unfaced Mineral Fiber Blanket Insulation: ASTM C 665, Type I (blankets without membrane facing), in thicknesses shown. Mineral-Fiber Type: Fibers manufactured from glass, slag wool, or rock wool.
   2. Extruded Polystyrene Board Insulation: ASTM C 578, Type IV, rigid, cellular, polystyrene thermal insulation formed from polystyrene resin using an extrusion process.

I. Isolation Strip at Exterior Walls:
   1. Asphalt-Saturated Organic Felt: ASTM D 226, Type I (No. 15 asphalt felt), non• perforated.
   2. Foam Gasket: Adhesive backed, closed cell vinyl foam strips that allow fastener penetration without foam displacement, 1/8 inch thick, in width to suit steel stud size.

J. Access Doors: If not specified elsewhere, Inryco/Milcor Style DW, size 14" x 14" in walls and 22" x 22" in ceilings. Baked enamel prime coat. Contractor to finish paint (spec. section 09 90 00). Concealed spring hinges. Flush, screwdriver operated steel cam lock. Door shall be manufactured with drywall bead attached.

PART 3 - EXECUTION

3.01 GENERAL / EXAMINATION

A. Examine substrates to which gypsum board construction attaches or abuts, installed hollow metal frames, cast-in anchors and structural framing with Installer present for compliance with requirements for installation tolerances and other conditions affecting performance of gypsum board assemblies specified in this Section.

B. Interior gypsum wallboard and ceiling board installation may not commence until all exterior dampproofing and roofing are completed and roof top equipment is fully installed and flashed and exterior wall openings are protected.

C. Do not proceed with installation until unsatisfactory conditions have been corrected.

D. Protect gypsum products from moisture and contaminants. Do not store near materials that may offgas harmful voes.

E. Protect workers, building occupants, and HVAC systems from gypsum dust to maintain construction Indoor Air Quality Management Plan.

3.02 INSTALLATION OF STEEL FRAMING, GENERAL

A. Steel Framing Installation Standard: Comply with ASTM C 754.

B. Install supplementary framing, blocking and bracing at terminations in work and for support of fixtures, equipment services, heavy trim, grab bars, toilet accessories, door bumpers, furnishings and similar construction to comply with details indicated and with recommendations of gypsum board manufacturer, or if none available, with "Gypsum

Construction Handbook", published by United States Gypsum Co.

C. Isolate steel framing from building structure to prevent transfer of loading imposed by structural movement, at locations indicated below to comply with details shown on drawings.
   1. Where suspended ceiling assemblies abut building structure horizontally at ceiling perimeters or penetrations of ceiling.
   2. Where partition and wall framing abut overhead structure.
      a. Provide slip or cushioned type joints to attain lateral support and avoid axial loading.

D. Do not bridge building expansion and control joints with steel framing or furring members, independently frame both sides of joints with framing or furring members or as indicated.

3.03 INSTALLATION OF STEEL FRAMING FOR CEILINGS AND SOFFITS

A. Suspend ceiling hangers from building structural members and as follows:
   1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum not part of supporting structural or ceiling suspension system.
      a. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, counter splaying or other equally effective means.
   2. Where widths of ducts and other construction within ceiling plenum produce hanger spacings that interfere with the location of hangers at spacing required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices.
      a. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards.
   3. Secure wire hangers to structure, by looping or wire tying, directly to supporting structure, including intermediate framing members. Attach to inserts, eye screws, or other devices appropriate for structure to which hangers are attached as well as for type of hanger involved, in manner that will not cause deterioration or failure, due to age, corrosion or elevated temperatures.
   4. Do not attach hangers to metal roof deck or metal deck tabs.
   5. Do not connect or suspend steel framing from ducts, pipes or conduits.

B. Keep hangers and braces 2 inches clear of ducts, pipes and conduits.

C. Sway-brace suspended steel framing with hangers used for support.

D. Install suspended steel framing components in sizes and at spacing indicated, but not less than required by referenced steel framing installation standard.
   1. Wire Hangers: 0.1620 inch diameter (8 gage), 4 fl. o.c.
   2. Carrying Channels (Main Runners): 1-1/2 inch, 4 fl. o.c.
   3. Rigid Furring Channels (Furring Members): 16 inches o.c.

E. Installation Tolerances: Install steel framing components for suspended ceilings so cross furring members are level to within 1/8 inch in 12 fl. as measured both lengthwise in each member and transversely between parallel members.

F. Wire-tie or clip furring members to main runners and to other structural supports as indicated.

G. Grid Suspension Systems: Attach perimeter wall track or angle where grid suspension system abuts vertical surfaces. Mechanically join main beam and cross furring members to each other and butt cut to fit wall track.

H. For exterior soffits, install cross-bracing and additional framing to resist wind uplift.

3.04 INSTALLATION OF STEEL FRAMING FOR WALLS AND PARTITIONS

A. Install runners (tracks) at floors, ceilings and structural walls and columns where gypsum board stud system abuts other construction.
   1. Use proprietary tracks for non-rated and fire rated walls and partitions.
   2. Install studs full height for all partitions unless noted otherwise.
   3. Where studs are installed directly against exterior walls, install asphalt felUfoam isolation strips between studs and wall.

B. Installation Tolerances: Install each steel framing and furring member so that fastening surface does not vary more than 1/8 inch from plane of faces of adjacent framing.

C. Extend partition framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at or just above suspended ceilings. Continue framing over frames for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board.
   1. Cut studs 1/2 inch short of full height to provide perimeter relief.
   2. For STC-rated or fire-resistance rated partitions that extend full height, install framing around structural members, as required to support gypsum board closures needed to make partitions continuous from floor to underside of structure above.
   3. Install bridging/spacing bar.

D. Brace partition framing, not extending full height to structure above, with studs same size and thickness as partition framing. Provide bracing at:
   1. 6'-0" o.c. intervals along length of partitions.
   2. Not less than 6'-0" from partition ends and corners.
   3. Door and window openings.

E. Terminate partition framing at suspended ceilings where indicated.

F. Install steel studs and furring in sizes and at spacings indicated.
   1. Single-Layer Construction: Space studs 16 inches o.c., unless otherwise indicated.
   2. Multiple-Layer Construction: Space studs 16 inches o.c., unless otherwise indicated.

G. Install steel studs with flanges in same direction and leading edge or end of gypsum board panel can be attached to open (unsupported) edges of stud flanges first.

H. Frame door openings to comply with details indicated, with GA-219 and with applicable published recommendations of gypsum board manufacturer. Attach vertical studs at jambs with screws either directly to frames or to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.
   1. Extend vertical jamb studs through suspended ceilings and attach to underside of floor or roof structure above.

I. Frame openings other than door openings to comply with details indicated, or if none indicated, in same manner as required for door openings; and install framing below sills of openings to match framing required above door heads.

J. Install thermal insulation vertically and hold in place with Z-furring members spaced at 24 inches o.c.
   1. Except at exterior corners, securely attach narrow flanges of furring members to wall with concrete stub nails or screws designed for masonry attachment, spaced at 24 inches o.c.
   2. At exterior corners attach wide flange of furring members to wall with short flange extending beyond corner; on adjacent wall surface, screw attach short flange of furring channel to web of attached channel. Start from this furring channel with standard width insulation and continue in regular manner.
   3. At interior corners, space second member no more than 12 inches from corner and cut insulation to fit.

3.05 APPLICATION AND FINISHING OF GYPSUM BOARD, GENERAL

A. Gypsum Board Application and Finishing Standards: Comply with ASTM C 840 and GA-216.

B. Install sound attenuation insulation blankets where indicated, prior to gypsum board, unless readily installed after board has been installed on one side.

C. Locate exposed end-butt joints as far from center of walls and ceilings as possible, and stagger not less than 24 inches in alternate courses of board.

D. Install ceiling boards across framing in manner to minimize end-butt joints, and avoids end joints in central area of each ceiling. Stagger end joints at least 24 inches.

E. Install wall/partition boards in manner to minimize end-butt joints or avoids them entirely where possible. At high walls, install boards horizontally with end joints staggered over studs.

F. Install exposed gypsum board with face side out. Do not install imperfect, damaged or damp boards. Butt boards together for light contact at edges and ends with not more than 1/16 inch open space between boards. Do not force into place.

G. Locate both edge or end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints.
   1. Position boards so like edges abut, tapered edges against tapered edges and mill-cut or field-cut ends against mill-cut or field-cut ends.
   2. Do not place tapered edges against cut edges or ends.
   3. Stagger vertical joints over different studs on opposite sides of partitions.

H. Attach gypsum board to steel studs so leading edge or end of each board is attached to open (unsupported) edge of stud flange first.

I. Attach gypsum board to supplementary framing and blocking provided for additional support at openings and cutouts.

J. Spot grout hollow metal door frames for solid core wood doors, hollow metal doors and doors over 32 inches wide except where full grout shown. Apply spot grout at each jamb anchor clip just before inserting board into frame.

K. Form control joints and expansion joints at locations indicated or as recommended, with space between edges of boards, prepared to receive trim accessories.

L. Cover both faces of steel stud partition framing with gypsum board in concealed spaces (above ceiling, etc.), except in chase walls which are braced internally.
   1. Except where concealed application is indicated or required for sound, fire, air or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. fl. area, and may be limited to not less than 75 percent of full coverage.
   2. Fit gypsum board around ducts, pipes and conduits.

M. Isolate perimeters of non-load-bearing drywall partitions at structural abutments. Provide 1/4 to 1/2 inch space and trim edge with "U" bead edge trim. Seal joints with acoustical sealant unless fire resistant sealant shown.

N. Where STC-rated gypsum board assemblies are indicated, seal construction at perimeters, behind control and expansion joints, openings, and other penetrations with a continuous bead of acoustical sealant. Include a bead of sealant at both faces of partitions.
   1. Comply with ASTM C 919 and manufacturer's recommendations for location of edge trim and closing off sound flanking paths around or through gypsum board assemblies, including partitions extending above ceilings.

O. Space fasteners in gypsum board in accordance with referenced gypsum board application and finishing standard and manufacturer's recommendations.

P. Space fasteners in panels that are tile substrates maximum 8 inches o.c.

3.06 METHODS OF GYPSUM BOARD APPLICATION

A. Single-Layer Application: Install gypsum wallboard as follows:
   1. On ceilings apply gypsum board prior to wall/partition board application to greatest extent possible.
   2. On partitions/walls apply gypsum board vertically (parallel to framing), unless otherwise indicated or required by fire resistance rated assembly, and provide sheet lengths which will minimize end joints.
      a. On partitions/walls 8'-1" or less in height, apply gypsum board horizontally (perpendicular to framing); use maximum length sheets possible to minimize end joints.
      b. At stairwells and other high walls, install gypsum board horizontal, unless otherwise indicated or required for fire resistance rating.
      c. On Z-furring, apply gypsum panels vertically (parallel to framing). Locate edge joints over furring member.

B. Double-Layer Application: Install gypsum backing board for base layer and exposed gypsum board for face layer.
   1. On ceilings apply base layer prior to application of base layer on walls/partitions; apply face layers in same sequence. Offset joints between layers minimum one stud space. Apply base layers at right angles to supports, unless otherwise indicated.
   2. On partitions/walls apply base layer and face layers vertically (parallel to framing) with joints of base layer over supports and face layer joints offset minimum one stud space with base layer joints.

C. Wall Tile Substrates: For substrates scheduled to receive ceramic tile, comply with the following:
   1. Install glass-mat, water-resistant gypsum backing board panels to comply with

manufacturer's installation instructions at locations scheduled to receive wall tile. Install with 1/4-inch open space where panels abut other construction.

D. Single-Layer Fastening Methods: Apply gypsum boards to metal supports with screws and to wood supports with nails.

E. Double-Layer Fastening Methods: Apply base layer of gypsum board and face layer to base layer as follows:
   1. Fasten base layer with screws and face layer with adhesive and supplementary fasteners, except where otherwise required for fire-resistance rated assemblies.

3.07 INSTALLATION OF DRYWALL TRIM ACCESSORIES

A. General: Where feasible, use same fasteners to anchor trim accessory flanges as required to fasten gypsum board to supports. Otherwise, fasten flanges to comply with manufacturer's recommendations.

B. Install corner beads at external corners, except for walls to receive corner guards.

C. Install metal edge trim whenever edge of gypsum board would otherwise be exposed or semi- exposed. Provide type with face flange to receive joint compound except where "U" bead (semi-finishing type) is indicated.
   1. Install "LC" bead where drywall construction is tightly butted to other construction and back flange can be attached to framing or supporting substrate.
   2. Install "LK" bead where substrate is kerfed to receive long flange of trim.
   3. Install "L" bead where edge trim can only be installed after gypsum board is installed.
   4. Install U-type trim where edge is exposed, gasketed or sealant-filled (including expansion joints).

D. Install control joints at locations indicated, or if not indicated, at spacings not greater than 20'- 0" centers and locations required by ASTM C 840 and manufacturer's recommendations; and approved by Architect for visual effect.

E. Install reveals at locations indicated on Drawings, whether specifically called out or not. Lines on drawings that are in-plane with the wall shall be considered reveals for bidding purposes and shall be coordinated with Architect prior to beginning wall framing.

F. Install soffit vents at locations indicated.

3.08 FINISHING OF GYPSUM WALL BOARD

A. General: Apply joint treatment at gypsum board joints (both directions); flanges of corner bead, edge trim and control joints; penetrations; fastener heads, surface defects and elsewhere as required to prepare work for decoration.

B. Prefill open joints using setting-type joint compound.

C. Apply joint tape at joints between gypsum boards, except where trim accessories are indicated.

D. Finish interior gypsum wallboard by applying the following joint compounds in three coats (not including prefill of openings in base), sand between coats, and after last coat.
   1. Embedding and First Coat: Setting-type joint compound.
   2. Fill (Second) Coat: Setting-type joint compound.
   3. Finish (Third) Coat: Ready-mix drying all-purpose or topping compound.
   4. Textured finishes may be achieved by means of roller texture. Contractor to provide mockup of texture area in small, well lit room for Architect's review and approval prior to installation throughout project.

E. Mold and Mildew Resistant Gypsum Board: Finish using setting type joint compounds to prefill joints and embed tape, for first, fill (second), and finish (third) coats, with last coat being a sandable product. Smooth each coat before joint compound hardens to minimize sanding.

F. Water-Resistant Backer Board Base for Ceramic Tile: Finish joints to comply with ASTM C 840, with gypsum board manufacturer's recommendations, and installation standards referenced in Section 09 31 00 - Ceramic and Quarry Tile.

G. Glass-Mat Water Resistant Backer Board: Comply with glass mat backer board manufacturer's recommendations.

H. Partial Finishing: Omit third coat and sanding on concealed drywall construction indicated for drywall finishing or which requires finishing to achieve fire-resistance rating, sound rating or to act as air or smoke barrier.

I. Levels of Finish: Provide in accordance with Gypsum Association GA 214, "Recommended Levels of Gypsum Board Finish".
   1. Level 0 finish: For temporary construction only where gypsum board is scheduled for removal before project completion.
      a. No taping, finishing or accessories required.
   2. Level 1 finish: Ceiling plenum areas and concealed areas not visible to view, except provide higher level of finish as required to comply with fire resistance ratings and acoustical ratings.
      a. All joints and interior angles shall have tape set in joint compound. Surface shall be free of excess joint compound. Tool marks and ridges are acceptable.
   3. Level 2 finish: All visible areas not receiving paint finish or unconditioned spaces not receiving other finish.
      a. All joints and interior angles shall have tape embedded in joint compound and wiped with a joint knife leaving a thin coating of joint compound over all joints and interior angles.
      b. Fastener heads and accessories shall be covered with a coat of joint compound. Surface shall be free of excess joint compound.
      c. Tool marks and ridges are acceptable.
      d. Joint compound applied over the body of the tape at the time of tape embedment shall be considered a separate coat of joint compound and shall satisfy the conditions of this level.
   3. Level 3 finish: Gypsum board substrate at areas to receive textured finishes before painting or areas to receive wall coverings. Do not use for smooth painted surfaces.
      a. All joints and interior angles shall have tape embedded in joint compound and one additional coat of joint compound applied over all

joints and interior angles.

b. Fastener heads and accessories shall be covered with two separate coats of joint compound. All joint compound shall be smooth and free of tool marks and ridges.

c. The prepared surface shall be coated with a drywall primer prior to the application of final finishes.

4. Level 4 finish: All Gypsum board surfaces, to receive flat, eggshell or satin paint, or light texture finish except where another finish level is indicated.

a. All joints and interior angles shall have tape embedded in joint compound and two separate coats of joint compound applied over all flat joints and one separate coat of joint compound applied over interior angles.

b. Fastener heads and accessories shall be covered with three separate coats of joint compound. All joint compound shall be smooth and free of tool marks and ridges.

c. The prepared surface shall be coated with a drywall primer prior to the application of final finishes.

5. Level 5 finish: All gypsum board surfaces to receive gloss, semi-gloss, or enamel finish or where severe lighting conditions occur. Also to be used on all formed curved drywall surfaces.

a. All joints and interior angles shall have tape embedded in joint compound and two separate coats of joint compound applied over all flat joints and one separate coat of joint compound applied over interior angles.

b. Fastener heads and accessories shall be covered with three separate coats of joint compound.

c. A thin skim coat of joint compound trowel applied, or a material manufactured especially for this purpose and applied in accordance with manufacturer's recommendations, shall be applied to the entire surface. The surface shall be smooth and free of tool marks and ridges.

d. The prepared surface be coated with a drywall primer prior to the application of finish paint.

3.09 CLEANING AND PROTECTION

A. Promptly remove any residual joint compound from adjacent surfaces.

B. Provide final protection and maintain conditions, in manner suitable to Installer, to ensure gypsum board assemblies are without damage or deterioration at time of Substantial Completion.

END OF SECTION

SECTION 09 2216
NON-STRUCTURAL METAL FRAMING

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Metal partition, ceiling, and soffit framing.

1.02 RELATED REQUIREMENTS

A. Section 06 1000 - Rough Carpentry: Wood blocking within stud framing.

B. Section 06 1000 - Rough Carpentry: Wall sheathing.

C. Section 07 9000- Joint Sealants: Sealing acoustical gaps in construction other than gypsum board or plaster work.

D. Section 09 2116 - Gypsum Board Assemblies: Execution requirements for anchors for attaching work of this section.

1.03 REFERENCE STANDARDS

A. ASTM C645 - Standard Specification for Nonstructural Steel Framing Members.

B. ASTM C754 - Standard Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products.

C. ASTM C1002 - Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs.

1.04 SUBMITTALS

A. See Section 01 3000 - Administrative Requirements, for submittal procedures.

B. Product Data: Provide data describing framing member materials and finish, product criteria, load charts, and limitations.

C. Manufacturer's Installation Instructions: Indicate special procedures and perimeter conditions requiring special attention.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: Company specializing in performing the work of this section with minimum five years documented experience and approved by manufacturer.

PART 2 PRODUCTS

2.01 FRAMING MATERIALS

A. Non-Loadbearing Framing System Components: ASTM C645; galvanized sheet steel, of size and properties necessary to comply with ASTM C754 for the spacing indicated, with maximum deflection of wall framing of L/240 at 5 psf.
   1. Studs: C shaped with flat or formed webs with knurled faces.
   2. Runners: U shaped, sized to match studs.

B. Partition Head to Structure Connections: Provide track fastened to structure with legs of sufficient length to accommodate deflection, for friction fit of studs cut short and braced with continuous bridging on both sides.

C. Tracks and Runners: Same material and thickness as studs, bent leg retainer notched to receive studs with provision for crimp locking to stud.

D. Furring and Bracing Members: Of same material as studs; thickness to suit purpose; complying with applicable requirements of ASTM C754.

E. Fasteners: ASTM C1002 self-piercing tapping screws.

2.02 FABRICATION

A. Fabricate assemblies of framed sections to sizes and profiles required.

B. Fit, reinforce, and brace framing members to suit design requirements.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify existing conditions before starting work.

B. Verify that rough-in utilities are in proper location.

3.02 INSTALLATION OF STUD FRAMING

A. Extend partition framing to structure where indicated and to ceiling in other locations.

B. Partitions Terminating at Ceiling: Attach ceiling runner securely to ceiling track in accordance with manufacturer's instructions.

C. Partitions Terminating at Structure: Attach extended leg top runner to structure, maintain clearance between top of studs and structure, and brace both flanges of studs as indicated.

D. Align and secure top and bottom runners at 24 inches on center.

E. Fit runners under and above openings; secure intermediate studs to same spacing as wall studs.

F. Install studs vertically at spacing indicated on drawings.

G. Align stud web openings horizontally.

H. Secure studs to tracks using crimping method. Do not weld.

I. Stud splicing is not permissible.

J. Fabricate corners using a minimum of three studs.

K. Double stud at wall openings, door and window jambs, not more than 2 inches from each side of openings.

L. Brace stud framing system rigid.

M. Coordinate erection of studs with requirements of door frames; install supports and attachments.

N. Coordinate installation of bucks, anchors, and blocking with electrical, mechanical, and other work to be placed within or behind stud framing.

3.03 CEILING AND SOFFIT FRAMING

A. Install furring after work above ceiling or soffit is complete. Coordinate the location of hangers with other work.

B. Install furring independent of walls, columns, and above-ceiling work.

C. Securely anchor hangers to structural members or embed in structural slab. Space hangers as required to limit deflection to criteria indicated. Use rigid hangers at exterior soffits.

D. Space main carrying channels at maximum 72 inch on center, and not more than 6 inches from wall surfaces. Lap splice securely.

E. Securely fix carrying channels to hangers to prevent turning or twisting and to transmit full load to hangers.

F. Place furring channels perpendicular to carrying channels, not more than 2 inches from perimeter walls, and rigidly secure. Lap splices securely.

3.04 TOLERANCES

A. Maximum Variation From True Position: 1/8 inch in 10 feet.

B. Maximum Variation From Plumb: 1/8 inch in 10 feet.

END OF SECTION

SECTION 09 3000

TILING

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Tile for floor applications.

B. Tile for wall applications.

C. Cementitious backer board as tile substrate.

D. Transition strips.

E. Ceramic trim.

1.02 SUBMITTALS

A. Product Data: Provide manufacturers' data sheets on tile, mortar, grout, and accessories. Include instructions for using grouts and adhesives.

B. Shop Drawings: Indicate tile layout, patterns, color arrangement, perimeter conditions, control and expansion joints, and thresholds.

1.03 QUALITY ASSURANCE

A. Installer Qualifications: Company specializing in performing tile installation, with minimum of 5 years of documented experience.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Protect adhesives from freezing or overheating in accordance with manufacturer's instructions.

1.05 FIELD CONDITIONS

A. Do not install adhesives in an unventilated environment.

PART 2 PRODUCTS

2.01 TILE

A. Manufacturers:
   1. Daltile; www.daltile.com
   2. Crossville Cermamics; www.crossvilleinc.com.
   3. Interceramic; www.interceramic.com
   4. Arizonatile: www.arizonatile.com
   5. Tilebar: www.tilebar.com
   6. Substitutions: Under provisions of Section 01 2500.

B. Ceramic Tile:
   1. Colors, sizes and textures as designated on the Finish Schedule.

C. Porcelain Tile:
   1. Colors, sizes and textures as designated on the Finish Schedule.

2.02 TRIM AND ACCESSORIES

A. Ceramic Trim: Matching bullnose, double bullnose, cove base, and cove ceramic shapes in sizes coordinated with field tile.
   1. Applications: Use in the following locations:
      a. Open Edges: Bullnose.

b. Inside Corners: Jointed.
c. Floor to Wall Joints: Cove base.

2. Manufacturer: Same as for tile.

B. Thresholds: Class A white marble, honed finish, beveled both sides, radiused from bevels to vertical planes, one piece for full width of door or opening.

2.03 ADHESIVE MATERIALS

A. Manufacturers:
1. Bonsal American, Inc; StayFlex 590: www.prospec.com
2. Bostik Inc: www.bostik-us.com.
3. Mapei Corporation: www.mapei.com.
4. Substitutions: See Section 01 2500 - Substitution Procedures.

B. Organic Adhesive: ANSI A136.1, thinset bond type; use Type I in areas subject to prolonged moisture exposure.

2.04 GROUT MATERIALS

A. Manufacturers:
1. Bonsal American, Inc: www.prospec.com
2. Bostik Inc: www.bostik-us.com.
3. Custom Building Products: www.custombuildingproducts.com.

B. Standard Grout: Any type specified in ANSI A118.6 or A118.7.
1. Colors: To be selected by Architect from manufacturer's standard range.

2.05 MORTAR BED MATERIALS

A. Pre-packaged mix of Portland cement, sand, latex additive, and water.
1. Products:
a. LATICRETE International, Inc; LATICRETE 3701 Fortified Mortar Bed: www.laticrete.com/#sle.
b. Merkrete, by Parex USA, Inc; Merkrete Underlay C: www.merkrete.com/sle.
c. Proflex Products, Inc; MSI - Mud Set Installation: www.proflex.us.
d. Substitutions: See Section 01 2500 - Substitution Procedures.

2.06 ACCESSORY MATERIALS

A. Concrete Floor Slab Crack Isolation Membrane: Material complying with ANSI A118.12; not intended as waterproofing.
1. Type: Fluid-applied.
2. Thickness: 20 mils, maximum.
3. Crack Resistance: No failure at 1/16 inch gap, minimum.
4. Products:
a. LATICRETE International, Inc; LATICRETE Blue 92 Anti-Fracture Membrane: www.laticrete.com/#sle.
b. Merkrete, by Parex USA, Inc; Merkrete Fracture Guard: www.merkrete.com/sle.
c. Substitutions: See Section 01 2500 - Substitution Procedures.

B. Cementitious Backer Board: ANSI A118.9; High density, cementitious, glass fiber reinforced, 1/2 inch thick; 2 inch wide coated glass fiber tape for joints and corners.

C. Cleavage Membrane Under Thick Mortar Bed:
1. Material: 4 mil thick polyethylene film.

D. Waterproofing Membrane at Floors: Specifically designed for bonding to cementitious substrate under thick mortar bed or thin-set tile; complying with ANSI A118.10.
1. Fluid or Trowel Applied Type:
a. Material: Synthetic rubber.

b. Thickness: 25 mils, minimum, dry film thickness.

c. Products:
   1) Custom Building Products; RedGard Crack Prevention and Waterproofing Membrane: www.custombuildingproducts.com.
   2) LATICRETE International, Inc; LATICRETE HYDRO BAN: www.laticrete.com/#sle.
   3) Merkrete, by Parex USA, Inc; Merkrete Hydro Guard 2000: www.merkrete.com/sle.
   4) Substitutions: See Section 01 2500 - Substitution Procedures.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that sub-floor surfaces are smooth and flat within the tolerances specified for that type of work and are ready to receive tile.

B. Verify that wall surfaces are smooth and flat within the tolerances specified for that type of work, are dust-free, and are ready to receive tile.

C. Verify that sub-floor surfaces are dust-free and free of substances that could impair bonding of setting materials to sub-floor surfaces.

D. Verify that concrete sub-floor surfaces are ready for tile installation by testing for moisture emission rate and alkalinity; obtain instructions if test results are not within limits recommended by tile manufacturer and setting materials manufacturer.

3.02 PREPARATION

A. Protect surrounding work from damage.

B. Vacuum clean surfaces and damp clean.

C. Seal substrate surface cracks with filler. Level existing substrate surfaces to acceptable flatness tolerances.

D. Install cementitious backer board in accordance with ANSI A108.11 and board manufacturer's instructions. Tape joints and corners, cover with skim coat of dry-set mortar to a feather edge.

E. Install tile backer board in strict accordance with manufacturer's instructions, using galvanized roofing nails or corrosion-resistant bugle head drywall screws. Bed fiberglass self-adhesive tape at all joints and corners with material used to set tiles.

F. Prepare substrate surfaces for adhesive installation in accordance with adhesive manufacturer's instructions.

3.03 INSTALLATION - GENERAL

A. Install tile, thresholds, and stair treads and grout in accordance with applicable requirements of ANSI A108.1 through A108.13, manufacturer's instructions, and TCA Handbook recommendations.

B. Lay tile to pattern indicated. Do not interrupt tile pattern through openings.

C. Cut and fit tile to penetrations through tile, leaving sealant joint space. Form corners and bases neatly. Align floor joints.

D. Place tile joints uniform in width, subject to variance in tolerance allowed in tile size. Make joints watertight, without voids, cracks, excess mortar, or excess grout.

E. Form internal angles square and external angles bullnosed.

F. Install thresholds where indicated.

G. Sound tile after setting. Replace hollow sounding units.

H. Keep expansion joints free of adhesive or grout. Apply sealant to joints.

I. Allow tile to set for a minimum of 48 hours prior to grouting.

J. Grout tile joints. Use standard grout unless otherwise indicated.

K. Apply sealant to junction of tile and dissimilar materials and junction of dissimilar planes.

3.04 INSTALLATION - FLOORS - MORTAR BED METHODS (QUARRY TILE)

A. Over exterior concrete substrates, install in accordance with TCNA (HB) Method F101, bonded, with standard grout.

B. Over interior concrete substrates, install in accordance with TCNA (HB) Method F111, with cleavage membrane, unless otherwise indicated.
   1. Where waterproofing membrane is indicated, with standard grout or no mention of grout type, install in accordance with TCNA (HB) Method F121.
   2. Where epoxy or furan grout is indicated, but not epoxy or furan bond coat, install in accordance with TCNA (HB) Method F114, with cleavage membrane.

C. Cleavage Membrane: Lap edges and ends.

D. Waterproofing Membrane: Install as recommended by manufacturer and as specified in the section in which the product is specified.

E. Mortar Bed Thickness: 5/8 inch, unless otherwise indicated.

3.05 INSTALLATION - FLOORS - THIN-SET METHODS

A. Over interior concrete substrates, install in accordance with TCA Handbook Method F113, dry-set or latex-Portland cement bond coat, with standard grout, unless otherwise indicated.
   1. Use uncoupling membrane under all tile unless other underlayment is indicated.

3.06 INSTALLATION - WALL TILE

A. Over cementitious backer units on studs, install in accordance with TCA Handbook Method W244, using membrane at toilet rooms.

B. Over gypsum wallboard on wood or metal studs install in accordance with TCA Handbook Method W243, thin-set with dry-set or latex-portland cement bond coat, unless otherwise indicated.

C. Over interior concrete and masonry install in accordance with TCA Handbook Method W202, thin-set with dry-set or latex-portland cement bond coat.

3.06 CLEANING

A. Clean tile and grout surfaces.

3.07 PROTECTION

A. Do not permit traffic over finished floor surface for 4 days after installation.

END OF SECTION

SECTION 09 5100

ACOUSTICAL CEILINGS

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Suspended metal grid ceiling system.

B. Acoustical units.

1.02 REFERENCE STANDARDS

A. ASTM C 635 - Standard Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings; 2009b.

B. ASTM E 1264 - Standard Classification for Acoustical Ceiling Products; 2008.

C. UL (FRD) - Fire Resistance Directory; Underwriters Laboratories Inc.; current edition.

1.03 SUBMITTAL PROCEDURES

A. Sequence work to ensure acoustical ceilings are not installed until building is enclosed, sufficient heat is provided, dust generating activities have terminated, and overhead work is completed, tested, and approved.

B. Do not install acoustical units until after interior wet work is dry.

1.04 SUBMITTALS

A. Product Data: Provide data on suspension system components.

B. Manufacturer's Installation Instructions: Indicate special procedures.

1.05 QUALITY ASSURANCE

A. Fire-Resistive Assemblies: Complete assembly listed and classified by UL for the fire resistance indicated.

1.06 FIELD CONDITIONS

A. Maintain uniform temperature of minimum 60 degrees F, and maximum humidity of 40 percent prior to, during, and after acoustical unit installation.

1.07 MAINTENACE MATERIALS

A. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.

1. Ceiling tile: Quantity equal to 15 percent of total installed of each type installed.

PART 2 PRODUCTS

2.01 ACOUSTICAL UNITS

A. Drawings and specifications are based on manufacturer's literature from Armstrong World Industries, Inc. unless otherwise indicated. Other manufacturers to comply with the minimum levels of material and detailing indicated on the drawings and in the specifications and in conformance with provisions of Section 01 2500 – Substitution Procedures.

B. Other Acceptable Manufacturers:

1. Certain Teed Corporation: www.certainteed.com.
2. Hunter Douglas Contract: www.hunterdouglascontract.com.
3. Substitutions permitted in accordance with provisions of Section 01 2500.

C. Acoustical Units

1. Acoustical Tile:
   a. 24 x 24 panel.
   b. Square edge.
   c. Color: Flat white.

d. Texture: Fine fissured.
e. Thickness: ¾".

2. Units for Installation in Fire-Rated Suspension System: Listed and classified for the resistive assembly the suspension system is a part of.

2.02 SUSPENSION SYSTEM

A. Acceptable Manufacturers:
1. Provide suspension system from the same manufacturer as for acoustical units.
2. Substitutions: Not permitted.

B. Suspension Systems - General: ASTM C 635; die cut and interlocking components, with stabilizer bars, clips, splices, perimeter moldings, and hold down clips as required.
1. Match existing systems for repair or replacement.

2.03 FORMATIONS CURVES CLOUD KITS

A. Acceptable Manufacturer:
a. Armstrong Ceilings Formations Curves Cloud Kits
b. Panel: Ultima Vector Factory-cut Curved Panels
c. Trim Types: 4" AXIOM VECTOR Trim
d. Cloud Size: as noted on drawings
e. Material: Mineral Fiber with Acoustic performance
f. Color: Manufacturer Axiom Trim Colors

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify existing conditions before starting work.

B. Verify that layout of hangers will not interfere with other work.

3.02 INSTALLATION - SUSPENSION SYSTEM

A. Install new suspension system or components where existing is damaged or otherwise unusable.

B. Install suspension system in accordance with manufacturer's instructions and as supplemented in this section.

C. Rigidly secure system, including integral mechanical and electrical components, for maximum deflection of 1:360.

D. Locate system according to reflected plan shown on the drawings.

E. Install after major above-ceiling work is complete. Coordinate the location of hangers with other work.

F. Hang suspension system independent of walls, columns, ducts, pipes and conduit. Where carrying members are spliced, avoid visible displacement of face plane of adjacent members.

G. Where ducts or other equipment prevent the regular spacing of hangers, reinforce the nearest affected hangers and related carrying channels to span the extra distance.

H. Do not support components on main runners or cross runners if weight causes total dead load to exceed deflection capability.

I. Support fixture loads using supplementary hangers located within 6 inches of each corner, or support components independently.

J. Do not eccentrically load system or induce rotation of runners.

K. Perimeter Molding: Install at intersection of ceiling and vertical surfaces and at junctions with other interruptions.
1. Use longest practical lengths.
2. Miter corners.

L. Install light fixture boxes constructed of gypsum board above light fixtures in accordance with

fire rated assembly requirements and light fixture ventilation requirements.

3.03 INSTALLATION - ACOUSTICAL UNITS

A. Install acoustical units in accordance with manufacturer's instructions.

B. Fit acoustical units in place, free from damaged edges or other defects detrimental to appearance and function.

C. Fit border trim neatly against abutting surfaces.

D. Install units after above-ceiling work is complete.

E. Install acoustical units level, in uniform plane, and free from twist, warp, and dents.

F. Cutting Acoustical Units:
   1. Cut to fit irregular grid and perimeter edge trim.
   2. Make field cut edges of same profile as factory edges.
   3. Double cut and field paint exposed reveal edges.

G. Where round obstructions occur, provide preformed closures to match perimeter molding.

H. Install hold-down clips on each panel to retain panels tight to grid system; comply with fire rating requirements.

I. Install hold-down clips on panels within 20 ft of an exterior door.

3.04 TOLERANCES

A. Maximum Variation from Flat and Level Surface: 1/8 inch in 10 feet.

B. Maximum Variation from Plumb of Grid Members Caused by Eccentric Loads: 2 degrees.

END OF SECTION

SECTION 09 51 13

ACOUSTICAL CEILINGS – KITCHEN ZONE

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

Drawings and general conditions of Contract, including General and Supplementary Conditions and Divisions-1 Specification sections apply to work of this section.

1.2 SUMMARY

A. Section Includes

1. Acoustical ceiling panels
2. Exposed grid suspension system
3. Wire hangers, fasteners, main runners, cross tees, and wall angle moldings
4. Perimeter Trim

B. ALTERNATES

1. Prior Approval: Unless otherwise provided for in the Contract documents, proposed product substitutions may be submitted no later than TEN (10) working days prior to the date established for receipt of bids. Acceptability of a proposed substitution is contingent upon the Architect's review of the proposal for acceptability and approved products will be set forth by the Addenda. If included in a Bid are substitute products that have not been pre-approved by the architect and included in the Addenda, the originally specified products shall be provided without additional compensation.
2. Submittals that do not provide adequate data for the product evaluation will not be considered. The proposed substitution must meet all requirements of this section, including but not necessarily limited to, the following: Single source materials suppliers; Underwriters' Laboratories Classified Acoustical performance; Panel design, size, composition, color, and finish; Suspension system component profiles and sizes; Compliance with the referenced standards.

1.4 SYSTEM DESCRIPTION

A. Continuous/Wall-to-wall

1.5 SUBMITTALS

A. Product Data: Submit manufacturer's technical data for each type of acoustical ceiling unit and suspension system required.

B. Samples: Minimum 6-inch x 6-inch samples of specified acoustical panel; 8-inch-long samples of exposed wall molding and suspension system, including main runner and 4-foot cross tees.

C. Shop Drawings: Layout and details of acoustical ceilings show locations of items that are to be coordinated with or supported by the ceilings.

D. Acoustical Certifications: Manufacturer's certifications that products comply with specified requirements, including laboratory reports showing compliance with specified tests and standards. For acoustical performance, each carton of material must carry an approved independent laboratory classification, such as Underwriter’s Laboratory (UL), of NRC, CAC, and AC.

   1. If the material supplied by the acoustical subcontractor does not have an independent laboratory classification of acoustical performance on every carton, subcontractor shall be required to send material from every production run appearing on the job to an independent or NVLAP approved laboratory for testing, at the architect's or owner's discretion. All products not conforming to manufacturer's current published values must be removed, disposed of, and replaced with complying product at the expense of the Contractor performing the work.

1.6 QUALITY ASSURANCE

A. Single-Source Responsibility: Provide acoustical panel units and grid components by a single manufacturer to ensure fit and function.

B. Installer Qualifications: Company specializing in performing specified work type, a minimum of three years of documented experience, and approved by the manufacturer.

C. Fire Performance Characteristics: Identify acoustical ceiling components with appropriate markings of applicable testing and inspecting organization.

D. Surface Burning Characteristics: Tested per ASTM E 84 and complying with ASTM E 1264 Classification.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver acoustical ceiling units to project site in original, unopened packages and store them in a fully enclosed space where they will be protected against damage from moisture, direct sunlight, surface contamination, and other causes.
B. Before installing acoustical ceiling units, permit them to reach room temperature and a stabilized moisture content.
C. Handle acoustical ceiling units carefully to avoid chipping edges or damaging units in any way.

1.8 PROJECT CONDITIONS

A. Space Enclosure:
    1. HumiGuard Plus Ceilings: Building areas to receive ceilings shall be free of construction dust and debris. Products with HumiGuard Plus performance and hot dipped galvanized steel, aluminum or stainless-steel suspension systems can be installed up to 120°F (49°C) and in spaces before the building is enclosed, where HVAC systems are cycled or not operating. Cannot be used in exterior applications where standing water is present or where moisture will come in direct contact with the ceiling.

1.9 WARRANTY

A. Acoustical Panel: Submit a written warranty executed by the manufacturer, agreeing to repair or replace panels that fail within the warranty period. Failures include, but are not limited to the following:
    1. Acoustical Panels with HumiGuard® Max and HumiGuard® Plus performance: sagging and warping
    2. Acoustical panels with BioBlock® performance: growth of mold and mildew
    3. Grid System: rusting and manufacturer's defects
B. Warranty Period:
    1. Ceiling System: Thirty (30) years from date of substantial completion
C. The Warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and will be in addition to and run concurrent with other warranties made by the Contractor under the requirements of the Contract Documents.

1.10 MAINTENANCE

A. Extra Materials: Deliver extra materials to Owner. Furnish extra materials described below that match products installed. Packaged with protective covering for storage and identified with appropriate labels.
    1. Acoustical Ceiling Units: Furnish quality of full-size units equal to 5.0 percent of amount installed.

2. Exposed Suspension System Components: Furnish quantity of each exposed suspension component equal to 15 percent of amount installed.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Ceiling Panels:
   1. Armstrong World Industries, Inc.

B. Suspension Systems:
   1. Armstrong World Industries, Inc.

2.2 ACOUSTICAL CEILING UNITS

A. Acoustical Panel Ceilings
   1. Surface Texture: Smooth Texture
   2. Composition: Mineral Fiber
   3. Color: White
   4. Size: 24 in x 24 in, 24 in x 48 in
   5. Edge Profile: Square Lay-in
   6. Ceiling Attenuation Class (CAC): ASTM E1414/E1414M; Classified with UL label on product carton: 33
   7. Flame Spread: ASTM E 1264; Class A
   8. Light Reflectance (LR) White Panel: ASTM E 1477; 0.89
   9. Dimensional Stability: HumiGuard Plus
   10. Material Ingredient Transparency: Health Product Declaration (HPD); Declare Label
   11. Indoor Air Quality Certified to SCS-105 v4.2-2023
   12. Basis of Design: **KITCHEN ZONE** as manufactured by Armstrong World Industries, Inc.
   13. Substitutions: Refer to Alternates in Part 1.

2.3 METAL SUSPENSION SYSTEMS

A. Components: Main beams and cross tees, base metal and end detail, fabricated from commercial quality hot dipped galvanized steel complying with ASTM A 653. Main beams and cross tees are double-web steel construction exposed flange design. Exposed surfaces chemically cleansed, capping prefinished galvanized steel in baked polyester paint. Main beams and cross tees shall have rotary stitching.
   1. Structural Classification: ASTM C 635 Intermediate or Heavy Duty.
   2. Color: White or match the actual color of the selected ceiling tile, unless noted otherwise.
   3. Sustainability: Environmental Product Declaration (EPD), Health Product Declaration (HPD)
   4. Basis of Design:

i. Prelude XL 15/16” Exposed Tee as manufactured by Armstrong World Industries, Inc.

5. Substitutions: Refer to Alternates in Part 1.

B. Attachment Devices: Size for five times design load indicated in ASTM C 635, Table 1, Direct Hung unless otherwise indicated.

C. Wire for Hangers and Ties: ASTM A 641, Class 1 zinc coating, soft annealed, with a yield stress load of at least time three design load, but not less than 12 gauge.

D. Edge Moldings as manufactured by Armstrong World Industries, Inc.

E. AXIOM Trim & Transitions as manufactured by Armstrong World Industries, Inc. www.armstrongceilings.com/axiom

F. Accessories as manufactured by Armstrong World Industries, Inc.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Do not proceed with installation until all wet work such as concrete, terrazzo, plastering and painting has been completed and thoroughly dried out, unless expressly permitted by manufacturer's printed recommendations. (Exception: HumiGuard Max Ceilings)

3.2 PREPARATION

A. Measure each ceiling area and establish layout of acoustical units to balance border widths at opposite edges of each ceiling. Avoid use of less than half width units at borders and comply with reflected ceiling plans. Coordinate panel layout with mechanical and electrical fixtures.

B. Coordination: Furnish layouts for preset inserts, clips, and other ceiling anchors whose installation is specified in other sections.

1. Furnish concrete inserts and similar devices to other trades for installation well in advance of time needed for coordination of other work.

3.3 INSTALLATION

A. Follow manufacturer installation instructions.

B. Install suspension system and panels in accordance with the manufacturer's instructions, and in compliance with ASTM C 636 and with the authorities having jurisdiction.

C. Suspend main beam from overhead construction with hanger wires spaced 4 feet on center along the length of the main runner. Install hanger wires plumb and straight.

D. Install wall moldings at intersection of suspended ceiling and vertical surfaces. Miter corners where wall moldings intersect or install corner caps.

E. For reveal edge panels: Cut and reveal or rabbet edges of ceiling panels at border areas and vertical surfaces.

F. Install acoustical panels in coordination with suspended system, with edges resting on flanges of main runner and cross tees. Cut and fit panels neatly against abutting surfaces. Support edges by wall moldings.

3.4 ADJUSTING AND CLEANING

A. Replace damaged and broken panels.

B. Clean exposed surfaces of acoustical ceilings, including trim, edge moldings, and suspension members. Comply with manufacturer's instructions for cleaning and touch up of minor finish damage. Remove any ceiling products that cannot be successfully cleaned and or repaired. Replace with attic stock or new product to eliminate evidence of damage.

SECTION 09 6500
RESILIENT FLOORING

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Resilient tile flooring.

B. Resilient base.

C. Installation accessories.

1.02 REFERENCES

A. ASTM F 1066 - Standard Specification for Vinyl Composition Floor Tile; current edition.

B. ASTM F 1861 - Standard Specification for Resilient Wall Base; current edition.

1.03 SUBMITTALS

A. Product Data: Provide data on specified products, describing physical and performance characteristics; including sizes, patterns and colors available; and installation instructions.

B. Maintenance Data: Include maintenance procedures, recommended maintenance materials, and suggested schedule for cleaning, stripping, and re-waxing.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: Firm with a minimum of five years successful experience completing resilient tile installation similar to that required.

B. Pre-installation Conference: Conduct meeting at site prior to commencing work related to resilient tile installation.

1. Require attendance of parties directly affecting resilient tile installation.

2. Review site conditions, procedures, and coordination required with related work.

C. Field Mockup: Provide mock-up of each type of installation using approved materials and specified methods of installation. Obtain Architect's acceptance of mockup prior to start of resilient tile installation.

1.05 ENVIRONMENTAL REQUIREMENTS

A. Maintain temperature in storage area between 55 degrees F and 90 degrees F.

B. Store materials for not less than 48 hours prior to installation in area of installation at a temperature of 70 degrees F to achieve temperature stability. Thereafter, maintain conditions above 55 degrees F.

1.06 EXTRA MATERIALS

A. See Section 01 2500 - Substitution Procedures, for additional provisions.

B. Provide 100 sq ft of flooring, 100 lineal feet of base of each type and color specified.

PART 2 PRODUCTS

2.01 MATERIALS - TILE FLOORING

A. Vinyl Composition Tile: Homogeneous, with color extending throughout thickness.
   1. Manufacturers:
      a. Armstrong Flooring; Standard Excelon Imperial Texture
      b. Substitutions: See Section 01 2500 Substitution Procedures.
   2. Minimum Requirements: Comply with ASTM F 1066, of Class corresponding to type specified.
   3. Size: 12 by 12 inch.
   4. Thickness: 0.125 inch.
   5. Color and Pattern: As designated in the Finish Schedule on the Drawings..
   6. The above Basis of Design is intended to establish a standard of quality and configuration and is not intended to preclude the use of accepted substitutions: Submit substitutions in accordance with Section 01 2500 - Substitution Procedures.

B. Feature Strips: Of same material as tile.

2.02 MATERIALS – RESILIENT BASE

A. Resilient Base: Type TS rubber, vulcanized thermoset; style as scheduled.
   1. Manufacturers:
      a. Roppe Corporation
      b. Johnsonite, a Tarkett Compony
      c. Mannington Commercial
      d. Substitutions: See Section 01 600 Substitution Procedures.
   2. Height: 4 inches.
   3. Thickness: 0.125 inch.
   4. Finish: Satin.
   5. Length: Roll.
   6. Color: As selected.
   7. Accessories: Premolded internal and external corners.
   8. The above Basis of Design is intended to establish a standard of quality and configuration and is not intended to preclude the use of accepted substitutions. Submit substitutions in accordance with Section 01 2500 - Substitution Procedures.

2.03 TILE ACCESSORIES

A. Edge Strips (Moldings): Homogeneous vinyl, tapered or bullnose edge. Color: As selected by Architect to compliment vinyl composition tile.

B. Subfloor Filler: Hydraulic/Portland cement-based material designed for providing thin solid surface for leveling and for minor ramping of subsurface to adjacent floor finishes. Use material capable of being applied and feathered out to adjacent floor without spoiling.

C. Primers and Adhesives: Water and alkali resistant, zero regulated VOC types as recommended by flooring manufacturer for specific application.
   1. For increased substrate moisture and alkali tolerance, IQ Spray Smart adhesive system (Gold: Max 7 lbs (MVER)& 11 pH Tolerance or Platinum: Max 10 lbs (MVER) & 12 pH Tolerance) may be used only if approved or recommendation by flooring manufacturer.

D. Sealer and Wax: Provide Diversey Floor Finish Vectra, provide (7) coats of wax, install per manufacturer's.

E. Thresholds and Floor Transitions: Provide rubber transition strips, finish and color as selected by Architect from manufacturer colors. Provide at doorways where tile terminates, and at open edges of floor tile where adjacent finish is a different height.

1. Manufacturers:
   a. Roppe Corporation
   b. Mannington Commercial
   d. Substitutions: See Section 01 600 Substitution Procedures

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that sub-floor surfaces are smooth and flat within the tolerances specified for that type of work and are ready to receive resilient flooring.

B. Verify that wall surfaces are smooth and flat within the tolerances specified for that type of work, are dust-free, and are ready to receive resilient base.

C. Verify that sub-floor surfaces are dust-free and free of substances which would impair bonding of adhesive materials to sub-floor surfaces.

D. Verify that concrete sub-floor surfaces are ready for resilient flooring installation by testing for moisture emission rate and alkalinity; obtain instructions if test results are not within the following limits:
1. Moisture emission rate: Not greater than 3 lb per 1000 sq ft per 24 hours when tested using calcium chloride moisture test kit for 72 hours.
2. Alkalinity: pH range of 5-9.

E. Verify that required floor-mounted utilities are in correct location.

3.02 PREPARATION

A. Remove sub-floor ridges and bumps. Fill minor low spots, cracks, joints, holes, and other defects with sub-floor filler to achieve smooth, flat, hard surface.

B. Prohibit traffic until filler is cured.

C. Clean substrate.

D. Apply primer as required to prevent "bleed-through" or interference with adhesion by substances that cannot be removed.

3.03 INSTALLATION – RUBBER, PLANK, AND TILE FLOORING

A. Install in accordance with manufacturer's instructions.

B. Mix tile from container to ensure shade variations are consistent when tile is placed.

C. Spread only enough adhesive to permit installation of materials before initial set.

D. Set flooring in place, press with heavy roller to attain full adhesion.

E. Install edge strips at unprotected or exposed edges, where flooring terminates, and where indicated.

F. Scribe flooring to walls, columns, cabinets, floor outlets, and other appurtenances to produce tight joints.

G. Install feature strips and floor markings where indicated. Fit joints tightly.

3.04 INSTALLATION - BASE

A. Fit joints tightly and make vertical. Maintain minimum dimension of 18 inches between joints.

B. Miter internal corners. At external corners, use premolded units. At exposed ends, use premolded units.

C. Install base on solid backing. Bond tightly to wall and floor surfaces.

D. Scribe and fit to door frames and other interruptions.

3.05 CLEANING

A. Remove excess adhesive from floor, base, and wall surfaces without damage.

B. Clean, seal, and provide **(7) coats of Diversey Floor Finish Vectra (no substitution)** wax to resilient flooring products in accordance with manufacturer's instructions.

3.06 PROTECTION OF FINISHED WORK

A. Prohibit traffic on resilient flooring for 48 hours after installation.

B. Protect floors from damage during remainder of construction operations; do not move heavy objects over resilient tile flooring, which could damage flooring.

C. Replace all flooring damaged by subsequent construction operations.

END OF SECTION

SECTION 09 6813

TILE CARPETING

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Carpet tile, fully adhered.

1.02 RELATED SECTIONS

A. Section 09 6500 - Resilient Flooring: Wall base finish.

1.03 REFERENCES

A. CRI 104 - Standard for Installation of Commercial Textile Floorcovering Materials; Carpet and Rug Institute; current edition.

B. CRI (GLA) - Green Label Testing Program - Approved Adhesive Products; www.carpet-rug.org; current edition.

1.04 SUBMITTALS

A. See Section 01 3000 - Administrative Requirements, for submittal procedures.

B. Shop Drawings: Indicate layout of joints, direction of carpet pile, and location of edge moldings.

C. Product Data: Provide data on specified products, describing physical and performance characteristics; sizes, patterns, colors available, and method of installation.

D. Samples: Submit two carpet tiles illustrating color and pattern design for each carpet color selected.

E. Submit two, 12 inch long samples of edge strip.

F. Manufacturer's Installation Instructions: Indicate special procedures.

G. Maintenance Data: Include maintenance procedures, recommended maintenance materials, and suggested schedule for cleaning.

1.05 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing specified carpet tile with minimum five years documented experience.

B. Installer Qualifications: Company specializing in installing carpet with minimum three years’experience.

1.06 ENVIRONMENTAL REQUIREMENTS

A. Store materials in area of installation for minimum period of 24 hours prior to installation.

1.07 EXTRA MATERIALS

A. See Section 01 6000 - Product Requirements, for additional provisions.

B. Provide 30 each carpet tiles of each color and pattern selected.

PART 2 PRODUCTS

2.01 MANUFACTURER AND PRODUCT

A. Carpet materials are as called out in the Finish Schedule on the Drawings.

2.02 ACCESSORIES

A. Sub-Floor Filler: White premix latex; type recommended by flooring material manufacturer.

B. Thresholds and Floor Transitions: Provide rubber transition strips, finish and color as selected by Architect from manufacturer colors. Provide at doorways where tile terminates, and at open edges of floor tile where adjacent finish is a different height.

1. Manufacturers:
    a. Roppe Corporation
    b. Mannington Commercial
    d. Substitutions: See Section 01 600 Substitution Procedures

C. Adhesives: Acceptable to carpet manufacturers, compatible with materials being adhered; CRI Green Label certified; in lieu of labeled product, independent test report showing compliance is acceptable.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that sub-floor surfaces are smooth and flat within tolerances specified for that type of work and are ready to receive carpet tile.

B. Verify that wall surfaces are smooth and flat within the tolerances specified for that type of work, are dust-free, and are ready to receive carpet tile.

C. Verify that sub-floor surfaces are dust-free and free of substances which would impair bonding of adhesive materials to sub-floor surfaces.

D. Verify that concrete sub-floor surfaces are ready for carpet tile installation by testing for moisture emission rate and alkalinity; obtain instructions if test results are not within limits recommended by carpet tile manufacturer and adhesive materials manufacturer.

E. Verify that required floor-mounted utilities are in correct location.

3.02 PREPARATION

A. Remove sub-floor ridges and bumps. Fill minor or local low spots, cracks, joints, holes, and other defects with sub-floor filler.

B. Apply, trowel, and float filler to achieve smooth, flat, hard surface. Prohibit traffic until filler is cured.

C. Vacuum clean substrate.

3.03 INSTALLATION

A. Install carpet tile in accordance with manufacturer's instructions and CRI 104.

B. Blend carpet from different cartons to ensure minimal variation in color match.

C. Cut carpet tile clean. Fit carpet tight to intersection with vertical surfaces without gaps.

D. Lay carpet tile in square pattern, with pile direction parallel to next unit, set parallel to building lines.

E. Fully adhere carpet tile to substrate.

F. Trim carpet tile neatly at walls and around interruptions.

G. Complete installation of edge strips, concealing exposed edges.

3.04 CLEANING

A. Remove excess adhesive without damage, from floor, base, and wall surfaces.

B. Clean and vacuum carpet surfaces.

END OF SECTION

SECTION 09 72 00

DIGITALLY PRINTED VINYL WALLCOVERING MURALS

PART 1 - GENERAL

1.01 SUMMARY

A. Provide digitally printed wallcovering vinyl wallcovering, complete.

B. Related Sections

1. Section 16500 - Lighting: Permanent during installation.
2. Section 09250 - Gypsum Board: Wall Substrates.
3. Section 09900 - Painting: Preparation and priming of substrate surfaces.

1.02 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. E 84 Test Method for Surface Burning Characteristics of Building Materials.

B. Wallcovering Association (WA):

1. WA-101-2011 Quality Standard for Polymer Coated Fabric Wallcovering.

C. Federal Specifications (FedSpec):

2. CCC-W- 408A Wallcovering, Vinyl Coated

D. Underwriters Laboratory, Inc. (UL)

1. UL 723: Test for Surface Burning Characteristics of Building Materials

F. National Fire Protection Agency (NFPA)

1. NFPA 101 Life Safety Code
2. NFPA 286 Standard Methods of Fire Tests for Evaluating Contribution of Wall and Ceiling Interior Finish to Room Fire Growth
3. CAN/ULC-S102 Test for Surface Burning Characteristics of Building Materials and Assemblies

1.03 SUBMITTALS

A. Submit one Color Proof for approval prior to manufacture of a full size miniature mural.

B. Submit one full size miniature strike-off for approval prior to the manufacture of full size mural

C. Submit manufacturers' product data and installation instructions for each digitally printed wallcovering mural, adhesive and accessory required.

1. Include data on physical properties, fire hazard classification and fire detection characteristics of wallcovering.

2. Include manufacturer's recommendations for maximum permissible moisture content of substrates.

D. Submit full-size samples, 54 inches wide by 36 inches long, cut from current production of each ground wallcovering selected to demonstrate quality, weight, color and embossing.

E. Submit manufacturer's written product certification that all furnished wallcovering ground meets or exceeds the specification requirements. Include certified copies of tests specified.

F. Submit wallcovering ground manufacturer's written instructions for recommended maintenance of each type of wallcovering required.

1.04 QUALITY ASSURANCE

A. Manufacturer: Provide each type of digitally printed vinyl wallcovering mural required produced by one manufacturer whose published product literature clearly indicates compliance of wallcovering ground with specified requirements.

B. Applicator: Installation by skilled commercial wallcovering applicators with no less than three years of documented experience installing wallcovering murals of the types and extent specified for the project.

C. Material Standards: Provide materials that meet or exceed Federal Specification CCC-W-408A and WA- 101 Quality Standard for Polymer Coated Fabric Wallcovering for Type I and Type II wallcovering.

D. Physical Properties: Provide wallcovering with the following physical properties when tested in accordance with ASTM D751.

1. Total weight: 21 oz./lin. yd

2. Tensile Strength: 50 X 55 Minimum (W x F)

3. Tear Strength: 25 X 25 Minimum (W x F)

E. Fire Hazard Classification: Provide materials that comply with Class A fire rating when tested in accordance with ASTM E84.

F. Underwriters Laboratories approval: Provide materials that have been tested and approved by Underwriters Laboratories.

G. Smoke Toxicity: Provide materials that have been tested for smoke toxicity and approved for use by New York City Materials and Equipment Acceptance Division (MEA).

H. Fire Detection Characteristics: Provide materials that have been laboratory tested for the Early Warning Effect® in accordance with ASTM E 603. Submit test results certifying that when one square foot section of the material is heated to 300 degrees F, the wallcovering emits an odorless, colorless non-toxic vapor that will activate an ionization smoke detector.

I. Low Emissions: Provide materials that meet the requirements of California Integrated Waste Management Board’s Special Environmental Requirements Specification CA 01350 for low emitting materials.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Deliver digitally printed vinyl wallcovering mural to the project site in unbroken and undamaged wrappings and clearly labeled with the manufacturer's identification label, quality or grade, UL label and sidemark.

B. Store materials in a clean, dry storage area with temperature maintained above 55 degrees with normal humidity.

C. Store material in a flat position to prevent damage to roll-ends. Do not cross stack material. Support material off the floor in a manner to prevent sagging and warping.

1.06 PROJECT CONDITIONS

A. Do not apply digitally printed wallcovering mural when surface and ambient temperatures are outside the temperature ranges required by the wallcovering manufacturer.

B. Provide continuous ventilation and heating facilities to maintain substrate surface and ambient temperatures above 60 degrees F unless required otherwise by manufacturer's instructions.

C. Apply adhesive only when substrate surface temperature or ambient temperature is above 60 degrees F, or relative humidity is below 40 percent.

D. Maintain constant recommended temperature and humidity for at least 72 hours prior to, throughout the installation period and for 72 hours after wallcovering installation completion.

E. Provide not less than an 80 foot candles per square foot lighting level minimum measured mid height at substrate surfaces.

1.07 WARRANTY

A. Submit manufacturer’s 5 year written warranty against manufacturing defects.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Digitally Printed Wallcovering Mural: **Koroseal** Digitally Printed Wallcovering Murals manufactured by Koroseal Interior Products, LLC.

2.02 MATERIALS

A. Wallcovering: Koroseal Digital Surfaces Wallcovering, Pattern: Dewdrop Inn – Mist, KDE-DDN-01 Type II conforming to Federal Specification CCC-W-408A and WA-101-A using test methods given in Federal Specification CCC-T-191 b excepted as otherwise specified.

1.	Total Weight:	21 ounces per linear yard.
2.	Backing Weight:	3.1 ounces per linear yard.
3.	Vinyl Weight:	17.9 ounces per linear yard
4.	Thickness:	0.018 to 0.026 inches
5.	Fabric backing and content:	Poly-Cotton Woven

B. Digital Image: Owner/Architect to provide PDF file of image to be digitally printed with UV inks on Koroseal Digital Surfaces Type II Wallcovering

2.03 ACCESSORIES

A. Adhesives: Koroseal A-848-B Heavy-Duty Premixed vinyl adhesive.

B. Substrate Primer/Sealer: White pigmented alkyd or acrylic/latex base primer specifically formulated for use with vinyl wallcoverings.

C. [Optional] Metal Moldings: Extruded aluminum, alloy 6063-T5, long lengths, with fine satin mechanical finish and class 2 clear architectural anodic coating conforming to AA M21A31 designed for use with vinyl wallcoverings.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates and installation conditions.

C. Test substrates with a suitable moisture meter and verify that moisture content does not exceed 4 percent

D. Verify substrate surfaces are clean, dry, smooth, structurally sound and free from surface defects and imperfections that would show through the finished surface.

E. Evaluate all painted surfaces for the possibility of pigment bleed-through.

F. Notify the contractor and architect in writing of any conditions detrimental to the proper and timely completion of the installation. Beginning of installation means acceptance of surface conditions.

3.02 INSTALLATION

A. Allow digitally printed vinyl wallcovering mural to acclimatize to the area of installation a minimum of 24 hours before installation.

B. Before cutting, examine image and color and determine that they are the correct image and color as specified for the correct location.

C. Read and follow the instructions in the manufacturer's installation sheet contained in each roll of the digitally printed vinyl wallcovering mural.

D. Use adhesive recommended by the wallcovering manufacturer.

E. Install each panel in sequence as indicated on the drawings.

F. If there are variations in color or image that are considered to be excessive, notify the manufacturer's representative for an inspection before any further wallcovering is installed.

G. Smooth wallcovering to the hanging surface using a stiff bristled sweep brush to eliminate air bubbles, wrinkles, gaps and overlaps.

H. Remove excess adhesive along finished seams immediately after each wallcovering strip applied. Use clean warm water, a natural sponge and clean towels. Change water often to maintain water cleanliness.

3.02 CLEAN-UP COMPLETION

A. Upon completion of the work, remove surplus materials, rubbish and debris resulting from the wallcovering installation. Leave areas in neat clean and orderly condition.

END OF SECTION

SECTION 09 9000
PAINTING AND COATING

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Surface preparation.

B. Field application of paints, stains, varnishes, and other coatings.

1.02 RELATED SECTIONS

A. Section 05 5000 - Metal Fabrications: Shop-primed items.

B. Mechanical Identification: Painted identification.

C. Electrical Identification: Painted identification.

1.03 REFERENCES

A. ASTM D 16 - Standard Terminology for Paint, Related Coatings, Materials, and Applications; current edition.

B. ASTM D 4442 - Standard Test Methods for Direct Moisture Content Measurement of Wood and Wood-Base Materials; current edition.

C. AWI/AWMAC (QSI) - Architectural Woodwork Quality Standards Illustrated; Architectural Woodwork Institute and Architectural Woodwork Manufacturers Association of Canada; current edition.

1.04 DEFINITIONS

A. Conform to ASTM D 16 for interpretation of terms used in this section.

1.05 SUBMITTALS

A. See Section 01 3000 - Administrative Requirements, for submittal procedures.

B. Product Data: Provide data on all finishing products.

C. Manufacturer's Instructions: Indicate special surface preparation procedures and substrate conditions requiring special attention.

D. Samples: Provide approval samples 24 inch x 24 inch of required specialty or “faux” finishes for Architect approval.

1.06 MOCK-UPS

A. Provide mockups of all painted or stained surfaces. Mock-up may remain in place following approval of the Architect.

B. Provide adequate lighting for mock up review.

C. Notify Owner and Architect minimum 72 hours prior to mock-up review.

1.07 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum five years documented experience.

B. Applicator Qualifications: Company specializing in performing the work of this section with minimum five years’ experience.

1.08 REGULATORY REQUIREMENTS

A. Conform to applicable code for flame and smoke rating requirements for products and finishes.

1.09 DELIVERY, STORAGE, AND PROTECTION

A. Deliver products to site in sealed and labeled containers; inspect to verify acceptability.

B. Container Label: Include manufacturer's name, type of paint, brand name, lot number, brand code, coverage, surface preparation, drying time, cleanup requirements, color designation, and instructions for mixing and reducing.

C. Paint Materials: Store at minimum ambient temperature of 45 degrees F and a maximum of 90 degrees F, in ventilated area, and as required by manufacturer's instructions.

1.10 ENVIRONMENTAL REQUIREMENTS

A. Do not apply materials when surface and ambient temperatures are outside the temperature ranges required by the paint product manufacturer.

B. Do not apply exterior coatings during rain or snow, or when relative humidity is outside the humidity ranges required by the paint product manufacturer.

C. Minimum Application Temperatures for Latex Paints: 45 degrees F for interiors; 50 degrees F for exterior; unless required otherwise by manufacturer's instructions.

D. Minimum Application Temperature for Varnish Finishes: 65 degrees F for interior or exterior, unless required otherwise by manufacturer's instructions.

E. Provide lighting level of 80 ft candles measured mid-height at substrate surface.

1.11 EXTRA MATERIALS

A. See Section 01 6000 - Product Requirements, for additional provisions.

B. Supply one gallons of each color; store where directed.

C. Label each container with color in addition to the manufacturer's label.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Paints:
   1. Base Manufacturer: Benjamin Moore & Co: www.benjaminmoore.com.
   2. Other Acceptable Manufacturers:
      a. Duron, Inc: www.duron.com.
      b. ICI Paints North America: www.icidecorativepaints.com.
      c. Sherwin Williams: www.sherwin-williams.com.
      d. PPG Architectural Finishes, Inc: www.ppgaf.com.

B. Stains:
   1. Base Manufacturer: Benjamin Moore & Co: www.benjaminmoore.com.
   2. Other Acceptable Manufacturers:
      a. Olympic Stains: www.olympic.com.
      b. Minxwax: www.minwax.com

C. Substitutions: See Section 01 60 00 - Product Requirements.

2.02 PAINTS AND COATINGS - GENERAL

A. Paints and Coatings: Ready mixed, except field-catalyzed coatings. Prepare pigments:
   1. To a soft paste consistency, capable of being readily and uniformly dispersed to a homogeneous coating.
   2. For good flow and brushing properties.
   3. Capable of drying or curing free of streaks or sags.

2.03 PAINT SYSTEMS - EXTERIOR

A. Concrete/Masonry, Opaque, Alkyd, 3 Coat:
   1. One coat of block filler.
   2. Eggshell: Two coats of alkyd enamel.

B. Gypsum Board and Plaster, Opaque, Latex, 3 Coat:
   1. One coat of latex primer sealer.
   2. Eggshell: Two coats of latex.

C. Ferrous Metals, Unprimed, Alkyd, 3 Coat:
   1. One coat of alkyd primer.
   2. Eggshell: Two coats of alkyd enamel.

D. Ferrous Metals, Primed, Alkyd, 2 Coat:
   Touch-up with rust-inhibitive primer recommended by top coat manufacturer.
   Semi-gloss: Two coats of alkyd enamel.

E. Galvanized Metals, Alkyd, 3 Coat:
   1. One coat galvanize primer.
   2. Eggshell: Two coats of alkyd enamel.

F. Aluminum, Unprimed, Alkyd, 3 Coat:
   1. One coat etching primer.
   2. Eggshell: Two coats of alkyd enamel.

G. Pavement Marking Paint:
   1. Specified in Civil sections.

2.04 PAINT SYSTEMS - INTERIOR

A. Wood, Opaque, Latex, 3 Coat:
   1. One coat of latex primer sealer.
   2. Eggshell: Two coats of latex enamel.

B. Concrete/Masonry, Opaque, Alkyd, 3 Coat:
   1. One coat of block filler.
   2. Eggshell: Two coats of alkyd enamel.

C. Ferrous Metals, Unprimed, Alkyd, 3 Coat:
   1. One coat of alkyd primer.
   2. Eggshell: Two coats of alkyd enamel.

D. Ferrous Metals, Primed, Alkyd, 2 Coat:
   1. Touch-up with alkyd primer.
   2. Eggshell: Two coats of alkyd enamel.

E. Galvanized Metals, Alkyd, 3 Coat:
   1. One coat galvanize primer.
   2. Eggshell: Two coats of alkyd enamel.

F. Aluminum, Unprimed, Alkyd, 3 Coat:
   1. One coat etching primer.
   2. Eggshell: Two coats of alkyd enamel.

G. Gypsum Board/Plaster, Latex-Acrylic, 3 Coat:
   1. One coat of alkyd primer sealer.
   2. Eggshell: Two coats of latex-acrylic enamel.

H. Fabrics/Insulation Jackets, Alkyd, 3 Coat:
   1. One coat of alkyd primer sealer.
   2. Eggshell: Two coats of alkyd enamel.

2.05 ACCESSORY MATERIALS

A. Accessory Materials: Linseed oil, shellac, turpentine, paint thinners and other materials not specifically indicated but required to achieve the finishes specified; commercial quality.

B. Patching Material: Latex filler.

C. Fastener Head Cover Material: Latex filler.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that surfaces are ready to receive Work as instructed by the product manufacturer.

B. Examine surfaces scheduled to be finished prior to commencement of work. Report any condition that may potentially affect proper application.

C. Test shop-applied primer for compatibility with subsequent cover materials.

D. Measure moisture content of surfaces using an electronic moisture meter. Do not apply finishes unless moisture content of surfaces are below the following maximums:
   1. Plaster and Gypsum Wallboard: 12 percent.
   2. Masonry, Concrete, and Concrete Unit Masonry: 12 percent.
   3. Interior Wood: 15 percent, measured in accordance with ASTM D 4442.
   4. Exterior Wood: 15 percent, measured in accordance with ASTM D 4442.

3.02 PREPARATION

A. Surface Appurtenances: Remove electrical plates, hardware, light fixture trim, escutcheons, and fittings prior to preparing surfaces or finishing.

B. Surfaces: Correct defects and clean surfaces which affect work of this section.

C. Marks: Seal with shellac those which may bleed through surface finishes.

D. Impervious Surfaces: Remove mildew by scrubbing with solution of tetra-sodium phosphate and bleach. Rinse with clean water and allow surface to dry.

E. Concrete and Unit Masonry Surfaces to be Painted: Remove dirt, loose mortar, scale, salt or alkali powder, and other foreign matter. Remove oil and grease with a solution of tri-sodium phosphate; rinse well and allow to dry. Remove stains caused by weathering of corroding metals with a solution of sodium metasilicate after thoroughly wetting with water. Allow to dry.

F. Gypsum Board Surfaces to be Painted: Fill minor defects with filler compound. Spot prime defects after repair.

G. Insulated Coverings to be Painted: Remove dirt, grease, and oil from canvas and cotton.

H. Aluminum Surfaces to be Painted: Remove surface contamination by steam or high pressure water. Remove oxidation with acid etch and solvent washing. Apply etching primer immediately following cleaning.

I. Galvanized Surfaces to be Painted: Remove surface contamination and oils and wash with solvent. Apply coat of etching primer.

J. Uncoated Steel and Iron Surfaces to be Painted: Remove grease, mill scale, weld splatter, dirt, and rust. Where heavy coatings of scale are evident, remove by power tool wire brushing or sandblasting; clean by washing with solvent. Apply a treatment of phosphoric acid solution, ensuring weld joints, bolts, and nuts are similarly cleaned. Prime paint entire surface; spot prime after repairs.

K. Shop-Primed Steel Surfaces to be Finish Painted: Sand and scrape to remove loose primer and rust. Feather edges to make touch-up patches inconspicuous. Clean surfaces with solvent. Prime bare steel surfaces.

L. Interior Wood Items to Receive Opaque Finish: Wipe off dust and grit prior to priming. Seal knots, pitch streaks, and sappy sections with sealer. Fill nail holes and cracks after primer has dried; sand between coats. Back prime concealed surfaces before installation.

M. Interior Wood Items to Receive Transparent Finish: Wipe off dust and grit prior to sealing, seal knots, pitch streaks, and sappy sections with sealer. Fill nail holes and cracks after sealer has dried; sand lightly between coats. Prime concealed surfaces with gloss varnish reduced 25 percent with thinner.

N. Exterior Wood to Receive Opaque Finish: Remove dust, grit, and foreign matter. Seal knots, pitch streaks, and sappy sections. Fill nail holes with tinted exterior calking compound after prime coat has been applied. Back prime concealed surfaces before installation.

O. Metal Doors to be factory painted.

3.03 APPLICATION

A. Apply products in accordance with manufacturer's instructions.

B. Where adjacent sealant is to be painted, do not apply finish coats until sealant is applied.

C. Do not apply finishes to surfaces that are not dry. Allow applied coats to dry before next coat is applied.

D. Apply each coat to uniform appearance. Apply each coat of paint slightly darker than preceding coat unless otherwise approved.

E. Sand wood surfaces lightly between coats to achieve required finish.

F. Vacuum clean surfaces of loose particles. Use tack cloth to remove dust and particles just prior to applying next coat.

G. Where clear finishes are required, tint fillers to match wood. Work fillers into the grain before set. Wipe excess from surface.

H. Touch-up painting to be conducted full height, from corner to corner. Spot touch-up is not allowed.

3.04 FINISHING MECHANICAL AND ELECTRICAL EQUIPMENT

A. Refer to Division 23 and Division 26 for schedule of color coding of equipment, duct work, piping, and conduit.

B. Paint shop-primed equipment, where indicated.

C. Remove unfinished louvers, grilles, covers, and access panels on mechanical and electrical components and paint separately.

D. Finish equipment, piping, conduit, and exposed duct work in utility areas in colors according to the color coding scheme indicated.

E. Reinstall electrical cover plates, hardware, light fixture trim, escutcheons, and fittings removed prior to finishing.

3.05 FIELD QUALITY CONTROL

A. See Section 01 40 00 - Quality Requirements, for general requirements for field inspection.

3.06 CLEANING

A. Collect waste material which may constitute a fire hazard, place in closed metal containers, and remove daily from site.

3.07 SCHEDULE - SURFACES TO BE FINISHED

A. Do Not Paint or Finish the Following Items:
   1. Items fully factory-finished unless specifically noted.

2. Fire rating labels, equipment serial number and capacity labels.
3. Stainless steel items.

B. Mechanical and Electrical: Use paint systems defined for the substrates to be finished.
1. Paint all insulated and exposed pipes occurring in finished areas to match background surfaces, unless otherwise indicated.
2. Paint shop-primed items occurring in finished areas.
3. Paint interior surfaces of air ducts and convector and baseboard heating cabinets that are visible through grilles and louvers with one coat of Eggshell black paint to visible surfaces.
4. Paint dampers exposed behind louvers, grilles, and convector and baseboard cabinets to match face panels.

C. Paint both sides and edges of plywood backboards for electrical and telephone equipment before installing equipment.

END OF SECTION

SECTION 10 11 00

VISUAL DISPLAY UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Porcelain enamel marker boards with aluminum frames.
2. Porcelain enamel chalk boards with aluminum frames.
3. Tack boards with aluminum frames.

B. Related Requirements:

1. Section 097723 "Fabric-Wrapped Panels" for tackable, fabric-covered panels mounted on walls.
2. Section 101146 "Visual Display Fabrics" for visual display wall coverings intended for use with dry-erase markers.
3. Section 101200 "Display Cases" for individually framed and enclosed, wall-mounted bulletin boards.

1.2 ACTION SUBMITTALS

A. Product Data:

1. Visual display board assemblies.

B. Product Data Submittals: For each product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, finishes, and accessories for visual display units.

C. Shop Drawings: For visual display units.

1. Include plans, elevations, sections, details, and attachment to other work.
2. Show locations of panel joints, including locations of field-assembled joints for factory-fabricated units too large to ship in one piece, if any.
3. Show locations and layout of special-purpose graphics.
4. Include sections of typical trim members.

D. Samples for Initial Selection: For each type of visual display unit indicated, for units with factory-applied color finishes, and as follows:

1. Samples of facings for each visual display panel type, indicating color and texture.
2. Actual factory-finish color samples, applied to color anodized aluminum trim.
3. Include accessory Samples to verify color selected.

E. Product Schedule: For visual display units. Use same designations indicated on Drawings.

1.3 INFORMATIONAL SUBMITTALS

A. Sample Warranties: For manufacturer's special warranties.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For visual display units to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver factory-fabricated visual display units completely assembled in one piece. If dimensions exceed maximum manufactured unit size, or if unit size is impracticable to ship in one piece, provide two or more pieces with joints in locations indicated on approved Shop Drawings.

1.7 FIELD CONDITIONS

A. Environmental Limitations: Do not deliver or install visual display units until spaces are enclosed and weathertight, wet-work in spaces is complete and dry, work above ceilings is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.8 WARRANTY

A. Special Warranty for Porcelain-Enamel Face Sheets: Manufacturer agrees to repair or replace Writanium® face sheets that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Surfaces lose original writing and erasing qualities.
b. Surfaces exhibit crazing, cracking, or flaking.

2. Warranty covers the cost of material replacement of defective Writanium® markerboards and chalkboards due to discoloration, crazing, cracking, or flaking. Warranty does not cover labor or miscellaneous material costs for removal and re-installation of markerboards and chalkboards.

3. Warranty Period:

a. Manufacturer’s "Forever Warranty", stating that under normal usage and maintenance, Writanium® Porcelain Markerboards and Chalkboards are guaranteed for the life of the building.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 50 or less.

2.2 VISUAL DISPLAY BOARD ASSEMBLIES

A. Visual Display Board Assemblies:

1. Basis of Design: Subject to compliance with the requirements, provide Platinum Visual Solutions "Box Tray (BTS)" Writanium® Porcelain Markerboard.
2. Prior to receipt of bids, additional Manufacturer's whose products equal or exceed the specified products in every regard to the specified products may request to be included as a specified manufacture by following procedures outlined in Division 01 Section "Substitution Procedures".

B. Visual Display Board Assembly: Factory fabricated.

1. Assembly **markerboard and tackboard**
2. Corners: Square.
3. Width: As indicated on Drawings.
4. Height: As indicated on Drawings.
5. Mounting Method: **Mechanically fastened directly to wall**

C. Markerboard Panel: Writanium® Porcelain-enamel-faced markerboard panel on 7/16-inch-thick particleboard core.

1. Color: As selected by Architect from Manufacturer's full range of colors.

D. Tackboard Panel: **Polyester-fabric-faced** tackboard panel on core indicated.
1. Color and Pattern: As selected by Architect from full range of Manufacturer's standard colors.

E. Aluminum Frames and Trim: Fabricated from not less than 0.062-inch- (1.57-mm-) thick, extruded aluminum; Type CH215 standard channel with ¾ inch face.

1. Aluminum Finish: **Clear anodic**

b. Color: As selected by Architect from full range of Manufacturer's standard colors and color densities.

F. Joints: Make joints only where total length exceeds maximum manufactured length. Fabricate with minimum number of joints, balanced around center of board, as acceptable to Architect.

G. Combination Assemblies: Provide manufacturer's standard exposed trim between abutting sections of visual display panels.

H. Marker Tray: Manufacturer's standard; continuous.

1. Box Type: Extruded aluminum with slanted front, grooved tray, and cast-aluminum end closures.

I. Display Rail: Manufacturer's standard, extruded-aluminum display rail with **linoleum impregnated cork** insert.

1. Size: **1 inch (25 mm)**
2. Map Hooks: One map hook for every 24 inches (600 mm) of display rail or fraction thereof.
3. Flag Holder: Two for each room.
4. Aluminum Color: Match finish of visual display assembly trim.

J. Panels and Accessories:

1. Display Rail: Manufacturer's standard, extruded-aluminum display rail with **linoleum impregnated cork** insert and end trim piece.

a. Aluminum Trim: Factory applied; in manufacturer's standard size and profile; with **Clear anodic** trim finish rest of unit.

2.3 MARKERBOARD PANELS

A. Porcelain-Enamel Markerboard Panels: Balanced, high-pressure, factory-laminated markerboard assembly of three-ply construction, consisting of moisture-barrier backing, core material, and porcelain-enamel (Writanium®) face sheet with **low**-gloss finish. Laminate panels under heat and pressure with manufacturer's standard, flexible waterproof adhesive.

1. Manufacturer's Standard Core: Minimum 1/4 inch (6 mm) thick, with manufacturer's standard moisture-barrier backing.
2. Particleboard Core: 7/16 inch (11.1 mm) thick; with **0.015-inch- (0.38-mm-) thick, aluminum sheet**
3. Laminating Adhesive: Manufacturer's standard moisture-resistant thermoplastic type.

2.4 TACKBOARD PANELS

A. Tackboard Panels:

1. Facing:

a. 1/4-inch- (6-mm-) thick, natural cork.
b. **Polyester** fabric factory laminated to 1/4-inch- (6-mm-) thick, cork sheet.
c. ¼ inch-(6-mm) linoleum impregnated cork.

2. Core:

a. **Fabric or Vinyl covered ¼ inch natural cork on ¼" hardboard**

2.5 MATERIALS

A. Porcelain-Enamel Face Sheet (Writanium®): PEI-1002, with face sheet manufacturer's standard three-coat process.

B. Natural-Cork Sheet: Seamless, single-layer, compressed fine-grain cork sheet; bulletin board quality; face sanded for natural finish[**; with surface-burning characteristics indicated**].

C. Vinyl Fabric: Mildew resistant, washable, complying with ASTM F793/F793M, Type II, **burlap weave**; weighing not less than 13 oz./sq. yd. (440 g/sq. m); with surface-burning characteristics indicated.

D. Polyester Fabric: Nondirectional weave, 100 percent polyester; weighing not less than 15 oz./sq. yd. (508 g/sq. m); with surface-burning characteristics indicated.

E. Linoleum: 1/4-inch- (6-mm-) thick homogeneous tackable surface material made of primary natural materials consisting of linseed oil, cork, rosin binders and dry pigments mixed and calendared onto a natural jute backing. The uni-color extends throughout the thickness of the material

2.6 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM/NOMMA AMP 500 for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.7 ALUMINUM FINISHES

A. Clear Anodic Finish: AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.

B. Color Anodic Finish: AAMA 611, AA-M12C22A32/A34, Class II, 0.010 mm or thicker.

C. Baked-Enamel or Powder-Coat Finish: AAMA 2603, except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances, surface conditions of wall, and other conditions affecting performance of the Work.

B. Examine walls and partitions for proper preparation and backing for visual display units.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Comply with manufacturer's written instructions for surface preparation.

B. Clean substrates of substances, such as dirt, mold, and mildew, that could impair the performance of and affect the smooth, finished surfaces of visual display boards.

C. Prepare surfaces to achieve a smooth, dry, clean surface free of flaking, unsound coatings, cracks, defects, projections, depressions, and substances that will impair bond between visual display units and wall surfaces.

3.3 INSTALLATION

A. General: Install visual display surfaces in locations and at mounting heights indicated on Drawings, or if not indicated, at heights indicated below. Keep perimeter lines straight, level, and plumb. Provide grounds, clips, backing materials, adhesives, brackets, anchors, trim, and accessories necessary for complete installation.

B. Field-Assembled Visual Display Board Assemblies: Coordinate field-assembled units with trim and accessories indicated. Join parts with a neat, precision fit.

1. Make joints only where total length exceeds maximum manufactured length. Fabricate with minimum number of joints, balanced around center of board, as acceptable to Architect.

C. Visual Display Board Assembly Mounting Heights: Install visual display units at mounting heights indicated on Drawings, or if not indicated, at heights indicated below.

1. Mounting Height for Grades K through 3: 24 inches (610 mm) above finished floor to top of marker or chalk tray.
2. Mounting Height for Grades 4 through 6: 28 inches (711 mm) above finished floor to top of marker or chalk tray.
3. Mounting Height for Grades 7 and Higher: 36 inches (914 mm) above finished floor to top of marker or chalk tray.

3.4 CLEANING AND PROTECTION

A. Clean visual display units in accordance with manufacturer's written instructions. Attach one removable cleaning instructions label to visual display unit in each room.

B. Touch up factory-applied finishes to restore damaged or soiled areas.

C. Cover and protect visual display units after installation and cleaning.

END OF SECTION 101100

SECTION 10 14 00 - ARCHITECTURAL SIGNAGE

PART 1 – GENERAL

1.01 SCOPE

A. Furnish and install the following:

1. Exterior wall mounted school name (individual letters).
2. Building plaque.
3. Room identification signage.
4. Occupancy signage for all assembly areas per applicable sections of the International Building Code (IBC)
5. Brackets, clips, posts, fasteners, concrete footings, and all accessories required for proper installation of signage.

1.02 SUBMITTALS

A. Product Data:

1. Manufacturer's specifications and other data needed to prove compliance with specified requirements.

2. Manufacturer's installation instructions.

B. Shop Drawings:

1. Indicating materials, sizes, and finishes, indicate letter style, edge and corner treatment, details of fabrication and mounting installation, fasteners and hardware, attachments, related and adjacent work.

2. Electronic layout of actual pattern of cast metal plaque for Architect's approval prior to casting. Do not proceed with casting without architect’s review and approval.

C. Samples:

1. One (1) 6 inch by 6 inch sample of cast metal(plaque material with specified finish).
2. One (1) 4 inch actual sample of cast metal letter in specified letter style and finish.
3. One (1) actual sample of each type room identification sign with specified finish.

1.03 QUALITY ASSURANCE

A. All signage and signage installation shall comply with latest edition of Americans with Disabilities Act (ADAAG) and Texas Accessibility Standards (TAS)..

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Specifications are based on products and manufacturers listed as basis of specification or named. Products of manufacturers listed which meet or exceed the specifications are approved for use on the Project. Other manufacturers must have a minimum of five (5) years experience manufacturing products meeting or exceeding the specifications and comply with Division 1 requirements regarding substitutions to be considered.

1. Approved Manufacturers:

   a. A.R.K. Ramos Architectural Signage Systems, Oklahoma City, OK; www.arkramos.com
   b. The Southwell Co., San Antonio, TX; www.southwellco.com
   c. South Texas Graphic Specialties, Inc. , Houston, www.stxgraphics.com
   d. In-Pro Corporation; www.inprocorp.com
   e. CCSW Architectural Graphics & Sign Systems, Corpus Christi, TX. www.ccswsignsystems.com
   f. Sign Resource Management, 512.863.9929; Seguin, TX

2.02 CAST METAL BUILDING LETTERS

A. Material and Fabrication:

1. Casting shall be of 319 aluminum alloy with satin polished faces and matte sides.
2. Letters shall be finished in clear anodized finish.

B. Letters shall be San Serif style upper case letters, unless shown otherwise. Allow for twenty-six (26) 18” high letters and twenty-four (24) 12” high letters.

C. Fasteners and Attachment Hardware: Concealed fasteners and hardware of size and type recommended by manufacturer for attachment of letters on brick wall where indicated on drawings.

D. Provide all materials required for a complete installation.

2.03 BUILDING PLAQUE

A. Furnish and install 18” x 24” aluminum plaque equal to that as manufactured by Southwell Company, San Antonio, Texas. Plaque shall contain no more than five hundred (500) letters and thirty (30) lines. Metal Arts, ASI, Mills Mfg. Company, and Sign International, Inc. are also approved manufacturers.

1) Cast virgin ingots, F-214 aluminum alloy. Casting shall be free of pits and gas holes and all letters shall be sharp and hand tooled.

2) Single line border; border and faces of raised letters are to be satin finish and plaque background to be leatherette texture. Background shall be sprayed with black acrylic lacquer. Plaque shall be chemically cleaned and etched and treated with alodine. Two coats of clear acrylic lacquer shall be sprayed on completed plaque.

3) Letter style shall be San Serif.

4) Plaque shall be mounted on masonry wall with concealed fastening.

5) Architect will furnish plaque design and general layout. Contractor will furnish rubbing of actual pattern for owner’s approval prior to casting.

2.04 ROOM IDENTIFICATION SIGNAGE

A. General:

1. Provide one (1) sign for every room. Provide ten (10) additional signs to be located as directed by architect. Exact numbering / wording on signs to be provided by architect at the appropriate time.

2. Signs shall be constructed using clear non-glare acrylic surface with subsurface colored acrylic plates.

a. Thickness: Min 1/8” or as noted
b. Edges: Machine Finish
c. Corners: Radius 3/8” or square as noted
d. Font: San Serif (upper case only)
e. Background Color: As selected by Architect
f. Copy Color: As selected by Architect
g. Size: 8” x 8” unless noted otherwise

h. Raised tactile grade 2 Braille shall be integral with the sign face and be raised 1/32”. Glass or metallic rasters to have .059 surface diameters with body of sphere pressure secured below face laminate. Glued on dots will NOT be acceptable.

i. Raised symbols shall be raised 1/32” from sign face and unitized with the acrylic sign core.

j. All raised lettering shall be 5/8” high (min) to 2” maximum, raised 1/32” and be integral with the sign face; letter style to be Helvetica Medium; Helvetica Regular Condensed (all upper case).

k. All copy (lettering, numbering & symbols) shall have a contrast with their background and have an eggshell matte finish.

3. Demarcation line, if any, shall be infilled to match copy color.

4. Signs shall comply with all state and federal codes, including, but not limited to the ADA and TAS requirements.

5. Refer to drawings for signage details for dimensions, types, colors, graphic layout, and mounting and height specifications.

B. Room Numbers, Symbols, and Restroom Copy:

1. Shall be raised 1/32 inch, of a color contrasting to the sign face color.

2. Characters and pictograms shall be chemically welded to the acrylic backing, through the face laminate, to assure permanent adhesion.

3. Room numbers and restroom copy shall be accompanied by Grade II braille by means of "VisiTouch Duradot System". Glass or metallic "Durodots" shall have 0.059 inch surface diameter with body of sphere pressure secured to face.. Routed boxes or glued on dots are not acceptable.

C. Lower or Secondary Copy:

1. Shall be a minimum of 5/8 inch high incised sans serif style, (Helvetica, Optima, Futura as selected by Architect), all caps, paint-filled in a color as selected by Architect.

D. Restroom Pictograms:

1. Shall appear on a minimum six (6) inch square, unobstructed field.

E. Window (Slotted) Signs:

1. Shall be open on both ends for an insert by Owner, window shall be a non-glare acrylic window, with an exposed color behind in color as selected by Architect.

F. Fasteners and Accessories:

1. 1/8 inch thick, double-sided foam tape of type recommended to suit application and commercial grade silicone sealant.

2. Back-up plates shall be supplied, where shown or required, for signage mounted on glass.

G. Provide all materials required for a complete installation.

2.05 OCCUPANCY LOAD SIGNAGE

A. Provide every room or space that is an assembly occupancy one sign with the occupant load of the room or space posted in a conspicuous place, near the main exit or exit access doorway from the room or space.

B. Occupancy signs shall match type, style and size of specified room identification signs.

C. Posted signs shall be of an approved legible permanent design and shall be maintained by the owner or authorized agent.

D. Include assembly area occupancy signage similar to room identification signs.

1. Rooms or areas to have occupancy load signage include but are not limited to the following:

a. Multi-purpose Rooms
b. Cafeteria
c. Auditoriums
d. Stages
e. Libraries
f. Gymnasiums
g. Any room having an occupant load of 50 or more where fixed seating is not installed and which are used as assembly areas.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install signage level, plumb and at height required for disabled accessibility as required by Texas Accessibility Standards (TAS) and ADA. Locate signage as directed by Architect.

B. All architectural signage items shall be securely mounted with first quality anchors; mechanical mounting with sheet metal/wood or tap-in (for concrete block) screws, full threaded, one-way theft resistant. Mount level and square to surrounding surfaces. Location as directed by Architect.

C. At completion of work, clean signage in accordance with manufacturer's instructions. Clean surrounding materials to remove dust, materials, etc.

D. Room Identification Signs:

1. Install in accordance with manufacturer's instructions and in locations shown on drawings.

2. Installation shall be by means of double sided tape and silicone.

3. Tactile characters on signs shall be located a min of 48 inches above finished floor or ground surface, measured from the baseline of the lowest tactile character and 60 inches maximum above finished floor or ground surface measured from the baseline of the highest tactile character on the wall adjacent to the latch side of the door.

4. Signs containing tactile characters shall be located so that a clear floor space of 18 inches min. by 18 inches min., centered on the tactile characters, is provided beyond the arc of any door swing between the closed position and 45 degrees open position.

5. Signs with tactile characters shall be permitted on the push side of doors with closers and without hold-open devices

6. Where there is no wall space, including double leaf doors, sign shall be placed on the nearest adjacent wall.

7. Where shown or required, mount signs on glass using back-up plates.

END OF SECTION 10 14 00

SECTION 10 2601

WALL AND CORNER GUARDS

PART 1 - GENERAL

1.01 SECTION INCLUDES

A. Bumper Rails.

B. Corner guards.

1.02 REFERENCE STANDARDS

A. ASTM E 84 - Standard Test Method for Surface Burning Characteristics of Building Materials; 2010.

B. ICC A117.1 - Accessible and Usable Buildings and Facilities; 2009.

1.03 SUBMITTALS

A. See Section 01 3000 – Administrative Requirements, for submittal procedures.

B. Product Data: Indicate physical dimensions, features, anchorage details, and rough-in measurements.

C. Manufacturer's Instructions: Indicate special procedures, perimeter conditions requiring special attention.

PART 2 - PRODUCTS

2.01 COMPONENTS

A. Bumper Rails: Factory- or shop-fabricated, with preformed end caps and internal and external corners:
   1. Performance of Installed Assembly:
      a. Resist lateral force of 250 lbs at any point without damage or permanent set.
   2. Material: Type 430 stainless steel, No. 4 finish.
   3. Mounting: Surface.
   4. Projection From Wall to Outside of Rail: 3/4 inch.
   5. Return rail to wall.

B. Corner Guards, Stainless Steel (Where indicated on Drawings) - Flush Mounted:
   1. Material: Type 430 stainless steel, No. 4 finish, 16 gage.
   2. Performance: Resist lateral impact force of 100 lbs at any point without damage or permanent set.
   3. Width of Wings: 1-1/2 inch to 3-1/2 inch based on condition
   4. Corner: Square.
   5. Length: Floor to ceiling.
   6. Mounting: Provide corner guards with countersunk holes for attachment screws.

C Mounting Brackets and Attachment Hardware: Appropriate to component and substrate.
   1. For corner guards, attach with adhesive backing and secure with countersunk screws.

2.03 FABRICATION

A. Fabricate components with tight joints, corners and seams.

B. Pre-drill holes for attachment.

C. Form end trim closure by capping and finishing smooth.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that rough openings, concealed blocking, and anchors are correctly sized and located.

B. Verify that field measurements are as indicated on Drawings.

3.02 INSTALLATION

A. Install components in accordance with manufacturer's instructions, level and plumb, secured rigidly in position to wall framing members only.

3.03 TOLERANCES

A. Maximum Variation From Required Height: 1/4 inch.

B. Maximum Variation From Level or Plane For Visible Length: 1/4 inch.

END OF SECTION

SECTION 10 28 00
TOILET AND BATH ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following toilet accessory items:

1.2 SUBMITTALS

A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specifications Sections.

B. Product Data for each toilet accessory item specified, including details of construction relative to materials, dimensions, gages, profiles, method of mounting, specified options, and finishes.

C. Schedule: Indicating types, quantities, sizes, and installation locations (by room) for each toilet accessory item to be provided for project.

D. Setting Drawings: Where cutouts are required in other work, provide templates, substrate preparation instructions, and directions for preparing cutouts and for installation of anchorage devices.

1.3 QUALITY ASSURANCE

A. Inserts and Anchorages: Furnish inserts and anchoring devices that must be set in concrete or built into masonry; coordinate delivery with other work to avoid delay.

B. Single-Source Responsibility: Provide products of same manufacturer for each type of accessory unit and for units exposed to view in same areas, unless otherwise acceptable to Architect.

1.4 PROJECT CONDITIONS

A. Coordination: Coordinate accessory locations, installation, and sequencing with other work to avoid interference and to assure proper installation, operation, adjustment, cleaning, and servicing of toilet accessory items.

1.5 WARRANTY

A. Special Project Warranty: Provide manufacturer's written 5-year warranty against silver spoilage of mirrors, agreeing to replace any mirrors that develop visible defects within warranty period.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the Work include the following:

1. Toilet and Bath Accessories

a. A&J Washroom Accessories 845-562-3332 www.ajwashroom.com
b. American Specialties, Inc. 914-476-9000 www.americanspecialties.com

c. Bobrick Washroom Equipment, Inc. 800-553-1600 www.bobrick.com
d. Bradley Corporation 800-272-3539 www.bradleycorp.com
e. GAMCO Commercial Restroom Accessories, A Division of Bobrick Washroom Equipment, Inc. 518-877-7444 www.gamcousa.com
f. McKinney/Parker
g. PSISC 866-337-7286 www.psisc.com

2.2 MATERIALS, GENERAL

A. Stainless Steel: AISI Type 302/304, with polished No. 4 finish, 22 gage (0.034 inch) minimum thickness, unless otherwise indicated.

B. Brass: Leaded and unleaded, flat products, ASTM B 19; rods, shapes, forgings, and flat products with finished edges, ASTM B 16, Castings, ASTM B-30.

C. Sheet Steel: Cold-rolled, commercial quality ASTM A 366, 20 gage (0.040 inch) minimum, unless otherwise indicated. Surface preparation and metal pretreatment as required for applied finish.

D. Galvanized Steel Sheet: ASTM A 527, G60.

E. Chromium Plating: Nickel and chromium electro-deposited on base metal, ASTM B 456, Type SC 2.

F. Baked Enamel Finish: Factory-applied, gloss white, baked acrylic enamel coating.

G. Vinyl-Backed Safety Mirror Glass: Nominal 6.0 mm (0.23 inch) thick, conforming to ASTM C 1036, Type I, Class 1, Quality q2, and with silvering, electro- plated copper coating, and protective organic coating. Apply vinyl backing with pressure-sensitive adhesive coating over glass coating by method recommended by vinyl-backing manufacturer to produce a surface free of bubbles, blisters, or other imperfections. Use adhesives and vinyl backing compatible with glass coating as certified by organic coating manufacturer.

H. Galvanized Steel Mounting Devices: ASTM A 153, hot-dip galvanized after fabrication.

I. Fasteners: Screws, bolts, and other devices of same material as accessory unit or of galvanized steel where concealed.

J. Keys: Unless otherwise indicated, provide universal keys for access to toilet accessory units requiring internal access for servicing, resupply, etc. Provide minimum of six (6) keys to Owner's representative and obtain receipt.

2.3 TOILET TISSUE DISPENSERS/PAPER TOWEL DISPENSERS

A. Owner supplied and Contractor installed

2.4 GRAB BARS

A. Stainless Steel Type: Provide grab bars with wall thickness not less than 18 gage (0.050 inch) and as follows:
1. Basis of Design: GAMCO Min. 150 Series or approved equal.
2. Mounting: Concealed, manufacturer's standard flanges and anchorages.

B. Clearance: 1-1/2 inches clearance between wall surface and inside face of bar.

C. Gripping Surfaces: Smooth, satin finish.

D. Heavy-Duty Size: Outside diameter of 1-1/2 inches.

E. Provide horizontal and vertical grab bars at water closets or showers
1. Length:

a. 42 inches at sides of water closet
b. 36 inches behind water closet.
c. 40” x 54” at shower grab bar; refer to drawings for locations

2.5 SOAP DISPENSERS

A. Owner furnished and Contractor installed

2.6 MOP AND BROOM HOLDER

A. Surface mounted mop and broom holder; made of 22 gauge stainless steel with satin finish with spring activated rubber cam holders
1. Basis of Design: Model 9953 – 3 holders; Bradley Corp.

2.7 MIRROR UNITS

A. Stainless Steel Framed Mirror Units
1. Basis-of-Design: GAMCO 'A' Series- 1/4” Tempered or approved equal

2.8 ELECTRIC HAND DRYER

A. Electric Hand Dryer: 115 volt, 20 amp
1. Provide surface-mounted unit; ADA compliant unit
2. Basis-of-Design: Saniflow M06ACS-UL Speedflow or approved equal.
3. Finish-Brushed Stainless Steel

2.9 ROBE HOOKS

A. Bobrick B-2116 or approved equal

2.10 SANITARY NAPKIN DISPOSALS

A. GAMCO ND1 or approved equal

2.11 SANITARY NAPKIN DISPENSER

A. GAMCO NV-2-4FS or approved equal

B. Install at nurses office or per campus staff recommendation

2.12 PAPER TOWEL DISPENSERS

A. Owner furnished and Contractor installed

2.13 SHOWER CURTAIN ROD WITH VINYL CURTAIN

A. Bobrick B207 (Sized for opening) or approved equal.

2.14 ADA Compliant Under Lavatory Tubular

A. Plumberex – Pro-extreme – 3PC Kit White

2.15 FABRICATION

A. General: Only a maximum 1-1/2 inch diameter, unobtrusive stamped logo of manufacturer, as approved by Architect, is permitted on exposed face of toilet or bath accessory units. On either interior surface not exposed to view or back surface, provide additional identification by means of either a printed, waterproof label or a stamped nameplate, indicating manufacturer's name and product model number.

B. Surface-Mounted Toilet Accessories, General: Except where otherwise indicated, fabricate units with tight seams and joints, exposed edges rolled. Hang doors or access panels with continuous stainless steel piano hinge. Provide concealed anchorage wherever possible.

C. Recessed Toilet Accessories, General: Except where otherwise indicated, fabricate units of all welded construction, without mitered corners. Hang doors or access panels with full-length stainless steel piano hinge. Provide anchorage that is fully concealed when unit is closed.

D. Framed Mirror Units, General: Fabricate frames for glass mirror units to accommodate wood, felt, plastic, or other glass edge protection material. Provide mirror backing and support system that will permit rigid, tamperproof glass installation and prevent accumulation of moisture, as follows:

1. Provide galvanized steel backing sheet, not less than 22 gage (0.034 inch) and full mirror size, with nonabsorptive filler material. Corrugated cardboard is not an acceptable filler material.

E. Mirror Unit Hangers: Provide system of mounting mirror units that will permit rigid, tamperproof, and theftproof installation, as follows:

1. Heavy-duty wall brackets of galvanized steel, equipped with concealed locking devices requiring special tool to remove.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install toilet accessory units in accordance with manufacturers' instructions, using fasteners appropriate to substrate and recommended by manufacturer of unit. Install units plumb and level, firmly anchored in locations and at heights indicated.

B. Secure mirrors to walls in concealed, tamperproof manner with special hangers, toggle bolts, or screws. Set units plumb, level, and square at locations indicated, in accordance with manufacturer's instructions for type of substrate involved.

C. Install grab bars to resist tensile and moment forces generated by a load of 250 lb. applied in any direction, or as otherwise required by authorities having jurisdiction, whichever is more stringent.

D. Provide blocking as required for accessories.

3.2 ADJUSTING AND CLEANING

A. Adjust toilet accessories for proper operation and verify that mechanisms function smoothly. Replace damaged or defective items.

B. Clean and polish all exposed surfaces in strict accordance with manufacturer's recommendations after removing temporary labels and protective coatings.

END OF SECTION 10 28 00

SECTION 10 44 00

FIRE PROTECTION SPECIALTIES

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Fire extinguishers.

B. Fire extinguisher cabinets.

1.02 REFERENCES

A. UL (FPED) - Fire Protection Equipment Directory; Underwriters Laboratories Inc.; current edition.

1.03 PERFORMANCE REQUIREMENTS

A. Conform to applicable code and NFPA 10.

B. Provide extinguishers classified and labeled by Underwriters Laboratories Inc. for the purpose specified and indicated.

1.04 SUBMITTALS

A. Shop Drawings: Indicate cabinet physical dimensions, rough-in measurements for recessed cabinets, wall bracket mounted measurements, and location.

B. Product Data: Provide extinguisher operational features, color and finish, and anchorage details.

C. Manufacturer's Installation Instructions: Indicate special criteria and wall opening coordination requirements.

D. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

E. Maintenance Data: Include test, refill or recharge schedules and re-certification requirements.

1.05 ENVIRONMENTAL REQUIREMENTS

A. Do not install extinguishers when ambient temperature may cause freezing of extinguisher ingredients.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Drawings and specifications are based on manufacturer's literature from Larsen's Manufacturing Company unless otherwise indicated. Other manufacturers to comply with the minimum levels of material and detailing indicated on the drawings and in conformance with provisions of Section 01 6000 – Product Requirements. www.larsensmfg.com

B. Other Acceptable Manufacturers: Fire Extinguishers and Cabinets.
   1. JL Industries, Inc: www.jlindustries.com.
   2. Larsen's Manufacturing Co: www.larsensmfg.com.
   3. Potter-Roemer: www.potterroemer.com.
   4. Substitutions: See Section 01 6000 - Product Requirements.

2.02 FIRE EXTINGUISHERS

A. Multi-Purpose Dry Chemical Type (Unless noted otherwise): Stainless steel tank, with pressure gage.
   1. Size and classification: MP-10 as manufactured by Larsen’s Manufacturing Company.

2. Finish: Baked enamel, red.

B. Kitchen Extinguisher: Larsen's WC Series Wet Chemical unit, 2.5 gallon, rated for type K fires. Provide Larsen's mounting bracket 1007 for kitchen extinguisher.

2.03 FIRE EXTINGUISHER CABINETS

A. Fire Extinguisher Cabinet with Fire Blanket (Science Classrooms): Architectural Series Model No. AL FB3612-RL, semi-recessed, with fire blanket, as manufactured by Larsen's Manufacturing.
   1. All-aluminum construction.
   2. White baked enamel finish.
   3. Handle: FH Red, die cast, raised letters.
   4. Extinguisher: MP10 manufactured by Larsen's Manufacturing Company.

B. Fire Extinguisher Cabinet without Blanket (All other areas): Architectural Series Model No. AL2712-RA, semi-recessed, as manufactured by Larsen's Manufacturing.
   1. All-aluminum construction, with door glass.
   2. White baked enamel finish.
   3. Handle: FH Red, die cast, raised letters.
   4. Extinguisher: MP10 manufactured by Larsen's Manufacturing Company.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify existing conditions before starting work.

B. Verify rough openings for cabinet are correctly sized and located.

3.02 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install cabinets plumb and level at heights indicated on drawing schedule.

C. Place extinguishers in cabinets.

END OF SECTION

SECTION

10 7516 - FLAGPOLE

PART 1 - GENERAL REQUIREMENTS

1.01 SCOPE

A. Provide and install ground-set aluminum flagpole, accessories, foundation and flags.

B. Quantity required: Refer to Drawing Floor Plans for total quantity of poles.

1.02 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide flagpole assemblies, including anchorages and supports, capable of withstanding the effects of wind loads, determined according to NAAMM FP 1001, "Guide Specifications for Design of Metal Flagpoles."

1. Base flagpole design with polyester flags of maximum standard size suitable for use with flagpole or flag size indicated, whichever is more stringent.

2. Basic Wind Speed: min. 95 mph; 3-second gust speed at 33 feet above ground.

1.03 SUBMITTALS

A. Product Data: For each type of flagpole required.

B. Structural Calculations: For flagpoles indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Qualification Data: For professional engineer.

1.04 QUALITY ASSURANCE

A. Source Limitations: Obtain each flagpole as a complete unit, including fittings, accessories, bases, and anchorage devices, from a single manufacturer.

1. Obtain flagpoles through one source from a single manufacturer.

1.05 DELIVERY, STORAGE, AND HANDLING

A. General: Spiral wrap flagpoles with heavy paper and enclose in a hard fiber tube or other protective container.

PART 2 - MATERIALS

2.01 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. American Flagpole www.americanflagpole.com
2. The Baartol Company Inc. www.baartol.com
3. Concord Industries, Inc. www.concordindustries.com
4. Carrot-Top Industries www.carrot-top.com
5. Concord Industries www.concordindustries.com
6. Eder Flag Manufacturing Co. www.ederflag.com
7. Pole-Tech Company Inc. www.poletech.com
8. Morgan-Francis Co., www.morgan-francis.com
9. United States Flag Store, www.united-states-flag.com
10. Flagpoles Etc. www.flagpolesetc.com

2.02 FLAGPOLES

A. Flagpole Construction, General: Construct flagpoles in one piece if possible. If more than one piece is necessary, comply with the following:

B. Fabricate shop and field joints without using fasteners, screw collars, or lead calking.

C. For tapered flagpoles, provide flush hairline joints using self-aligning, snug-fitting, internal sleeves.

D. Exposed Height: 35 feet.

E. Aluminum Flagpoles: Provide cone-tapered flagpoles fabricated from seamless extruded tubing complying with ASTM B 241/ (B 241 M), Alloy 6063, with a minimum wall thickness of 3/16 inch. Heat treat after fabrication to comply with ASTM B 597, Temper T6.

F. Foundation Tube: Galvanized corrugated-steel foundation tube, 0.064-inch minimum nominal wall thickness. Provide with 3116-inch steel bottom plate and support plate; 3/4 inch diameter, steel ground spike; and steel centering wedges all welded together. Galvanize steel parts, including foundation tube, after assembly. Provide loose hardwood wedges at top of foundation tube for plumbing pole.

1. Provide flashing collar of same material and finish as flagpole.

2.03 FITTINGS

A. External Halyard: Ball-bearing, nonfouling, revolving truck assembly of cast metal with continuous 5/16 inch diameter, braided steel halyard and 9-inch cast-metal cleats with fasteners. Finish exposed metal surfaces to match flagpole.

1. Provide one halyard and one cleat at each flagpole.

2. Provide cast-metal cleat covers, finished to match flagpole, secured with cylinder locks.

3. Provide halyard covers consisting of a 2-inch channel, 60 inches long, finished to match flagpole.

B. Halyard Flag Snaps: Provide four (4) stainless-steel swivel snap hooks per halyard.

C. 6-inch diameter fineal ball and standard; non-fouling ball bearing truck. Cleats: 9” standard cleats.

D. 16-gauge galvanized foundation sleeve with base plate, self-centering wedges and lightning protection ground spike.

E. Continuous braided #10 diameter polypropylene halyard with swivel flag snaps. Provide cast aluminum cleat cover for padlock installation.

F. Flagpole and all accessories to receive machined 80-120 grit satin-brushed finish.

G. Provide external halyard complete assembly, truck assembly, etc. Provide spun aluminum flash collar.

2.04 MISCELLANEOUS MATERIALS

A. Concrete: Comply with requirements in Division 3 Section "Cast-in-Place Concrete" for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 3000 psi unless otherwise indicated.

B. Sand: ASTM C 33, fine aggregate.

C. Elastomeric Joint Sealant: Single-component neutral-curing silicone joint sealant complying with requirements in Division 7 Section "Joint Sealants" for Use NT (nontraffic) and for Use M, G, A, and, as applicable to joint substrates indicated, O joint substrates.

2.05 FLAGS

A. Commercial-quality nylon, 5 x 8-foot size; furnish one flag of each of the following types, per flag pole:
   1. United States,
   2. State of Texas.

2.06 FINISHES

A. Metal Finishes, General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Aluminum: Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
   1. Class 1, Clear Anodic Finish: AA-M12C2A41 (Mechanical Finish: nonsecular as fabricated; Chemical Finish: etched, medium matte); Anodic Coating: Architectural Class 1, clear coating 0.018 mm or thicker) complying with AAMA 611.

PART 3 - EXECUTION

3.01 PREPARATION

A. Prepare uncoated metal flagpoles that are set in foundation tubes by painting below-grade portions with a heavy coat of bituminous paint.

B. Foundation Excavation: Excavate to neat clean lines in undisturbed soil. Remove loose soil and foreign matter from excavation and moisten earth before placing concrete.

C. Provide forms where required due to unstable soil conditions and for perimeter of flagpole base at grade. Secure and brace forms and foundation tube, sleeve, or anchor bolts in position, to prevent displacement during concreting.

D. Place concrete immediately after mixing. Compact concrete in place by using vibrators. Moist-cure exposed concrete for not less than seven days or use nonstaining curing compound.

E. Trowel exposed concrete surfaces to a smooth, dense finish, free of trowel marks, and uniform in texture and appearance. Provide positive slope for water runoff to perimeter of concrete base.

3.02 FLAGPOLE INSTALLATION

A. General: Install flagpoles were shown and according to manufacturer's written instructions.

B. Foundation-Tube Installation: Install flagpole in foundation tube, seated on bottom plate between steel centering wedges. Plumb flagpole and install hardwood wedges to secure flagpole in place. Place and compact sand in foundation tube and remove hardwood wedges. Seal top of foundation tube with a 2-inch layer of elastomeric joint sealant and cover with flashing collar.

END OF SECTION 10 75 16

SECTION 12 24 14

MOTORIZED WINDOW SHADES

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Motorized, roll-up fabric interior window shades including motor operator, controls, and mounting hardware.

1.2 RELATED SECTIONS

A. Section 06100 [06 10 00] – Rough Carpentry: Blocking for support of window shade hardware.

B. Section 07900 [07 90 00] - Joint Sealers: Sealants for perimeter of shade system.

C. Section 09260 [09 21 23] - Gypsum Board Assemblies: Suspended gypsum board ceilings to contain recessed window shade pockets.

D. Section 09510 [09 51 23] - Acoustical Tile Ceilings: Suspended acoustical panel ceilings to contain recessed window shade pockets.

E. Section 11132 [11 52 13] - Motorized Projection Screens: Motorized projection screens to be interfaced with shade controls.

F. Section 11132 [11 52 13] - Motorized Projector Lifts: Motorized projector lifts and mounts to be interfaced with shade controls.

G. Division 16 [26] - Electrical: Electrical supply, conduit, and wiring for motorized window shades.

1.3 REFERENCES

A. NFPA 70 - National Electrical Code.

B. NFPA 701-99 - Fire Tests for Flame-Resistant Textiles and Films.

C. ANSI/WCMA A100.1-2022.

1.4 SUBMITTALS

A. Submit under provisions of Section 01330 - Submittal Procedures:

B. Product Data: Manufacturer's data sheets on each product specified, including:
   1. Preparation instructions and recommendations.
   2. Installation and maintenance instructions.
   3. Styles, material descriptions, dimensions of individual components, profiles, features, finishes and operating instructions.
   4. Storage and handling requirements and recommendations.

5. Mounting details and installation methods.
6. Typical wiring diagrams including integration of motor controllers with building management system, audiovisual and lighting control systems as applicable.

C. Shop Drawings: Plans, elevations, sections, product details, installation details, operational clearances, wiring diagrams and relationship to adjacent work. Location of switches shall be shown on plans and coordinated with other trades.

D. Window Treatment Schedule: For all roller shades. Use same room designations as indicated on the Drawings, field verified window dimensions, quantities, type of shade, controls, fabric, and color, and include opening sizes and key to typical mounting details.

E. Selection Samples: For each finish product specified, two complete sets of shade cloth options and aluminum finish color samples representing manufacturer's full range of available colors and patterns.

F. Verification Samples: For each finish product specified, two complete sets of shade components, unassembled, demonstrating compliance with specified requirements. Shade fabric sample and aluminum finish sample as selected, representing actual product, color, and patterns. Mark face of material to indicate interior faces.

G. Maintenance Data: Methods for maintaining roller shades, precautions regarding cleaning materials and methods, instructions for operating hardware and controls.

H. Manufacturer's Certificates: Certify products meet or exceed specified requirements.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications: Obtain roller shades through one source from a single manufacturer with a minimum of twenty years experience in manufacturing products comparable to those specified in this section. Manufacturers that do not meet the required experience requirements must submit life cycle test data showing minimum 2000 complete operational cycles for each year of warranty showing no failure and that shade remains fit for use as an operable shade).

B. NFPA Flame-Test: Passes NFPA 701. Materials tested shall be identical to products proposed for use. Show complete manufacturer data (name,location,contact) and certification from manufacturer that the fabrics sourced for this project comply with the test data provided.

C. Mock-Up: Provide a mock-up of one of each type roller shade assembly specified for evaluation of mounting, appearance and accessories.
1. Locate mock-up in window(s) designated by Architect.
2. Do not proceed with remaining work until mock-up is accepted by Architect.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Do not deliver window shades until building is enclosed and construction within spaces where shades will be installed is substantially complete.

B. Deliver products in manufacturer's original, unopened, undamaged containers with labels intact.

C. Label containers and shades according to Window Shade Schedule.

D. Store products in manufacturer's unopened packaging until ready for installation.

1.7 SEQUENCING

A. Ensure that locating templates and other information required for installation of products of this section are furnished to affected trades in time to prevent interruption of construction progress.

B. Ensure that products of this section are supplied to affected trades in time to prevent interruption of construction progress.

1.8 PROJECT CONDITIONS

A. Install roller shades after finish work and ambient temperature, humidity and ventilation conditions are maintained at levels recommended for project upon completion.

1.9 WARRANTY

A. Hardware and Shade Fabric: Draper’s standard twenty-five year limited warranty.

B. Motors and Controls: Draper’s standard five year limited warranty.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer: Draper, Inc. Sales offices and manufacturing facility located at: 411 S. Pearl P. O. Box 425; Spiceland, IN 47385-0425. ASD. Toll Free Tel: 800-238-7999; Tel: 765-987-7999; Fax: 866-637-5611; Web: www.draperinc.com.

B. Requests for substitutions will be considered in accordance with provisions of Section 01600.

2.2 INTERMEDIATE SIZE MOTORIZED WINDOW SHADES

A. Type: Motorized vertical roll-up, fabric, window shade with motors, controls, mounting brackets, and other components necessary for complete installation; Motorized FlexShade® 2 as manufactured by Draper, Inc.
   1. Mounting brackets.
   2. Endcaps and fascia.
   3. Endcaps and ceiling/wall headbox.
   4. Endcaps with pocket headbox.

B. Shade Motor and Control System
   1. FlexShade 2 120V AC motor. Single phase, 60 HZ, instantly reversible, lifetime lubricated, and equipped with internal thermal overload protector, electric brake, and pre-set accessible limit switches. Tubular motor concealed inside each shade roller tube.
   2. FlexShade 2 Quiet 120V AC motor. Operates at 44 Db measured 3 feet from the motor. Makes no audible clicks when motor stops or starts. Tubular motor concealed inside each shade roller tube.
      a. Individual Control:

1) Wall Switch - Toggle three position wall switch.

b. Group Control:

1) 1 Motor Isolating Relay (1ISO) – One ISO relay per motor. Allows 110-120V group switching. Allows for up to 12 motors on one double throw switch. Input Voltage: 120V AC/60Hz. Output Voltage: 120V AC/60Hz. Max Output Current: 4.0 Amps.

c. Individual and Group Control:

1) IGC4N1. Individual and Group control of up to four motors with up to three intermediate positions per motor.

3. Roller: Size–4 inch (102 mm) or 5 inch (127 mm) O.D. steel tube. Size at manufacturer's discretion.
4. Roller Idler Assembly: Zinc-plated steel shaft supported by roller bearings in an aluminum housing.
5. Slat: 13/16" aluminum dowel, encased in heat seamed hem.
6. Mounting

a. Endcaps: 1028 steel stamping. Complete with adapter roller bracket. Installs to wall, ceiling, or jamb. Accepts fascia or headbox.

1) Finish: Custom powder coat as selected by the Architect.

b. Brackets: 1018 plated steel stamping, suitable for mounting to wall, ceiling, or jamb. Brackets do not require additional adapters.

c. Fascia: 6½ inch x 6½ inch (165 x 165 mm) square cover of extruded aluminum, .125 inch (3.175 mm) wall.

1) Attachment: Snaps onto endcaps without requiring exposed fasteners of any kind.
2) Finish: Selected from Manufacturers standard range.
3) Finish: Custom powder coat as selected by the Architect.

d. Headbox Ceiling/Wall Style: 6-5/8" x 6-5/8" (168 x 168 mm) square fascia and L-shaped back/top cover to be fabricated of extruded aluminum:

1) Finish: Custom powder coat as selected by the Architect.

e. Pocket headbox constructed of extruded aluminum. Bottom of headbox fully enclosed except for slot allowing fabric passage. Bottom closure panel shall be extruded aluminum, finished white, and may be removed manually for access to roller and drive unit. Aluminum endplates with integrated steel brackets for suspended mounting shall be fastened to extruded headbox with thread-cutting screws.

1) Ceiling Tile Flange: 12 foot (366 cm) extruded aluminum, finished white. Attaches to pocket headbox. Hardware for attachment to headbox included.
2) Endcap Ceiling Tile Flange: Extruded aluminum, finished white. Available on one or both endcaps.

2.3 FABRIC

A. Light-Filtering Fabrics

1. PVC Coated Fiberglass

a. Basketweave

1) E Screen 5% by Mermet: PVC coated fiberglass yarn woven in 2 by 2 basketweave. Fire rating: NFPA 701-10 TM#1, California U.S. Title 19, CAN/ULC-S109-03 Small & Large Flame Test. Environmental Benefits: Certified to UL GREENGUARD and GREENGUARD Gold standards for low chemical emissions into indoor air during product usage. RoHS compliant – lead free. Bacterial and fungal resistance: ASTM E 2180, ASTM G21. Average 5 percent open, .016 inches thick, 10.7 oz/square yard.

B. Color and pattern: As selected by Architect from manufacturer's standard range.

C. Custom Printed Graphics: As submitted to manufacturer in accordance with manufacturer’s guidelines.

PART 3 EXECUTION

3.1 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.2 PREPARATION

A. Coordinate requirements for blocking and structural supports to ensure adequate means for installation of window shades.

B. Coordinate requirements for blocking, construction of shade pockets, and structural supports to ensure adequate means for installation of window shades.

C. Coordinate installation of recessed shade pockets with construction of suspended acoustical panel ceilings specified in Section 09510.

D. Coordinate installation of recessed shade pockets with construction of suspended gypsum board ceilings specified in Section 09260.

E. Coordinate requirements for power supply conduit, and wiring required for window shade motors and controls.

3.3 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install roller shades level, plumb, square, and true. Allow proper clearances for window operation hardware.

C. Shade pockets:
1. Install shade pockets prior to installation of suspended ceiling system. Attach to supporting structure with screws through top of pocket at 24 inches (610 mm) minimum centers.
2. Shades in storm shelter will need to penetrate steel channel as windows are storm rated. Provide correct mounting screws that will penetrate steel channel.
3. Install shade pockets in conjunction with installation of suspended ceiling system. Attach to supporting structure with screws through top of pocket at 24 inches (610 mm) minimum centers.
4. Install corner pieces securely and in alignment with pockets.
5. Install pocket ends securely and in alignment with pockets.
6. After interior construction is essentially complete, install shade and operating mechanism in pocket.

D. Position shades level, plumb, and at proper height relative to adjacent construction. Secure with fasteners recommended by manufacturer.

3.4 TESTING AND DEMONSTRATION

A. Test motorized window shades to verify that controls, limit switches, interface to other building systems, and other operating components are functional. Correct deficiencies.

B. Test window shades to verify that operating mechanism, fabric retainer, and other operating components are functional. Correct deficiencies.
   1. Motorized operating mechanism.

C. Demonstrate operation of shades to Owner's designated representatives.

3.5 PROTECTION

A. Protect installed products until completion of project.

B. Touch-up, repair or replace damaged products before Substantial Completion.

3.6 SCHEDULES

A. Refer to Drawings for shade types and locations.

END OF SECTION

SECTION 12 3600

COUNTERTOPS

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Solid surface and plastic laminate countertops for architectural cabinetwork.

1.02 REFERENCES

A. ANSI A208.1 - American National Standard for Particleboard; current edition.

B. ANSI A208.2 - American National Standard for Medium Density Fiberboard for Interior Use; current edition.

C. ANSI Z124.3 - American National Standard for Plastic Lavatories; current edition.

D. ASTM E 84 - Standard Test Method for Surface Burning Characteristics of Building Materials; current edition.

E. AWI/AWMAC (QSI) - Quality Standard Illustrated; Architectural Woodwork Institute and Architectural Woodwork Manufacturers Association of Canada; 2006, 8th Ed., Version 2.0.

F. ISSFA-2 - Classification and Standards for Solid Surfacing Material; International Solid Surface Fabricators Association; current edition

G. NEMA LD 3 - High-Pressure Decorative Laminates; current edition.

H. PS 1 - Construction and Industrial Plywood; current edition.

1.03 SUBMITTALS

A. See Division 1 sections for submittal procedures.

B. Product Data: Manufacturer's data sheets on each product to be used, including:
   1. Preparation instructions and recommendations.
   2. Storage and handling requirements and recommendations.
   3. Specimen warranty.

C. Shop Drawings: Complete details of materials and installation; combine with shop drawings of cabinets and casework specified in other sections.

D. Selection Samples: For each finish product specified, color chips representing manufacturer's full range of available colors and patterns.

E. Verification Samples: For each finish product specified, minimum size 6 inches square, representing actual product, color, and patterns.

F. Test Reports: Chemical resistance testing, showing compliance with specified requirements.

G. Installation Instructions: Manufacturer's installation instructions and recommendations.

H. Maintenance Data: Manufacturer's instructions and recommendations for maintenance and repair of countertop surfaces.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: Installation by fabricator.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened packaging until ready for installation.

B. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.06 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

PART 2 PRODUCTS

2.01 COUNTERTOP ASSEMBLIES

A. Solid Surfacing Countertops: Solid surfacing sheet or plastic resin casting over continuous substrate.
   1. Flat Sheet Thickness: ¾ inch, minimum.
   2. Solid Surfacing Sheet and Plastic Resin Castings: Complying with ISSFA-2 and NEMA LD 3; acrylic or polyester resin, mineral filler, and pigments; homogenous, non-porous and capable of being worked and repaired using standard woodworking tools; no surface coating; color and pattern consistent throughout thickness.
      a. Surface Burning Characteristics: Flame spread 25, maximum; smoke developed 450, maximum; when tested in accordance with ASTM E 84.
      b. NSF approved for food contact.
      c. Sinks and Bowls: Integral castings; minimum 3/4 inch wall thickness; comply with ANSI Z124.3.
      d. Finish on Exposed Surfaces: As approved by Architect.
      e. Color and Pattern: As designated in the 'Finish Schedule' on Drawings.
      f. Manufacturers:
         1) Dupont: www.corian.com.
         2) Substitutions: See Section 01 6000 Product Requirements for substitution procedures.
   3. Other Components Thickness: 1/2 inch, minimum.
   4. Exposed Edge Treatment: Built up to minimum 1-1/4 inch thick; radiused edge.
   5. Back and End Splashes: Same sheet material, radiused top; minimum 4 inches high.

B. Plastic Laminate Countertops: High-pressure decorative laminate (HPDL) sheet bonded to substrate.
   1. Laminate Sheet: NEMA LD 3, Grade HDS, 0.048 inch nominal thickness.
      a. Manufacturers: Wilsonart; www.wilsonart.com
      b. Color and pattern: As designated in the 'Finish Schedule' on the Drawings.

2.02 ACCESSORY MATERIALS

A. Plywood for Supporting all Substrate: FSC Certified PS 1 Exterior Type, AC veneer grade, minimum 5-ply; minimum 3/4 inch thick; join lengths using metal splines.

B. Adhesives: Chemical resistant waterproof adhesive as recommended by manufacturer of materials being joined.

C. Cove Molding for Top of Splashes: Rubber with semi-gloss finish and T-spline to fit between splash and wall; 1/2 inch by 1/2 inch; color as selected. To be applied to all splashes with the exception of tile splashes.

D. Joint Sealant: Mildew-resistant silicone sealant, color approved by Architect. To be applied at all casework and millwork joints, corners and where at dissimilar materials.

2.03 FABRICATION

A. Fabricate tops and splashes in the largest sections practicable, with top surface of joints flush.
   1. Join lengths of tops using best method recommended by manufacturer.
   2. Prepare all cutouts accurately to size; replace tops having improperly dimensioned or unnecessary cutouts or fixture holes.

B. Provide back/end splash wherever counter edge abuts vertical surface unless otherwise indicated.
   1. Secure to countertop with concealed fasteners and with contact surfaces set in waterproof glue.
   2. Height: 4 inches, unless otherwise indicated.

C. Solid Surfacing: Fabricate tops up to 144 inches long in one piece; join pieces with adhesive sealant in accordance with manufacturer's recommendations and instructions.

PART 3 EXECUTION

3.01 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

C. Verify that wall surfaces have been finished and mechanical and electrical services and outlets are installed in proper locations.

3.02 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.03 INSTALLATION

A. Securely attach countertops to cabinets using concealed fasteners. Make flat surfaces level; shim where required.

B. Attach plastic laminate countertops using screws with minimum penetration into substrate board of 5/8 inch.

C. Seal joint between back/end splashes and vertical surfaces.
   1. Where indicated use rubber cove molding.
   2. Where applied cove molding is not indicated use specified sealant.

3.04 TOLERANCES

A. Variation from Horizontal: 1/8 inch in 10 feet, maximum.

B. Offset from Wall, Counterops: 1/8 inch maximum, 1/16 inch, minimum.

C. Field Joints: 1/16 inch, wide, maximum.

3.05 CLEANING AND PROTECTION

A. Clean countertops surfaces thoroughly.

B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 12 36 53

LABORATORY WORKSURFACES

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Epoxy resin worksurfaces and accessories.
   2. Setting materials.

1.2 REFERENCES

A. ASTM International (ASTM):
   1. D570 - Standard Test Method for Water Absorption of Plastics.
   2. D635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plasticsin a Horizontal Position.
   3. D648 - Standard Test Method for Deflection Temperature of Plastics Under Flexural Oad in edgewise Position.
   4. D695 - Standard Test Method for Compressive Properties of Rigid Plastics.
   5. D696 - Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between 30^0 C and 30^0 C With a Vitreous Silica Dilatometer.
   6. D785 - Standard Test Method for Rockwell Hardness of Plastics and Electrical Insulating Materials.
   7. D790 - Standard Test Method for Flexural Properties of Unreinforced and Reinforced Plasticsand Electrical Insulating Materials.
   8. D792 - Standard Test Method for Density and Specific Gravity (Relative Density) of Plastics by Displacement.
   9. D3801 - Standard Test Method for Measuring the Comparative Burning Characteristics ofSolid Plastics in a Vertical Position.

B. E84 - Standard Test Method for Surface Burning Characteristics of Building Materials. NSF International / American National Standards Institute (NSF/ANSI) - 51 - Food Equipment Materials.

C. Scientific Certification Systems (SCS) - Recycled Content Certifications.

D. Scientific Equipment and Furniture Association (SEFA) 3 - Work Surfaces.

1.3 SUBMITTALS

A. Submittals for Review:
   1. Shop Drawings:
      a. Submit plan, section, elevation and perspective drawings necessary to describe and convey layout, profiles, and product components, including edge conditions, joints, fitting and fixture locations, anchorage, accessories, and finish colors.
      b. Verify actual measurements/openings by field measurements before fabrication; show recorded measurements on Shop Drawings.
      c. Coordinate field measurements and fabrication schedule with construction progress to avoid construction delays.
   2. Product Data: Manufacturer's data sheets on each product to be used, including:
      a. Preparation instructions and recommendations.
      b. Storage and handling requirements and recommendations.
      c. Installation methods.
   3. Samples:
      a. Selection samples: For each finished product specified, submit complete set of

color chips representing manufacturer's full range of standard colors.
b. Verification samples: For each finished product specified, submit samples representing actual product color; supplied product color and gloss may vary slightly from supplied samples.

B. Quality Control Submittals:
1. Test Reports: Certified test reports or recognized evaluation reports showing compliance with specified performance characteristics and physical properties.

C. Closeout Submittals:
1. Maintenance Data:
a. Provide maintenance, cleaning, and life cycle information.
b. Include recommended cleaning materials and procedures and list of materials detrimental to epoxy resin.

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications:
1. Primary products furnished by single manufacturer with minimum 10 years [documented] experience in work of this Section.
2. Products manufactured in ISO 9001 certified facility.

B. Installer Qualifications: Minimum [5] [ ] years [documented] experience in work of this Section.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Delivery:
1. Use pallets larger than sheets during transportation.
2. Package materials to prevent damage during shipping and handling.

B. Storage:
1. Store products in enclosed areas protected from ultraviolet.
2. Store products in manufacturer's unopened packaging until ready for installation.
3. Store panels using protective dividers to avoid damage to surfaces.
4. For horizontal storage, store sheets on pallets of equal or greater size than sheets with protective layer between pallet and sheet and on top of uppermost sheet.
5. Do not store sheets or fabricated panels vertically.

C. Handling:
1. If protective film is provided, do not remove until panel has been installed.
2. Handle sheets to prevent damage.
3. Remove stickers immediately after installation.

1.6 PROJECT CONDITIONS

A. Do not install products under environmental conditions outside manufacturer's limits.

B. Avoid direct exposure of products to sunlight.

C. Do not use worksurfaces as bench, ladder, or seating.

PART 2 PRODUCTS

2.1 MATERIALS

A. Solid Epoxy Resin:
1. Sheets cast from modified epoxy resin and non-asbestos inert fillers; compounded mixture

cured and thermoset specifically from formulation to provide exceptional physical and chemical resistance required in medium to heavy duty laboratory environments.

2. Sheets monolithic throughout without surface coating application.
3. Physical properties; minimum acceptable physical performance in accordance with SEFA3 testing procedures:
   a. Density/specific gravity: Tested to ASTM D792; minimum test rating of 134.8 PSF or 2.16 gcm.
   b. Rockwell hardness: Tested to ASTM D785; minimum M scale rating of 110.
   c. Fire resistance: tested to ASTM D635; classified as self-extinguishing.
   d. Surface burning characteristics: Tested to ASTM E84; flame spread index 7.4 and smoke develop index of 221.2.
   e. Surface burning characteristics in vertical position: Tested to ASTM D3801; maximum flame spread index of 7.4 and smoke developed index of 221.2.
   f. Coefficient of linear thermal expansion: Tested to ASTM D696; rating of 2.46 x 10-5.
   g. Heat deflection: Tested to ASTM D648; maximum 205 degrees F or 96 degrees C.
   h. Flexural strength: Tested to ASTM D790; minimum rating 14.9 KPSI or 103 Mpa.
   i. Flexural modulus: Tested to ASTM D790; 2,777,501 PSI or 19.2 Gpa.
   j. Water absorption, 24 hours: tested to ASTM D570; maximum 0.008 percent by weight.
   k. Compression strength: Tested to ASTM D695; minimum 38.4 kpsi or 265 Mpa.
   l. Chemical resistance; minimum acceptable chemical resistance performance in accordance with SEFA 3:

4. Testing Method Descriptions:

Method A - Volatile chemicals (organic solvents): Cotton ball saturated with test reagent is placed in one-ounce bottle (20 x 75mm test tube or similar container) with reservoir of liquid above ball. Container is inverted on test material for period of 24 hours at standard temperature 23 degrees C plus or minus 2 degrees C (73 degrees F plus or minus 4 degrees F).

Method B - Non-Volatile Chemicals: Five drops (1/4 cc) of test reagent are placed on test material surface. Reagent is then covered with watch glass (25 mm) for period of no less than 24 hours at standard temperature of 23 degrees C plus or minus 2 degrees C (73 degrees F plus or minus 4 degrees F).

5. **Result Definitions:**
   0 - No Effect: No detectible change in material surface.
   1 - Good: Slight detectable change in color or gloss but no change to function or life of work surface material.
   2 - Fair: Slight surface etching or severe staining. Clearly discernable change in color or gloss but no significant impairment of surface life or function.
   3 - Poor: Pitting, cratering or erosion of work surface material; obvious and significant deterioration. Objectionable change in appearance due to surface discoloration.
6. Color: To be selected from manufacturer's standard color range.

2.2 ACCESSORIES

A. Provide solid epoxy resin [laboratory shelving] [laboratory fume hood base work surfaces][pegboards] [reagent racks] where indicated.

B. Installation Materials: Manufacturer's joint adhesive, panel adhesive, and sealants as required to suit project conditions.

2.3 FABRICATION

A. Fabricated tops and accessories in accordance with manufacturer's recommendations, approved Shop Drawings, and SEFA 3.

B. Epoxy Resin Worksurfaces:
   1. Thickness:
      a. [3/4 inch (19 mm)] [1 inch (25 mm)] [1-1/4 inches (32 mm)] unless otherwise indicated.
      b. Check each sheet at factory for required thickness.
      c. Maximum variation in thickness: plus or minus 1/16 inch (1.6 mm) from corner to corner.
   2. Warpage:
      a. Inspect tops for warpage prior to fabrication by placing on true flat surface.
      b. Maximum allowable warpage: 1/16 inch (1.5 mm) in 36 inch (900 mm) span or 3/16 inch (4.5 mm) in 96 inch (2400 mm) span.
   3. Fabrication:
      a. Shop fabricate in longest practical lengths.
      b. Bond joints with highly chemical resistant cement with properties and color similar to base material.
      c. Provide 1/8 inch (3 mm) drip groove at underside of exposed edges, set back 1/2 inch(13 mm) from face.
      d. Finish exposed edges.
   4. Fabricate tops flat with 1/4 inch (6 mm) raised marine edge. Flat with 1/4 inch (6 mm) raised marine edge at epoxy sink locations.
   5. Edge treatment: Standard 1/4 inch (2 mm) radius edge with drip groove.
   6. Corner treatment: exposed corners shall be eased slightly for safety.
   7. Back and end splashes:
      a. Supplied loose for field installation.
      b. Same material and thickness as worksurfaces.
      c. 4 inches high unless otherwise indicated.

d. Top-mounted end splash where worksurfaces abut adjacent construction at and locations indicated on Drawings.

8. Joints: [As indicated on Drawings.] [Maximum 1/8 inch (2 mm), bonded with epoxy grout.] [__.]
9. Make joints between two benches level.
10. Locate joints away from sinks and over or near supports.
11. Sink cutouts: Routed for drop-in sink.
12. Allowable tolerances:
    a. Square: Plus or minus 1/64 inch (0.4 mm) for each 12 inches (300 mm) of length.
    b. Location of cutouts and drilled openings: Plus or minus 1/8 inch (3 mm) of design dimension.
    c. Size of cutouts and drilled openings: Plus 1/8 inch (3 mm) or minus 0 inches (0 mm).

C. Epoxy Resin Sinks:
1. Mold sinks from thermosetting epoxy resin.
2. Mold interior corners to radius. Slope sink base to drain outlet.
3. Provide 1-1/2 inch (38 mm) outlet with open ended standpipe; standpipe overflow 2 inches (50 mm) shorter than depth of sink.
4. Unless otherwise indicated, fabricate sinks of drop-in design supported by upper flange from worksurface.
5. Color: To match adjacent worksurface.

PART 3 EXECUTION

3.1 EXAMINATION

A. Do not begin installation until cabinets have been installed.

B. Confirm that surfaces to receive tops are plumb and level, with maximum deflection of 1/4 inch (6 mm) in 20 feet (6 m).

3.2 PREPARATION

A. Clean surfaces just prior to installation.

B. Prepare surfaces using methods recommended by manufacturer.

3.3 INSTALLATION

A. Install in accordance with manufacturer's instructions and approved Shop Drawings.

B. Install tops plumb and level.

C. Scribe to adjacent surfaces in accordance with manufacturer's recommendations.

D. Fasten tops to supporting construction with adhesives appropriate for use with adjoining construction and as recommended by manufacturer.

E. Form field joints using manufacturer's recommended adhesive. Form joints to be inconspicuous and nonporous.

F. Install [laboratory shelving] [laboratory fume hood base work surfaces] [pegboards] [reagent racks] using fasteners and adhesive appropriate for use with adjoining construction and as recommendedby manufacturer.

3.4 PROTECTION

A. Protect installed products until completion of Project.

B. Touch up, repair, or replace damaged products.

SECTION 21 0400

GENERAL REQUIREMENTS FOR FIRE SUPPRESSION

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. Section Includes: Every item of labor, materials, equipment and appurtenances for installing complete Fire Suppressions Systems included in Division 21 of the Specifications.

A. The Fire Suppression Drawings are diagrammatic in nature and show the general arrangement of all piping, equipment and appurtenances and shall be followed as closely as actual building construction and the work of other trades will permit. Because of the small scale of the Drawings, it is not feasible to indicate all offsets, fittings and accessories that may be required. The Contractor shall investigate the construction conditions affecting the work and provide fittings and accessories as required to meet actual conditions.

B. Where discrepancies in scope of work as to which Trade provides specific items, such as starters, disconnects, flow switches, electrical control components, etc. exist, such conflicts shall be reported to the Engineer. If such action is not taken, the Contractor, as applicable, shall furnish such items as part of his work, for complete and operable systems and equipment, as determined by the Engineer

1.03 REGULATIONS AND STANDARDS:

A. The completed installation and all materials and equipment shall conform to local ordinances and codes, other regulations and standards listed herein or in related sections. These are intended as a minimum and shall be exceeded if required by the specifications or the Drawings. In the event of conflict between the codes, standards, or regulations, and information contained in the Contract Documents, the applicable code, standards, or regulation shall take precedence.

1.04 INSPECTION CERTIFICATES:

A. The Contractor shall furnish three copies of certificates of final acceptance to the Engineer from all inspection authorities having jurisdiction.

1.05 SUBSTANTIAL COMPLETION INSPECTION :

A. The Engineer will visit the site for the purpose of conducting a substantial completion inspection once the following items have been met by the Contractor:
   1. All fire protection systems shall be complete, operational and under automatic control.
   2. Fire suppression systems cleaning and testing shall be complete and the final report shall be approved by the Engineer

B. All discrepancies noted in the substantial completion report shall be corrected prior to the final inspection. The Contractor shall provide a detailed item-by-item description of all corrections made for each item on the substantial completion discrepancy list prior to scheduling final inspection by the Engineer. Additional visits required after the final inspection, for the reason that previously documented discrepancies had not been corrected at the time of the final inspection, will be made at the Contractor’s expense.

1.06 LEED COMPLIANCE

A. Comply with requirements for LEED certification specified in Division 01.

1.07 ASBESTOS

A. Asbestos Free Materials: The intention of these Drawings and specifications is that there are no asbestos-containing materials installed on this project. To the best of the Architects and Engineers knowledge, none of the material or equipment specified herein or shown on the Drawings contains asbestos. The Contractor shall make every effort to prevent any asbestos materials from being installed in or used on the construction of the project. At the completion of the project, the Contractor shall certify by letter that to the best of his knowledge, no asbestos-containing materials were used for or in the construction of this project.

B. Existing Materials:

1. Contractor shall review the Owners asbestos management plan to ensure suspected asbestos containing materials are under surveillance.
2. Discovery: If during the construction of this project, work involving friable asbestos is suspected, or encountered, all work in this area shall be discontinued and the Owner or the Owner's representative, shall be notified immediately and the Owner with his own forces or by separate contract shall be responsible for complete investigation, removal, and disposition of the friable asbestos hazard in accordance with applicable laws and regulations. If the Contractor claims that delay or additional cost is involved because of such action by the Owner, he shall make such claim as provided elsewhere in the Contract Documents.
3. Removal: All work involving the removal of friable asbestos will be done under a separate contract.

1.08 MATERIALS AND WORKMANSHIP:

A. Equipment and material used in the project shall be new and undamaged. The fire suppression installation shall fit into the space allotted and shall allow adequate and acceptable clearances for entry, servicing and maintenance. Similar types of equipment shall be the products of the same manufacturer unless specified otherwise. Work shall be performed by mechanics or tradesmen skilled in the trade involved.

B. All piping and equipment shall be installed in a neat and organized manner, parallel to other work and the nearest building elements, unless specifically shown otherwise on the Drawings.

1.09 SUBMITTALS:

A. Submit shop drawings, product data, hydraulic calculations and samples in accordance with Division 01 for all items marked [S] [TD] as specified in related sections of these specifications. Submittals not required by the Contract Documents will not be reviewed. Eight (8) copies of the submittal shall be submitted. Five (5) copies of the submittal will be returned to the Contractor. If additional copies are required, they will be the responsibility of the Contractor. One copy of approved submittals shall be turned over to the Commissioning Agent by the Contractor. If additional copies are required, they will be the responsibility of the Contractor. Where drawings are submitted, Contractor shall submit one (1) reproducible sepia or vellum and three (3) prints. The reproducible and prints will be marked with the Owner, Architect and Engineer each retaining one (1) print for their records. The reproducible will be returned to the Contractor and the Contractor shall be responsible for all additional copies required for his use. All submittal data shall be correctly identified to show project name, and the exact model, style or size of item being submitted. Improperly identified submittals will not be reviewed by the Engineer. Each item submitted for review shall bear the Subcontractor's stamp which states that they have reviewed the submission, that it is complete, and that in their opinion it meets the contract requirements. Contractor's stamp shall identify the specification section, paragraph and page number for which the submittal is being made. Shop drawings will be reviewed only for general compliance with the Contract Documents. Review will not include correctness of details, proper configuration, utility connections, dimensions, sizes, quantities, and the like. Any submission which has not been reviewed and stamped by the Fire Suppression System Subcontractor will not be reviewed be the Engineer. No reviews prior to award of Contract will be considered or accepted.

NOTE: USE THIS PARAGRAPH FOR ALL CAPITAL OUTLAY PROJECTS

B. Contractor shall bid and install the fire protection system as shown on the construction documents. Deviations in materials, locations, configurations or sizes proposed by the Contractor shall be reviewed under the provisions of Section 26 of the General Conditions as a “Substitution” and are to be to be documented by an approved Change Order.

C. When the Contractor is satisfied that the construction design is complete and code compliant, then the Shop Drawings, Product Data and Calculations shall be submitted to the Architect-Engineer of Record and shall be reviewed and approved before any piping or equipment is installed. Re-submissions of the Shop Drawings, Product Data and Calculations shall include the entire original submittal. **Partial submittals or re-submittals will not be reviewed by the Engineer of Record.**

D. Submissions will be stamped by the Engineer in one of the following ways:

"No Exceptions Taken"	No exceptions are taken and subject to compliance\ with the Contract Documents.
"Make Corrections Noted"	Minor corrections are noted and a re-submittal is not required subject to compliance with the corrections and the Contract Documents.
"Correct and Resubmit "	The submitted material, method or system meets the intent of the specifications, yet has insufficient data to determine compliance with the Contract Documents. Re-submittal is required.
“Rejected”	The submitted material, method or system does not meet the intent of the specifications, or has insufficient data to determine compliance with the Contract Documents

E. Submission Procedures:

1. If a submission is satisfactory to the Engineer, the Engineer will annotate the submission, "No Exceptions Taken" or "Make Corrections Noted" and transmit five (5) copies to the Contractor. If a resubmission is required, the Engineer will annotate the submission “Correct and Resubmit” or "Rejected" and transmit five (5) copies to the Contractor for appropriate action.
2. The Contractor shall revise and resubmit submissions as required by the Engineer until submissions are acceptable to the Engineer.
3. Approval of a working and/or shop drawings by the Engineer will constitute acceptance of the subject matter for which the drawing was submitted and not for any other structure, material, equipment or appurtenances indicated as shown.
4. The Engineer's review of the Contractor's submissions shall in no way relieve the Contractor of any of his responsibilities under the Contract. An approval of a submission shall be interpreted to mean that the Engineer has no specific objections to the submitted material, subject to conformance with the Contract Documents.
5. Where as-built drawings, record drawings and specifications are available and when provided to the Contractor for use in performing the work, the Contractor shall verify the content of such drawings and specifications, the suitability of their use in performing the work and their accuracy for the purposes in which the Contractor intends to use any record or historical documents which may be obtained. In no case shall the Contractor assume that such documents reflect a true and accurate record of the construction. Acceptance of any such materials, records, and/or drawings shall in no way result in additional cost to the Owner should an error and/or omission in these documents result in additional costs to the Contractor.

6. On the first pages of all submittals, the Contractor shall provide a table showing all individual specification section paragraphs and drawings that apply to the equipment/component and a statement for each paragraph and drawing that the requirements have been met. The table shall be similar in format to the following, but shall include all relevant specification paragraphs and drawings:

Section 21 07 00 (example)	
1.2 A	Comply
1.2 B	Comply
1.3 A	Comply
1.3 B	Comply
1.3 C	Comply
1.4 A	Comply
1.4 A.1	Comply
1.4 A.2	Comply
Drawing M0.01	Comply

G. Equivalents: Manufacturers, trade names, and model numbers indicated herein and on Drawings shall be interpreted as establishing a standard of quality and shall not be construed as limiting competition. Unless definitely stated otherwise and upon complying with Division 01, the Contractor may use any article which, in his judgment is equal to that specified and is accepted by the Engineer. Manufacturers listed first in these specifications and on Drawings were used as a basis of design. It will be the responsibility of the Contractor to verify all connections, physical sizes, capacities, etc. of all other manufacturer's items, both named and proposed. If the equipment necessitates changes in ductwork, piping, wiring or other building systems from that indicated on the Drawings, the Contractor shall be responsible for all additional costs included and notify other trades. Where such changes are required, detail drawings indicating all required changes shall be submitted for review at the same time the manufacturers drawings are submitted for approval.

H. Operation and Maintenance manual(s) shall be submitted in according to Division 01, this section; and shall include a complete product index in each volume, installation and maintenance data, parts lists, a copy of all approved shop drawings, product data hydraulic calculations and the name, address and telephone number of supplier or nearest representative. In addition to the above two (2) copies of the latest edition of NFPA No. 25 booklet "Standard for Inspection, Testing and Maintenance of Water Based Fire Protection Systems" shall be turned over to the Owner at the time of his instructions on the operation and maintenance of the Fire Suppression System. All devices, equipment and systems marked [O/M] in these specifications shall be included with all other such items that will require servicing before the duration of its useful life has been reached. Manual(s) shall be presented to the Engineer for review and transmittal to the Owner before final payment is recommended.

1.10 WARRANTY:

A. The Contractor shall provide a warranty for a period of one year for all work provided under the Contract to include, but not necessarily limited to, all systems, equipment, materials, and workmanship. This shall not be construed to limit any extended warranty periods of longer than one year for specific items or systems specified elsewhere in the Contract Documents.

B. The warranty period shall commence on the date of acceptance by the Owner and shall cover all parts and labor as required to fulfill the warranty at no cost to the Owner.

C. Comply with Division 01 for additional warranty requirements.

D. Information on all warranties shall be included in the O&M Manuals specified herein to be provided to the Owner.

E. In phased construction, warranties shall not begin until substantial completion of the FINAL phase. Contractor shall maintain all new equipment and systems until that time. Owner will maintain all existing equipment and systems. Where new systems are connected to existing, the Contractor and Owner shall determine coordination of maintenance responsibilities at the preconstruction meeting.

1.11 FIRE FLOW TESTS:

A. As soon as practical after award of contract and prior to the preparation of approval or installation drawings, or doing fabrication or installation of any work, the Contractor shall make necessary arrangements to have flow tests made to determine the adequacy of the water supply system. Any revisions or adjustments to systems as indicated on the drawings which are necessitated by the results of the flow test and which changes are required to obtain approval by the Authorities having jurisdiction shall be made subject to Owner's approval and the contract price adjusted accordingly.

1.17 EXISTING UNDERGROUND UTILITIES:

A. The location of underground utilities shown on the Drawings shall be considered approximate, and any locations may not be indicated or known. Care shall be exercised by the Contractor during construction to locate and protect the known and unknown utilities, and to prevent disrupting the affected utility. The Contractor shall be responsible for repairing damage to any utility caused by his work.

B. Where any existing utilities are damaged, they shall be repaired as directed by the Engineer, with materials approved by the local utility company or the Owner, at no additional cost to the Owner.

1.18 INTERRUPTION OF UTILITY SERVICES:

A. It is necessary that close liaison be maintained with the Administrative Authorities in all matters affecting interruptions of any utility services serving the facility and existing buildings. Prior to interrupting any utility service, the Administrative Authorities shall be consulted and interruptions for connections made at a time (or times) suitable to the Administrative Authorities. Work shall be laid out and planned to limit the interruption times to a minimum.

1.19 VERIFYING MEASUREMENTS AND CONDITIONS:

A. The exactness of grades, elevations, dimensions, or locations given on the Drawings, is not guaranteed by the Engineer. The Contractor shall, therefore, satisfy himself as to the accuracy of all grades, elevations, dimensions and locations. In all cases of interconnection of his work with existing or other work, he shall verify at the site all dimensions relating to such existing or other work. Any errors due to the Contractor's failure to so verify all such grades, elevations, locations, or dimensions shall be promptly rectified by him without cost to Owner.

B. [**The Contractor shall base his bid on site examinations performed by him. This requirement is mandatory. The Contractor shall visit the site of the proposed project where work is scheduled to be performed, visit the existing buildings scheduled to be renovated, inspect piping systems where new-to-existing connections shall be made, etc., and ascertain for himself the amount of work required to fulfill the intent of his Contract and the complexity of the installation. The Contractor shall not hold the Engineer, his Consultants, agents or employees responsible for or bound by, any**

schedule, estimate or for any plan thereof. The Contractor shall study all Contract Documents to determine exactly the extent of work to be provided under each Section, and in installing new equipment and systems and coordinating the work with the other Trades and existing conditions.]

1.20 COORDINATION OF WORK:

A. General: The Contract Documents indicate the extent and general arrangement of the fire suppression systems. The Contractor shall be responsible for the coordination and proper relation of the fire suppression work to the building structure and to the work of other trades. No additional compensation or extension of completion time will be granted for extra work caused by the lack of coordination.

B. Cooperation: The Contractor shall provide dimensions and locations of all openings, shafts and similar items to the proper trades and install work as required so as not to interfere with, or delay, the building construction.

C. Locations of lines and equipment shall be determined from actual field measurements. The outlines of the building shown on the Drawings are intended only as a guide to indicate relative locations of the work. Refer to Architectural and Structural Drawings for building construction details. The Contractor shall determine the exact routing and location of his systems prior to fabrication or installation of any system component. Accurate measurements and coordination shall be completed to verify dimensions and characteristics for the installation of each system.

D. Unless necessitated by equipment access or otherwise indicated in the Contract Documents, all equipment, piping, and conduit concealed above ceilings and in finished or utility spaces shall be routed as high as possible.

E. Offsets, transitions and changes of direction in all systems shall be made as required to maintain proper headroom and pitch of sloping lines whether or not indicated on the drawings. The Fire Suppression System Subcontractor shall provide manual drains as required for his work to affect these offsets, transitions and changes in direction, as applicable.

F. Comply with Division 01 requirements for cutting and patching.

[Cutting and Patching: Unless stated otherwise, the Fire Suppression Trade shall do all cutting necessary for the installation of his work. All work should be installed sufficiently in advance of new construction in order to permit installation of supports, sleeves, and similar items without cutting. Patching and repair work shall exactly match new and existing adjacent work in all respects and shall not be obvious the Architect-Engineer. The Fire Suppression Trade is responsible for patching where he does cutting. Patching shall be done to the satisfaction of the Architect-Engineer.]

G. Roughing-In: Verify the locations of machines, door swings, block coursing, alignment of tile end and other similar features before roughing-in.

H. Fire Suppression System piping shall be concealed except in rooms or spaces without ceilings, and the equipment rooms and as indicated otherwise. Sprinkler heads in ceilings shall be located as shown on the drawings. The Fire Suppression System Subcontractor shall give due consideration to minimize conflicts, and coordinate, with other trades as to location of equipment, piping, conduits, ductwork, grilles, diffusers, electrical switchgear, panelboards, light fixtures, etc. Full access and clearance requirements around equipment of all other trades shall be maintained.

I. Unless otherwise indicated, fire suppression piping in spaces with no ceilings shall be run tight to decking and corners. Where possible, piping shall be concealed behind walls, chases, soffits, and above ceilings. Piping exposed in areas with sloped roof decking shall follow the slope of the decking.

J. Damage to Other Work: Each Contractor is responsible for damage to other work caused by his work or workmen. Repairing of damaged work shall be done by the Subcontractor who

installed the work, and as directed by the Architect-Engineer; the cost of which shall be paid for by the Subcontractor responsible for the damage.

1.21 EQUIPMENT INSTALLATION:

A. General: Equipment shall be installed in accordance with manufacturer's instructions to conform to the details and application indicated.

B Supports: Provide necessary supports for all equipment and appurtenances as required; this includes but is not limited to frames or supports for items such as tanks, air compressors, pumps, valves and other similar items requiring supports. Floor mounted equipment in Equipment Rooms shall be set on 4-inch high concrete foundation pads unless shown otherwise. All pads shall be poured such that the top of the pad is level. Foundation drawings, bolt setting information and foundation bolts shall be furnished by the equipment suppliers furnishing the equipment for all equipment required to have concrete foundations. Concrete for foundations shall be provided by the Fire Suppression System Subcontractor unless indicated otherwise. Except where indicated, all equipment shall be anchored to concrete pads.

C. Service Area: All equipment and appurtenances shall be located to permit adequate service clearance in accordance with manufacturer's recommendations and as otherwise required. Service clearance shall include but not be limited to adequate space for inspection, servicing, testing and removal of Fire Protection System including motors, controls and equipment. All piping and other equipment shall be located outside of the service area or shall be flanged for easy removal to facilitate equipment service. All equipment shall be located with sufficient distance from building features, structural components, and the equipment of other trades. Service clearance in front of electrical panels shall be the minimum as required by National Electric Code (NEC) where applicable.

D. Temporary Requirements: Openings in equipment shall be kept plugged at all times until connection is made to the system. The ends of all pipes and equipment openings shall be kept plugged or capped properly with approved devices. Approved devices are items such as specially molded plastic caps, pipe plugs, test plugs and sheet metal caps.

1.22 SLEEVES AND INSERTS:

A. General: Sleeves and inserts shall be provided and correctly located in the structure, as require for the work.

B. Inserts shall be steel and proper size for loads encountered.

C. Sleeves shall be provided for all pipes passing through concrete or masonry walls, partitions, concrete slabs installed during construction of the wall, partition or slab. Sleeves through existing concrete walls and slabs may be omitted if wall or slab can be core drilled and properly sealed in a manner acceptable to the Engineer. Sleeves placed horizontally in walls placed vertically in non-waterproof floors shall be 20 gauge galvanized sheet steel of length equal to thickness of slab, flared and nailed to the form, or fastened to reinforcing fabric and filled with sand during pouring to prevent deformation. Sleeves occurring in floors of rooms where hose bibs or floor drains occur, and in pipe spaces, shall be standard weight steel pipe projecting 2" above the finished floor except in Equipment Rooms they shall project four (4) inches above floor. Sleeves in floors with waterproof membrane shall be provided with flanges or flashing rings and shall be clamped or flashed into membrane. All sleeves and core drilled openings shall be of sufficient diameter to clear bare or covered pipes by 1/4" all around except sleeves on lines subject to movement by expansion which shall clear the bare pipe or insulation on insulated pipe at least one inch all around. Pipes through exterior walls below grade and above footings shall be installed in sleeves having a minimum size of two larger pipe diameters and sealed watertight with flexible synthetic rubber seals. Sleeve shall have anchor and water stop plate. The entire assembly shall be tightened and adjusted and made watertight. Sleeves for pipes and conduit, penetrating fire (and smoke) rated partitions, walls and floors shall be sealed in accordance with the terms of U.L. Listed Through-Penetration Firestop Systems XHEZ as published in the U.L. Fire Resistance Directory.

Penetrations shall exactly conform to details of the Firestop System indicated for the type of partition, wall and floor construction encountered. All penetrations through nonfireresistance rated floor assemblies and through the ceiling membrane of nonfireresistance rated roof assemblies shall be fireblocked with tightly packed mineral-wool insulation secured in place. All penetrations through equipment room walls and other areas of noise or heat generation shall be tightly sealed with mineral fiber rope. All penetrations through draftstop partitions shall be sealed to maintain the integrity of the partition. All firestopping and draftstopping of sleeves for fire suppression work shall be provided under Division 21.

1.23 ESCUTCHEONS:

A. Where pipes pass through floors, walls or ceilings in finished rooms, they shall be fitted with chromium plated escutcheons of suitable pattern to effectively cover the rough opening. Where sleeves project above floors, special deep type escutcheons shall be provided.

1.24 ACCESS DOORS:

A. Provide for all concealed valves or any item requiring access. Doors shall be of sufficient size and so located that the concealed items may be serviced or completely removed and replaced. Doors required for fire suppression work shall be furnished as a part of this Division 21 to the General Contractor for installation. The Fire Suppression Subontractor shall provide locations of all access doors such that service may be safely performed from a ladder, lift, or platform without the need for support from the ceiling system. Doors in acoustic tile ceilings shall be furnished in multiples of tile sizes. Doors are not required in exposed grid type ceilings where tiles are removable. Doors shall be metal access doors with cam lock, style to match ceiling or wall construction. Doors occurring in rated construction shall be fire rated U.L. labeled access doors correlated to preserve the integrity of the rated construction. Doors shall be prime finish steel except those in toilets, shower rooms, locker rooms, kitchens and other similar areas shall be stainless steel with brushed finish.

1.25 ELECTRICAL WIRING AND EQUIPMENT:

A

D. Wiring, low voltage (100 volts or less) control wiring shall be provided as a part of Section 28 31 00 “Fire Detection and Alarm”. Verify that wiring of all motors and controls required by equipment furnished is accomplished for the correct sequence of operation.

E. Comply with Division 26 requirements for wiring, line voltage (101 volts or higher) power or control wiring. Items shall be provided under Division 26.

F. Disconnects shall be provided for each item of equipment under Division 26, unless specified otherwise in other sections.

G. Miscellaneous manual or automatic control and protective or signal devices required for the sequence of operation indicated for fire suppression equipment shall be provided under the section of the specifications where the item of equipment is specified unless indicated otherwise.

1.26 PROTECTION FROM MOVING PARTS:

A. Belts, pulleys, chains, gears, shafts, couplings and other rotating or moving parts located so that any person may come in close proximity thereto shall be fully enclosed or properly guarded.

1.27 MARKING AND DESIGNATION OF EQUIPMENT:

A. After all other painting is completed, operating and control parts of the equipment and systems such as valves disconnect switches, motor starters and control devices shall be properly marked. Valve markers shall be metal tags with designations stamped thereon, securely chained to the respective valve. Starters disconnect switches and pneumatic or electric control instruments shall be marked with laminated engraved plastic nameplates fastened with sheet metal screws, bolts or permanent adhesive. Pressure sensitive tape is not acceptable. Identification symbols or designations shall be the same as shown on the Contract Documents.

1.28 RECORD OF UNDERGROUND LINES:

A. On completion of the project, the Contractor shall prepare and submit to the Engineer a drawing on tracing paper and one blue line print to show the location of any underground lines installed in locations different from those on the Architect-Engineer's Drawings.

1.29 CHARTS AND DIAGRAMS:

A.. General: Material as listed below shall be provided by the Contractor and shall be mounted in separate hardwood frames where directed in the field or folded and stored in a plastic document folder and located in the control cabinets. All charts, diagrams and schemes shall be photographic positives prepared from original tracings. A copy of charts and diagrams shall be included with O/M manuals.

B. Charts for identification of valves.

1.30 INSTRUCTION OF OWNER'S REPRESENTATIVE:

A. Contractors shall instruct the representative of the Owner in the proper operation and maintenance of all elements of the Fire Suppression systems. Competent representatives of the Contractor shall spend such time as necessary to fully prepare the Owner to operate and maintain the Mechanical and Electrical systems.

1.31 CONSTRUCTION STATUS REPORT:

A. Each item of discrepancies noted on Construction Status Report prepared by the Engineer shall be answered in detail in writing by the Contractor before payment can be recommended.

1.32 GRAPHICS DATABASE:

A. This project's Computer Aided Design & Drafting (CADD) drawing files may be obtained from the Engineer for use in preparing computer graphics specific to this project. Refer to Division 1. [**Refer to Appendix A at the end of this Section for letter of Indemnification and ordering instructions].**

1.33 DEMOLITION

A. Contractor shall visit site before bidding to determine extent of demolition.

B. Removal of Sprinklers, Piping and Equipment: Remove all sprinkler and piping connections, plugging outlets, etc., such that are not required for present equipment and fixtures, or are not reused or needed for reconnecting new equipment and fixtures. Remove all equipment, fixtures, etc., indicated to be removed, or not reused or needed after the renovations are complete.

C. Where piping, conduit or other similar items passing through rated assemblies are removed; the assemblies shall be patched in accordance with UL so as to maintain the integrity of the assembly.

D. The Owner will select and retain such existing equipment and materials which are indicated to be removed and not reused, as he desires. All other existing equipment and materials indicated to be removed and not reused shall become the property of the Contractor, who shall promptly remove them from the premises. All existing equipment and fixtures indicated to be relocated

shall be disconnected, removed, relocated and reconnected. All equipment and fixtures shall be protected from damage during demolition.

E. Miscellaneous: In all altered portions of the buildings, the Contractor shall remove or alter as necessary all existing fire suppression work that is not coordinated to operate with the new construction. Demolition shall not begin until the work schedule is approved by the owner. The work shall be scheduled to prevent any disruption to the normal operations of the building.

F. General Scope of Demolition:)

1.36 TEMPORARY FIRE PROTECTION:

A. Provide all piping and accessories including temporary piping equipment to provide and maintain system operation during construction as required by the building code.

1.37 LIMITS OF CONTRACT:

A. Fire Main piping shall be extended under this section of the specifications to a point 5'-0" beyond the building line, unless otherwise indicated on the drawings, where the pipes shall be capped or plugged with location identified and left ready for connection and extension included under Division 33 Utilities.

1.38 TESTING OF WORK:

A. Partial Testing: As much as practical, systems shall be tested as complete systems. Tests on portions of a system will be permitted to facilitate proper progress scheduling. When systems are tested in segments, a system diagram indicating portion tested and a separate and complete report including the date of test is required for each segment.

B. Concealed Work:

1. All concealed work shall be tested and approved by the Architect/Engineer prior to the application of insulation or construction of chase walls.
2. Covering shall not be applied to any piping nor shall any piping be concealed or covered until pipes have been tested, all leaks stopped, retested and approved

C. Fire Suppression System Testing:

1. Perform and pay for all tests as may be required in the applicable NFPA Standards and as specified herein and as may be required by Authorities having jurisdiction. Any defects shall be corrected to the satisfaction of the Authorities having jurisdiction and the Architect-Engineer.
2. The entire Fire Protection System shall be tested according to NFPA-13 Chapter 24 “Systems Acceptance”
3. After the Contractor has satisfied himself that the Fire Suppression System is complete and properly serviceable in all respects, he shall arrange with the Authorities having jurisdiction and the Architect-Engineer for a final test and inspection as applicable.
4. The final tests and inspections shall be made by a representative of the Authorities having jurisdiction, who must be satisfied with the entire installation before final acceptance by the Architect-Engineer.
5. For the **[Sprinkler] [Fire Suppression]** System, the Contractor shall furnish the Architect-Engineer with two copies of complete NFPA 13- **[and] [NFPA-14]** Form “Contractor’s Material and Test Certificate or Aboveground Piping”.

D. Backflow Preventers:

1. Inspect and test after initial installation using testing procedures in accordance with the manufacturers printed instructions. Test shall be performed by a Backflow Prevention Mechanic certified by a Texas Department of Health approved school.
2. Test results shall be recorded on forms approved or provided by_____ .

1.39 COMMISSIONING OF FIRE SUPPRESSION SYSTEMS:

A. Comply with Section 01 91 13, General Commissioning Requirements, for systems to be commissioned and responsibilities for commissioning.

B. All prefunctional testing and startups for each component of a system shall be successfully completed by the Subcontractor responsible for the purchase of the equipment or system and shall be conducted prior to formal functional performance testing (FPT) of equipment or subsystems of the given system.

C. The Contactor and each Subcontractor shall provide skilled tradesmen/technicians, with specific knowledge of the equipment and systems installed on this project, to provide and support the functional performance testing of individual systems as outlined in Section 01 91 13.

PART 2 - PRODUCTS

2.1 PAINTING:

A. Acceptable manufacturers: Except as otherwise specified, materials shall be the products of the following manufacturers:

Sherwin-Williams

Pratt and Lambert

Pittsburgh Paints (PPG)

Benjamin Moore

Porter Paints

Seton Identification Products

B. Materials:

1. Deliver all paints and materials to the project site in their unopened original containers with all labels intact and legible at the time of use.
2. For adhesives and sealants applied within the building waterproofing envelope, comply with low emitting requirements in Division 01section”Indoor Air Quality Requirements.”
3. All coatings exposed to supply and return airstreams and where applied to exposed surfaces in a return air plenum, shall have a composite flame spread rating not exceeding 25, and a smoke developed rating not exceeding 50 as tested under procedure ASTM E-84-75, NFPA 255 and UL 723. Coatings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411, latest edition.
4. Sherwin-Williams Industrial Maintenance Coatings System 4000 products are listed below to establish color and a standard of quality.
   a. All Hangers and Supports: One coat Pro–Industrial Zero VOC Acrylic Gloss Black.
   b. Piping: Exposed in equipment rooms and where connections are made to equipment located in storage rooms and other utility type areas.
      (1) Priming:
         a) Bare Iron or Steel or Copper: One coat Pro-Cryl Primer (1000g/L).
         b) Galvanized Steel: Pipes shall be chemically prepared and primed with one coat of Pro-Cryl B66-310 Primer.
      (2) Finish: All pipe lines and the supports or hangers therefore, shall be finished with Pro–Industrial Zero VOC Acrylic Gloss, gray No. SW4028 Gypsum applied in sufficient number of coats to effectively cover the prime coat. Painting of pipe hangers is specified hereinbefore.
      (3) Materials shall be as recommended by the manufacturer for the surface to be finished.
      (4) Unless otherwise specified, primer shall be by the same manufacturer as the finish coat.

(5) Materials shall not be thinned or cut except as recommended by the coating manufacturer. Thinners shall be by the same manufacturer as the primer and finish coat.
(6) Sprinkler heads and all associated fire protection sensors and controllers shall not be painted.
(7) Fire Suppression System piping shall not be painted until fire suppression system testing is complete and accepted by the authorities having jurisdiction

PART 3 - EXECUTION:

3.01 PAINTING:

A. Workmanship: The work shall be accomplished by qualified mechanics skilled in the painting trade. Painting of equipment, piping and other materials shall not commence until all testing is complete and systems are ready for operation. Materials shall be applied according to manufacturer's directions. All containers shall be securely closed when not in use. Flammable materials shall not be stored on premises. Flammable waste shall be disposed of daily in devices approved for such purposes. Materials shall be evenly spread, and smoothly flowed on without runs or sags. Each coat shall be thoroughly dry before application of succeeding coats.

B. Protection of Work: The painters shall protect all adjacent surfaces with drop covers during the process of painting. Upon completion, paint spots, if any, shall be removed from all surfaces. Sprinkler heads shall not be painted.

C. Preparation of Surface: Surfaces to be painted shall be completely dry before applying paint. Metal surfaces shall be cleaned with mineral spirits before applying materials. Rust and scale shall be removed by wire brushing or sanding. Galvanized surfaces shall be chemically pretreated with crystalline (zinc phosphate) phosphate in strict accordance with the manufacturer's recommendations. Surfaces shall not be painted when the temperature is, or is likely to be, near the freezing point, or when they are exposed to hot sun.

3.02 IDENTIFICATION OF PIPES AND EQUIPMENT:

A. Equipment: After all other painting is completed; each major item of equipment shall be properly identified with laminated engraved plastic nameplates fastened with sheet metal screws, bolts or permanent adhesive. Identification symbols and designations shall be the same as shown on the Contract Documents. Where equipment or valves are installed above lay-in ceilings the plastic nameplate shall be adhered to the face of the T-bar support so that it can be identified from within the space.

B. Piping: All piping shall be identified with Seton Ultra-Mark or equal wrap around piping system markers and arrow flow directional marker. Markers shall be pre-coiled, semi-rigid plastic or polyester with sealed color graphics. Markers shall be minimum 12 inches long with 1-¼ inch high letters, formed to cover entire circumference of the pipe. Markers shall be attached to piping using plastic tie wraps. Pipe identification shall use the same designations or abbreviations used on the drawings. Marker colors shall be in accordance with ANSI.

C. Apply piping system markers after completion of required finishes on piping systems. Markers shall be applied in the following locations and where identified by the Engineer:
1. At each valve and at connection to equipment.
2. At every tee and branch connection.
3. At each riser including branch risers from mains.
4. At each side of a pipe passage through floors, walls and partitions.
5. Every 15 feet on straight runs of piping mains and branches.
6. Within 6 feet of elbows (each side).
7. At access doors or similar points that permit view of concealed piping.
8. Markers shall be provided on all piping above lay-in ceilings.
9. Provide arrow markers showing direction of flow incorporated into, or adjacent to, each piping system marker.

10. Apply all piping system markers where view is unobstructed, and legends can be read and easily identified.
11. Apply all tags and piping system markers in accordance with the supplier's instructions.

END OF SECTION

APPENDIX A
LETTER OF INDEMNIFICATION

Project Name:

Project Location:

At the Contractors request, Stratus will provide electronic files of the Revit Models for their convenience and use, subject to the following terms and conditions:

Stratus electronic files are compatible with Autodesk Revit Product version for which they were designed. Autocad files will be provided in the Autocad 2018 DWG format. Stratus makes no representation as to the compatibility of these files with your hardware or your software.

Data contained on these electronic files is part of Stratus's instruments of service and shall not be used by you or anyone else receiving this data through or from you for any purpose other than as a convenience in the preparation of project layout for the referenced project. Any other use or reuse by you or by others will be at your sole risk and without liability or legal exposure to Stratus. You agree to make no claim and hereby waive, to the fullest extent permitted by law, any claim or cause of action of any nature against Stratus, its officers, directors, employees, agents, or subconsultants which may arise out of or in connection with your use of the electronic files.

Furthermore, you shall, to the fullest extent permitted by law, indemnify and hold harmless Stratus from all claims, damages, losses, and expenses, including attorney's fees arising out of or resulting from your use of these electronic files.

These electronic files are not Contract Documents. Significant differences may exist between these electronic files and corresponding hard copy Contract Documents due to Addenda, Change Orders, or other revisions. Stratus makes no representation regarding the accuracy or completeness of the electronic files you receive. In the event that a conflict arises between the signed documents prepared by Stratus and the electronic files, the signed Contract Documents shall govern. You are responsible for determining if any conflict exists. By your use of these electronic files, you are not relieved of your duty to fully comply with the Contract Documents, including and without limitation, the need to check, confirm, and coordinate all dimensions and details, take field measurements, verify field conditions and coordinate your work with that of other contractors for the project.

The use of the Revit Model files prepared by the Engineer shall not in any way negate the Contractor's responsibility for coordination with other trades or for the proper checking and coordination of dimensions, details, member sizes and gage, and quantities of materials as required to facilitate complete and accurate fabrication and erection.

All information added to the drawings by the Contractor shall be in a distinctively heavier pen weight and different font, such that all Contractor information can be clearly distinguished from the original files.

Any information added by the Contractor, which represents a proposed change to the original design, shall be clearly identified by flagging or other distinctive presentation. Because of the potential that the information presented on the electronic files can be modified, unintentionally or otherwise, Stratus reserves the right to remove all indicia of its ownership and/or involvement for each electronic display.

Under no circumstances shall delivery of the electronic files for use by you deemed a sale by Stratus, and Stratus makes no warranties, either expressed or implied, of merchantability and fitness for any particular purpose. In no event shall Stratus be liable for any loss of profit or any consequential damages.

The Engineer believes that no licensing or copyright fees are due to others on account of the transfer of the Revit Model files, but to the extent any are, the Contractor will pay the appropriate fees and hold the Engineer harmless from such claims as may arise.

Any purchase order number provided by the Contractor is for the Contractor's accounting purposes only. The Contractor's purchase order terms and conditions are void and are not a part of this agreement.

The Recipient further agrees that the drawing files will only be used in graphics preparation for the above-referenced project.

SECTION 21 1313

WET-PIPE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Pipes, fittings, and specialties.
   2. Sprinklers.

1.03 DEFINITIONS

A. Standard-Pressure Sprinkler Piping: Wet-pipe sprinkler system piping designed to operate at working pressure of 175 psig maximum.

1.04 SYSTEM DESCRIPTIONS

A. Wet-Pipe Sprinkler System: Automatic sprinklers are attached to piping containing water and that is connected to water supply through alarm valve. Water discharges immediately from sprinklers when they are opened. Sprinklers open when heat melts fusible link or destroys frangible device. Hose connections are included if indicated.

1.05 PERFORMANCE REQUIREMENTS

A. Standard-Pressure Piping System Component: Listed for 175-psig minimum working pressure.

B. Delegated Design: Design sprinkler system(s), including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
   1. Fire Flow Tests: Comply with requirements for Fire Flow Tests specified in Section 21 04 00 “General Requirements for Fire Suppression
   2. The Authorities having jurisdiction shall include the Seagoville Fire Marshal’s Office and other local Administrative Representatives.
   3. Margin of Safety for Available Water Flow and Pressure: 5 psig, including losses through water-service piping, valves, and backflow preventers.
   4. Sprinkler Occupancy Hazard Classifications:
      a. Electrical Equipment Rooms: Ordinary Hazard, Group 1.
      b. General Storage Areas: Ordinary Hazard, Group 1.
      c. Office, Classrooms and Public Areas: Light Hazard.
   5. Minimum Density for Automatic-Sprinkler Piping Design:
      a. Light-Hazard Occupancy: 0.10 gpm over 1500-sq. ft.
      b. Ordinary-Hazard, Group 1 Occupancy: 0.15 gpm over 1500-sq. ft.
   6. Maximum Protection Area per Sprinkler:
      a. Office Spaces and Classrooms: 225 sq. ft.
      b. Storage Areas: 130 sq. ft.
      c. Mechanical Equipment Rooms: 130 sq. ft.
      d. Electrical Equipment Rooms: 130 sq. ft.
      e. Other Areas: According to NFPA 13 recommendations unless otherwise indicated.
   7. Total Combined Hose-Stream Demand Requirement: According to NFPA 13 unless otherwise indicated:
      a. Light-Hazard Occupancies: 100 gpm for 30 minutes
      b. Ordinary-Hazard Occupancies: 250 gpm for 60 to 90 minutes

1.06 SUBMITTALS

A. Submittal data is required for items in this Section and as specified in Division 01 and Section 210400 “General Requirements for Fire Suppression**s**

B. Product Data: For each type of product indicated [S]**.** Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories. Comply with requirements in Division 01 and Section 210400 “General Requirements for Fire Suppression”.

C. Shop Drawings: For wet-pipe sprinkler systems. Include plans, elevations, sections, details, and attachments to other work.

D. Hydraulic Calculations: Include Hydraulic Calculations for each remote area.

E. Delegated-Design Submittal: For sprinkler systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified design professional responsible for their preparation.

F. Coordination Drawings: Sprinkler systems, drawn to scale, on which the following items are and coordinated with each other, using input from installers of the items involved:

1. Plumbing piping.
2. HVAC Equipment, Ductwork and hydronic piping.
3. Items penetrating finished ceiling include the following:
    a. Lighting fixtures.
    b. Ceiling diffusers and grilles.
    c. Exit Signs.
    d. Heat and Smoke Detectors, Speakers, Projectors, Motion Sensors
4. Electric Switchgear, panelboards

G. Qualification Data: For qualified Installer.

H. Approved Sprinkler Piping Drawings: Working plans, prepared according to The International Fire Code (IFC) and NFPA 13, that have been approved by authorities having jurisdiction, including hydraulic calculations if applicable.

I. Fire-hydrant flow test report.

J. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 13. Include "Contractor's Material and Test Certificate for Aboveground Piping." Comply with requirements in Section 210400 ‘General Requirements for Fire Suppression”.

K. Field quality-control reports.

L. Operation and Maintenance Data: For sprinkler specialties indicated [O/M], to include in emergency, operation, and maintenance manuals. Comply with requirements in Division 01 and Section 210400 “General Requirements for Fire Suppression”.

1.07 APPROVAL DRAWINGS AND CALCULATIONS

A. Before any piping or equipment is installed, this Contractor shall submit appropriate drawings, calculations and equipment specifications to the Authorities having jurisdiction and obtain their approval. A copy of the Authorities’ letter of approval shall be furnished, along with submittals, to the Architect-Engineer and the Owner. All work shall be subject to installation, testing and inspection requirements of the Authorities having jurisdiction.

1.08 QUALITY ASSURANCE

A. Installer Qualifications:

1. Installer's responsibilities include designing, fabricating, and installing sprinkler systems and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.

a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified professional engineer.

B. Standards: Sprinkler system equipment, specialties, accessories, installation, and testing shall comply with the following:
   1. NFPA 13, "Installation of Sprinkler Systems."
   2. The International Fire Code (IFC)

1.09 PROJECT CONDITIONS

A. Interruption of Existing Sprinkler Service: Do not interrupt sprinkler service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary sprinkler service according to requirements indicated:
   1. Notify Architect and Owner no fewer than two days in advance of proposed interruption of sprinkler service.
   2. Do not proceed with interruption of sprinkler service without Architect's and Owner's written permission.

1.10 COORDINATION

A. Coordinate layout and installation of fire suppression system with other construction. Comply with requirements in Section 21 04 00 "General Requirements for Fire Suppression".

1.11 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Sprinkler Cabinets [s]: Finished, wall-mounted, steel cabinet with hinged cover, and with space for minimum of six spare sprinklers plus sprinkler wrench. Include number of sprinklers required by NFPA 13 and sprinkler wrench. Include separate cabinet with sprinklers and wrench for each type of sprinkler used on Project.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes. **All pipe and fittings shall have a minimum corrosion resistance ratio (CRR) of 1.0. Submit printed data from pipe manufacturer certifying materials meet this requirement.**

2.02 STEEL PIPE AND FITTINGS [S]

A. Schedule 40, Black-Steel Pipe: ASTM A 135 or ASTM A 795. Pipe ends may be factory or field formed to match joining method.
   1. Pipe larger than 2-1/2 inch to be welded or rolled groove.
   2. Pipe smaller than 2-1/2 inch to have malleable iron threaded or rolled groove fittings.

B. Black-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53, standard-weight, seamless steel pipe with threaded ends.

C. Uncoated, Steel Couplings: ASTM A 865, threaded.

D. Uncoated, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.

E. Malleable- or Ductile-Iron Unions: UL 860.

F. Cast-Iron Flanges: ASME 16.1, Class 125.

G. Steel Flanges and Flanged Fittings: ASME B16.5, Class 150.

H. Steel Welding Fittings: ASTM A 234 and ASME B16.9.

I. Grooved-Joint, Steel-Pipe Appurtenances:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Anvil International, Inc.
      b. Corcoran Piping System Co.
      c. National Fittings, Inc.
      d. Shurjoint Piping Products.
      e. Tyco Fire & Building Products LP.
      f. Victaulic Company.
   2. Pressure Rating: 175 psig minimum.
   3. Uncoated, Grooved-End Fittings for Steel Piping: ASTM A 47, malleable-iron casting or ASTM A 536, ductile-iron casting; with dimensions matching steel pipe.
   4. Grooved-End-Pipe Couplings for Steel Piping: AWWA C606 and UL 213, rigid pattern, unless otherwise indicated, for steel-pipe dimensions. Include ferrous housing sections, EPDM-rubber gasket, and bolts and nuts. Fittings in paragraph below are available in NPS 3/4 to NPS 2 (DN 20 to DN 50).

2.03 PIPING JOINING MATERIALS

A. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch thick.
   1. Class 125, Cast-Iron Flanges and Class 150, Bronze Flat-Face Flanges: Full-face gaskets.
   2. Class 250, Cast-Iron Flanges and Class 300, Steel Raised-Face Flanges: Ring-type gaskets.

B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.

C. Welding Filler Metals: Comply with AWS D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.04 LISTED FIRE-PROTECTION VALVES [S]

A. General Requirements:
   1. Valves shall be UL listed or FM approved.
   2. Minimum Pressure Rating for Standard-Pressure Piping: 175 psig

B. Ball Valves:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Anvil International, Inc.
      b. Victaulic Company.
   2. Standard: UL 1091 except with ball instead of disc.
   3. Valves NPS 1-1/2 and Smaller: Bronze body with threaded ends.
   4. Valves NPS 2 and NPS 2-1/2: Bronze body with threaded ends or ductile-iron body with grooved ends.
   5. Valves NPS 3: Ductile-iron body with grooved ends.

C. Bronze Butterfly Valves:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Fivalco Inc.
      b. Global Safety Products, Inc.
      c. Milwaukee Valve Company.
   2. Standard: UL 1091.
   3. Pressure Rating: 175 psig.
   4. Body Material: Bronze.
   5. End Connections: Threaded.

D. Iron Butterfly Valves:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    a. Anvil International, Inc.
    b. Fivalco Inc.
    c. Global Safety Products, Inc.
    d. Kennedy Valve; a division of McWane, Inc.
    e. Milwaukee Valve Company.
    f. NIBCO INC.
    g. Pratt, Henry Company.
    h. Shurjoint Piping Products.
    i. Tyco Fire & Building Products LP.
    j. Victaulic Company.
2. Standard: UL 1091.
3. Pressure Rating: 175 psig
4. Body Material: Cast or ductile iron.
5. Style: Lug or wafer.
6. End Connections: Grooved.

E. Check Valves:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    a. Anvil International, Inc.
    b. Fivalco Inc.
    c. Globe Fire Sprinkler Corporation.
    d. Kennedy Valve; a division of McWane, Inc.
    e. Milwaukee Valve Company.
    f. Mueller Co.; Water Products Division.
    g. NIBCO INC.
    h. Potter Roemer.
    i. Reliable Automatic Sprinkler Co., Inc.
    j. Tyco Fire & Building Products LP.
    k. United Brass Works, Inc.
    l. Victaulic Company.
    m. Viking Corporation.
2. Standard: UL 312.
3. Pressure Rating: 250 psig minimum
4. Type: Swing check.
5. Body Material: Cast iron.
6. End Connections: Flanged or grooved.

F. Bronze OS&Y Gate Valves:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    a. Crane Co.; Crane Valve Group; Crane Valves.
    b. Crane Co.; Crane Valve Group; Stockham Division.
    c. Milwaukee Valve Company.
    d. NIBCO INC.
    e. United Brass Works, Inc.
2. Standard: UL 262.
3. Pressure Rating: 175 psig.
4. Body Material: Bronze.
5. End Connections: Threaded.

G. Iron OS&Y Gate Valves:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    a. American Cast Iron Pipe Company; Waterous Company Subsidiary.

b. American Valve, Inc.
c. Clow Valve Company; a division of McWane, Inc.
d. Crane Co.; Crane Valve Group; Crane Valves.
e. Crane Co.; Crane Valve Group; Jenkins Valves.
f. Crane Co.; Crane Valve Group; Stockham Division.
g. Hammond Valve.
h. Milwaukee Valve Company.
i. Mueller Co.; Water Products Division.
j. NIBCO INC.
k. Shurjoint Piping Products.
l. Tyco Fire & Building Products LP.
m. United Brass Works, Inc.
n. Watts Water Technologies, Inc.

2. Standard: UL 262.
3. Pressure Rating: 250 psig minimum
4. Body Material: Cast or ductile iron.
5. End Connections: Flanged or grooved.

H. NRS Gate Valves:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
   b. American Valve, Inc.
   c. Clow Valve Company; a division of McWane, Inc.
   d. Crane Co.; Crane Valve Group; Stockham Division.
   e. Kennedy Valve; a division of McWane, Inc.
   f. Mueller Co.; Water Products Division.
   g. NIBCO INC.
   h. Tyco Fire & Building Products LP.
2. Standard: UL 262.
3. Pressure Rating: 250 psig minimum
4. Body Material: Cast iron with indicator post flange.
5. Stem: Nonrising.
6. End Connections: Flanged or grooved.

2.05 TRIM AND DRAIN VALVES

A. General Requirements:

1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating: 175 psig minimum.

B. Angle Valves:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Fire Protection Products, Inc.
   b. United Brass Works, Inc.

C. Ball Valves:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Affiliated Distributors.
   b. Anvil International, Inc.
   c. Barnett.
   d. Conbraco Industries, Inc.; Apollo Valves.
   e. Fire-End & Croker Corporation.
   f. Fire Protection Products, Inc.
   g. Flowserve.

h. FNW.
i. Jomar International, Ltd.
j. Kennedy Valve; a division of McWane, Inc.
k. Kitz Corporation.
l. Legend Valve.
m. Metso Automation USA Inc.
n. Milwaukee Valve Company.
o. NIBCO INC.
p. Potter Roemer.
q. Red-White Valve Corporation.
r. Southern Manufacturing Group.
s. Stewart, M. A. and Sons Ltd.
t. Tyco Fire & Building Products LP.
u. Victaulic Company.
v. Watts Water Technologies, Inc.

D. Globe Valves:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Fire Protection Products, Inc.
b. United Brass Works, Inc.

2.06 SPRINKLER SPECIALTY PIPE FITTINGS

A. Branch Outlet Fittings:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Anvil International, Inc.
b. National Fittings, Inc.
c. Shurjoint Piping Products.
d. Tyco Fire & Building Products LP.
e. Victaulic Company.
2. Standard: UL 213.
3. Pressure Rating: 300 psig.
4. Body Material: Ductile-iron housing with EPDM seals and bolts and nuts.
5. Type: Mechanical-T and -cross fittings.
6. Configurations: Snap-on and strapless, ductile-iron housing with branch outlets.
7. Size: Of dimension to fit onto sprinkler main and with outlet connections as required to match connected branch piping.
8. Branch Outlets: Grooved, plain-end pipe, or threaded.

B. Flow Detection and Test Assemblies:[S]
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. AGF Manufacturing Inc.
b. Reliable Automatic Sprinkler Co., Inc.
c. Tyco Fire & Building Products LP.
d. Victaulic Company.
2. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
3. Pressure Rating: 300 psig.
4. Body Material: Cast- or ductile-iron housing with orifice, sight glass, and integral test valve.
5. Size: Same as connected piping.
6. Inlet and Outlet: Threaded.

C. Branch Line Testers:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following.

a. Elkhart Brass Mfg. Company, Inc.
b. Fire-End & Croker Corporation.
c. Potter Roemer.

2. Standard: UL 199.
3. Pressure Rating: 175 psig.
4. Body Material: Brass.
5. Size: Same as connected piping.
6. Inlet: Threaded.
7. Drain Outlet: Threaded and capped.
8. Branch Outlet: Threaded, for sprinkler.

D. Sprinkler Inspector's Test Fittings:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. AGF Manufacturing Inc.
   b. Triple R Specialty.
   c. Tyco Fire & Building Products LP.
   d. Victaulic Company.
   e. Viking Corporation.
2. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
3. Pressure Rating: 300 psig.
4. Body Material: Cast- or ductile-iron housing with sight glass.
5. Size: Same as connected piping.
6. Inlet and Outlet: Threaded.

E. Adjustable Drop Nipples:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. CECA, LLC.
   b. Corcoran Piping System Co.
   c. Merit Manufacturing; a division of Anvil International, Inc.
2. Standard: UL 1474.
3. Pressure Rating: 300 psig
4. Body Material: Steel pipe with EPDM-rubber O-ring seals.
5. Size: Same as connected piping.
6. Length: Adjustable.
7. Inlet and Outlet: Threaded.

F. Flexible, Sprinkler Hose Fittings:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Fivalco Inc.
   b. FlexHead Industries, Inc.
   c. Gateway Tubing, Inc.
   d. Victaulic Company
2. Standard: UL 1474.
3. Type: Braided Flexible hose for connection to sprinkler, and with bracket for connection to ceiling grid.
4. Pressure Rating: 175 psig minimum
5. Size: Same as connected piping, for sprinkler.

2.07 SPRINKLERS [S]

A. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. AFAC Inc.
2. Globe Fire Sprinkler Corporation.

3. Reliable Automatic Sprinkler Co., Inc.
4. Tyco Fire & Building Products LP.
5. Venus Fire Protection Ltd.
6. Victaulic Company.
7. Viking Corporation.

B. General Requirements:

1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating for Automatic Sprinklers: 175 psig minimum.

C. Sprinkler Finishes:

1. Chrome plated.

D. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers.

1. Ceiling Mounting: Chrome-plated steel, two piece, with 1-inch vertical adjustment.
2. Sidewall Mounting: Chrome-plated steel, one piece, flat.

PART 3 - EXECUTION

3.01 PREPARATION

A. Perform fire-hydrant flow test according to NFPA 13 and NFPA 291. Use results for system design calculations required in "Quality Assurance" Article.

B. Report test results promptly and in writing.

3.02 PIPING INSTALLATION

A. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.

1. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with Architect before deviating from approved working plans.

B. Piping Standard: Comply with requirements for installation of sprinkler piping in NFPA 13.

C. Use listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.

D. Install unions adjacent to each valve in pipes NPS 2 and smaller.

E. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 and larger end connections.

F. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, and sized and located according to NFPA 13.

G. Install sprinkler piping with drains for complete system drainage.

H. Install alarm devices in piping systems.

I. Install hangers and supports for sprinkler system piping according to NFPA 13. Comply with requirements for hanger materials in NFPA 13.

J. Fill sprinkler system piping with water.

K. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves in Section 210400 “General Requirements” for Fire-Suppression."

L. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons in Section 210400 “General Requirements for Fire-Suppression."

3.03 JOINT CONSTRUCTION

A. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.

B. Install unions adjacent to each valve in pipes NPS 2 and smaller.

C. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2and larger end connections.

D. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

E. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

F. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.

G. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

H. Welded Joints: Construct joints according to AWS D10.12M, using qualified processes and welding operators according to "Quality Assurance" Article.

1. Shopweld pipe joints where welded piping is indicated. Do not use welded joints for galvanized-steel pipe.

I. Steel-Piping, Roll-Grooved Joints: Roll rounded-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints.

J. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.

3.04 VALVE AND SPECIALTIES INSTALLATION

A. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 13 and authorities having jurisdiction.

B. Install listed fire-protection shutoff valves supervised open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.

3.05 SPRINKLER INSTALLATION

A. Install sprinklers in suspended ceilings in center of acoustical ceiling panels.

B. In areas without ceilings, sprinkler heads to be upright type.

C. Install sprinklers into flexible, sprinkler hose fittings and install hose into bracket on ceiling grid.

3.06 IDENTIFICATION

A. Install labeling and pipe markers on equipment and piping. Comply with requirements in NFPA 13 and Section 210400 “General Requirements for Fire Suppression”.

B. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.07 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:

1. Leak Test: After installation, charge systems and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
4. Energize circuits to electrical equipment and devices.
5. Coordinate with fire-alarm tests. Operate as required.
6. Coordinate with fire-pump tests. Operate as required.
7. Verify that equipment hose threads are same as local fire-department equipment.

C. Sprinkler piping system will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.08 CLEANING

A. Clean dirt and debris from sprinklers.

B. Remove and replace sprinklers with paint other than factory finish.

3.09 PIPING SCHEDULE

A. Standard-pressure, wet-pipe sprinkler system, NPS 2 ½ inch and smaller shall be the following:

1. Schedule 40, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
2. Schedule 40, black-steel pipe with roll-grooved ends; grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.

B. Standard-pressure, wet-pipe sprinkler system, NPS 2 ½ inch and larger, shall be the following:

1. Schedule 40, black-steel pipe with roll-grooved ends; grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
2. Schedule 40, black-steel pipe with plain ends; welding fittings; and welded joints.

3.10 SPRINKLER SCHEDULE

A. Use sprinkler types in subparagraphs below for the following applications:

1. Rooms without Ceilings: Upright Sprinklers.
2. Rooms with Suspended Ceilings: Sprinkler heads to be fully concealed similar to Reliable model G1 with chrome cover plate.
3. Wall Mounting: When necessary to avoid conflicts with distribution room equipment, wall-mounted, side discharge sprinkler heads with wire baskets are allowed.

B. Provide sprinkler types in subparagraphs below with finishes indicated.

1. Concealed Sprinklers: Rough brass, with chrome plate.
2. Upright Sprinklers: Chrome plated in finished spaces exposed to view; rough bronze in unfinished spaces not exposed to view; wax coated where exposed to acids, chemicals, or other corrosive fumes.

END OF SECTION

SECTION 22 0400

GENERAL REQUIREMENTS FOR PLUMBING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes: Every item of labor, materials, equipment and appurtenances for installing Plumbing Systems included in Division 22 of the Specifications.

1.03 DRAWINGS

A. The Plumbing Drawings are diagrammatic in nature and show the general arrangement of all piping, equipment and appurtenances and shall be followed as closely as actual building construction and the work of other trades will permit. Because of the small scale of the Plumbing Drawings, it is not feasible to indicate all offsets, fittings and accessories that may be required. The Contractor shall investigate the construction conditions affecting the work and provide fittings and accessories as required to meet actual conditions.

B. Where discrepancies in scope of work as to which Trade provides specific items, such as starters, disconnects, flow switches, electrical control components, etc. exist, such conflicts shall be reported to the Engineer. If such action is not taken, the Contractor, as applicable, shall furnish such items as part of his work, for complete and operable systems and equipment, as determined by the Engineer.

1.04 REGULATIONS AND STANDARDS

A. The completed installation and all materials and equipment shall conform to local ordinances and codes, other regulations and standards listed herein or in related sections. These are intended as a minimum and shall be exceeded if required by the specifications or the Drawings. In the event of conflict between the codes, standards, or regulations, and information contained in the Contract Documents, the applicable code, standards, or regulation shall take precedence.

1.05 LIMITS OF CONTRACT:

A. Sanitary Sewer, Storm Sewer and Water Service piping shall be extended under this section of the specifications to a point 5'-0" beyond the building line, unless otherwise indicated on the drawings, where the pipes shall be capped or plugged with location identified and left ready for connection and extension included under Division 33 Utilities.

1.06 INSPECTION CERTIFICATES

A. The Contractor shall furnish three copies of certificates of final acceptance to the Engineer from all inspection authorities having jurisdiction.

1.07 SUBSTANTIAL COMPLETION INSPECTION

A. The Engineer will visit the site for the purpose of conducting a substantial completion inspection once the following items have been met by the Contractor:
   1. All Plumbing systems shall be complete, operational and under automatic control.
   2. Plumbing systems cleaning, balancing, and testing shall be complete and the final report shall be approved by the Engineer.

B. All discrepancies noted in the substantial completion report shall be corrected prior to the final inspection. The Contractor shall provide a detailed item-by-item description of all corrections

made for each item on the substantial completion discrepancy list prior to scheduling final inspection by the Engineer. Additional visits required after the final inspection, for the reason that previously documented discrepancies had not been corrected at the time of the final inspection, will be made at the Contractor's expense.

1.08 LEED COMPLIANCE

A. Comply with requirements for LEED certification specified in Division 01.

1.09 ASBESTOS

A. Asbestos Free Materials: The intention of these Drawings and specifications is that there are no asbestos-containing materials installed on this project. To the best of the Architects and Engineers knowledge, none of the material or equipment specified herein or shown on the Drawings contains asbestos. The Contractor shall make every effort to prevent any asbestos materials from being installed in or used on the construction of the project. At the completion of the project, the Contractor shall certify by letter that to the best of his knowledge, no asbestos-containing materials were used for or in the construction of this project.

B. Existing Materials:

1. Contractor shall review the Owners asbestos management plan to ensure suspected asbestos containing materials are under surveillance.
2. Discovery: If during the construction of this project, work involving friable asbestos is suspected, or encountered, all work in this area shall be discontinued and the Owner or the Owner's representative, shall be notified immediately and the Owner with his own forces or by separate contract shall be responsible for complete investigation, removal, and disposition of the friable asbestos hazard in accordance with applicable laws and regulations. If the Contractor claims that delay or additional cost is involved because of such action by the Owner, he shall make such claim as provided elsewhere in the Contract Documents.
3. Removal: All work involving the removal of friable asbestos will be done under a separate contract.

1.10 MATERIALS AND WORKMANSHIP

A. Equipment and material used in the project shall be new and undamaged. The Plumbing installation shall fit into the space allotted and shall allow adequate and acceptable clearances for entry, servicing and maintenance. Similar types of equipment shall be the products of the same manufacturer unless specified otherwise. Work shall be performed by mechanics or tradesmen skilled in the trade involved.

B. All piping and equipment shall be installed in a neat and organized manner, parallel to other work and the nearest building elements, unless specifically shown otherwise on the Drawings.

C. Equipment and materials shall be suitable for use in the environment in which they are installed. Equipment exposed to outside conditions shall be adequately protected from the weather, manufactured from materials suitable for outdoor use, and designed specifically for use in outdoor environments.

1.11 SUBMITTALS

A. Submit shop drawings, product data and samples in accordance with Division 01 for all items as specified in related sections of these specifications. Eight (8) copies of the submittal shall be submitted. Five (5) copies of the submittal will be returned to the Contractor. If additional copies are required, they will be the responsibility of the Contractor. All submittal data shall be correctly identified to show project name, and the exact model, style or size of item being submitted. Improperly identified submittals will not be reviewed by the Engineer. Each item submitted for review shall bear the Subcontractor's stamp which states that they have reviewed the submission, that it is complete, and that in their opinion it meets the contract requirements. Contractor's stamp shall identify the specification section, paragraph and page number for

which the submittal is being made. Shop drawings will be reviewed only for general compliance with the Contract Documents. Review will not include correctness of details, proper configuration, utility connections, dimensions, sizes, quantities, and the like. Any submission which has not been reviewed and stamped by the Plumbing Subcontractor will not be reviewed be the Engineer. No reviews prior to award of Contract will be considered or accepted. Re-submissions of shop drawings, product data and samples shall include the entire original submittal. **Partial submittals will not be reviewed by the Engineer.**

B. Submissions will be stamped by the Engineer in one of the following ways:

“No Exceptions Taken"	No exceptions are taken and subject to compliance\ with the Contract Documents.
"Make Corrections Noted"	Minor corrections are noted and a re-submittal is not required subject to compliance with the corrections and the Contract Documents.
"Correct and Resubmit "	The submitted material, method or system meets the intent of the specifications, yet has insufficient data to determine compliance with the Contract Documents. Re-submittal is required.
"Rejected"	The submitted material, method or system does not meet the intent of the specifications, or has insufficient data to determine compliance with the Contract Documents.

C. Submission Procedures:

1. If a submission is satisfactory to the Engineer, the Engineer will annotate the submission, "No Exceptions Taken" or "Make Corrections Noted" and transmit five (5) copies to the Contractor. If a resubmission is required, the Engineer will annotate the submission “Correct and Resubmit” or "Rejected" and transmit five (5) copies to the Contractor for appropriate action.
2. The Contractor shall revise and resubmit submissions as required by the Engineer until submissions are acceptable to the Engineer.
3. Approval of a working and/or shop drawings by the Engineer will constitute acceptance of the subject matter for which the drawing was submitted and not for any other structure, material, equipment or appurtenances indicated as shown.
4. The Engineer's review of the Contractor's submissions shall in no way relieve the Contractor of any of his responsibilities under the Contract. An approval of a submission shall be interpreted to mean that the Engineer has no specific objections to the submitted material, subject to conformance with the Contract Documents.
5. Where as-built drawings, record drawings and specifications are available and when provided to the Contractor for use in performing the work, the Contractor shall verify the content of such drawings and specifications, the suitability of their use in performing the work and their accuracy for the purposes in which the Contractor intends to use any record or historical documents which may be obtained. In no case shall the Contractor assume that such documents reflect a true and accurate record of the construction. Acceptance of any such materials, records, and/or drawings shall in no way result in additional cost to the Owner should an error and/or omission in these documents result in additional costs to the Contractor.
6. On the first pages of all submittals, the Contractor shall provide a table showing all individual specification section paragraphs and drawings that apply to the equipment/component and a statement for each paragraph and drawing that the requirements have been met. The table shall be similar in format to the following, but shall include all relevant specification paragraphs and drawings:

Section 22 07 00 (example)	
1.2 A	Comply
1.2 B	Comply
1.3 A	Comply
1.3 B	Comply
1.3 C	Comply
1.4 A	Comply
1.4 A.1	Comply
1.4 A.2	Comply
Drawing M0.01	Comply

D. Equivalents: Manufacturers, trade names, and model numbers indicated herein and on Drawings shall be interpreted as establishing a standard of quality and shall not be construed as limiting competition. Manufacturers listed first in these specifications and on Drawings were used as a basis of design. It will be the responsibility of the Contractor to verify all connections, physical sizes, capacities, etc. of all other manufacturer's items, both named or proposed. If the equipment necessitates changes in rough-in, piping, wiring or other building systems from that indicated on the Drawings, the Contractor shall be responsible for all additional costs included and notify other trades. Where such changes are required, detail drawings indicating all required changes shall be submitted for review at the same time the manufacturers drawings are submitted for approval.

E. Shop drawings, diagrams, product data and such other data necessary to fully describe and substantiate compliance with these specifications shall be submitted for all equipment and materials where specifically required by specification and all items identified with an [S] behind the product title. Submittals not required by the Contract Documents will not be reviewed.

F. Shop Drawing manual(s) shall be submitted in accordance with Division 01 and shall include a complete product index, a copy of all approved shop drawings, and the name, address and telephone number of supplier or nearest representative. The manual(s) shall be presented to the Engineer for review and transmittal to the Owner before final payment is recommended.

G. Operation and Maintenance manual(s) shall be submitted in accordance with Division 01, this Section and shall include a complete product index in each volume, installation and maintenance data, parts lists, a copy of all approved shop drawings and the name, address and telephone number of supplier or nearest representative. All Plumbing devices, equipment and systems marked [O/M] in these specifications shall be included and all other such plumbing items that will require servicing before the duration of its useful life has been reached. Manual(s) shall be presented to the Engineer for review and transmittal to the Owner before final payment is recommended.

1.12 WARRANTY

A. The Contractor shall provide a warranty for a period of one year for all work provided under the Contract to include, but not necessarily limited to, all systems, equipment, materials, and workmanship. This shall not be construed to limit any extended warranty periods of longer than one year for specific items or systems specified elsewhere in the Contract Documents.

B. The warranty period shall commence on the date of acceptance by the Owner and shall cover all parts and labor as required to fulfill the warranty at no cost to the Owner.

C. Comply with requirements for additional warranties specified in Division 01.

D. Information on all warranties shall be included in the O&M Manuals specified herein to be provided to the Owner.

E. In phased construction, warranties shall not begin until substantial completion of the FINAL phase. Contractor shall maintain all new equipment and systems until that time. Owner will maintain all existing equipment and systems. Where new systems are connected to existing, the Contractor and Owner shall determine coordination of maintenance responsibilities at the preconstruction meeting.

***** USE THE FOLLOWING THROUGH (INTERRUPTION OF UTILITY SERVICES) WHERE DIVISION 22 WORK IS NOT COVERED IN DIVISION 31.**

1.13 EXCAVATION, BEDDING AND BACKFILLING

A. Excavation:

1. Perform all excavation of every description and of whatever substance encountered to the depths required for installation of the work as indicated on the Drawings or specified herein. The amount of trench opened at one time shall not exceed 200 feet including the backfilled portion of any trench which is not in condition for traffic. All excavated materials not required, or which are not suitable for backfill, shall be removed by the Contractor. Shoring shall be provided as necessary to protect existing facilities, new work, and the safety of personnel. Sheathing for pipe trenches shall be left in place at the Contractor's expense. Provide cofferdams or other structures required for construction at no additional cost.
2. Trenches shall be necessary width for the proper laying of the pipe with the banks as nearly vertical as practicable. Trench width at the top of the pipe shall not exceed 8 inches on either side of pipe. In rock excavation, the rocks shall be removed to a minimum of 6 inches from the sides of the pipe. Trenches shall be excavated to a depth of 4" below the normal pipe depth except where rock, shale or other hard material is encountered. Where rock, shale, or other hard material is encountered, the trench shall be excavated to a depth of 6" below normal pipe depth. Except where rock, shale, or other hard material is encountered, care shall be taken not to excavate below the depths indicated. Unauthorized over depths shall be backfilled with No. 10 crushed stone to levels previously specified. Whenever wet or otherwise unsuitable soil that is incapable of properly supporting the pipe is encountered in the bottom of the trench, such soil shall be removed to the depth required as determined by the Engineer and the trench backfilled to the proper grade with material as specified above for over depth.
3. Trenches for the utility piping shall be of a depth that will provide a minimum of _____ feet of cover from top of pipe to finished grade, unless otherwise indicated.
4. Excavation for Appurtenances: Excavation for manholes and similar appurtenances shall be sufficient to leave at least 12 inches in the clear between their outer surfaces and the embankment or shoring. Final earth supporting elevations shall be of bearing capacity for loads encountered. Rock and over depth shall be treated same as described for trench excavation.

B. Bedding and Backfilling:

1. Backfilling shall not commence until all tests have been performed and all utility systems conform to the Contract Documents.
2. Trenches shall be accurately graded and bedded with No. 10 crushed stone to the pipe level and thoroughly compacted as specified hereinafter. Bedding shall be installed and shaped in accordance with details shown on the Drawings. The pipe shall rest firmly on the bedding along the entire length of pipe except as necessary for proper jointing. Trenches shall be backfilled, thoroughly haunched and tamped. Settling the backfill with

water will not be permitted. The surface shall be graded to reasonable uniformity and mounded over trenches. Sewers shall be checked to determine any displacement of the pipe after trenches have been backfilled to two (2) feet above the pipe. A light shall be flashed between manhole or structure locations for straight sections of pipe and poor alignment or any other defects shall be remedied.

3. Compacted Backfill: All backfill material used in trenches under paved areas shall be classified as “compacted backfill”. Backfill materials shall be approved excavated material, or other select material, as approved by the Engineer, free from large clods of earth, cinders, ashes, refuse, vegetable or organic matter, and rocks or stones over 1” dimension. Backfill from the bottom of the trench to the center line of the pipe shall be compacted bedding. Backfill from this point to the top of the trench shall be placed in 6 inch layers and compacted to prevent future settlement. Methods and materials used in backfilling shall be provided to obtain 95 percent of maximum density at optimum moisture as determined by AASHO Standard T99, and as sufficient to prevent settlement of the pavement or surface.
4. Normal Backfill: For all backfill not under paved or future paved areas, backfill material shall be free from cinders, ashes, refuse, vegetable or organic matter, boulders, rocks or stones over 3” dimension. Backfill from the bottom of trench to centerline of pipe shall be compacted bedding. Above this point, backfill shall be placed and compacted in 6 inch layers to one foot above the top of the pipe. The remainder of the backfill shall be placed in one foot layers and tamped.
5. The Contractor shall supply the backfill material as specified herein without additional cost to the Owner.

1.14 CUTTING AND PATCHING OF EXISTING PAVEMENT AND CONCRETE

A. Pavement and concrete removed for trenching shall be saw cut before removal. All paving removed for trenches shall be restored to original condition with materials that match adjacent surfaces, as close as possible. The Contractor shall be responsible for any sinking of the backfill or pavement which may occur within one year from acceptance by the Owner.

1.15 EXISTING UNDERGROUND UTILITIES

A. The location of underground utilities shown on the Drawings shall be considered approximate, and any locations may not be indicated or known. Care shall be exercised by the Contractor during construction to locate and protect the known and unknown utilities, and to prevent disrupting the affected utility. The Contractor shall be responsible for repairing damage to any utility caused by his work.

B. Where any existing utilities are damaged, they shall be repaired as directed by the Engineer, with materials approved by the local utility company or the Owner, at no additional cost to the Owner.

1.16 VERIFYING MEASUREMENTS AND CONDITIONS

A. The exactness of grades, elevations, dimensions, or locations given on the Drawings, is not guaranteed by the Engineer. The Contractor shall, therefore, satisfy himself as to the accuracy of all grades, elevations, dimensions and locations. In all cases of interconnection of his work with existing or other work, he shall verify at the site all dimensions relating to such existing or other work. Any errors due to the Contractor’s failure to so verify all such grades, elevations, locations, or dimensions shall be promptly rectified by him without cost to Owner.

B. [**The Contractor shall base his bid on site examinations performed by him. This requirement is mandatory. The Contractor shall visit the site of the proposed project where work is scheduled to be performed, visit the existing buildings scheduled to be renovated, inspect piping systems where new-to-existing connections shall be made, etc., and ascertain for himself the amount of work required to fulfill the intent of his Contract and the complexity of the installation. The Contractor shall not hold the Engineer, his Consultants, agents or employees responsible for or bound by, any schedule, estimate or for any plan thereof. The Contractor shall study all Contract**

Documents to determine exactly the extent of work to be provided under each Section, and in installing new equipment and systems and coordinating the work with the other Trades and existing conditions.]

1.17 INTERRUPTION OF UTILITY SERVICES

A. It is necessary that close liaison be maintained with the Administrative Authorities in all matters affecting interruptions of any utility services serving the facility and existing buildings. Prior to interrupting any utility service, the Administrative Authorities shall be consulted and interruptions for connections made at a time (or times) suitable to the Administrative Authorities. Work shall be laid out and planned to limit the interruption times to a minimum.

1.18 COORDINATION OF WORK

A. General: The Contract Documents indicate the extent and general arrangement of the Plumbing systems. The Contractor shall be responsible for the coordination and proper relation of the Plumbing work to the building structure and to the work of other trades. No additional compensation or extension of completion time will be granted for extra work caused by the lack of coordination.

B. Cooperation: The Contractor shall provide dimensions and locations of all openings, shafts and similar items to the proper trades and install work as required so as not to interfere with, or delay, the building construction.

C. Locations of lines and equipment shall be determined from actual field measurements. The outlines of the building shown on the Plumbing Drawings are intended only as a guide to indicate relative locations of the Plumbing work. Refer to Architectural and Structural Drawings for building construction details. The Contractor shall determine the exact routing and location of his systems prior to fabrication or installation of any system component. Accurate measurements and coordination shall be completed to verify dimensions and characteristics for the installation of each system.

D. Unless necessitated by equipment access or otherwise indicated in the Contract Documents, all equipment, piping and conduit concealed above ceilings and in finished or utility spaces shall be routed as high as possible.

E. Offsets, transitions and changes of direction in all systems shall be made as required to maintain proper headroom and pitch of sloping lines whether or not indicated on the drawings. The Contractor shall provide manual air vents and drains as required for his work to affect these offsets, transitions and changes in direction, as applicable.

F. Cutting and Patching: Comply with requirements for cutting and patching specified in Division 01.

[Cutting and Patching: Unless stated otherwise, the Plumbing Trade shall do all cutting necessary for the installation of his work. All work should be installed sufficiently in advance of new construction in order to permit installation of supports, sleeves, and similar items without cutting. Patching and repair work shall exactly match new and existing adjacent work in all respects and shall not be obvious as patching. Cutting which will in any way affect the building structure shall not be performed without permission of the Architect-Engineer. The Plumbing Trade is responsible for patching where he does cutting. Patching shall be done to the satisfaction of the Architect-Engineer.]

G. Roughing-In: Verify the locations of machines, door swings, block coursing, alignment of tile end and other similar features before roughing-in for Plumbing equipment components and/or controls.

H. Damage to Other Work: Each Contractor is responsible for damage to other work caused by his work or workmen. Repairing of damaged work shall be done by the Contractor who installed

the work, and as directed by the Architect-Engineer; the cost of which shall be paid for by the Contractor responsible for the damage.

1.19 EQUIPMENT INSTALLATION

A. General: Equipment shall be installed in accordance with manufacturer's instructions to conform with the details and application indicated. Where manufacturer's recommendations or installation instructions require options or accessories not specified, they shall be included and installed by the Contractor.

B. Supports: Provide necessary supports for all equipment and appurtenances as required; this includes but is not limited to frames or supports for items such as storage tanks, water heaters, air compressors, plumbing fixtures, pumps, valves, and other similar items requiring supports. Floor mounted equipment in Equipment Rooms shall be set on 4-inch high concrete foundation pads unless shown otherwise. All pads shall be poured such that the top of the pad is level. Foundation drawings, bolt setting information and foundation bolts shall be furnished by the subcontractors furnishing the equipment for all equipment required to have concrete foundations. Concrete for foundations shall be provided by Plumbing Subcontractor unless indicated otherwise. Except where indicated all equipment shall be anchored to concrete pads.

C. Service Area: All equipment and appurtenances shall be located to permit adequate service clearance in accordance with manufacturer's recommendations and as otherwise required. Service clearance shall include but not be limited to service and removal of plumbing system, water heaters, pumps, motors, controls and other of equipment. All piping and other equipment shall be located outside of the service area or shall be flanged for easy removal to facilitate equipment service. All equipment shall be located with sufficient distance from building features, structural components, and the equipment of other trades. Service clearance in front of electrical panels shall be minimum as required by National Electric Code (NEC) where applicable.

D. Temporary Requirements: Openings in equipment shall be kept plugged at all times until connection is made to the system. The ends of all pipes and equipment openings shall be kept plugged or capped properly with approved devices. Approved devices are items such as specially molded plastic caps, pipe plugs, test plugs and sheet metal caps.

1.20 EXISTING EQUIPMENT

A. General: Care shall be exercised to protect all existing equipment to be reused. The Contractor shall remove from operation all equipment that is shown to be reused and provide adequate protection including but not limited to prevention of corrosion, protection of seals, prevention of leaking, and prevention of internal/external contamination. All electronic components shall be protected from weather and moisture, deterioration and loss of programming.

1.21 SLEEVES AND INSERTS

A. General: Sleeves and inserts shall be provided and correctly located in the structure, as require for the work.

B. Inserts shall be steel and proper size for loads encountered.

C. Sleeves shall be provided for all pipes passing through concrete or masonry walls, partitions, concrete beams or slabs installed during construction of the wall, partition, beam or slab. Sleeves through existing concrete walls and slabs may be omitted if wall or slab can be core drilled and properly sealed in a manner acceptable to the Engineer. Sleeves placed horizontally in walls or in any position in beams shall be standard weight ASTM A53 steel pipe of length equal to thickness of wall or beam. Those placed vertically in non-waterproof floors shall be 20 gauge galvanized sheet steel of length equal to thickness of slab, flared and nailed to the form, or fastened to reinforcing fabric and filled with sand during pouring to prevent deformation. Sleeves occurring in floors of rooms where hose bibs or floor drains occur, and in pipe spaces,

shall be standard weight steel pipe projecting 2" above the finished floor except in Equipment Rooms they shall project four (4) inches above floor. Sleeves in floors with waterproof membrane shall be provided with flanges or flashing rings and shall be clamped or flashed into membrane. All sleeves (and core drilled openings) shall be of sufficient diameter to clear bare or covered pipes by 1/4" all around except sleeves on lines subject to movement by expansion which shall clear the bare pipe or insulation on insulated pipe at least one inch all around. Pipes through exterior walls below grade and above footings shall be installed in sleeves having a minimum size of two larger pipe diameters and sealed watertight with flexible synthetic rubber seals. Sleeve shall have anchor and water stop plate. The entire assembly shall be tightened and adjusted and made watertight. Sleeves for pipes and conduit, penetrating fire (and smoke) rated partitions, walls and floors shall be sealed in accordance with the terms of U.L. Listed Through-Penetration Firestop Systems XHEZ as published in the U.L. Fire Resistance Directory. Penetrations shall exactly conform to details of the Firestop System indicated for the type of partition, wall and floor construction encountered. All penetrations through nonfireresistance rated floor assemblies and through the ceiling membrane of nonfireresistance rated roof assemblies shall be fireblocked with tightly packed mineral-wool insulation secured in place. All penetrations through equipment room walls and other areas of noise or heat generation shall be tightly sealed with mineral fiber rope. All penetrations through draftstop partitions shall be sealed to maintain the integrity of the partition. All firestopping and draftstopping of sleeves for Plumbing work shall be provided under Division 22.

D. Where piping and equipment are supported from the light gauge structure, all connections shall be made in strict accordance with this Section and with details indicated on the Drawings.

E. Piping 4" or larger shall not be supported by light gauge metal roof framing, but rather shall be supported only by the designated steel channels shown on the structural drawings. Any connections to the light gauge metal roof framing shall be limited to 150 pounds per connection and to a maximum of two such connections to any individual light gauge member.

F. All connections to the light gauge roof framing shall be made thru shear hangers at the face of the light gauge members. No clamps or eccentric connections shall be used that will induce twisting of the light gauge members. All connections shall be made by screws. No welding to the light gauge members will be allowed.

G. Hangers for multiple pipes shall be staggered to distribute weight on light gauge framing as evenly as possible.

1.22 PENETRATIONS THROUGH PRE-CAST HOLLOW-CORE SLAB SYSTEM

A. General: Contractor shall coordinate work with the pre-cast system. Refer to architectural and structural documents for details. Installation of work shall be in strict accordance with the pre-cast system manufacturer's recommendations, as approved by the Architect.

B. Openings: Holes in the slabs made in the field shall be made by the trade involved. Openings shall be made only through hollow cells, shall not exceed the width of the hollow cells, and shall not penetrate the webs between the cells or the pre-stressed strands unless prior approval is obtained from the Architect and the slab manufacturer. Holes shall not exceed 6" diameter without approval. Certain holes for pipe may be pre-cut. Refer to Structural Drawings for locations.

C. Cutting holes: Holes may be drilled or cut and trimmed with a chisel. Generally, holes will be made by cutting the outline of the hole through the lower portion of the slab from the underside and then cutting out the top side. All holes shall be made prior to the installation of the topping slab.

D. Sleeves: Sleeves are not required through pre-cast system slabs except where required to support packing material at hollow cores. Sleeves are required to be placed through concrete topping slab on top of the pre-cast slabs.

E. Supports: Hangers shall be supported from inserts or approved sockets, or toggle bolts in core slab construction. Hanger spacing shall be such that weight on hanger does not exceed 250 pounds for any one hanger. All hanger rods shall be minimum 3/8 inch in diameter. Where hanger rods must extend through slab, they shall be secured by two bolts over steel washers or plates on top of the slab in the floor fill or roof insulation space. Washers or plates shall not be less than 2" size and 1/4" thick. Larger plates are required for larger pipe supports. Cumulative thickness of plates, washers and bolts shall be 1/4" less than thickness of topping slab.

F. Explosives: Inserts set with explosives shall not be used.

1.23 ESCUTCHEONS

A. Where pipes pass through floors, walls or ceilings in finished rooms, they shall be fitted with chromium plated escutcheons of suitable pattern to effectively cover the rough opening. Where sleeves project above floors, special deep type escutcheons shall be provided.

1.24 ACCESS DOORS

A. Provide for all concealed valves, controls, dampers, junction boxes, equipment, or any item requiring access. Doors shall be of sufficient size and so located that the concealed items may be serviced or completely removed and replaced. Doors required for Plumbing work shall be furnished as a part of this Division to the General Contractor for installation. The Plumbing Sub-Contractor shall provide locations of all access doors such that service may be safely performed from a ladder, lift, or platform without the need for support from the ceiling system. Doors in acoustic tile ceilings shall be furnished in multiples of tile sizes. Doors are not required in exposed grid type ceilings where tiles are removable. Doors shall be metal access doors with cam lock, style to match ceiling or wall construction. Doors occurring in rated construction shall be fire rated U.L. labeled access doors correlated to preserve the integrity of the rated construction. Doors leading to concealed spaces shall be provided with means to open from the inside. Doors shall be prime finish steel except those in toilets, shower rooms, locker rooms, kitchens and other similar areas shall be stainless steel with brushed finish.

1.25 ELECTRICAL WIRING AND EQUIPMENT

A. Motors shall be provided in place as an integral part of the driven equipment, ready for electrical connections. Motors shall be in accordance with NEMA Standards and of design suitable for the starting and running characteristics of the driven equipment. Minimum efficiencies of motors shall be "nominal" efficiency as indicated in ASHRAE Standard 90.1-1989 as amended by 90.1c-1993 (ie: 1 HP, 82.5%; 5 HP, 87.5%; 10 HP, 89.5%; 20 HP, 91%; 50 HP, 93%) and shall meet or exceed those contained in NEMA MG1-1993, Table 10-12.

B. Motor starters and motor protective switches shall be provided under Division 26 except where specified to be furnished specifically with the driven equipment. Accessories such as auxiliary contacts, hand-off-automatic switches, start-stop switches, pilot lights, control power transformers and other similar items shall be provided in or on the controllers as required by the control sequence indicated. Starting equipment, unless factory mounted on the equipment, shall be installed under Division 26.

D. Wiring, low voltage (100 volts or less) control wiring shall be provided as a part of Section 23 09 00 Instrumentation and Control for HVAC. Wiring material and installation shall be in strict accordance with Division 26 and manufacturer's recommendations to comply with the sequence of control indicated. Verify that wiring of all motors and controls required by equipment furnished is accomplished for the correct sequence of operation.

E. Wiring, line voltage (101 volts or higher) power or control wiring shall be furnished and installed under Division 26.

F. Disconnects shall be provided for each item of equipment under Division 26 unless specified otherwise in other sections.

G. Miscellaneous manual or automatic control and protective or signal devices required for the sequence of operation indicated for mechanical equipment shall be provided under the section of the specifications where the item of equipment is specified unless indicated otherwise.

1.26 PROTECTION FROM MOVING PARTS

A. Belts, pulleys, chains, gears, shafts, couplings and other rotating or moving parts located so that any person may come in close proximity thereto shall be fully enclosed or properly guarded.

1.27 RECORD OF UNDERGROUND LINES

A. On completion of the project, the Contractor shall prepare and submit to the Engineer a drawing on tracing paper and one blue line print to show the location of any underground lines installed in locations different from those on the Architect-Engineer's Drawings. The location of cleanouts, and the distance from the building to outside sewers, mains, and manholes shall be dimensioned.

1.28 CHARTS AND DIAGRAMS

A. General: Material as listed below shall be provided by the Contractor and shall be mounted in separate hardwood frames where directed in the field or folded and stored in a plastic document folder and located in the control cabinets. All charts, diagrams and schemes shall be photographic positives prepared from original tracings. A copy of charts and diagrams shall be included with O/M manuals.

B. Automatic Temperature Control Diagrams identified as to name, sequence of operation, location and number of systems. Components of a control system shall be identified as to location, function, temperature setting and manufacturer's part number.

C. Electric Sequence Control Diagrams of entire Mechanical system.

D. Charts for identification of valves.

1.29 INSTRUCTION OF OWNER'S REPRESENTATIVE

A. Contractors shall instruct the representative of the Owner in the proper operation and maintenance of all elements of the Plumbing systems. Competent representatives of the Contractor shall spend such time as necessary to fully prepare the Owner to operate and maintain the Plumbing systems.

1.30 COMMISSIONING OF PLUMBING SYSTEMS:

A. The commissioning agent has been contracted directly with the Owner for this project. The Commissioning Agent has overall responsibility for planning and coordination of the commissioning process. However, commissioning involves all parties to the design and construction process, including the Plumbing Sub-Contractor

B. Refer to Section 01 91 13, General Commissioning Requirements, for systems to be commissioned and responsibilities for commissioning.

C. All prefunctional testing and startups for each component of a system shall be successfully completed by the Subcontractor responsible for the purchase of the equipment or system and shall be conducted prior to formal functional performance testing (FPT) of equipment or subsystems of the given system.

1.31 CONSTRUCTION STATUS REPORT

A. Each item of discrepancies noted on Construction Status Report prepared by the Engineer shall be answered in detail in writing by the Contractor before payment can be recommended.

1.32 GRAPHICS DATABASE

A. This project's Computer Aided Design & Drafting (CADD) drawing files may be purchased directly from the Engineer for use in preparing computer graphics specific to this project.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.01 PHASING OF WORK

A. Coordinate phasing requirements with Division 01.

3.02 DEMOLITION

A. Contractor shall visit site before bidding to determine extent of demolition.

B. Removal of Piping and Equipment: Remove all piping connections and equipment, plugging outlets, etc., such that are not required for present equipment and fixtures, or are not reused or needed for reconnecting new equipment and fixtures. Remove all equipment, fixtures, etc., indicated to be removed, or not reused or needed after the renovations are complete.

C. Where piping or other similar items passing through rated assemblies are removed; the assemblies shall be patched in accordance with UL so as to maintain the integrity of the assembly.

D. The Owner will select and retain such existing plumbing fixtures, equipment and materials which are indicated to be removed and not reused, as he desires. All other existing plumbing fixtures, equipment and materials indicated to be removed and not reused shall become the property of the Contractor, who shall promptly remove them from the premises. All existing equipment and fixtures indicated to be relocated shall be disconnected, removed, relocated and reconnected. All equipment and fixtures shall be protected from damage during demolition.

E. Miscellaneous: In all altered portions of the buildings, the Contractor shall remove or alter as necessary all existing Plumbing work that is not coordinated to operate with the new construction. Demolition shall not begin until the work schedule is approved by the owner. The work shall be scheduled to prevent any disruption to the normal operations of the building.

3.03 CONNECTIONS TO EQUIPMENT FURNISHED BY OTHERS:

A. The Plumbing Contractor shall make proper **waste vent water,** etc, connections to all fixtures and equipment furnished by Division22> such as, but not limited to, <**insert equipment**>where indicated on the drawings. This Contractor shall make connections to this equipment and fixtures and install water cutoffs or stops, and gas or air cocks at each piece of equipment. Comply with requirements for pipe and fittings specified under appropriate Division 22 Sections. herein.

B. The exact location of and roughing-in requirements of each piece of equipment shall be determined by the Contractor before roughing-in is done.

C. Check Valves: Provide check valves in hot and cold water connections to fixtures where faucets or valves generally remain open during extended operation.

END OF SECTION

APPENDIX A
LETTER OF INDEMNIFICATION

Project Name:

Project Location:

At the Contractors request, Stratus will provide electronic files of the Revit Models for their convenience and use, subject to the following terms and conditions:

Stratus electronic files are compatible with Autodesk Revit Product version for which they were designed. Autocad files will be provided in the Autocad 2018 DWG format. Stratus makes no representation as to the compatibility of these files with your hardware or your software.

Data contained on these electronic files is part of Stratus's instruments of service and shall not be used by you or anyone else receiving this data through or from you for any purpose other than as a convenience in the preparation of project layout for the referenced project. Any other use or reuse by you or by others will be at your sole risk and without liability or legal exposure to Stratus. You agree to make no claim and hereby waive, to the fullest extent permitted by law, any claim or cause of action of any nature against Stratus, its officers, directors, employees, agents, or subconsultants which may arise out of or in connection with your use of the electronic files.

Furthermore, you shall, to the fullest extent permitted by law, indemnify and hold harmless Stratus from all claims, damages, losses, and expenses, including attorney's fees arising out of or resulting from your use of these electronic files.

These electronic files are not Contract Documents. Significant differences may exist between these electronic files and corresponding hard copy Contract Documents due to Addenda, Change Orders, or other revisions. Stratus makes no representation regarding the accuracy or completeness of the electronic files you receive. In the event that a conflict arises between the signed documents prepared by Stratus and the electronic files, the signed Contract Documents shall govern. You are responsible for determining if any conflict exists. By your use of these electronic files, you are not relieved of your duty to fully comply with the Contract Documents, including and without limitation, the need to check, confirm, and coordinate all dimensions and details, take field measurements, verify field conditions and coordinate your work with that of other contractors for the project.

The use of the Revit Model files prepared by the Engineer shall not in any way negate the Contractor's responsibility for coordination with other trades or for the proper checking and coordination of dimensions, details, member sizes and gage, and quantities of materials as required to facilitate complete and accurate fabrication and erection.

All information added to the drawings by the Contractor shall be in a distinctively heavier pen weight and different font, such that all Contractor information can be clearly distinguished from the original files.

Any information added by the Contractor, which represents a proposed change to the original design, shall be clearly identified by flagging or other distinctive presentation. Because of the potential that the information presented on the electronic files can be modified, unintentionally or otherwise, Stratus reserves the right to remove all indicia of its ownership and/or involvement for each electronic display.

Under no circumstances shall delivery of the electronic files for use by you deemed a sale by Stratus, and Stratus makes no warranties, either expressed or implied, of merchantability and fitness for any particular purpose. In no event shall Stratus be liable for any loss of profit or any consequential damages.

The Engineer believes that no licensing or copyright fees are due to others on account of the transfer of the Revit Model files, but to the extent any are, the Contractor will pay the appropriate fees and hold the Engineer harmless from such claims as may arise.

Any purchase order number provided by the Contractor is for the Contractor's accounting purposes only. The Contractor's purchase order terms and conditions are void and are not a part of this agreement.

The Recipient further agrees that the drawing files will only be used in graphics preparation for the above-referenced project.

SECTION 22 0513

COMMON MOTOR REQUIREMENTS FOR PLUMBING EQUIPMENT

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes: General requirements for single-phase and polyphase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on ac power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation.

1.03 COORDINATION

A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:
   1. Motor controllers.
   2. Torque, speed, and horsepower requirements of the load.
   3. Ratings and characteristics of supply circuit and required control sequence.
   4. Ambient and environmental conditions of installation location.

PART 2 - PRODUCTS

2.01 GENERAL MOTOR REQUIREMENTS

A. Comply with requirements in this Section except when stricter requirements are specified in plumbing equipment schedules or Sections.

B. Comply with NEMA MG 1 unless otherwise indicated.

C. Comply with IEEE 841 for severe-duty motors.

2.02 MOTOR CHARACTERISTICS

A. Duty: Continuous duty at ambient temperature of 40 deg C and at altitude of 3300 feet above sea level.

B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

2.03 POLYPHASE MOTORS

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Energy efficient, as defined in NEMA MG 1.

C. Service Factor: 1.15.

D. Multispeed Motors: Variable torque.
   1. For motors with 2:1 speed ratio, consequent pole, single winding.
   2. For motors with other than 2:1 speed ratio, separate winding for each speed.

E. Multispeed Motors: Separate winding for each speed.

F. Rotor: Random-wound, squirrel cage.

G. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.

H. Temperature Rise: Match insulation rating.

I. Insulation: **Class F**

2.04 **SINGLE-PHASE MOTORS**

A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application:
   1. Permanent-split capacitor.
   2. Split phase.
   3. Capacitor start, inductor run.
   4. Capacitor start, capacitor run.

B. Multispeed Motors: Variable-torque, permanent-split-capacitor type.

C. Bearings: Prelubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.

D. Motors 1/20 HP and Smaller: Shaded-pole type.

E. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 - EXECUTION (Not Applicable)

END OF SECTION

SECTION 22 0523

GENERAL-DUTY VALVES FOR PLUMBING PIPING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Brass ball valves.
   2. Bronze ball valves.
   3. Iron ball valves.
   4. Bronze lift check valves.
   5. Bronze swing check valves.
   6. Iron swing check valves.

1.03 DEFINITIONS

A. CWP: Cold working pressure.

B. EPDM: Ethylene propylene copolymer rubber.

C. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber.

D. NRS: Nonrising stem.

E. OS&Y: Outside screw and yoke.

F. RS: Rising stem.

G. SWP: Steam working pressure.

1.04 SUBMITTALS

A. Product Data: For each type of valve indicated [S]. Comply with requirements for submittals in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

1.05 QUALITY ASSURANCE

A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.

B. ASME Compliance:
   1. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
   2. ASME B31.1 for power piping valves.
   3. ASME B31.9 for building services piping valves.

C. NSF Compliance for valve materials that will be in contact with potable water:
   1. NSF 61 "Drinking Water System Components - Health Effects".
   2. NSF 372 "Drinking Water System Components - Lead Content".

1.06 DELIVERY, STORAGE, AND HANDLING

A. Prepare valves for shipping as follows:
   1. Protect internal parts against rust and corrosion.
   2. Protect threads, flange faces, grooves, and weld ends.
   3. Set gate, and globe valves closed to prevent rattling.
   4. Set ball and plug valves open to minimize exposure of functional surfaces.

5. Block check valves in either closed or open position.

B. Use the following precautions during storage:
   1. Maintain valve end protection.
   2. Store valves indoors and maintain at higher than ambient dew point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR VALVES

A. Refer to valve schedule articles for applications of valves.

B. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.

C. Valve Sizes: Same as upstream piping unless otherwise indicated.

D. Valve Actuator Types:
   1. Gear Actuator: For quarter-turn valves NPS 8 and larger.
   2. Handwheel: For valves other than quarter-turn types.
   3. Handlever: For quarter-turn valves NPS 6 and smaller [**except plug valves**].
   4. Wrench: For plug valves with square heads. Furnish Owner with 1 wrench for every **5** plug valves, for each size square plug-valve head.
   5. Chainwheel: Device for attachment to valve handwheel, stem, or other actuator; of size and with chain for mounting height, as indicated in the "Valve Installation" Article.

E. Valves in Insulated Piping: With 2-inch stem extensions and the following features:
   1. Gate Valves: With rising stem.
   2. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation.

F. Valve-End Connections:
   1. Flanged: With flanges according to ASME B16.1 for iron valves.
   2. Solder Joint: With sockets according to ASME B16.18.
   3. Threaded: With threads according to ASME B1.20.1.

G. Valve Bypass and Drain Connections: MSS SP-45.

2.02 BRASS BALL VALVES[S]

A. Two-Piece, Full-Port, Brass Ball Valves with Brass Trim:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Crane Co.; Crane Valve Group; Crane Valves.
      b. Crane Co.; Crane Valve Group; Jenkins Valves.
      c. DynaQuip Controls.
      d. Flow-Tek, Inc.; a subsidiary of Bray International, Inc.
      e. Hammond Valve.
      f. Jamesbury; a subsidiary of Metso Automation.
      g. Jomar International, LTD.
      h. Kitz Corporation.
      i. Legend Valve.
      j. Marwin Valve; a division of Richards Industries.
      k. Milwaukee Valve Company.
      l. NIBCO INC.
      m. Red-White Valve Corporation.

n. RuB Inc.

2. Description:
   a. Standard: MSS SP-110.
   b. SWP Rating: 150 psig.
   c. CWP Rating: 600 psig.
   d. Body Design: Two piece.
   e. Body Material: Forged brass.
   f. Ends: Threaded.
   g. Seats: PTFE or TFE.
   h. Stem: Brass.
   i. Ball: Chrome-plated brass.
   j. Port: Full.

B. Two-Piece, Full-Port, Brass Ball Valves with Stainless-Steel Trim:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Crane Co.; Crane Valve Group; Crane Valves.
   b. Crane Co.; Crane Valve Group; Jenkins Valves.
   c. Flow-Tek, Inc.; a subsidiary of Bray International, Inc.
   d. Hammond Valve.
   e. Jamesbury; a subsidiary of Metso Automation.
   f. Kitz Corporation.
   g. Marwin Valve; a division of Richards Industries.
   h. Milwaukee Valve Company.
   i. RuB Inc.
2. Description:
   a. Standard: MSS SP-110.
   b. SWP Rating: 150 psig.
   c. CWP Rating: 600 psig.
   d. Body Design: Two piece.
   e. Body Material: Forged brass.
   f. Ends: Threaded.
   g. Seats: PTFE or TFE.
   h. Stem: Stainless steel.
   i. Ball: Stainless steel, vented.
   j. Port: Full.

C. Two-Piece, Regular-Port, Brass Ball Valves with Brass Trim:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Hammond Valve.
   b. Jamesbury; a subsidiary of Metso Automation.
   c. Legend Valve.
   d. Marwin Valve; a division of Richards Industries.
   e. Milwaukee Valve Company.
2. Description:
   a. Standard: MSS SP-110.
   b. SWP Rating: 150 psig.
   c. CWP Rating: 600 psig.
   d. Body Design: Two piece.
   e. Body Material: Forged brass.
   f. Ends: Threaded.
   g. Seats: PTFE or TFE.
   h. Stem: Brass.
   i. Ball: Chrome-plated brass.
   j. Port: Regular.

D. Three-Piece, Full-Port, Brass Ball Valves with Stainless-Steel Trim:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    a. Jomar International, LTD.
    b. Kitz Corporation.
    c. Marwin Valve; a division of Richards Industries.
    d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Description:
    a. Standard: MSS SP-110.
    b. SWP Rating: 150 psig.
    c. CWP Rating: 600 psig.
    d. Body Design: Three piece.
    e. Body Material: Forged brass.
    f. Ends: Threaded.
    g. Seats: PTFE or TFE.
    h. Stem: Stainless steel.
    i. Ball: Stainless steel, vented.
    j. Port: Full.

2.03 BRONZE BALL VALVES [S]

A. Two-Piece, Full-Port, Bronze Ball Valves with Bronze Trim:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    a. American Valve, Inc.
    b. Conbraco Industries, Inc.; Apollo Valves.
    c. Crane Co.; Crane Valve Group; Crane Valves.
    d. Hammond Valve.
    e. Lance Valves; a division of Advanced Thermal Systems, Inc.
    f. Legend Valve.
    g. Milwaukee Valve Company.
    h. NIBCO INC.
    i. Red-White Valve Corporation.
    j. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Description:
    a. Standard: MSS SP-110.
    b. SWP Rating: 150 psig.
    c. CWP Rating: 600 psig.
    d. Body Design: Two piece.
    e. Body Material: Bronze.
    f. Ends: Threaded.
    g. Seats: PTFE or TFE.
    h. Stem: Bronze.
    i. Ball: Chrome-plated brass.
    j. Port: Full.

B. Two-Piece, Full-Port, Bronze Ball Valves with Stainless-Steel Trim:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    a. Conbraco Industries, Inc.; Apollo Valves.
    b. Crane Co.; Crane Valve Group; Crane Valves.
    c. Hammond Valve.
    d. Lance Valves; a division of Advanced Thermal Systems, Inc.
    e. Milwaukee Valve Company.
    f. NIBCO INC.
    g. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Description:
    a. Standard: MSS SP-110.

b. SWP Rating: 150 psig.
c. CWP Rating: 600 psig.
d. Body Design: Two piece.
e. Body Material: Bronze.
f. Ends: Threaded.
g. Seats: PTFE or TFE.
h. Stem: Stainless steel.
i. Ball: Stainless steel, vented.
j. Port: Full.
k. Port: Regular.

C. Three-Piece, Full-Port, Bronze Ball Valves with Bronze Trim:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Conbraco Industries, Inc.; Apollo Valves.
b. DynaQuip Controls.
c. Hammond Valve.
d. Milwaukee Valve Company.
e. NIBCO INC.
f. Red-White Valve Corporation.
2. Description:
a. Standard: MSS SP-110.
b. SWP Rating: 150 psig.
c. CWP Rating: 600 psig.
d. Body Design: Three piece.
e. Body Material: Bronze.
f. Ends: Threaded.
g. Seats: PTFE or TFE.
h. Stem: Bronze.
i. Ball: Chrome-plated brass.
j. Port: Full.

D. Three-Piece, Full-Port, Bronze Ball Valves with Stainless-Steel Trim:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Conbraco Industries, Inc.; Apollo Valves.
b. Hammond Valve.
c. Milwaukee Valve Company.
d. NIBCO INC.
2. Description:
a. Standard: MSS SP-110.
b. SWP Rating: 150 psig.
c. CWP Rating: 600 psig.
d. Body Design: Three piece.
e. Body Material: Bronze.
f. Ends: Threaded.
g. Seats: PTFE or TFE.
h. Stem: Stainless steel.
i. Ball: Stainless steel, vented.
j. Port: Full.

2.04 IRON BALL VALVES [S]

A. Class 125, Iron Ball Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. American Valve, Inc.
b. Conbraco Industries, Inc.; Apollo Valves.

c. Kitz Corporation.
d. Sure Flow Equipment Inc.
e. Watts Regulator Co.; a division of Watts Water Technologies, Inc.

2. Description:
a. Standard: MSS SP-72.
b. CWP Rating: 200 psig.
c. Body Design: Split body.
d. Body Material: ASTM A 126, gray iron.
e. Ends: Flanged.
f. Seats: PTFE or TFE.
g. Stem: Stainless steel.
h. Ball: Stainless steel.
i. Port: Full.

2.05 BRONZE LIFT CHECK VALVES [S]

A. Class 125, Lift Check Valves with Bronze Disc:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Jenkins Valves.
c. Crane Co.; Crane Valve Group; Stockham Division.
2. Description:
a. Standard: MSS SP-80, Type 1.
b. CWP Rating: 200 psig.
c. Body Design: Vertical flow.
d. Body Material: ASTM B 61 or ASTM B 62, bronze.
e. Ends: Threaded.
f. Disc: Bronze.

2.06 BRONZE SWING CHECK VALVES [S]

A. Class 125, Bronze Swing Check Valves with Bronze Disc:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. American Valve, Inc.
b. Crane Co.; Crane Valve Group; Crane Valves.
c. Crane Co.; Crane Valve Group; Jenkins Valves.
d. Crane Co.; Crane Valve Group; Stockham Division.
e. Hammond Valve.
f. Kitz Corporation.
g. Milwaukee Valve Company.
h. NIBCO INC.
i. Powell Valves.
j. Red-White Valve Corporation.
k. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
l. Zy-Tech Global Industries, Inc.
2. Description:
a. Standard: MSS SP-80, Type 3.
b. CWP Rating: 200 psig.
c. Body Design: Horizontal flow.
d. Body Material: ASTM B 62, bronze.
e. Ends: Threaded.
f. Disc: Bronze.

B. Class 150, Bronze Swing Check Valves with Bronze Disc:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. American Valve, Inc.
b. Crane Co.; Crane Valve Group; Crane Valves.
c. Crane Co.; Crane Valve Group; Jenkins Valves.
d. Crane Co.; Crane Valve Group; Stockham Division.
e. Kitz Corporation.
f. Milwaukee Valve Company.
g. NIBCO INC.
h. Red-White Valve Corporation.
i. Zy-Tech Global Industries, Inc.

2. Description:
a. Standard: MSS SP-80, Type 3.
b. CWP Rating: 300 psig.
c. Body Design: Horizontal flow.
d. Body Material: ASTM B 62, bronze.
e. Ends: Threaded.
f. Disc: Bronze.

2.07 IRON SWING CHECK VALVES [S]

A. Class 125, Iron Swing Check Valves with Metal Seats:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Jenkins Valves.
c. Crane Co.; Crane Valve Group; Stockham Division.
d. Hammond Valve.
e. Kitz Corporation.
f. Legend Valve.
g. Milwaukee Valve Company.
h. NIBCO INC.
i. Powell Valves.
j. Red-White Valve Corporation.
k. Sure Flow Equipment Inc.
l. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
m. Zy-Tech Global Industries, Inc.

2. Description:
a. Standard: MSS SP-71, Type I.
b. CWP Rating: 200 psig.
c. Body Design: Clear or full waterway.
d. Body Material: ASTM A 126, gray iron with bolted bonnet.
e. Ends: Flanged.
f. Trim: Bronze.
g. Gasket: Asbestos free.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

C. Examine threads on valve and mating pipe for form and cleanliness.

D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

E. Do not attempt to repair defective valves; replace with new valves.

3.02 VALVE INSTALLATION

A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

B. Locate valves for easy access and provide separate support where necessary.

C. Install valves in horizontal piping with stem at or above center of pipe.

D. Install valves in position to allow full stem movement.

E. Install chainwheels on operators for gate and globe valves 6” and larger and more than 96 inches above floor. Extend chains to 60 inches above finished floor.

F. Install check valves for proper direction of flow and as follows:

1. Swing Check Valves: In horizontal position with hinge pin level.
2. Lift Check Valves: With stem upright and plumb.

3.03 ADJUSTING

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.04 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS

A. If valve applications are not indicated, use the following:

1. Shutoff Service: Ball, gate, or plug valves.
2. Throttling Service: **ball** valves.
3. Pump-Discharge Check Valves:
   a. NPS 2 and Smaller: Bronze swing check valves with bronze disc.
   b. NPS 2-1/2 and Larger for Domestic Water: Iron swing check valves with metal seat.

B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP classes or CWP ratings may be substituted.

C. Select valves, except wafer types, with the following end connections:

1. For Copper Tubing, NPS 2 and Smaller: Threaded ends except where solder-joint valve-end option is indicated in valve schedules below.
2. For Copper Tubing, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules below.
3. For Copper Tubing, NPS 5 and Larger: Flanged ends.
4. For Steel Piping, NPS 2 and Smaller: Threaded ends.
5. For Steel Piping, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules below.
6. For Steel Piping, NPS 5 and Larger: Flanged ends.

3.05 LOW-PRESSURE, COMPRESSED-AIR VALVE SCHEDULE (150 PSIG OR LESS)

A. Pipe NPS 2 and Smaller:

1. Bronze and Brass Valves: Threaded ends.
2. Ball Valves: Two piece, full port, brass or bronze with bronze stainless-steel trim.
3. Bronze Lift Check Valves: Class 125, bronze disc.
4. Bronze Swing Check Valves: Class 150, bronze disc.
5. Bronze Gate Valves: Class 150, NRS.

B. Pipe NPS 2-1/2 and Larger:

1. Iron Valves, NPS 2-1/2 to NPS 4: May be provided with threaded ends instead of flanged ends.
2. Iron Swing Check Valves: Class 125 metal seats.
3. Iron Gate Valves: [Class 125].

3.06 HIGH-PRESSURE, COMPRESSED-AIR VALVE SCHEDULE (150 TO 200 PSIG

A. Pipe NPS 2 and Smaller:
   1. Bronze Valves: Threaded ends.
   2. Ball Valves: Two piece, full port, bronze with brass or bronze trim.
   3. Bronze Swing Check Valves: Class 150, [bronze] disc.
   4. Bronze Gate Valves: Class 150, NRS.

B. Pipe NPS 2-1/2 and Larger:
   1. Iron Valves, NPS 2-1/2 to NPS 4: May be provided with threaded ends instead of flanged ends.
   2. Iron Swing Check Valves: Class 250, metal seats.
   3. Iron Gate Valves: Class 250, NRS.

3.07 DOMESTIC, HOT- AND COLD-WATER VALVE SCHEDULE

A. Pipe NPS 3 and Smaller:
   1. Bronze and Brass Valves: May be provided with solder-joint ends instead of threaded ends. Valves in Copper Pressure-Seal Joint piping systems may have pressure seal ends.
   2. Ball Valves: Two or Three piece, full port, brass or bronze with bronze or stainless-steel trim.
   3. Bronze Swing Check Valves: **Class 125**, bronze disc.
   4. Bronze Gate Valves: **Class 125** NRS.
   5. Bronze Globe Valves: **Class 125** bronze disc.

B. Pipe NPS 4 and Larger:
   1. Iron Valves, NPS 2-1/2 to NPS 4: flanged ends.
   2. Iron Ball Valves: Class 150.
   3. Iron Swing Check Valves: [Class 125], metal seats.
   4. Iron Gate Valves: Class 125, NRS.
   5. Iron Globe Valves: Class 125.

3.08 [SANITARY-WASTE] [AND] [STORM-DRAINAGE] VALVE SCHEDULE

A. Pipe NPS 2 and Smaller:
   1. Bronze [**and Brass]** Valves: May be provided with solder-joint ends instead of threaded ends.
   2. Ball Valves: Two piece, full port, bronze with bronze trim.
   3. Bronze Swing Check Valves: Class 125, bronze disc.
   4. Bronze Gate Valves: Class 125, NRS.

B. Pipe NPS 2-1/2 and Larger:
   1. Iron Valves, NPS 2-1/2 to NPS 4: May be provided with threaded ends instead of flanged ends.
   2. Iron Ball Valves: Class 150.
   3. Iron Swing Check Valves: Class 125, metal seats.
   4. Iron Gate Valves: Class 125, NRS.
   5. Iron Globe Valves: Class 125.

END OF SECTION

SECTION 22 0529

HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Metal pipe hangers and supports.
   2. Trapeze pipe hangers.
   3. Metal framing systems.
   4. Thermal-hanger shield inserts.
   5. Fastener systems.
   6. Pipe stands.
   7. Pipe positioning systems.
   8. Equipment supports.

1.03 DEFINITIONS

A. MSS: Manufacturers Standardization Society of The Valve and Fittings Industry Inc.

1.04 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design trapeze pipe hangers and equipment supports, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to [**SEI/ASCE 7 "Minimum Design Loads for Buildings and Other Structures**]
   1. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.
   2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
   3. Design seismic-restraint hangers and supports for piping and equipment [**and obtain approval from authorities having jurisdiction**].

1.05 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Comply with requirements in Division 01 and Section 22 04 00 "General Requirements for Plumbing".

B. Shop Drawings: [**Signed and sealed by a qualified professional engineer.**] Show fabrication and installation details and include calculations for the following; include Product Data for components:
   1. Trapeze pipe hangers.
   2. Metal framing systems.
   3. Pipe stands.
   4. Equipment supports.

C. Delegated-Design Submittal: For trapeze hangers indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Detail fabrication and assembly of trapeze hangers.

2. Design Calculations: Calculate requirements for designing trapeze hangers.

D. Welding certificates.

1.06 QUALITY ASSURANCE

A. Structural Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel."

B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

PART 2 - PRODUCTS

2.01 METAL PIPE HANGERS AND SUPPORTS

A. Carbon-Steel Pipe Hangers and Supports:
   1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
   2. Galvanized Metallic Coatings: Pregalvanized or hot dipped.
   3. Nonmetallic Coatings: Plastic coating, jacket, or liner.
   4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
   5. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.

B. Stainless-Steel Pipe Hangers and Supports:
   1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
   2. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
   3. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

C. Copper Pipe Hangers:
   1. Description: MSS SP-58, Types 1 through 58, copper-coated-steel, factory-fabricated components.
   2. Hanger Rods: Continuous-thread rod, nuts, and washer made of copper-coated steel, stainless steel or cadmium plated steel.

2.02 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural carbon-steel shapes with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U-bolts.

2.03 METAL FRAMING SYSTEMS

A. MFMA Manufacturer Metal Framing Systems:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Allied Tube & Conduit.
      b. Cooper B-Line, Inc.
      c. Flex-Strut Inc.
      d. GS Metals Corp.
      e. Thomas & Betts Corporation.
      f. Unistrut Corporation; Tyco International, Ltd.
      g. Wesanco, Inc.
   2. Description: Shop- or field-fabricated pipe-support assembly for supporting multiple parallel pipes.
   3. Standard: MFMA-4.
   4. Channels: Continuous slotted steel channel with inturned lips.

5. Channel Nuts: Formed or stamped steel nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.
6. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.
7. Paint Coating: Alkyd.

B. Non-MFMA Manufacturer Metal Framing Systems:
1. Manufacturers: Subject to compliance with requirements available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Anvil International; a subsidiary of Mueller Water Products Inc.
b. Empire Industries, Inc.
c. ERICO International Corporation.
d. Haydon Corporation; H-Strut Division.
e. NIBCO INC.
f. PHD Manufacturing, Inc.
g. PHS Industries, Inc.
2. Description: Shop- or field-fabricated pipe-support assembly made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.
3. Standard: Comply with MFMA-4.
4. Channels: Continuous slotted steel channel with inturned lips.
5. Channel Nuts: Formed or stamped steel nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.
6. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.
7. Coating: Paint.

2.04 THERMAL-HANGER SHIELD INSERTS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Carpenter & Paterson, Inc.
2. Clement Support Services.
3. ERICO International Corporation.
4. National Pipe Hanger Corporation.
5. PHS Industries, Inc.
6. Pipe Shields, Inc.; a subsidiary of Piping Technology & Products, Inc.
7. Piping Technology & Products, Inc.
8. Rilco Manufacturing Co., Inc.
9. Value Engineered Products, Inc.

B. Insulation-Insert Material for Cold Piping: ASTM C 552, Type II cellular glass with 100-psig or ASTM C 591, Type VI, Grade 1 polyisocyanurate with 125-psig (862-kPa)] minimum compressive strength and vapor barrier.

C. Insulation-Insert Material for Hot Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate with 100-psig minimum compressive strength.

D. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

E. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

F. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.05 FASTENER SYSTEMS

A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

B. Mechanical-Expansion Anchors: Insert-wedge-type, [**zinc-coated**] [**stainless-**] steel anchors, for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

2.06 PIPE STANDS

A. General Requirements for Pipe Stands: Shop- or field-fabricated assemblies made of manufactured corrosion-resistant components to support roof-mounted piping.

B. Compact Pipe Stand: One-piece plastic unit with integral-rod roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.

C. Low-Type, Single-Pipe Stand: One-piece [**plastic**] [**stainless-steel**] base unit with plastic roller, for roof installation without membrane penetration.

D. High-Type, Single-Pipe Stand:
   1. Description: Assembly of base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.
   2. Base: Plastic or Stainless steel.
   3. Vertical Members: Two or more cadmium-plated-steel or stainless-steel, continuous-thread rods.
   4. Horizontal Member: Cadmium-plated-steel or stainless-steel rod with plastic or stainless-steel, roller-type pipe support.

E. High-Type, Multiple-Pipe Stand:
   1. Description: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.
   2. Bases: One or more; plastic.
   3. Vertical Members: Two or more protective-coated-steel channels.
   4. Horizontal Member: Protective-coated-steel channel.
   5. Pipe Supports: Galvanized-steel, clevis-type pipe hangers.

F. Curb-Mounting-Type Pipe Stands: Shop- or field-fabricated pipe supports made from structural-steel shapes, continuous-thread rods, and rollers, for mounting on permanent stationary roof curb.

2.07 PIPE POSITIONING SYSTEMS

A. Description: IAPMO PS 42, positioning system of metal brackets, clips, and straps for positioning piping in pipe spaces; for plumbing fixtures in commercial applications.

2.08 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural carbon-steel shapes.

2.09 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36, carbon-steel plates, shapes, and bars; black and galvanized.

B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
   1. Properties: Nonstaining, noncorrosive, and nongaseous.
   2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.01 HANGER AND SUPPORT INSTALLATION

A. Metal Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.

B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.
   1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.
   2. Field fabricate from ASTM A 36, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1.

C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled metal framing systems.

D. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

E. Fastener System Installation:
   1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.
   2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

F. Pipe Stand Installation:
   1. Pipe Stand Types except Curb-Mounted Type: Assemble components and mount on smooth roof surface. Do not penetrate roof membrane.
   2. Curb-Mounted-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. Comply with Division 07 Section "Roof Accessories" for curbs.

G. Pipe Positioning-System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture. Comply with Division 22 plumbing fixture Sections for requirements for pipe positioning systems for plumbing fixtures.

H. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.

I. Equipment Support Installation: Fabricate from welded-structural-steel shapes.

J. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

K. Install lateral bracing with pipe hangers and supports to prevent swaying.

L. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

M. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

N. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

O. Insulated Piping:
   1. Attach clamps and spacers to piping.
      a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
      b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.

c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.

2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
   a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick.
   b. NPS 4: 12 inches long and 0.06 inch thick.
   c. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick.
   d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick.
   e. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick.
5. Insulated Pipes NPS 2 1/2 inches and Larger: Include reinforced calcium-silicate-insulation inserts of length at least as long as protective shield.
6. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.02 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make bearing surface smooth.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.03 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.04 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.05 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.

B. Touchup: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 09 painting Sections.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

3.06 HANGER AND SUPPORT SCHEDULE

A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe-hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use carbon-steel pipe hangers and supports, metal trapeze pipe hangers and metal framing systems and attachments for general service applications.

F. Use stainless-steel pipe hangers and stainless-steel attachments for hostile environment applications.

G. Use copper-plated pipe hangers and copper or stainless-steel attachments for copper piping and tubing.

H. Use padded hangers for piping that is subject to scratching.

I. Use thermal-hanger shield inserts for insulated piping and tubing.

J. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated, stationary pipes NPS 1/2 to NPS 30.
   2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of up to 1050 deg F, pipes NPS 4 to NPS 24, requiring up to 4 inches of insulation.
   3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes NPS 3/4 to NPS 36, requiring clamp flexibility and up to 4 inches of insulation.
   4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes NPS 1/2 to NPS 24 if little or no insulation is required.
   5. Pipe Hangers (MSS Type 5): For suspension of pipes NPS 1/2 to NPS 4, to allow off-center closure for hanger installation before pipe erection.
   6. Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of noninsulated, stationary pipes NPS 3/4 to NPS 8.
   7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8.
   8. Adjustable Band Hangers (MSS Type 9): For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8.
   9. Adjustable, Swivel-Ring Band Hangers (MSS Type 10): For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8.
   10. Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11): For suspension of noninsulated, stationary pipes NPS 3/8 to NPS 8.
   11. Extension Hinged or Two-Bolt Split Pipe Clamps (MSS Type 12): For suspension of noninsulated, stationary pipes NPS 3/8 to NPS 3.
   12. U-Bolts (MSS Type 24): For support of heavy pipes NPS 1/2 to NPS 30.
   13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
   14. Pipe Saddle Supports (MSS Type 36): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.

15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.
16. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes NPS 2-1/2 to NPS 36 if vertical adjustment is required, with steel-pipe base stanchion support and cast-iron floor flange.
17. Single-Pipe Rolls (MSS Type 41): For suspension of pipes NPS 1 to NPS 30, from two rods if longitudinal movement caused by expansion and contraction might occur.
18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes NPS 2-1/2 to NPS 24, from single rod if horizontal movement caused by expansion and contraction might occur.
19. Complete Pipe Rolls (MSS Type 44): For support of pipes NPS 2 to NPS 42 if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes NPS 2 to NPS 24 if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is not necessary.
21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes NPS 2 to NPS 30 if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

K. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers NPS 3/4 to NPS 24.
2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers NPS 3/4 to NPS 24 if longer ends are required for riser clamps.

L. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.
3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 deg F piping installations.

M. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction, to attach to top flange of structural shape.
3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
6. C-Clamps (MSS Type 23): For structural shapes.
7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
11. Malleable-Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.

12. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
    a. Light (MSS Type 31): 750 lb.
    b. Medium (MSS Type 32): 1500 lb.
    c. Heavy (MSS Type 33): 3000 lb.
13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

N. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
    1. Steel-Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
    2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
    3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

O. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
    1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
    2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
    3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41, roll hanger with springs.
    4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
    5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.
    6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.
    7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.
    8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:
        a. Horizontal (MSS Type 54): Mounted horizontally.
        b. Vertical (MSS Type 55): Mounted vertically.
        c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

P. Comply with MSS SP-69 for trapeze pipe-hanger selections and applications that are not specified in piping system Sections.

Q. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system Sections.

R. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.

S. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

END OF SECTION

SECTION 22 0553

PAINTING AND IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Prepare and paint Division 22 equipment, accessories, piping and miscellaneous materials located in Equipment Rooms, Boiler Rooms and other utility areas housing Plumbing equipment and materials.
   2. Identification of piping in exposed and accessible locations.
   3. Marking and designation of equipment.

B. Not Included in Section:
   1. Painting of piping or equipment exposed in finished areas other than those listed under “Section Includes” above.
   2. **Painting of existing equipment or piping**

1.03 SUBMITTALS:

A. For each type of Product indicated [S]. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing.

1.04 REFERENCED STANDARDS:

A. General: The following standards or codes (latest edition) form a part of this specification to the extent indicated by the reference thereto.

B. American National Standards Institute (ANSI):

ANSI A13.1	Scheme for Identification of Piping Systems

C. American Society for Testing and Materials (ASTM):

ASTM E 84	Standard Test Method for Surface Burning Characteristics of Building Materials
ASTM C 411	Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation

D. National Fire Protection Association (NFPA):

Standard 255	Method of Test of Surface Burning Characteristics of Building Materials

E. Underwriters Laboratories, Inc. (UL)

Standard 723	Tests for Surface Burning Characteristics of Building Materials

F. California Department of Health Services

Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Except as otherwise specified, materials shall be the products of the following manufacturers:

Sherwin-Williams

Pratt and Lambert

Pittsburgh Paints (PPG)

Benjamin Moore

Porter Paints

Seton Identification Products

2.02 MATERIALS:

A. Deliver all paints and materials to the project site in their unopened original containers with all labels intact and legible at the time of use.

B. For adhesives and sealants applied within the building waterproofing envelope, comply with low emitting requirements in Division 01section"Indoor Air Quality Requirements."

C. All coatings exposed to supply and return airstreams and where applied to exposed surfaces in a return air plenum, shall have a composite flame spread rating not exceeding 25, and a smoke developed rating not exceeding 50 as tested under procedure ASTM E-84-75, NFPA 255 and UL 723. Coatings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411, latest edition.

D. Sherwin-Williams Industrial Maintenance Coatings System 4000 products are listed below to establish color and a standard of quality.

1. All Hangers and Supports: One coat Pro-Industrial Zero VOC Acrylic Gloss Black.
2. All major items of equipment and equipment supports including pumps, tanks and all other similar items shall be painted as follows:
   a. Uninsulated hot surfaces on equipment, operating at or above 150°F, shall be painted with two coats of No. B59S8 Heat Resistant Aluminum.
   b. Other unfinished equipment surfaces of aluminum, iron and steel shall be primed with one coat of Pro-Cryl Primer (1000g/L). Galvanized surfaces shall be chemically prepared and primed with one coat of Galvite B50W3 Primer. Field insulated surfaces shall be primed with No. B28W200 Wall Primer. Where equipment is furnished with factory finish coat, only touch up to match finish is required at any damaged areas. Finish all equipment with two coats of Pro–Industrial Zero VOC Acrylic Gloss, No. SW4063 Robotic Blue. Exterior of belt guards and other protective guards shall be finished with two coats of Pro–Industrial Zero VOC Acrylic Gloss, No. SW4084 safety yellow color. Interior of and all items covered by belt guards and other protective guards shall be finished with two coats of No. SW4083 safety orange color.
   c. Nameplates and Testing Agency Labels on equipment or machinery shall not be painted.
3. Piping: Exposed in equipment rooms and where connections are made to equipment located in storage rooms and other utility type areas.
   a. Priming:
      (1) Insulation Canvas or Paper Jacket: One coat Pro-Cryl Primer (1000g/L).
      (2) Insulation Aluminum Jacket: One coat Pro-Cryl Primer (1000g/L).
      (3) Bare Iron or Steel or Copper: One coat Pro-Cryl Primer (1000g/L).
      (4) Galvanized Steel: Pipes shall be chemically prepared and primed with one coat of Pro-Cryl B66-310 Primer.
      (5) Asphalt Coated Pipe: One coat No. B28W200 Wall Primer.

b. Finish: All pipe lines and the supports or hangers therefore, shall be finished with Pro–Industrial Zero VOC Acrylic Gloss gray No. SW4028 Gypsum applied in sufficient number of coats to effectively cover the prime coat. Painting of pipe hangers is specified hereinbefore.
c. Exterior gas piping shall be primed and painted with two (2) coats of Series 54 Alkyd Gloss Enamel, No. SW4084 Safety Yellow Color.
d. Materials shall be as recommended by the manufacturer for the surface to be finished.
e. Unless otherwise specified, primer shall be by the same manufacturer as the finish coat.
f. Materials shall not be thinned or cut except as recommended by the coating manufacturer. Thinners shall be by the same manufacturer as the primer and finish coat.

E. Valve tags shall be neat circular brass with designations stamped thereon, attached with solid brass jack chain to each valve stem or handle.

F. Each item of equipment such as pumps, water heaters, tempering valves and equipment control devices such as motor starters, disconnect switches, etc. shall be properly marked with laminated engraved plastic nameplates fastened with sheet metal screws, bolts, rivets or permanent adhesive. Pressure sensitive tape is not acceptable.

G. All piping, insulated and un-insulated, shall be identified with Seton Ultra-Mark or equal wrap around piping system markers and arrow flow directional marker. Markers shall be pre-coiled, semi-rigid plastic or polyester with sealed color graphics. Markers shall be minimum 12 inches long with 1-¼ inch high letters, formed to cover entire circumference of the pipe. Markers shall be attached to piping using plastic tie wraps. Pipe identification shall use the same designations or abbreviations used on the drawings. Marker colors shall be in accordance with ANSI.

H. For field applications within the weatherproofing system, all paints, adhesives and sealants shall comply with the requirements of the California Health Services Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers.

PART 3 - EXECUTION

3.01 WORKMANSHIP:

A. The work shall be accomplished by qualified mechanics skilled in the painting trade. Painting of equipment, piping, ductwork and other materials shall not commence until all testing is complete and systems are ready for operation. Materials shall be applied according to manufacturer's directions. All containers shall be securely closed when not in use. Flammable materials shall not be stored on premises. Flammable waste shall be disposed of daily in devices approved for such purposes. Materials shall be evenly spread, and smoothly flowed on without runs or sags. Each coat shall be thoroughly dry before application of succeeding coats.

3.02 PROTECTION OF WORK:

A. The painters shall protect all adjacent surfaces with drop covers during the process of painting. Upon completion, paint spots, if any, shall be removed from all surfaces.

3.03 PREPARATION OF SURFACE:

A. Surfaces to be painted shall be completely dry before applying paint. Metal surfaces shall be cleaned with mineral spirits before applying materials. Rust and scale shall be removed by wire brushing or sanding. Galvanized surfaces shall be chemically pretreated with crystalline (zinc phosphate) phosphate in strict accordance with the manufacturer's recommendations. Surfaces shall not be painted when the temperature is, or is likely to be, near the freezing point, or when they are exposed to hot sun.

3.04 **IDENTIFICATION OF PIPES AND EQUIPMENT**:

A. Equipment: After all other painting is completed; each major item of equipment shall be properly identified with nameplates. Identification symbols and designations shall be the same as shown on the Contract Documents. Where equipment is installed above lay-in ceilings the plastic nameplate shall be adhered to the face of the T-bar support so that it can be identified from within the space.

B. Apply piping system markers after completion of required insulation and finishes on piping systems. Markers shall be applied in the following locations and where identified by the Engineer:

1. At each valve and at connection to equipment.
2. At every tee and branch connection.
3. At each riser including branch risers from mains.
4. At each side of a pipe passage through floors, walls and partitions.
5. Every 15 feet on straight runs of piping mains and branches.
6. Within 6 feet of elbows (each side).
7. At access doors or similar points that permit view of concealed piping.
8. Markers shall be provided on all piping above lay-in ceilings.
9. Provide arrow markers showing direction of flow incorporated into, or adjacent to, each piping system marker.
10. Apply all piping system markers where view is unobstructed, and legends can be read and easily identified.
11. Apply all tags and piping system markers in accordance with the supplier's instructions.

END OF SECTION

SECTION 22 0700

PLUMBING INSULATION

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Insulation Materials:
      a. Calcium silicate.
      b. Flexible elastomeric.
      c. Mineral fiber.
      d. Phenolic.
      e. Polyolefin.
   2. Insulating cements.
   3. Adhesives.
   4. Sealants.
   5. Factory-applied jackets.
   6. Field-applied jackets.
   7. Tapes.
   8. Securements.
   9. Corner angles.

1.03 DEFINITIONS

A. Runout: Last section of pipe from branch or main to fixtures or equipment.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Include thermal conductivity, thickness, and jackets (both factory and field applied, if any). Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

B. LEED Submittal:
   1. Product Data for Credit EQ 4.1: For adhesives and sealants, including printed statement of VOC content.

C. Shop Drawings:
   1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
   2. Detail attachment and covering of heat tracing inside insulation.
   3. Detail insulation application at pipe expansion joints for each type of insulation.
   4. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
   5. Detail removable insulation at piping specialties, equipment connections, and access panels.
   6. Detail application of field-applied jackets.
   7. Detail application at linkages of control devices.
   8. Detail field application for each equipment type.

D. Qualification Data: For qualified Installer.

E. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation

materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.

F. Field quality-control reports.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

B. Fire-Test-Response Characteristics: Insulation and related materials shall have fire-test-response characteristics indicated, as determined by testing identical products per ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing and inspecting agency.

1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.07 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Section 22 05 29 “Hangers and Supports for Plumbing Piping and Equipment."

B. Coordinate clearance requirements with piping Installer for piping insulation application and equipment Installer for equipment insulation application. Before preparing piping Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

C. Coordinate installation and testing of heat tracing.

1.08 SCHEDULING

A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.01 INSULATION MATERIALS [S]

A. Comply with requirements in Part 3 schedule articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.

D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

F. Calcium Silicate:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Industrial Insulation Group (The); Thermo-12 Gold.
2. Preformed Pipe Sections: Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C 533, Type I.
3. Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C 533, Type I.
4. Prefabricated Fitting Covers: Comply with ASTM C 450 and ASTM C 585 for dimensions used in preforming insulation to cover valves, elbows, tees, and flanges.

G. Flexible Elastomeric: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C 534, Type I for tubular materials and Type II for sheet materials.

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Aeroflex USA Inc.; Aerocel.
   b. Armacell LLC; AP Armaflex.
   c. RBX Corporation; Insul-Sheet 1800 and Insul-Tube 180.

H. Mineral-Fiber, Preformed Pipe Insulation:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Fibrex Insulations Inc.; Coreplus 1200.
   b. Johns Manville; Micro-Lok.
   c. Knauf Insulation; 1000(Pipe Insulation.
   d. Manson Insulation Inc.; Alley-K.
   e. Owens Corning; Fiberglas Pipe Insulation.
2. Type I, 850 deg F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type I, Grade A, [**without factory-applied jacket**] [**with factory-applied ASJ**] [**with factory-applied ASJ-SSL**]. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

I. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied [**ASJ**] [**FSK jacket**] complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. CertainTeed Corp.; CrimpWrap.
   b. Johns Manville; MicroFlex.
   c. Knauf Insulation; Pipe and Tank Insulation.
   d. Manson Insulation Inc.; AK Flex.
   e. Owens Corning; Fiberglas Pipe and Tank Insulation.

2.02 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated, unless otherwise indicated.

2.03 SEALANTS

A. Joint Sealants: Provide sealants either manufactured or recommended by the insulation material manufacturer.

2.04 FACTORY-APPLIED JACKETS [S]

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
4. PVDC Jacket for Outdoor Applications: 6-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.01 perms when tested according to ASTM E 96 and with a flame-spread index of 5 and a smoke-developed index of 25 when tested according to ASTM E 84.
    a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
        1) Dow Chemical Company (The); Saran 540 Vapor Retarder Film and Saran 560 Vapor Retarder Film.

2.05 FIELD-APPLIED JACKETS [S]

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. Metal Jacket:

1. Aluminum Jacket: Comply with ASTM B 209, Alloy 3003, 3005, 3105 or 5005, Temper H-14.
    a. Factory cut and rolled to size.
    b. Finish and thickness are indicated in field-applied jacket schedules.
    c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper
    d. Moisture Barrier for Outdoor Applications: 3-mil-thick, heat-bonded polyethylene and kraft paper.
    e. Factory-Fabricated Fitting Covers:
        1) Same material, finish, and thickness as jacket.
        2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
        3) Tee covers.
        4) Flange and union covers.
        5) End caps.
        6) Beveled collars.
        7) Valve covers.
        8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.
2. Stainless-Steel Jacket: ASTM A 167 or ASTM A 240.
    a. Factory cut and rolled to size.
    b. Material, finish, and thickness are indicated in field-applied jacket schedules.
    c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper
    d. Moisture Barrier for Outdoor Applications: 3-mil-thick, heat-bonded polyethylene and kraft paper.
        1) Same material, finish, and thickness as jacket.
        2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
        3) Tee covers.
        4) Flange and union covers.
        5) End caps.
        6) Beveled collars.
        7) Valve covers.

8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

C. Underground Direct-Buried Jacket: 125-mil- thick vapor barrier and waterproofing membrane consisting of a rubberized bituminous resin reinforced with a woven-glass fiber or polyester scrim and laminated aluminum foil.

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Pittsburgh Corning Corporation; Pittwrap.
   b. Polyguard; Insulrap No Torch 125.

2.06 TAPES

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835.
   b. Compac Corp.; 104 and 105.
   c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ.
   d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
2. Width: 3 inches.
3. Thickness: 11.5 mils.
4. Adhesion: 90 ounces force/inch in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
   b. Compac Corp.; 110 and 111.
   c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK.
   d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
2. Width: 3 inches.
3. Thickness: 6.5 mils.
4. Adhesion: 90 ounces force/inch in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

C. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800.
   b. Compac Corp.; 120.
   c. Ideal Tape Co., Inc., an American Biltrite Company; 488 AWF.
   d. Venture Tape; 3520 CW.
2. Width: 2 inches.
3. Thickness: 3.7 mils.
4. Adhesion: 100 ounces force/inch in width.
5. Elongation: 5 percent.
6. Tensile Strength: 34 lbf/inch in width.

D. PVDC Tape: White vapor-retarder PVDC tape with acrylic adhesive.

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Dow Chemical Company (The); Saran 540 Vapor Retarder Tape.
2. Width: 3 inches.
3. Film Thickness: **4 mils**.
4. Adhesive Thickness: 1.5 mils.
5. Elongation at Break: 145 percent.
6. Tensile Strength: 55 lbf/inch in width.

2.07 SECUREMENTS

A. Bands:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Childers Products; Bands.
      b. PABCO Metals Corporation; Bands.
      c. RPR Products, Inc.; Bands.
   2. Stainless Steel: ASTM A 167 or ASTM A 240/A 240M, Type [**304**] [**316**] [**304 or Type 316**]; 0.015 inch thick, [**1/2 inch**] [**3/4 inch**] wide with [**wing seal**] [**closed seal**] [**wing or closed seal**].
   3. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, [**1/2 inch**] [**3/4 inch**] wide with [**wing seal**] [**closed seal**] [**wing or closed seal**].
   4. Springs: Twin spring set constructed of stainless steel with ends flat and slotted to accept metal bands. Spring size determined by manufacturer for application.

B. Staples: Outward-clinching insulation staples, nominal 3/4-inch- wide, stainless steel or Monel.

2.08 CORNER ANGLES

A. PVC Corner Angles: 30 mils thick, minimum 1 by 1 inch, PVC according to ASTM D 1784, Class 16354-C. White or color-coded to match adjacent surface.

B. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B 209, Alloy 3003, 3005, 3105 or 5005; Temper H-14.

C. Stainless-Steel Corner Angles: 0.024 inch thick, minimum 1 by 1 inch, stainless steel according to ASTM A 167 or ASTM A 240/A 240M, Type [**304**] [**316**] [**304 or 316**].

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.
   1. Verify that systems and equipment to be insulated have been tested and are free of defects.
   2. Verify that surfaces to be insulated are clean and dry.
   3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Surface Preparation: Clean and prepare surfaces to be insulated. Before insulating, apply a corrosion coating to insulated surfaces as follows:
   1. Stainless Steel: Coat 300 series stainless steel with an epoxy primer 5 mils thick and an epoxy finish 5 mils thick if operating in a temperature range between 140 and 300 deg F. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.

2. Carbon Steel: Coat carbon steel operating at a service temperature between 32 and 300 deg F with an epoxy coating. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.

C. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

3.03 GENERAL INSTALLATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment and piping including fittings, valves, and specialties.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment and pipe system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Keep insulation materials dry during application and finishing.

H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

I. Install insulation with least number of joints practical.

J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
   1. Install insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
   3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
   4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

L. Install insulation with factory-applied jackets as follows:
   1. Draw jacket tight and smooth.
   2. Cover circumferential joints with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
   3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at [**2 inches**] [**4 inches**] o.c.
      a. For below ambient services, apply vapor-barrier mastic over staples.
   4. Cover joints and seams with tape as recommended by insulation material manufacturer to maintain vapor seal.

5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.

M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

P. For above ambient services, do not install insulation to the following:
   1. Vibration-control devices.
   2. Testing agency labels and stamps.
   3. Nameplates and data plates.
   4. Manholes.
   5. Handholes.
   6. Cleanouts.

3.04 PENETRATIONS

A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
   1. Seal penetrations with flashing sealant.
   2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
   3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
   4. Seal jacket to roof flashing with flashing sealant.

B. Insulation Installation at Underground Exterior Wall Penetrations: Terminate insulation flush with sleeve seal. Seal terminations with flashing sealant.

C. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
   1. Seal penetrations with flashing sealant.
   2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
   3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
   4. Seal jacket to wall flashing with flashing sealant.

D. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

E. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.
   1. Comply with requirements in Division 07 Section "Penetration Firestopping" for firestopping and fire-resistive joint sealers.

F. Insulation Installation at Floor Penetrations:
   1. Pipe: Install insulation continuously through floor penetrations.
   2. Seal penetrations through fire-rated assemblies. Comply with requirements in Division 07 Section "Penetration Firestopping."

3.05 EQUIPMENT, TANK, AND VESSEL INSULATION INSTALLATION [USE ONLY IF TANKS ARE NOT PRE-INSULATED]

A. Mineral Fiber, Pipe and Tank Insulation Installation for Tanks and Vessels: Secure insulation with adhesive and anchor pins and speed washers.

1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for **100** percent coverage of tank and vessel surfaces.
2. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.
3. Protect exposed corners with secured corner angles.
4. Install adhesively attached or self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:
    a. Do not weld anchor pins to ASME-labeled pressure vessels.
    b. Select insulation hangers and adhesive that are compatible with service temperature and with substrate.
    c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints, and 16 inches o.c. in both directions.
    d. Do not overcompress insulation during installation.
    e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.
    f. Impale insulation over anchor pins and attach speed washers.
    g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
5. Secure each layer of insulation with stainless-steel or aluminum bands. Select band material compatible with insulation materials.
6. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch prestressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings, and stretch prestressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional circumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.
7. Stagger joints between insulation layers at least 3 inches.
8. Install insulation in removable segments on equipment access doors, manholes, handholes, and other elements that require frequent removal for service and inspection.
9. Bevel and seal insulation ends around manholes, handholes, ASME stamps, and nameplates.
10. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.

3.06 GENERAL PIPE INSULATION INSTALLATION

A. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.

B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:

1. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity, unless otherwise indicated.
2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.

3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below ambient services, provide a design that maintains vapor barrier.
6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below ambient services and a breather mastic for above ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
8. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
9. Stencil or label the outside insulation jacket of each union with the word "UNION." Match size and color of pipe labels.

C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes, vessels, and equipment. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

D. Install removable insulation covers at locations indicated. Installation shall conform to the following:
1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
3. Construct removable valve insulation covers in same manner as for flanges except divide the two-part section on the vertical center line of valve body.
4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.07 CALCIUM SILICATE INSULATION INSTALLATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation materials.
2. Install 2-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.
3. Apply a skim coat of mineral-fiber, hydraulic-setting cement to insulation surface. When cement is dry, apply flood coat of lagging adhesive and press on one layer of glass cloth or tape. Overlap edges at least 1 inch. Apply finish coat of lagging adhesive over glass cloth or tape. Thin finish coat to achieve smooth, uniform finish.

3.08 FLEXIBLE ELASTOMERIC INSULATION INSTALLATION

A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

B. Insulation Installation on Pipe Flanges:
1. Install pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as pipe insulation.
4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

C. Insulation Installation on Pipe Fittings and Elbows:
1. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed valve covers manufactured of same material as pipe insulation when available.
2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.
4. Secure insulation to valves and specialties and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.09 MINERAL-FIBER INSULATION INSTALLATION

A. Insulation Installation on Straight Pipes and Tubes:
1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above ambient surfaces, secure laps with outward clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets on below ambient surfaces, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:
1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.

4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:
1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
4. Install insulation to flanges as specified for flange insulation application.

3.10 PHENOLIC INSULATION INSTALLATION

A. General Installation Requirements:
1. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation materials.
2. Install 2-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with 0.062-inch wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.

B. Insulation Installation on Straight Pipes and Tubes:
1. Secure each layer of insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above ambient services, secure laps with outward clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets with vapor retarders on below ambient services, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

C. Insulation Installation on Pipe Flanges:
1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of block insulation of same material and thickness as pipe insulation.

D. Insulation Installation on Pipe Fittings and Elbows:
1. Install preformed insulation sections of same material as straight segments of pipe insulation. Secure according to manufacturer's written instructions.

E. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed insulation sections of same material as straight segments of pipe insulation. Secure according to manufacturer's written instructions.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.11 FIELD-APPLIED JACKET INSTALLATION

A. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.12 FINISHES

A. Equipment and Pipe Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 22 05 53 “Painting and Identification for Plumbing Piping and Equipment”.

B. Do not field paint aluminum or stainless-steel jackets.

3.13 FIELD QUALITY CONTROL

A. Testing Agency: [**Owner will engage**] [**Engage**] a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:

1. Inspect field-insulated equipment, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to [**one**] <**Insert number**> location(s) for each type of equipment defined in the "Equipment Insulation Schedule" Article. For large equipment, remove only a portion adequate to determine compliance.
2. Inspect pipe, fittings, strainers, and valves, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to [**three**] <**Insert number**> locations of straight pipe, [**three**] <**Insert number**> locations of threaded fittings, [**three**] <**Insert number**> locations of welded fittings, [**two**] <**Insert number**> locations of threaded strainers, [**two**] <**Insert number**> locations of welded strainers, [**three**] <**Insert number**> locations of threaded valves, and [**three**] <**Insert number**> locations of flanged valves for each pipe service defined in the "Piping Insulation Schedule, General" Article.

D. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.14 EQUIPMENT INSULATION SCHEDULE

A. Insulation materials and thicknesses are identified below. If more than one material is listed for a type of equipment, selection from materials listed is Contractor's option.

B. Insulate indoor and outdoor equipment in paragraphs below that is not factory insulated.

C. Domestic water and domestic water hydropneumatic tank insulation shall be **[one of]** the following: [**Use only where storage tanks are not factory insulated]**.

1. Flexible Elastomeric: **1 inch** thick.
2. Mineral-Fiber Pipe and Tank: **1 inch** thick.

D. Domestic hot-water storage tank insulation shall be [**one of**] the following, of thickness to provide an R-value of **12.5**: **[Use only where storage tanks are not factory insulated]**.

1. Mineral-fiber pipe and tank.
2. Phenolic.

E. Piping system filter-housing insulation shall be the following:

1. Mineral-Fiber Pipe and Tank: [**2 inches**] <**Insert thickness**> thick.

3.15 PIPING INSULATION SCHEDULE, GENERAL

A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
   1. Drainage piping located in crawl spaces.
   2. Chrome-plated pipes and fittings unless there is a potential for personnel injury.

3.16 INDOOR PIPING INSULATION SCHEDULE

A. Domestic Cold Water:
   1. Insulation shall be the following:
      a. Calcium Silicate: NPS 2-1/2 pipe and larger, 1inch thick at pipe hangers. Calcium silicate shall be installed in preformed sections 12inches long enclosing pipe around entire circumference.
      b. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
      c. Flexible Elastomeric: 1 inch thick in walls and pipe chases after Building “Dry-In”.
      d. Polyolefin: 1 inch thick under floor slab and in walls and chases prior to Building “Dry-In”.
   2. Runouts NPS 2 and smaller: Insulation shall be the following:
      a. Mineral–Fiber, Preformed Pipe Insulation, Type I: 1/2 inch thick.
      b. Flexible Elastomeric: 1/2 inch thick in walls and chases after Building “Dry-In”.
      c. Polyolefin: 1/2 inch thick in walls and chases prior to Building “Dry In”.

B. Domestic Hot and Recirculated Hot Water:
   1. NPS 2 and Smaller: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
      b. Flexible Elastomeric: 1 inch thick in walls and chases after Building Dry-In”.
      c. Polyolefin: 1 inch thick under floor slab, and in walls and chases prior to building “Dry In”.
   2. NPS 2-1/2 and Larger: Insulation shall be the following:
      a. Calcium Silicate: 1-1/2 inch thick at pipe hangers. Calcium silicate shall be installed in preformed sections 12 inches long enclosing pipe around entire circumference.
      b. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1- 1/2 inches thick
      c. Flexible Elastomeric: 1-1/2 inches thick, in walls and chases after Building “Dry-In”.
      d. Polyolefin: 1- 1/2 inches thick in walls and chases prior to Building “Dry-In”.
   3. Runouts NPS 2”and smaller”
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
      b. Flexible Elastomeric: 1 inch thick in walls and chases after Building “Dry-In”.
      c. Polyolefin: 1 inch thick in walls and chases prior to Building “Dry-In”.

C. Stormwater and Overflow:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
      b. Interior rain conductors, and secondary rain conductors including fittings, from the bottom of the roof drains to 3’-6” below the last fitting where the lowest horizontal offset turns down into the vertical.
      c. Down 4’-0” below the roof drain on vertical rain conductors without horizontal offsets.

D. Roof Drain and Overflow Drain Bodies:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.

E. Storm Drain or Sanitary Waste Piping Where Heat Tracing Is Installed:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1-1/2 inches thick.

F. Floor Drains, Traps, and Sanitary Drain Piping Receiving Condensate and Equipment Drain Water below 60 Deg F:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1/2 inch thick.

G. Hot Service Drains: **[Sterlizer]**
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe, Type I or II: 1 inch thick.

H. Hot Service Vents: **[Sterlizer]**
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe, Type I or II: 1 inch thick.

3.17 OUTDOOR, ABOVEGROUND PIPING INSULATION SCHEDULE

A. Domestic Water Piping:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 2 inches thick.
      b. Polyolefin: 2 inches thick.

B. Domestic Hot and Recirculated Hot Water:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 2 inches thick.
      b. Polyolefin: 2 inches thick.

C. Storm Drain or Sanitary Waste Piping Where Heat Tracing Is Installed:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 2 inches thick.

3.18 OUTDOOR, UNDERGROUND PIPING INSULATION SCHEDULE

A. Loose-fill insulation, for belowground piping, is specified in Division 33 piping distribution Sections.

3.19 INDOOR, FIELD-APPLIED JACKET SCHEDULE

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Piping, Concealed:
   1. None.
   2. Aluminum, [**Smooth**] [**Corrugated**] [**Stucco Embossed**]: [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] [**0.032 inch**] [**0.040 inch**] thick.
   3. Painted Aluminum, [**Smooth**] [**Corrugated**] [**Stucco Embossed**]: [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] [**0.032 inch**] thick.
   4. Stainless Steel, Type [**304**] [**316**] [**304 or 316**], [**Smooth 2B Finish**] [**Corrugated**] [**Stucco Embossed**]: [**0.010 inch**] [**0.016 inch]** [**0.020 inch**] [**0.024 inch**] thick.
   5. <**Insert jacket type.**>

D. Piping, Exposed:
   1. None.
   2. Aluminum, [**Smooth**] [**Corrugated**] [**Stucco Embossed**]: [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] [**0.032 inch**] [**0.040 inch**] thick.
   3. Painted Aluminum, [**Smooth**] [**Corrugated**] [**Stucco Embossed**]: [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] [**0.032 inch**] thick.
   4. Stainless Steel, Type [**304**] [**316**] [**304 or 316**], [**Smooth 2B Finish**] [**Corrugated**] [**Stucco Embossed**]: [**0.010 inch**] [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] thick.
   5. <**Insert jacket type.**>

3.20 OUTDOOR, FIELD-APPLIED JACKET SCHEDULE

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Piping, Concealed:

1. None.
2. Aluminum, [**Smooth**] [**Corrugated**] [**Stucco Embossed**]: [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] [**0.032 inch**] [**0.040 inch**] thick.
3. Painted Aluminum, [**Smooth**] [**Corrugated**] [**Stucco Embossed**]: [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] [**0.032 inch**] thick.
4. Stainless Steel, Type [**304**] [**316**] [**304 or 316**], [**Smooth 2B Finish**] [**Corrugated**] [**Stucco Embossed**]: [**0.010 inch**] [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] thick.
5. <**Insert jacket type.**>

D. Piping, Exposed:

1. [**Painted**]Aluminum, [**Smooth**] [**Corrugated**] [**Stucco Embossed**] [**with Z-Shaped Locking Seam**]: [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] [**0.032 inch**] [**0.040 inch**] thick.
2. Stainless Steel, Type [**304**] [**316**] [**304 or 316**], [**Smooth 2B Finish**] [**Corrugated**] [**Stucco Embossed**] [**with Z-Shaped Locking Seam**]: [**0.010 inch**] [**0.016 inch**] [**0.020 inch**] [**0.024 inch**] thick.
3. <**Insert jacket type.**>

3.21 UNDERGROUND, FIELD-INSTALLED INSULATION JACKET

A. For underground direct-buried piping applications, install underground direct-buried jacket over insulation material.

END OF SECTION

SECTION 22 1116

DOMESTIC WATER PIPING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Under-building slab and above ground domestic water pipes, tubes, fittings, and specialties inside the building.
   2. Specialty valves.
   3. Flexible connectors.
   4. Water meters furnished by utility company for installation by Contractor.
   5. Water meters.

1.03 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Domestic water piping and support and installation shall withstand effects of earthquake motions determined according to SEI/ASCE 7” Minimum Design loads for Buildings and other Structures”.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Comply with requirements in Division 1 and Section 22 04 00 “General Requirements for Plumbing”.

B. LEED Submittal:
   1. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, including printed statement of VOC content.

C. Water Samples: Specified in "Cleaning" Article.

D. Coordination Drawings: For piping in equipment rooms and other congested areas, drawn to scale, on which the following items are coordinated with each other, using input from Installers of the items involved:
   1. Fire-suppression-water piping.
   2. Domestic water piping.
   3. Compressed air piping.
   4. HVAC hydronic piping.
   5. Electric Switchgear, Panelboards

E. Field quality-control reports.

1.05 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. NSF Compliance for materials that will be in contact with potable water :
   1. Comply with NSF 14 for plastic, potable domestic water piping and components.
   2. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9."
   3. Comply with NSF 372, "Drinking Water System Components- Lead Content."

1.06 PROJECT CONDITIONS

A. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:
   1. Notify Owner no fewer than two days in advance of proposed interruption of water service.
   2. Do not proceed with interruption of water service without Owner's written permission.

1.07 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 COPPER TUBE AND FITTINGS

A. Hard Copper Tube: Under-building slab ASTMB88, Type K; above ground ASTM B 88, Type L; water tube, drawn temper.
   1. Cast-Copper Solder-Joint Fittings: ASME B16.18, pressure fittings.
   2. Wrought-Copper Solder-Joint Fittings: ASME B16.22, wrought-copper pressure fittings.
   3. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends.
   4. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.
   5. Copper Pressure-Seal-Joint Fittings:
      a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) Elkhart Products Corporation; Industrial Division.
         2) NIBCO INC.
         3) Viega; Plumbing and Heating Systems.
      b. NPS 2 and Smaller: Wrought-copper fitting with EPDM-rubber O-ring seal in each end.
      c. NPS 2-1/2 to NPS 4: Cast-bronze or wrought-copper fitting with EPDM-rubber O-ring seal in each end.
   6. Copper Push-on-Joint Fittings:
      a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
         1) NVent LLC.
      b. Description: Cast-copper fitting complying with ASME B16.18 or wrought-copper fitting complying with ASME B 16.22; with stainless-steel teeth and EPDM-rubber O-ring seal in each end instead of solder-joint ends.
   7. Copper-Tube Extruded-Tee Connections:
      a. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) T-DRILL Industries Inc.
         2) <**Insert manufacturer's name**>.
      b. Description: Tee formed in copper tube according to ASTM F 2014.

B. Soft Copper Tube: Under building slab, ASTM B 88, Type K water tube, annealed temper.

1. Copper Solder-Joint Fittings: ASME B16.22, wrought-copper pressure fittings.
2. Copper Pressure-Seal-Joint Fittings:
    a. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
        1) Elkhart Products Corporation; Industrial Division.
        2) NIBCO INC.
        3) Viega; Plumbing and Heating Systems.
    b. NPS 2 and Smaller: Wrought-copper fitting with EPDM-rubber O-ring seal in each end.
    c. NPS 3 and NPS 4: Cast-bronze or wrought-copper fitting with EPDM-rubber O-ring seal in each end.

2.03 DUCTILE-IRON PIPE AND FITTINGS

A. Mechanical-Joint, Ductile-Iron Pipe: AWWA C151, with mechanical-joint bell and plain spigot end unless grooved or flanged ends are indicated.
    1. Standard-Pattern, Mechanical-Joint Fittings: AWWA C110, ductile or gray iron.
        a. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

2.04 PIPING JOINING MATERIALS

A. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch thick or ASME B16.21, nonmetallic and asbestos free, unless otherwise indicated; full-face or ring type unless otherwise indicated.

B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.

C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

D. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.

E. Solvent Cements for Joining CPVC Piping and Tubing: ASTM F 493.
    1. Use CPVC solvent cement that has a VOC content of 490 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
    2. Use adhesive primer that has a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

F. Solvent Cements for Joining PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.
    1. se PVC solvent cement that has a VOC content of 510 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
    2. Use adhesive primer that has a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

G. Plastic, Pipe-Flange Gaskets, Bolts, and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.

2.05 SPECIALTY VALVES [S]

A. Comply with requirements in Section 22 05 23"General-Duty Valves for Plumbing Piping" for general-duty metal valves.

B. Comply with requirements in Section 22 11 19 "Domestic Water Piping Specialties" for balancing valves, drain valves, backflow preventers, and vacuum breakers.

2.06 DIELECTRIC FITTINGS

A. General Requirements: Assembly of copper alloy and ferrous materials or ferrous material body with separating nonconductive insulating material suitable for system fluid, pressure, and temperature.

B. Dielectric Unions:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
      a. Capitol Manufacturing Company.
      b. Central Plastics Company.
      c. EPCO Sales, Inc.
      d. Hart Industries International, Inc.
      e. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
      f. Zurn Plumbing Products Group; Wilkins Water Control Products.
   2. Description:
      a. Pressure Rating: [**150 psig**] [**250 psig**] at 180 deg F.
      b. End Connections: Solder-joint copper alloy and threaded ferrous.

C. Dielectric Flanges:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
      a. Capitol Manufacturing Company.
      b. Central Plastics Company.
      c. EPCO Sales, Inc.
      d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
   2. Description:
      a. Factory-fabricated, bolted, companion-flange assembly.
      b. Pressure Rating: [**150 psig**] [**175 psig minimum**] [**300 psig**].
      c. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

D. Dielectric-Flange Kits:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Advance Products & Systems, Inc.
      b. Calpico, Inc.
      c. Central Plastics Company.
      d. Pipeline Seal and Insulator, Inc.
   2. Description:
      a. Nonconducting materials for field assembly of companion flanges.
      b. Pressure Rating: [**150 psig**]
      c. Gasket: Neoprene or phenolic.
      d. Bolt Sleeves: Phenolic or polyethylene.
      e. Washers: Phenolic with steel backing washers.

E. Dielectric Couplings:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Calpico, Inc.
      b. Lochinvar Corporation.
   2. Description:
      a. Galvanized-steel coupling.
      b. Pressure Rating: 300 psig at 225 deg F .
      c. End Connections: Female threaded.
      d. Lining: Inert and noncorrosive, thermoplastic.

F. Dielectric Nipples:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Perfection Corporation; a subsidiary of American Meter Company.
   b. Precision Plumbing Products, Inc.
   c. Victaulic Company.
2. Description:
   a. Electroplated steel nipple complying with ASTM F 1545.
   b. Pressure Rating: [**300 psig at 225 deg F**] **temperature**>.
   c. End Connections: Male threaded or grooved.
   d. Lining: Inert and noncorrosive, propylene.

2.07 FLEXIBLE CONNECTORS

A. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Flex-Hose Co., Inc.
   2. Flexicraft Industries.
   3. Flex Pression, Ltd.
   4. Flex-Weld, Inc.
   5. Hyspan Precision Products, Inc.
   6. Mercer Rubber Co.
   7. Metraflex, Inc.
   8. Proco Products, Inc.
   9. Tozen Corporation.
   10. Unaflex, Inc.
   11. Universal Metal Hose; a Hyspan company

B. Bronze-Hose Flexible Connectors: Corrugated-bronze tubing with bronze wire-braid covering and ends brazed to inner tubing.
   1. Working-Pressure Rating: Minimum [**200 psig**] [**250 psig**].
   2. End Connections NPS 2 and Smaller: Threaded copper pipe or plain-end copper tube.
   3. End Connections NPS 2-1/2 and Larger: Flanged copper alloy.

2.08 WATER METERS [S[[O/M]

A. Displacement-Type Water Meters:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
      a. AALIANT; a Venture Measurement Product Line.
      b. ABB.
      c. Badger Meter, Inc.
      d. Carlon Meter.
      e. Mueller Company; Water Products Division.
      f. Schlumberger Limited; Water Division.
      g. Sensus Metering Systems.
   2. Description:
      a. Standard: AWWA C700.
      b. Pressure Rating: 150-psig working pressure.
      c. Body Design: Nutating disc; totalization meter.
      d. Registration: In gallons or cubic feet as required by utility.
      e. Case: Bronze.
      f. End Connections: Threaded.

B. Turbine-Type Water Meters:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. AALIANT; a Venture Measurement Product Line.

b. ABB.
c. Badger Meter, Inc.
d. Hays Fluid Controls.
e. Master Meter, Inc.
f. McCrometer.
g. Mueller Company; Water Products Division.
h. Schlumberger Limited; Water Division.
i. SeaMetrics Inc.
j. Sensus Metering Systems.

2. Description:
   a. Standard: AWWA C701.
   b. Pressure Rating: [**150-psig**] <**Insert pressure**> working pressure.
   c. Body Design: Turbine; totalization meter.
   d. Registration: In gallons or cubic feet as required by utility company.
   e. Case: Bronze.
   f. End Connections for Meters NPS 2 and Smaller: Threaded.
   g. End Connections for Meters NPS 2-1/2 and Larger: Flanged.

C. Compound-Type Water Meters:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
   a. ABB.
   b. Badger Meter, Inc.
   c. Master Meter, Inc.
   d. Mueller Company; Water Products Division.
   e. Schlumberger Limited; Water Division.
   f. Sensus Metering Systems.
   g. <**Insert manufacturer's name**>.
2. Description:
   a. Standard: AWWA C702.
   b. Pressure Rating: 150-psig working pressure.
   c. Body Design: With integral mainline and bypass meters; totalization meter.
   d. Registration: In gallons or cubic feet as required by utility company.
   e. Case: Bronze.
   f. Pipe Connections: Flanged.

D. Fire-Service-Type Water Meters:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Badger Meter, Inc.
   b. Mueller Company; Water Products Division.
   c. Schlumberger Limited; Water Division.
   d. Sensus Metering Systems.
   e. <**Insert manufacturer's name**>.
2. Description:
   a. Standard: AWWA C703 and UL listing.
   b. Pressure Rating: 175-psig working pressure.
   c. Body Design:
      1) Proportional, Detector-Type Water Meters: With meter on bypass.
         a) Bypass Meter: [**AWWA C701, turbine**] [**AWWA C702, compound**] type with bronze case; size not less than one-half nominal size of main-line meter.
      2) Turbine-Type Water Meters: With strainer, and with meter on bypass.
         a) Strainer: Full size, matching water meter.
         b) Bypass Meter: AWWA C701, turbine type with bronze case; not less than NPS 2.

d. Registration: In gallons or cubic feet as required by utility company.
e. Case: Bronze.
f. Pipe Connections for Meters NPS 2 and Smaller: Threaded.
g. Pipe Connections for Meters NPS 2-1/2 and Larger: Flanged.

E. Remote Registration System: Direct-reading type complying with AWWA C706; modified with signal transmitting assembly, low-voltage connecting wiring, and remote register assembly as required by utility company.

F. Remote Registration System: Encoder type complying with AWWA C707; modified with signal transmitting assembly, low-voltage connecting wiring, and remote register assembly as required by utility company.

PART 3 - EXECUTION

3.01 EARTHWORK

A. Comply with requirements in **[Section 22 04 00 "General Requirements for Plumbing"] Section 31 20 00 "Earth Moving"** for excavating, trenching, and backfilling.

3.02 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of domestic water piping. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install copper tubing under building slab according to CDA's "Copper Tube Handbook."

C. Install ductile-iron piping under building slab with restrained joints according to AWWA C600 and AWWA M41.

D. Install shutoff valve, hose-end drain valve, strainer, pressure gage, and test tee with valve, inside the building at each domestic water service entrance. Comply with requirements in Section 22 11 19 "Domestic Water Piping Specialties" for pressure gages, drain valves and strainers.

E. Install shutoff valve immediately upstream of each dielectric fitting.

F. Install water-pressure-reducing valves downstream from shutoff valves. Comply with requirements in Section 22 11 19 "Domestic Water Piping Specialties" for pressure-reducing valves.

G. Install domestic water piping level [**with 0.25 percent slope downward toward drain**] [**without pitch**] and plumb.

H. Rough-in domestic water piping for water-meter installation according to utility company's requirements.

I. Install seismic restraints on piping. Comply with requirements in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

J. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.

K. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

L. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal, and coordinate with other services occupying that space.

M. Install piping adjacent to equipment and specialties to allow service and maintenance.

N. Install piping to permit valve servicing.

O. Install nipples, unions, special fittings, and valves with pressure ratings the same as or higher than system pressure rating used in applications below unless otherwise indicated.

P. Install piping free of sags and bends.

Q. Install fittings for changes in direction and branch connections.

R. Install unions in copper tubing at final connection to each piece of equipment, machine, and specialty.

S. Install pressure gages on suction and discharge piping from each plumbing pump and packaged booster pump. Comply with requirements in Section "22 11 19 “Domestic Water Piping Specialties” for pressure gages.

T. Install thermostats in hot-water circulation piping. Comply with requirements in Section 22 11 23"Domestic Water Pumps" for thermostats.

U. Install thermometers at inlet of hot water circulating pump and outlet piping from each water heater. Comply with requirements in Section 22 11 19 "Domestic Water Piping Specialties" for thermometers.

V. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 22 04 00 "General Requirements for Plumbing."

W. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 22 04 00 "General Requirements for Plumbing."

3.03 JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs.

B. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

C. Brazed Joints: Join copper tube and fittings according to CDA's "Copper Tube Handbook," "Brazed Joints" Chapter.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux to end of tube. Join copper tube and fittings according to ASTM B 828 or CDA's "Copper Tube Handbook."

E. Pressure-Sealed Joints: Join copper tube and pressure-seal fittings with tools recommended by fitting manufacturer.

F. Copper-Tubing, Push-on Joints: Clean end of tube. Measure insertion depth with manufacturer's depth gage. Join copper tube and push-on-joint fittings by inserting tube to measured depth.

G. Extruded-Tee Connections: Form tee in copper tube according to ASTM F 2014. Use tool designed for copper tube; drill pilot hole, form collar for outlet, dimple tube to form seating stop, and braze branch tube into collar.

H. Flanged Joints: Select appropriate asbestos-free, nonmetallic gasket material in size, type, and thickness suitable for domestic water service. Join flanges with gasket and bolts according to ASME B31.9.

I. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements. Apply primer.
   2. CPVC Piping: Join according to ASTM D 2846 Appendix.
   3. PVC Piping: Join according to ASTM D 2855.

J. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.

3.04 VALVE INSTALLATION

A. General-Duty Valves: Comply with requirements in Section 22 05 23 "General-Duty Valves for Plumbing Piping" for valve installations.

B. Install shutoff valve close to water main on each branch and riser serving plumbing fixtures or equipment, on each water supply to equipment, and on each water supply to plumbing fixtures that do not have supply stops. Use ball valves for piping NPS 2 and smaller. Use ball or gate valves for piping NPS 2-1/2 and larger.

C. Install drain valves for equipment at base of each water riser, at low points in horizontal piping, and where required to drain water piping. Drain valves are specified in Section 22 11 19 "Domestic Water Piping Specialties."

1. Hose-End Drain Valves: At low points in water mains, risers, and branches.
2. Stop-and-Waste Drain Valves: Instead of hose-end drain valves where indicated.

D. Install balancing valve in each hot-water circulation return branch and discharge side of each pump and circulator. Comply with requirements in Section 22 11 19 "Domestic Water Piping Specialties" for balancing valves.

3.05 TRANSITION FITTING INSTALLATION

A. Install transition couplings at joints of dissimilar piping.

B. Transition Fittings in Underground Domestic Water Piping:

1. NPS 1-1/2 and Smaller: Fitting-type coupling.
2. NPS 2 and Larger: Sleeve-type coupling.

C. Transition Fittings in Aboveground Domestic Water Piping NPS 2 and Smaller: Plastic-to-metal transition [**fittings**] [**or**] [**unions**].

3.06 DIELECTRIC FITTING INSTALLATION

A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

B. Dielectric Fittings for NPS 2 and Smaller: Use dielectric unions.

C. Dielectric Fittings for NPS 2-1/2 to NPS 4: Use dielectric flanges.

3.07 FLEXIBLE CONNECTOR INSTALLATION

A. Install flexible connectors in suction and discharge piping connections to each domestic water booster pump.

B. Install bronze-hose flexible connectors in copper domestic water tubing.

3.08 WATER METER INSTALLATION

A. Rough-in domestic water piping [**for water meter installation**] [**, and install water meters**] according to utility company's requirements.

B. Water meters will be furnished and installed by utility company.

C. Install water meters according to AWWA M6, utility company's requirements, and the following:

D. Install displacement-type water meters with shutoff valve on water-meter inlet. Install valve on water-meter outlet and valved bypass around meter unless prohibited by authorities having jurisdiction.

E. Install turbine-type water meters with shutoff valve on water-meter inlet. Install valve on water-meter outlet and valved bypass around meter unless prohibited by authorities having jurisdiction.

F. Install compound-type water meters with shutoff valves on water-meter inlet and outlet and on valved bypass around meter. Support meters, valves, and piping on brick or concrete piers.

G. Install fire-service water meters with shutoff valves on water-meter inlet and outlet and on full-size valved bypass around meter. Support meter, valves, and piping on brick or concrete piers.

H. Install remote registration system according to standards of utility company and of authorities having jurisdiction.

3.09 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

B. Comply with requirements in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support products and installation.
   1. Vertical Piping: MSS Type 8 or 42, clamps.
   2. Individual, Straight, Horizontal Piping Runs:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet If Indicated: MSS Type 49, spring cushion rolls.
   3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   4. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support vertical piping and tubing at base and at each floor.

D. Rod diameter may be reduced one size for double-rod hangers, to a minimum of 3/8 inch.

E. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 3/4 and Smaller: 60 inches with 3/8-inch rod.
   2. NPS 1 and NPS 1-1/4: 72 inches with 3/8-inch rod.
   3. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
   4. NPS 2-1/2: 108 inches with 1/2-inch rod.
   5. NPS 3 to NPS 5: 10 feet with 1/2-inch rod.

F. Install supports for vertical copper tubing every 10 feet.

G. Install vinyl-coated hangers for CPVC piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1 and Smaller: 36 inches with 3/8-inch rod.
   2. NPS 1-1/4 to NPS 2: 48 inches with 3/8-inch rod.
   3. NPS 2-1/2 to NPS 3-1/2: 48 inches with 1/2-inch rod.
   4. NPS 4 and NPS 5: 48 inches with 5/8-inch rod.

H. Install supports for vertical CPVC piping every 60 inches for NPS 1 and smaller, and every 72 inches for NPS 1-1/4 and larger.

I. Install vinyl-coated hangers for PVC piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 2 and Smaller: 48 inches with 3/8-inch rod.
   2. NPS 2-1/2 to NPS 3-1/2: 48 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 48 inches with 5/8-inch rod.
   4. NPS 6: 48” with 3/4” rod.

J. Install supports for vertical PVC piping every 48 inches.

K. Support piping and tubing not listed in this article according to MSS SP-69 and manufacturer's written instructions.

3.10 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment and machines to allow service and maintenance.

C. Connect domestic water piping to exterior water-service piping. Use transition fitting to join dissimilar piping materials.

D. Connect domestic water piping to water-service piping with shutoff valve; extend and connect to the following:

1. Domestic Water Booster Pumps: Cold-water suction and discharge piping.
2. Water Heaters: Cold-water inlet and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections.
3. Plumbing Fixtures: Cold- and hot-water supply piping in sizes indicated, but not smaller than required by plumbing code. Comply with requirements in Division 22 plumbing fixture Sections for connection sizes.
4. Equipment: Cold- and hot-water supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for NPS 2-1/2 and larger.

3.11 IDENTIFICATION

A. Identify system components. Comply with requirements Section 22 05 53 "Painting and Identification for Plumbing Piping and Equipment" for identification materials and installation.

B. Label pressure piping with system operating pressure.

3.12 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Piping Inspections:

1. Do not enclose, cover, or put piping into operation until it has been inspected and approved by authorities having jurisdiction.
2. During installation, notify authorities having jurisdiction at least one day before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:
   a. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
   b. Final Inspection: Arrange final inspection for authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
3. Reinspection: If authorities having jurisdiction find that piping will not pass tests or inspections, make required corrections and arrange for reinspection.
4. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

C. Piping Tests:

1. Fill domestic water piping. Check components to determine that they are not air bound and that piping is full of water.
2. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit a separate report for each test, complete with diagram of portion of piping tested.
3. Leave new, altered, extended, or replaced domestic water piping uncovered and unconcealed until it has been tested and approved. Expose work that was covered or concealed before it was tested.
4. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow

to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.

5. Repair leaks and defects with new materials and retest piping or portion thereof until satisfactory results are obtained.
6. Prepare reports for tests and for corrective action required.

D. Domestic water piping will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.13 ADJUSTING

A. Perform the following adjustments before operation:

1. Close drain valves, hydrants, and hose bibbs.
2. Open shutoff valves to fully open position.
3. Open throttling valves to proper setting.
4. Adjust balancing valves in hot-water return piping to provide adequate flow at indicated hot water temperature, at all times to point where hot water return pipe connects to hot water pipe.
    a. Manually adjust balancing valves in hot-water-circulation return piping to provide flow of hot water in each branch.
5. Remove plugs used during testing of piping and for temporary sealing of piping during installation.
6. Remove and clean strainer screens. Close drain valves and replace drain plugs.
7. Remove filter cartridges from housings and verify that cartridges are as specified for application where used and are clean and ready for use.
8. Check plumbing specialties and verify proper settings, adjustments, and operation.

3.14 CLEANING

A. Clean and disinfect potable domestic water piping as follows:

1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction; if methods are not prescribed, use procedures described in either AWWA C651 or AWWA C652 or follow procedures described below:
    a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
    b. Fill and isolate system according to either of the following:
        1) Fill system or part thereof with water/chlorine solution with at least 50 ppm of chlorine. Isolate with valves and allow to stand for 24 hours.
        2) Fill system or part thereof with water/chlorine solution with at least 200 ppm of chlorine. Isolate and allow to stand for three hours.
    c. Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.
    d. Submit water samples in sterile bottles to testing agency for testing. Repeat procedures if biological examination shows contamination.

B. Clean non-potable domestic water piping as follows:

1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
2. Use purging procedures prescribed by authorities having jurisdiction or; if methods are not prescribed, follow procedures described below:
    a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
    b. Submit water samples in sterile bottles to testing agency for testing. Repeat procedures if biological examination shows contamination.

C. Prepare and submit reports of purging and disinfecting activities.

D. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

3.15 PIPING SCHEDULE

A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.

B. Flanges and unions may be used for aboveground piping joints unless otherwise indicated.

C. Fitting Option: Extruded-tee connections and brazed joints may be used on aboveground copper tubing.

D. Under-building-slab, domestic water, building service piping, [**NPS 3 and smaller**] shall be the following:

1. Hard or Soft copper tube, **ASTM B 88, Type K**; **wrought-copper solder-joint fittings; and brazed copper pressure-seal fittings; and pressure-sealed**] joints.
2. PVC, [**Schedule 40 pipe; PVC, Schedule 40**] [**Schedule 80 pipe; PVC, Schedule 80**] socket fittings; and solvent-cemented joints.

E. Under-building-slab, domestic water, building-service piping, [**NPS 4 and larger],** shall be the following:

1. Mechanical-joint, ductile-iron pipe; standard pattern mechanical-joint fittings; and mechanical joints.

F. Under-building-slab, domestic water piping, **NPS 2** and smaller, shall be the following:

1. [**Hard or soft**] copper tube, ASTM B 88, Type K; **wrought-copper solder-joint fittings; and brazed copper pressure-seal-joint fittings; and pressure-sealed** joints.

Aboveground domestic water piping, shall be the following:

2. Hard copper tube, ASTM B 88, Type cast-or wrought- copper solder-joint fittings; and **soldered**] joints.
3. Hard copper tube, ASTM B 88, Type L copper pressure-seal-joint fittings; and pressure-sealed joints.
4. Hard copper tube, ASTM B 88, Type L; copper push-on-joint fittings; and push-on joints.

3.16 VALVE SCHEDULE

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Shutoff Duty: Use ball valves for piping NPS 2 and smaller. Use ball, or gate valves for piping NPS 2-1/2 and larger.
2. Throttling Duty: Use ball or globe valves Hot-Water Circulation Piping, Balancing Duty: Calibrated Memory-stop balancing valves.
3. Hot-Water Circulation Piping, Balancing Duty: Calibrated, Memory-stop balancing valves.
4. Drain Duty: Hose-end drain valves.

B. Use check valves to maintain correct direction of domestic water flow to and from equipment.

C. Iron grooved-end valves may be used with grooved-end piping.

D. CPVC and PVC valves matching piping materials may be used.

END OF SECTION

SECTION 22 1119

DOMESTIC WATER PIPING SPECIALTIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section includes:

1. Backflow Prevention Devices
2. Water Pressure-Reducing Valves.
3. Balancing Valves.
4. Temperature-Actuated Water Mixing Valves.
5. Strainers.
6. Hose Stations.
7. Hose Bibbs.
8. Sill Cocks.
9. Drain Valves.
10. Water Hammer Arresters.
11. Air Vents.
12. Trap-Seal Primer Valves.
13. Trap-Seal Primer Systems.
14. Thermometers
15. Pressure Gages

1.03 PERFORMANCE REQUIREMENTS

A. Minimum Working Pressure for Domestic Water Piping Specialties: **125 psig**, unless otherwise indicated.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

B. Field quality-control test reports.

C. Operation and Maintenance Data: For domestic water piping specialties indicated [O/M], include in emergency, operation, and maintenance manuals. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

1.05 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. NSF Compliance for materials that will come in contact with potable water:

1. NSF 14, "Plastics Piping Components and Related Materials," for plastic domestic water piping components.
2. NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9."
3. NSF 372, "Drinking Water System Components - Lead Content."

PART 2 - PRODUCTS

2.01 BACKFLOW PREVENTION DEVICES [S] [O/M]

A. Backflow Prevention Devices: All equipment subject to backflow or back siphonage such as, but not limited to **Water Service,Watering Systems**etc., shall be equipped with Backflow Prevention Devices to satisfy the requirements of the [**International Plumbing Code**,] all local codes and ordinances.

B. Pressure Vacuum Breakers:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following: **Conbraco model 4V-500, Watts's model 800M4QTFR, Wilkins model 420**.
2. Standard: ASSE 1020.
3. Operation: Continuous-pressure applications.
4. Pressure Loss: [**5 psig**] maximum, through middle 1/3 of flow range.
5. Size:
6. Design Flow Rate:
7. Selected Unit Flow Range Limits:
8. Pressure Loss at Design Flow Rate:
9. Accessories:
    a. Valves: Ball type, on inlet and outlet.

C. Intermediate Atmospheric-Vent Backflow Preventers for use in water lines serving **Clothes Washer**:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following: **Conbraco model 40-400, Watts model 90 Wilkins model 760.**
2. Standard: ASSE 1012.
3. Operation: Continuous-pressure applications.
4. Size: **NPS ½**
5. Body: Bronze.
6. End Connections: Union, solder joint.
7. Finish: Rough bronze.

D. Reduced-Pressure-Principle Backflow Preventers for use in **Water Service**

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following: **Conbraco model 40-210-A2, Watts model 909QTS.Wilkins**
2. Standard: ASSE 1013.
3. Operation: Continuous-pressure applications.
4. Pressure Loss: **12 psig** maximum, through middle 1/3 of flow range.
5. Size: **[NPS 3/4] [NPS 1]**
6. Body: Bronze
7. End Connections: Threaded.
8. Configuration: Designed for horizontal, straight through flow.
9. Accessories:
    a. Valves: Ball type with threaded ends on inlet and outlet.
    b. Air-Gap Fitting: ASME A112.1.2, matching backflow-preventer connection.
    c. Strainer: On inlet.

2.02 BALANCING VALVES [S] [O/M]

A. Copper-Alloy Calibrated Balancing Valves:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **Bell & Gossett "Circuit Setter Plus" model CB, Nibco 1710, Watts CSM-61-M1,**
2. Type: Ball or Y-pattern globe valve with two readout ports and memory setting indicator.
3. Body: Brass or bronze,

4. Size: Same as connected piping, but not larger than NPS 2.
5. Accessories: Meter hoses, fittings, valves, differential pressure meter, and carrying case.

B. Cast-Iron Calibrated Balancing Valves:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**: ITT Bell & Bossett "Circuit Setter", Nibco 737, Watts CSM-81-F,**
2. Type: Adjustable with Y-pattern globe valve, two readout ports, and memory-setting indicator.
3. Size: Same as connected piping, but not smaller than NPS 2-1/2.

C. Accessories: Meter hoses, fittings, valves, differential pressure meter, and carrying case.

2.03 TEMPERATURE-ACTUATED WATER MIXING VALVES [S] [O/M]

A. Tempering Valve TV:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Lawler Manufacturing Company, Inc.
   b. Leonard Valve Company.
   c. Powers; a Watts Industries Co.
   d. Symmons Industries, Inc.
2. Standard: ASSE 1017.
3. Pressure Rating: 125 psig.
4. Type: [**Exposed-mounting**]thermostatically controlled water mixing valve.
5. Material: Bronze body with corrosion-resistant interior components.
6. Connections: Threaded inlets and outlet.
7. Accessories: Manual temperature control, check stops on hot- and cold-water supplies, and adjustable, temperature-control handle.
8. Valve Pressure Rating: 125 psig minimum, unless otherwise indicated.
9. Tempered-Water Setting: <**Insert deg F.**>
10. Tempered-Water Design Flow Rate: TBD
11. Selected Valve Flow Rate at 45-psig Pressure Drop: TBD
12. Pressure Drop at Design Flow Rate: 10 **psig.**>
13. Valve Finish: [**Chrome plated**]
14. Piping Finish: [**Chrome plated**]
15. Cabinet: Factory-fabricated, stainless steel, for [**recessed**] mounting and with hinged, stainless-steel door.

B. Tempering Valve Manifold TVM:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Leonard Valve Company.
   b. Powers; a Watts Industries Co.
   c. Symmons Industries, Inc.
2. Description: Factory-fabricated, [**exposed-mounting**], thermostatically controlled, water-mixing-valve assembly in [**two**] valve parallel arrangement.
3. Large-Flow Parallel: Thermostatic water mixing valve and downstream pressure regulator with pressure gages on inlet and outlet.
4. Intermediate-Flow Parallel: Thermostatic water mixing valve and downstream pressure regulator with pressure gages on inlet and outlet.
5. Small-Flow Parallel: Thermostatic water mixing valve.
6. Thermostatic Mixing Valves: Comply with ASSE 1017. Include check stops on hot- and cold-water inlets and shutoff valve on outlet.
7. Water Regulator(s): Comply with ASSE 1003. Include pressure gage on inlet and outlet.
8. Component Pressure Ratings: 125 psig minimum, unless otherwise indicated.
9. Cabinet: Factory-fabricated, stainless steel, for [**recessed**] [**surface**] mounting and with hinged, stainless-steel door.

10. Selected Large Flow, Tempered Water Valve Size: <**Insert size**>
11. Tempered-Water Setting: <**Insert deg F**>
12. Unit Tempered-Water Design Flow Rate: <**Insert gpm.**>
13. Unit Minimum Tempered-Water Design Flow Rate: <**Insert gpm**>
14. Selected Unit Flow Rate at 45-psig Pressure Drop: <**Insert gpm**>
15. Unit Pressure Drop at Design Flow Rate: 10 **psig.**>
16. Unit Tempered-Water Outlet Size: <**Insert NPS**> end connection.
17. Unit Hot- and Cold-Water Inlet Size: <**Insert NPS** > end connections.
18. Thermostatic Mixing Valve and Water Regulator Finish: [**Chrome plated,**]
19. Piping Finish: [**Chrome plated**]

2.04 STRAINERS FOR DOMESTIC WATER PIPING

A. Y-Pattern Strainers
   1. Pressure Rating: 125 psig minimum, unless otherwise indicated.
   2. Body: Bronze for NPS 2 and smaller; cast iron [**with interior lining complying with AWWA C550 or FDA-approved, epoxy coating and**] for NPS 2-1/2 and larger.
   3. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
   4. Screen: Stainless steel with round perforations, unless otherwise indicated.
   5. Perforation Size:
      a. Strainers NPS 2 and Smaller: [**0.020 inch**]
      b. Strainers NPS 2-1/2 to NPS 4: [**0.045 inch**]
   6. Drain: **, hose-end drain valve**].

2.05 OUTLET BOXES [S]

A. Laundry Outlet LO-1: Refer to Detail on Drawings
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **Guy Gray model WBE-200,**
   2. Mounting: Recessed.
   3. Material and Finish: Epoxy painted steel box and faceplate.
   4. Faucet: Combination, valved fitting, complying with ASME A112.18.1. Include garden-hose thread complying with ASME B1.20.7 on outlet.
   5. Drain: **NPS 2** Standpipe and P-trap for direct waste connection to drainage piping.
   6. Receptacle: 20 AMP, Duplex Grounding.

B. Icemaker Outlet Boxes IMB-1:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**: Guy Gray model BIM 875,**
   2. Mounting: Recessed.
   3. Material and Finish: Epoxy-painted-steel box and faceplate.
      Shutoff: NPS 1/2 compression angle valve with NPS ¼ outlet smaller copper tube outlet.

2.06 HOSE BIBBS [S] [

A. Hose Bibbs:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Hose Bibbs in Toilets: **Chicago No. 293 LK, T&S B-0717, Zurn Z-81307,** loose key, chrome plated, 1/2" size, with wall flange. **Watts No. 8AC, Chicago E-27, T&S BL-5550-10,** vacuum breaker.
      b. Hose Bibbs in Other Finished Areas Inside Building**: Chicago No. 15, T&S B-0717** with wall flange, furnished with lever or cross handle chrome plated, 3/4" inlet, **Chicago E-27, T&S BL-5550-10, Watts No. 8AC** vacuum breaker.
      c. Hose Bibbs in Equipment Rooms and Unfinished Areas Inside Building: **Chicago No. 387-LF, T&S B-0731-RGH, Zurn Z-80701**, rough chrome plated, wheel, cross, or

lever handle, 3/4" size. **Watts No. 8AC Chicago E-27, T&S BL-5550-10,** vacuum breaker.

d. Hose Bibbs at Mop Sink: **Chicago No. 952-CP, T&S B-0720, No. Z-875L7**, wall flange, integral vacuum breaker, chrome plated, 3/4" size, not threaded outlet lever or key handle.

2. Standard: ASME A112.18.1 for sediment faucets.
3. Body Material: Bronze.
4. Seat: Bronze, replaceable.
5. Supply Connections: NPS 1/2 or NPS 3/4 threaded or solder-joint inlet.
6. Outlet Connection: Garden-hose thread complying with ASME B1.20.7.
7. Pressure Rating: 125 psig.
8. Vacuum Breaker: Integral [**or field-installation,**] non-removable, drainable, hose-connection vacuum breaker complying with ASSE 1011.
9. Finish for Equipment Rooms: Rough bronze, or chrome or nickel plated.
10. Finish for Service Areas: [**Rough bronze**] [
11. Finish for Finished Rooms: Chrome or nickel plated.
12. Operation for Equipment Rooms: Wheel handle or operating key.
13. Operation for Service Areas: **Operating key**.
14. Operation for Finished Rooms: [**Operating key**].
15. Include operating key with each operating-key hose bibb.
16. Include [**integral**] wall flange with each chrome- or nickel-plated hose bibb.

2.07 DRAIN VALVES

A. Ball-Valve-Type, Hose-End Drain Valves :

1. Standard: MSS SP-110 for standard-port, two-piece ball valves.
2. Pressure Rating: 400-psig minimum CWP.
3. Size: NPS 3/4.
4. Body: Copper alloy.
5. Ball: Chrome-plated brass.
6. Seats and Seals: Replaceable.
7. Handle: Vinyl-covered steel.
8. Inlet: Threaded or solder joint.
9. Outlet: Threaded, short nipple with garden-hose thread complying with ASME B1.20.7 and cap with brass chain.
10. Vacuum Breaker: Integral [**or field-installation,**] non-removable, drainable, hose-connection vacuum breaker complying with ASSE 1011.

B. Stop-and-Waste Drain Valves:

1. Standard: MSS SP-110 for ball valves or MSS SP-80 for gate valves.
2. Pressure Rating: 200-psig minimum CWP or Class 125.
3. Size: NPS 3/4.
4. Body: Copper alloy or ASTM B 62 bronze.
5. Drain: NPS 1/8 side outlet with cap.

2.08 WATER HAMMER ARRESTERS (SHOCK ABSORBERS) [S]

A. Water Hammer Arresters:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. AMTROL, Inc.
   b. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   c. Tyler Pipe; Wade Div.
   d. Zurn Plumbing Products Group; Specification Drainage Operation.
2. Standard: ASSE 1010 or PDI-WH 201.
3. Type: [[**Copper tube with piston**].
4. Size: ASSE 1010, Sizes AA and A through F or PDI-WH 201, Sizes A through F.

2.09 AIR VENTS [S]

A. Bolted-Construction Automatic Air Vents :
   1. Body: Bronze.
   2. Pressure Rating: 125-psig minimum pressure rating at 140 deg F.
   3. Float: Replaceable, corrosion-resistant metal.
   4. Mechanism and Seat: Stainless steel.
   5. Size: [**NPS 3/8**] [**NPS 1/2**] minimum inlet.
   6. Inlet and Vent Outlet End Connections: Threaded.

B. Welded-Construction Automatic Air Vents :
   1. Body: Stainless steel.
   2. Pressure Rating: 150-psig minimum pressure rating.
   3. Float: Replaceable, corrosion-resistant metal.
   4. Mechanism and Seat: Stainless steel.
   5. Size: NPS 3/8 minimum inlet.
   6. Inlet and Vent Outlet End Connections: Threaded.

2.10 FILLED-SYSTEM THERMOMETERS [S]

A. Direct-Mounted, Metal-Case, Vapor-Actuated Thermometers:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Ashcroft Inc.
      b. Marsh Bellofram.
      c. Miljoco Corporation.
      d. Palmer Wahl Instrumentation Group.
      e. REOTEMP Instrument Corporation.
      f. Trerice, H. O. Co.
      g. Weiss Instruments, Inc.
   2. Standard: ASME B40.200.
   3. Case: Sealed type, cast aluminum or drawn steel; [**4-1/2-inch**] nominal diameter.
   4. Element: Bourdon tube or other type of pressure element.
   5. Movement: Mechanical, [**dampening type,**] with link to pressure element and connection to pointer.
   6. Dial: Non-reflective aluminum with permanently etched scale markings [0 **deg F to 200 deg f]**.
   7. Pointer: Dark-colored metal.
   8. Window: **Glass**
   9. Ring: [**Metal**]
   10. Connector Type(s): Union joint, **adjustable, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device** with ASME B1.1 screw threads.
   11. Thermal System: Liquid-filled bulb in copper-plated steel, aluminum, or brass stem and of length to suit installation.
      a. Design for Thermowell Installation: Bare stem.
   12. Accuracy: Plus or minus 1 percent of scale range.

2.11 PRESSURE GAGES [S]

A. Direct-Mounted, Metal-Case, Dial-Type Pressure Gages:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. AMETEK, Inc.; U.S. Gauge.
      b. Ashcroft Inc.
      c. Ernst Flow Industries.
      d. Flo Fab Inc.
      e. Marsh Bellofram.
      f. Miljoco Corporation.

g. Noshok.
h. Palmer Wahl Instrumentation Group.
i. REOTEMP Instrument Corporation.
j. Tel-Tru Manufacturing Company.
k. Trerice, H. O. Co.
l. Watts Regulator Co.; a div. of Watts Water Technologies, Inc.
m. Weiss Instruments, Inc.
n. WIKA Instrument Corporation - USA.
o. Winters Instruments - U.S.

2. Standard: ASME B40.100.
3. Case: [**Sealed**] type(s); cast aluminum or drawn steel; [**4-1/2-inch]** nominal diameter.
4. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
5. Pressure Connection: Brass, with NPS 1/4, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
6. Movement: Mechanical, with link to pressure element and connection to pointer.
7. Dial: Nonreflective aluminum with permanently etched scale markings graduated in 0 psig to 160 psig, 20 psig figure intervals, 2psig graduation marks.
8. Pointer: Dark-colored metal.
9. Window: Glass.
10. Ring: Stainless steel.
11. Accuracy: Grade A, plus or minus 1 percent of middle half of scale range.

B. Snubbers: ASME B40.100, brass; with NPS 1/4 ASME B1.20.1 pipe threads and piston porous-metal-type surge-dampening device. Include extension for use on insulated piping.

C. Valves: Brass ball with NPS 1/4, ASME B1.20.1 pipe threads.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Comply with requirements in other Division 22 Sections for piping joining materials, joint construction, and basic installation requirements.

B. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction and the International Plumbing Code.

1. Locate backflow preventers in same room as connected equipment or system.
2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe to floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are not acceptable for this application.
3. Do not install bypass piping around backflow preventers.

C. Install water regulators with inlet and outlet shutoff valves and bypass with memory-stop balancing valve. Install pressure gages on inlet and outlet.

D. Install balancing valves in locations where they can easily be adjusted. Adjust balancing valves to provide indicated temperature hot water at all times to point where the hot water return pipe connects to the hot water pipe.

E. Install temperature-actuated water mixing valves with check stops or shutoff valves on inlets and with shutoff valve on outlet.

1. Install thermometers and water regulators if specified.
2. Install cabinet-type units recessed in or surface mounted on wall as specified.

F. Water mixing valves shall be installed and piped as indicated in the manufacturer's recommendations for the application intended.

G. Install Y-pattern strainers for water on supply side of each water pressure-reducing valve, solenoid valve, and pump.

H. Install outlet boxes recessed in wall with face plate flush with finished wall.

I. Install ground hydrants with 1 cu. yd. of crushed gravel around drain hole. Set ground hydrants with box flush with grade.

J. Install draining-type post hydrants with 1 cu. yd**.** of crushed gravel around drain hole. Set post hydrants in concrete paving or in 1 cu. ft. of concrete block at grade.

K. Install water hammer arresters in water piping according to PDI-WH 201.

L. Install air vents at high points of water piping.

M. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.

N. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.

O. Install direct-mounted pressure gages in piping tees with pressure gage located on pipe at the most readable position.

P. Install valve and snubber in piping for each pressure gage for fluids.

Q. Install test plugs in piping tees.

R. Install thermometers in the following locations:
   1. Outlet of each water heater.
   2. Inlets and outlets of each domestic water heat exchanger.
   3. Inlet and outlet of each domestic hot-water storage tank.
   4. Inlet of each hot water circulating pump.

S. Install pressure gages in the following locations:
   1. Building water service entrance into building.
   2. Inlet and outlet of each pressure-reducing valve.
   3. Suction and discharge of each domestic water booster pump.

3.02 CONNECTIONS

A. Comply with requirements, for piping installation, in Sections 22 11 16 “Domestic Water Piping”. Drawings indicate general arrangement of piping and specialties.

B. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

C. Connect wiring according to Section 26 05 23 "Low-Voltage Electrical Power Conductors and Cables."

D. Install meters and gages adjacent to machines and equipment to allow service and maintenance of meters, gages, machines, and equipment.

3.03 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following: Comply with requirements in Section 22 05 53 “Painting and Identification for Plumbing Piping and Equipment.
   1. Intermediate atmospheric-vent backflow preventers.
   2. Reduced-pressure-principle backflow preventers.
   3. Double-check backflow-prevention assemblies.
   4. Water pressure-reducing valves.
   5. Primary, thermostatic, water mixing valves.
   6. Manifold, thermostatic, water-mixing-valve assemblies.
   7. Photographic-process, thermostatic, water-mixing-valve assemblies.

8. Primary water tempering valves.
9. Outlet boxes.
10. Hose stations.
11. Supply-type, trap-seal primer valves.
12. Trap-seal primer systems.

3.04 FIELD QUALITY CONTROL

A. Perform the following tests and prepare test reports:
   1. Test each **pressure vacuum breaker reduced-pressure-principle backflow preventer**] according to authorities having jurisdiction and the device's reference standard.
   2. Test results shall be recorded on forms approved or provided by **engineer**

B. Remove and replace malfunctioning domestic water piping specialties and retest as specified above.

3.05 ADJUSTING

A. Set field-adjustable pressure set points of water pressure-reducing valves.

B. Set field-adjustable flow set points of balancing valves.

C. Set field-adjustable temperature set points of temperature-actuated water mixing valves.

D. Adjust faces of thermometers and pressure gages to proper angle for best visibility.

END OF SECTION

SECTION 22 1123

DOMESTIC WATER PUMPS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. In-line, sealless centrifugal pumps.

1.03 DEFINITIONS

A. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

B. DDC: Direct Digital Control

1.04 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Include materials of construction, rated capacities, certified performance curves with operating points plotted on curves, operating characteristics, electrical characteristics, and furnished specialties and accessories. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

B. Operation and Maintenance Data: For domestic water pumps indicated [O/M], to include in operation and maintenance manuals. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing.

1.05 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. UL Compliance: Comply with UL 778 for motor-operated water pumps.

C. NSF Compliance for materials that will come in contact with potable water:
   1. NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9."
   2. NSF 372, "Drinking Water System Components- Lead Content."

PART 2 - PRODUCTS

2.01 IN-LINE, SEALLESS HOT WATER CIRCULATING PUMPS[S] [O/M]

A. HWCP No.<**insert number**>: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the Work include, but are not limited to the following:
   1. Armstrong Pumps Inc.
   2. Bell & Gossett Domestic Pump; ITT Corporation.
   3. Grundfos Pumps Corp.
   4. TACO Incorporated.
   5. WILO USA LLC - WILO Canada Inc.

B. Description: Factory-assembled and -tested, in-line, close-coupled, canned-motor, sealless, overhung-impeller centrifugal pumps.

C. Pump Construction:

1. Pump and Motor Assembly: Hermetically sealed, replaceable-cartridge type with motor and impeller on common shaft and designed for installation with pump and motor shaft horizontal.
2. Casing: Bronze, with threaded or companion-flange connections.
3. Impeller: Plastic.
4. Motor: Single speed, unless otherwise indicated.

D. Capacities and Characteristics:

1. Capacity: <**Insert gpm**>.
2. Total Dynamic Head: <**Insert feet**>.
3. Minimum Working Pressure: 125 psig.
4. Maximum Continuous Operating Temperature: 220 deg F.
5. Inlet and Outlet Size: <**Insert NPS**>.
6. Pump Speed: <**Insert rpm**>.
7. Pump Control: [**DDC**] [**Pressure switch**] [**Thermostat**] [**Timer**].
8. Motor Horsepower: <**Insert value**>.
9. Electrical Characteristics:
   a. Volts: 120.
   b. Phases: Single.
   c. Hertz: 60.
   d. Full-Load Amperes: <**Insert value**>.

2.02 CONTROLS

A. Direct Digital Control: Comply with requirements in Section 23 09 00 “Instrumentation and Control for HVAC”.

B. Thermostats: Electric; adjustable for control of [**hot-water circulation**] pump.

1. Type: Water-immersion temperature sensor, for installation in piping.
2. Range: [**50 to 125 deg F**]
3. Enclosure: NEMA 250,
4. Operation of Pump: On or off.
5. Transformer: Provide if required.
6. Power Requirement: [**24 V, ac**] [**120 V, ac**] <
7. Settings: Start pump at [**105 deg F**]

C. Timers: Electric, for control of [**hot-water circulation**] pump.

1. Type: Programmable, [**seven-day**] <**Insert time**> clock with manual override on-off switch.
2. Enclosure: NEMA 250, [**Type 1**] <**Insert type**>.suitable for wall mounting.
3. Operation of Pump: On or off.
4. Transformer: Provide if required.
5. Power Requirement: [**24 V, ac**] [**120 V, ac**]
6. Programmable Sequence of Operation: [**Up to two on-off cycles each day for seven days**]

D. Time-Delay Relays: Electric, for control of hot-water circulation pump between water heater and connected hot-water storage tank.

1. Type: Adjustable time-delay relay.
2. Range: Up to five minutes.
3. Setting: Five minutes.
4. Enclosure: NEMA 250,
5. Operation of Pump: On or off.
6. Transformer: Provide if required.
7. Power Requirement: [**24 V, ac**] [**120 V, ac**]
8. Programmable Sequence of Operation: Limit pump operation to periods of burner operation plus maximum five minutes after the burner stops.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine roughing-in of domestic-water-piping system to verify actual locations of connections before pump installation.

3.02 PUMP INSTALLATION

A. Comply with HI 1.4.

B. Install in-line, sealless centrifugal pumps with shaft horizontal unless otherwise indicated.

C. Install horizontally mounted, in-line, centrifugal pumps with shaft(s) horizontal.

D. Install continuous-thread hanger rods and [**spring hangers**]] of size required to support pump weight.

1. Comply with requirements for vibration isolation devices in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment." Fabricate brackets or supports as required.
2. Comply with requirements for hangers and supports in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."

E. Install thermostats in hot-water return piping.

F. Install timers [**control room**]

G. Install time-delay relays in piping between water heaters and hot-water storage tanks.

3.03 CONNECTIONS

A. Comply with requirements for piping in Section 22 11 16 "Domestic Water Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to pumps to allow service and maintenance.

C. Connect domestic water piping to pumps. Install suction and discharge piping equal to or greater than size of pump nozzles.

1. Comply with requirements for flexible connectors in Section 22 11 16 "Domestic Water Piping"
2. Install shutoff valve and strainer on suction side of each pump, and check, shutoff, and throttling valves on discharge side of each pump. Install valves same size as connected piping. Comply with requirements for valves specified in Section 22 05 23 "General-Duty Valves for Plumbing Piping" and comply with requirements for strainers in Section 22 11 19 "Domestic Water Piping Specialties."
3. Install thermometer at inlet of each circulating pump and pressure gage. Comply with requirements for thermometers in Section 22 11 19 “Domestic Water Piping Specialties”.

D. Comply with Division 26 requirements for electrical connections, and wiring methods.

E. Connect [**DDC Controls**] [**thermostats,**] [**time-delay relays,**] [**and**] [**timers**] to pumps that they control.

F. Interlock pump between water heater and hot-water storage tank with water heater burner and time-delay relay.

3.04 IDENTIFICATION

A. Comply with requirements for identification in Section 22 05 53 "Painting and Identification for Plumbing Piping and Equipment" for identification of pumps.

3.05 STARTUP SERVICE

A. [**Perform**] startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

2. Check piping connections for tightness.
3. Clean strainers on suction piping.
4. Set [**DDC Controls,**] [**thermostats,**] [**timers,**] [**and**] [**time-delay relays**] for automatic starting and stopping operation of pumps.
5. Perform the following startup checks for each pump before starting:
   a. Verify bearing lubrication.
   b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
   c. Verify that pump is rotating in the correct direction.
6. Prime pump by opening suction valves and closing drains, and prepare pump for operation.
7. Start motor.
8. Open discharge valve slowly.
9. Adjust temperature settings on thermostats.
10. Adjust timer settings.

3.06 ADJUSTING

A. Adjust domestic water pumps to function smoothly, and lubricate as recommended by manufacturer.

B. Adjust initial temperature set points.

C. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

END OF SECTION

SECTION 22 1316

SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Pipe, tube, and fittings.
   2. Specialty pipe fittings.
   3. Encasement for underground metal piping.

1.03 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure unless otherwise indicated:
   1. Soil, Waste, and Vent Piping: **10-foot head of water**.
   2. Waste, Force-Main Piping: **50 psig**] [**100 psig**] [**150 psig**] <**Insert pressure**>.

B. Seismic Performance: Soil, waste, and vent piping and support and installation shall withstand the effects of earthquake motions determined according to SEI/ASCE 7 "Minimum Design Loads for Buildings and Other Structures".

1.04 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Comply with requirements in Division 01 and Section 22 04 00 "General Requirements for Plumbing".

B. LEED Submittal:
   1. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.

C. Seismic Qualification Certificates: For waste and vent piping, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Detailed description of piping anchorage devices on which the certification is based and their installation requirements.

D. Field quality-control reports.

1.05 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF/ANSI 14, "Plastics Piping Systems Components and Related Materials," for plastic piping components. Include marking with "NSF-dwv" for plastic drain, waste, and vent piping and "NSF-sewer" for plastic sewer piping.

1.06 PROJECT CONDITIONS

A. Interruption of Existing Sanitary Waste Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:

1. Notify Owner no fewer than two days in advance of proposed interruption of sanitary waste service.
2. Do not proceed with interruption of sanitary waste service without Owner's written permission.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 HUB-AND-SPIGOT, CAST-IRON SOIL PIPE AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following: **AB&I Foundry, Charlotte Pipe & Foundry or Tyler Pipe**. Cast iron pipe and fittings shall be manufactured in the USA bear the Collective Trademark of the Cast Iron Soil Pipe Institute.

B. Pipe and Fittings: ASTM A 74, **[Service]** **[and]** **[Extra Heavy]** class(es).

C. Gaskets: ASTM C 564, rubber.

D. Calking Materials: ASTM B 29, pure lead and oakum or hemp fiber.

2.03 SPECIALTY PIPE FITTINGS

A. Transition Couplings:
   1. General Requirements: Fitting or device for joining piping with small differences in OD's or of different materials. Include end connections same size as and compatible with pipes to be joined.
   2. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.
   3. Unshielded, Nonpressure Transition Couplings:
      a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) Dallas Specialty & Mfg. Co.
         2) Fernco Inc.
         3) Mission Rubber Company; a division of MCP Industries, Inc.
         4) Plastic Oddities; a division of Diverse Corporate Technologies, Inc.
      b. Standard: ASTM C 1173.
      c. Description: Elastomeric, sleeve-type, reducing or transition pattern. Include shear ring and corrosion-resistant-metal tension band and tightening mechanism on each end.
      d. Sleeve Materials:
         1) For Cast-Iron Soil Pipes: ASTM C 564, rubber.
         2) For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
         3) For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.
   4. Shielded, Nonpressure Transition Couplings:
      a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) Cascade Waterworks Mfg. Co.
         2) Mission Rubber Company; a division of MCP Industries, Inc.
      b. Standard: ASTM C 1460.

c. Description: Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.

5. Pressure Transition Couplings:
   a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      1) Cascade Waterworks Mfg. Co.
      2) Dresser, Inc.
      3) EBAA Iron, Inc.
      4) JCM Industries, Inc.
      5) Romac Industries, Inc.
      6) Smith-Blair, Inc.; a Sensus company.
      7) The Ford Meter Box Company, Inc.
      8) Viking Johnson.
   b. Standard: AWWA C219.
   c. Description: Metal, sleeve-type same size as, with pressure rating at least equal to, and ends compatible with, pipes to be joined.
   d. Center-Sleeve Material: [**Manufacturer's standard**]
   e. Gasket Material: Natural or synthetic rubber.
   f. Metal Component Finish: Corrosion-resistant coating or material.

B. Dielectric Fittings:
   1. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
   2. Dielectric Unions:
      a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) Capitol Manufacturing Company.
         2) Central Plastics Company.
         3) Hart Industries International, Inc.
         4) Jomar International Ltd.
         5) Matco-Norca, Inc.
         6) McDonald, A. Y. Mfg. Co.
         7) Watts Regulator Co.; a division of Watts Water Technologies, Inc.
         8) Wilkins; a Zurn company.
      b. Description:
         1) Standard: ASSE 1079.
         2) Pressure Rating: [**125 psig minimum at 180 deg F**]
         3) End Connections: Solder-joint copper alloy and threaded ferrous.
   3. Dielectric Flanges:
      a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) Capitol Manufacturing Company.
         2) Central Plastics Company.
         3) Matco-Norca, Inc.
         4) Watts Regulator Co.; a division of Watts Water Technologies, Inc.
         5) Wilkins; a Zurn company.
      b. Description:
         1) Standard: ASSE 1079.
         2) Factory-fabricated, bolted, companion-flange assembly.
         3) Pressure Rating: [**125 psig minimum at 180 deg F**]

4) End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

PART 3 - EXECUTION

3.01 EARTH MOVING

A. Comply with requirements for excavating, trenching, and backfilling specified in **[Section 22 04 00 "General Requirements for Plumbing"] Section 31 20 00 "Earth Moving**.

3.02 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.

B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping at indicated slopes.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Install piping to allow application of insulation.

J. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

K. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if two fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

L. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.

M. Install soil and waste drainage and vent piping at the following minimum slopes unless otherwise indicated:

1. Building Sanitary Drain: 2 percent downward in direction of flow for piping NPS 2 and smaller; 1 percent downward in direction of flow for piping NPS 3 and larger.

2. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.

N. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

1. Install encasement on underground piping according to ASTM A 674 or AWWA C105/A 21.5.

O. Install steel piping according to applicable plumbing code.

P. Install aboveground copper tubing according to CDA's "Copper Tube Handbook."

Q. Install underground [**ABS**] [**and**] [**PVC**] piping according to ASTM D 2321.

R. Install force mains at elevations indicated.

S. Plumbing Specialties:
   1. Install backwater valves in sanitary waste gravity-flow piping. Comply with requirements for backwater valves in Division 22 Section "Sanitary Waste Piping Specialties."
   2. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers in sanitary drainage gravity-flow piping. **[Install cleanout fitting with closure plug inside the building in sanitary drainage force-main piping.]** Comply with requirements for cleanouts in Section 22 04 00 “General Requirements for Plumbing”.
   3. Install drains in sanitary drainage gravity-flow piping. Comply with requirements for drains in Section 22 13 19 "Sanitary Waste Piping Specialties."

T. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

U. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves in Section 22 04 00 “General Requirements for Plumbing”.

V. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons in Section 22 04 00 “General Requirements for Plumbing”.

3.03 JOINT CONSTRUCTION

A. Join hub-and-spigot, cast-iron soil piping with gasket joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.

B. Join hub-and-spigot, cast-iron soil piping with calked joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for lead-and-oakum calked joints.

C. Joints for hubless, cast-iron soil pipes and fittings shall conform to CISPI 310 , latest revision and be certified by NSF for compliance to CISPI 310.

D. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

E. Join copper tube and fittings with soldered joints according to ASTM B 828. Use ASTM B 813, water-flushable, lead-free flux and ASTM B 32, lead-free-alloy solder.

F. Flanged Joints: Align bolt holes. Select appropriate gasket material, size, type, and thickness. Install gasket concentrically positioned. Use suitable lubricants on bolt threads. Torque bolts in cross pattern.

G. Plastic, Nonpressure-Piping, Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
   2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
   3. PVC Piping: Join according to ASTM D 2855 and ASTM D 2665 Appendixes.

3.04 SPECIALTY PIPE FITTING INSTALLATION

A. Transition Couplings:
   1. Install transition couplings at joints of piping with small differences in OD's.
   2. In Drainage Piping: [**Unshielded**] [**Shielded**], nonpressure transition couplings.
   3. In Aboveground Force Main Piping: Fitting-type transition couplings.
   4. In Underground Force Main Piping:
      a. NPS 1-1/2 and Smaller: Fitting-type transition couplings.
      b. NPS 2 and Larger: Pressure transition couplings.

B. Dielectric Fittings:
   1. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

3.05 VALVE INSTALLATION

A. Comply with requirements for general valve installation in Section 22 05 23 "General-Duty Valves for Plumbing Piping."

B. Shutoff Valves:
   1. Install shutoff valve on each sewage pump discharge.
   2. Install gate or full-port ball valve for piping NPS 2 and smaller.
   3. Install gate valve for piping NPS 2-1/2 and larger.

C. Check Valves: Install swing check valve, between pump and shutoff valve, on each sewage pump discharge.

D. Backwater Valves: Install backwater valves in piping subject to backflow.
   1. Horizontal Piping: Horizontal backwater valves.[**Use normally closed type unless otherwise indicated.**]
   2. Floor Drains: Drain outlet backwater valves unless drain has integral backwater valve.
   3. Install backwater valves in accessible locations.
   4. Comply with requirements for backwater valves in Section 22 13 19 "Sanitary Waste Piping Specialties."

3.06 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements for seismic-restraint devices in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

B. Comply with requirements for pipe hanger and support devices and installation in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."
   1. Install carbon-steel pipe hangers for horizontal piping in noncorrosive environments.
   2. Install stainless-steel pipe hangers for horizontal piping in corrosive environments.
   3. Install carbon-steel pipe support clamps for vertical piping in noncorrosive environments.
   4. Install stainless-steel pipe support clamps for vertical piping in corrosive environments.
   5. Vertical Piping: MSS Type 8 or Type 42, clamps.
   6. Install individual, straight, horizontal piping runs:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet if Indicated: MSS Type 49, spring cushion rolls.
   7. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   8. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support horizontal piping and tubing within 12 inches of each fitting [**, valve,**] and coupling.

D. Support vertical piping and tubing at base and at each floor.

E. Rod diameter may be reduced one size for double-rod hangers, with 3/8-inch minimum rods.

F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:

1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod.
2. NPS 3: 60 inches with 1/2-inch rod.
3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
4. NPS 6 and NPS 8: 60 inches with 3/4-inch rod.
5. NPS 10 and NPS 12: 60 inches with 7/8-inch rod.
6. Spacing for 10-foot lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches.

G. Install supports for vertical cast-iron soil piping every 15 feet.

H. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:

1. NPS 1-1/2: 108 inches with 3/8-inch rod.
2. NPS 2: 10 feet with 3/8-inch rod.
3. NPS 2-1/2: 11 feet with 1/2-inch rod.
4. NPS 3: 12 feet with 1/2-inch rod.
5. NPS 4 and NPS 5 12 feet with 5/8-inch rod.
6. NPS 6 and NPS 8: 12 feet with 3/4-inch rod.
7. NPS 10 and NPS 12: 12 feet with 7/8-inch rod.

I. Install supports for vertical steel piping every 15 feet.

J. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:

1. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
2. NPS 2-1/2: 108 inches with 1/2-inch rod.
3. NPS 3 and NPS 5: 10 feet with 1/2-inch rod.
4. NPS 6: 10 feet with 5/8-inch rod.
5. NPS 8: 10 feet with 3/4-inch rod.

K. Install supports for vertical copper tubing every 10 feet.

L. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.07 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

C. Connect drainage and vent piping to the following:

1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code.
2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by the plumbing code.
3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code.
4. Install test tees (wall cleanouts) in stacks near floor and floor cleanouts with cover flush with floor.
5. Install horizontal backwater valves [**with cleanout cover flush with floor**] [**in pit with pit cover flush with floor**]
6. Comply with requirements for [**cleanouts**] [**and**] [**drains**] specified in Section 22 13 19 "Sanitary Waste Piping Specialties."
7. Equipment: Connect drainage piping as indicated. Provide shutoff valve if indicated and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 and larger.

D. Connect force-main piping to the following:

1. Sanitary Sewer: To exterior force main.

2. Sewage Pump: To sewage pump discharge.

E. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

F. Make connections according to the following unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3.08 IDENTIFICATION

A. Identify exposed sanitary waste and vent piping. Comply with requirements for identification in Section 22 05 53 "Painting and Identification for Plumbing Piping and Equipment."

3.09 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
   1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
   2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test sanitary drainage and vent piping according to plumbing code:
   1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
   2. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
   3. Drainage and Vent Water Test: A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less that 10-foot head of water. In testing successive sections, at least the upper 10 feet of the next preceding section shall be tested so that no joint or pipe in the building , except the uppermost 10 feet of the system, shall have been submitted to a test of less than 10-foot head of water. This pressure shall be held for at least 15 minutes. The system shall then be tight at all points.
   4. Drainage and Vent Air Test: An air test shall be made by forcing air into the system until there is a uniform gauge pressure of 5 psi or sufficient to a balance a 10 inch column of mercury. This pressure shall be held for a test period of at least 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperature or the seating of gaskets shall be made prior to the beginning of the test period. **Plastic piping shall not be tested with air unless manufacturer literature states air testing is acceptable.**
   5. Drainage and Vent Final Test: The final test of the completed drainage and vent system shall be visual and in sufficient detail to determine compliance with the provisions of the plumbing code. Where a smoke test is utilized, it shall be made by filling all traps with water and then introducing into the entire system a pungent, thick smoke produced by one or more smoke machines. When the smoke appears at stack openings on the roof, the

stack openings shall be closed and pressure equivalent to a 1-inch water column shall be held for a test period of not less than 15 minutes.

6. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
7. Prepare reports for tests and required corrective action.

E. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:

1. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
2. Cap and subject piping to static-water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
3. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
4. Prepare reports for tests and required corrective action.

3.10 CLEANING AND PROTECTION

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

3.11 PIPING SCHEDULE

A. Flanges and unions may be used on aboveground pressure piping unless otherwise indicated.

B. Aboveground, soil and waste piping NPS 4 and smaller shall be[**any of**] the following:

1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
2. Hubless, cast-iron soil pipe and fittings [**CISPI]** hubless-piping couplings; and coupled joints.

C. Aboveground, soil and waste piping NPS 5 and larger shall be the following:

1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
2. Hubless, cast-iron soil pipe and fittings; [**CISPI**] [**heavy-duty**] hubless-piping couplings; and coupled joints.
3. Dissimilar Pipe-Material Couplings: [**Unshielded**] nonpressure transition couplings.

D. Aboveground, vent piping NPS 4 and smaller shall bethe following:

1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
2. Hubless, cast-iron soil pipe and fittings; [**CISPI**] hubless-piping couplings; and coupled joints.
3. Galvanized-steel pipe, drainage fittings, and threaded joints.
4. Copper DWV tube, copper drainage fittings, and soldered joints.
5. Dissimilar Pipe-Material Couplings: [**Unshielded**] nonpressure transition couplings.

E. Aboveground, vent piping NPS 5 and larger shall bethe following:

1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
2. Hubless, cast-iron soil pipe and fittings; [**CISPI**] hubless-piping couplings; and coupled joints.
3. Galvanized-steel pipe, drainage fittings, and threaded joints.

F. Underground, soil, waste, and vent piping NPS 4 and smaller shall be the following:

1. In Kitchens, Boiler Rooms and other areas where equipment discharge temperature is above 140 degrees F. or noted “CI” on the drawings [**Extra Heavy**] [**Service**] class, cast-iron soil piping; [**gaskets; and gasketed**] [**calking materials; and calked**] joints.

2. Solid wall ABS pipe, ABS socket fittings, and solvent-cemented joints.
3. Solid wall PVC pipe, PVC socket fittings, and solvent-cemented joints.
4. Dissimilar Pipe-Material Couplings: [**Unshielded**], nonpressure transition couplings.

G. Underground, soil and waste piping NPS 5 and larger shall be[**any of**] the following:
1. In Kitchens, Boiler Rooms and other areas where equipment discharge temperature is above 140 degrees F. or noted “CI” on the drawings **Extra Heavy**] [**Service**] class, cast-iron soil piping; [**gaskets; and gasketed**] [**calking materials; and calked**] joints.
2. Solid-wall PVC pipe; PVC socket fittings; and solvent-cemented joints.
3. Dissimilar Pipe-Material Couplings: [**Unshielded**] [**Shielded**], nonpressure transition couplings.

H. Aboveground sanitary-sewage force mains NPS 1-1/2 and NPS 2 shall be the following:
1. Hard copper tube, Type L; copper pressure fittings; and soldered joints.
2. Galvanized-steel pipe, pressure fittings, and threaded joints.

I. Aboveground sanitary-sewage force mains NPS 2-1/2 to NPS 6 shall be the following:
1. Hard copper tube, Type L; copper pressure fittings; and soldered joints.
2. Galvanized-steel pipe, pressure fittings, and threaded joints.
3. Grooved-end, galvanized-steel pipe; grooved-joint, galvanized-steel-pipe appurtenances; and grooved joints.

J. Underground sanitary-sewage force mains NPS 4 and smaller shall be[**any of**] the following:
1. [**Hard**] [**Soft**] copper tube, Type K; [**wrought-** copper pressure fittings; and soldered joints.
2. Ductile-iron, mechanical-joint piping and mechanical joints.
3. Ductile-iron, push-on-joint piping and push-on joints.
4. Fitting-type transition coupling for piping smaller than NPS 1-1/2 and pressure transition coupling for NPS 1-1/2 and larger if dissimilar pipe materials.

K. Underground sanitary-sewage force mains NPS 5 and larger shall be the following:
1. Ductile-iron, mechanical-joint piping and mechanical joints.
2. Ductile-iron, push-on-joint piping and push-on joints.
3. Pressure transition couplings if dissimilar pipe materials.

END OF SECTION

SECTION 22 1319

SANITARY WASTE PIPING SPECIALITIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section includes:
   1. Backwater valves.
   2. Cleanouts.
   3. Floor drains.

1.03 DEFINITIONS

A. ABS: Acrylonitrile-butadiene-styrene plastic.

B. FOG: Fats, oils, and greases.

C. FRP: Fiberglass-reinforced plastic.

D. HDPE: High-density polyethylene plastic.

E. PE: Polyethylene plastic.

F. PP: Polypropylene plastic.

G. PVC: Polyvinyl chloride plastic.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”:

B. Seismic Qualification Certification for Sanitary drainage piping accessories and components from manufacturer:
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
      a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
      b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
   2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For drainage piping specialties indicated [O/M], to include in emergency, operation, and maintenance manuals. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

1.05 QUALITY ASSURANCE

A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NSF 14, "Plastics Piping Components and Related Materials," for plastic sanitary piping specialty components.

1.06 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate size and location of roof penetrations.

1.07 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Cultures: Provide 1-gal. bottles of bacteria culture recommended by manufacturer of FOG disposal systems equal to [**200**] <**Insert number**> percent of amount installed, but no fewer than [**2**] <**Insert number**> 1-gal. bottles.

PART 2 - PRODUCTS

2.01 CLEANOUTS [S]

A. Floor Cleanouts:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but not limited to the following:
   a. Interior Finished Areas: **Josam 57000-22, Jay R. Smith, 4033L, Zurn ZN-1400**, Nickel bronze top.
   b. Interior Finished Areas: **Josam 58460-A, Jay R. Smith 4333C, Zurn ZN-1454**, Nickel bronze top, flashing flange.
   c. Interior Equipment Rooms and Concrete Floors of Unfinished Areas on Grade: **Josam 57000-X-CI-22, Jay R. Smith 4231, Zurn Z-1400 HD** cast iron frame and cover.
   d. Interior Equipment Rooms and Unfinished Spaces Above Slab on Grade: **Josam 58460A, Jay R. Smith 4333, Zurn Z-1455**, Cast iron frame and cover, flashing flange.
   e. Interior Equipment Rooms with Isolation Slabs Above Structural Slab: **Josam series 2900 drain body with pipe extension and 57000-X-CI-22 cleanout, Jay R. Smith No. 9350, Zurn Z-626, c**ast iron construction, elastomeric gaskets.
2. Standard: ASME A112.36.2M. **Cleanouts shall be manufactured in the USA.**
3. Size: Same as connected branch or as indicated on the Drawing.
4. Type**] [Cast-iron soil pipe with cast-iron ferrule]**
5. Body or Ferrule Material: Cast iron.
6. Clamping Device: **[Required].**
7. Outlet Connection: **Gasket] [Threaded].**
8. Closure: Brass plug with tapered threads.
9. Adjustable Housing Material**: [Cast iron]**
10. Frame and Cover Material and Finish: Nickel-bronze, copper alloy, Painted cast iron or Polished bronze.
11. Frame and Cover Shape: Round.
12. Top-Loading Classification: [**Extra-Heavy Duty**]
13. Riser: ASTM A 74, Service class, cast-iron drainage pipe fitting and riser to cleanout.

B. Base of Exposed Vertical Stacks Near Floor:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **Josam 48910, Jay R. Smith 4505Y, Wade 8560E, Zurn Z-1445.**

2. Standard: ASME A112.36.2M and ASTM A74, ASTM A888, or CISPI 301, for cleanout test tees. **Cleanouts shall be manufactured in the USA.**
3. Size: Same as connected drainage piping.
4. Body Material: Hub-and-spigot, cast-iron soil-pipe T-branch or hubless, cast-iron soil-pipe test tee as required to match connected piping.
5. Closure Plug: Countersunk, brass.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

C. Wall Cleanouts:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but not limited to, the following:
   a. Painted Drywall and Finished Masonry Walls: **Josam 58600-PLG, Jay R. Smith 4472, Zurn Z-1468.**
   b. Plastered Walls: **Josam 58640, Jay R. Smith 4930-Smooth, Zurn ZN-1447**, Nickel bronze frame and cover.
2. Standard: ASME A112.36.2M, for cleanouts. Include wall access. **Cleanouts shall be manufactured in the USA.**
3. Size: Same as connected drainage piping.
4. Body Material: [**Hub-and-spigot, cast-iron soil-pipe T-branch**] [**Hubless, cast-iron soil-pipe test tee**] as required to match connected piping.
5. Closure: Countersunk, drilled-and-threaded, brass plug.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
7. Wall Access: Round, flat, chrome-plated brass or stainless-steel cover plate with screw.

D. Outside Cleanouts:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **Josam 55000-X-22, Jay R. Smith 4233, Wade 6000-NH-X, Zurn Z-1400 NH.**
2. Standard: ASME A112.36.2M. **Cleanouts shall be manufactured in the USA.**
3. Size: Same as branch or as indicated on Drawings.
4. Type: Adjustable Housing
5. Body Material: Cast Iron.
6. Closure Plug Size: Brass with taper threads
7. Frame and Cover: Round Cast Iron
8. Top loading Classification: Heavy Duty.
9. Outlet: No-Hub or spigot.

2.02 FLOOR DRAINS [S]

A. General Requirements: Drains are listed to generally describe type and features and shall be modified and furnished as required herein, suitable for construction conditions.
1. Drains shall have one-piece bodies or the Contractor shall effectively seal drain bodies to prevent leakage from two-piece body drains.
2. Strainers shall be ¼" thick, or equivalent, nickel bronze in finished rooms and spaces.
3. Strainers shall be cast iron in equipment rooms, shops, unfinished storage rooms and janitors closets.
4. Strainer sizes shall be 5" for 2" drains, 7" for 3" drains, and 8" for 4" drains unless otherwise noted.
5. Provide flashing clamps for all floors with water-proofing membranes.
6. Drains located in Composition Decks, "Dex-O-Tex", or similar compositions floor surfaces shall be furnished with special 4" wide flanges for bonding the flooring surface to the strainer. The height of the top of strainer above the flange shall be determined and provided after coordinating with the flooring Contractor for thickness requirements.
7. Weepholes shall be eliminated in all drains where composition deck, "Dex-O-Tex", or waterproof floors are provided without waterproofing membrane.
8. Drain body shall be tapped for trap primer on floor drains equipped with trap primers.
9. **Floor drains shall be manufactured in the USA**

B. Cast-Iron Floor Drains :

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, of the following:
   a. Type A: **Josam 30000-A, Jay R Smith 2010-A, Wade 1100, Zurn ZN-415**, furnished where indicated on the drawings and for all finished areas not otherwise indicated.
   b. Type B: **Josam 32100-TG, Jay R Smith 2120, Wade 1310, Zurn Z-508**, deep flanged tractor grate which can be installed inverted to receive equipment drains.
   c. Type C: **Josam 37840, Jay R. Smith 2240, Wade 2370, Zurn Z-539-FY-T,** 12" square top, square sump, bottom outlet, sediment bucket, cast iron grate.
   d. Type D: **Josam 49580A-NB-4, Jay R. Smith 3060-13, Zurn ZN-1950-3**, 12" diameter receptor, enameled interior, dome strainer, nickel bronze rim, 3/4 nickel bronze grate.
   e. Type E: **Josam49520-A-LF-NB, Jay R. Smith 3060-10, Wade 9040, Zurn ZN-1950-1**, 8" diameter, 6" deep, enameled interior, dome strainer, nickel bronze rim, nickel bronze grate.
   f. Type<**insert designation**>: Same as Type E except furnished with depressed aluminum grate.
   g. Type <**insert designation**>: Similar to Type A, furnished with **Josam E1, Jay R. Smith S37, Wade ER7, Zurn I**, 7" adjustable nickel bronze extended rim strainer.
   h. Type<**insert designation**>: **Jay R Smith 2630C-NB, Wade 2370-1-27, Zurn ZN-566-TG,** 12" square top, square sump, sediment bucket nickel bronze grate.
   i. Type<**insert designation**>: **Josam 29000 drain body with pipe extension, and 32100 drain, Jay R. Smith 9340, Zurn Z-264**, for isolated floor slabs.
2. Standard: ASME A112.6.3.
3. Body Material: Gray iron.
4. Outlet: Bottom, caulk or soil pipe gasket.
5. Backwater Valve: As specified
6. Coating on Interior and Exposed Exterior Surfaces: Acid-resistant enamel.
7. Sediment Bucket: As specified.
8. Top or Strainer Material: Gray iron, Nickel bronze, or acid resisting enamel.
9. Top Shape: As specified.
10. Trap Material: Cast iron or PVC.
11. Trap Pattern: Standard P-trap.

C. Stainless-Steel Floor Drains :

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Type <**insert designation**>: **IMC-TEDDY Model No. ASFT-2430** floor trough, brush satin 14-gauge type 304 stainless steel construction, stainless steel strainer with 4" drain tailpiece, 24" x 30" x 6" size recessed grating flange, joints shall be leak proof. Provide with Model No. SG-2430 stainless steel subway grating sized to fit trough. Trough and grating shall be set flush with finished floor.
2. Outlet: Bottom.
3. Material: Stainless steel.
4. Top Shape: Rectangular.
5. Trap-Primer Connection: [Not required].
6. Trap Material: Cast iron.
7. Trap Pattern: Standard P-trap.

2.03 THROUGH-PENETRATION FIRESTOP ASSEMBLIES [S]

A. Through-Penetration Firestop Assemblies >:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. ProSet Systems Inc.
   b. <**Insert manufacturer's name.**>
2. Standard: UL 1479 assembly of sleeve and stack fitting with firestopping plug.
3. Size: Same as connected soil, waste, or vent stack.

4. Sleeve: Molded PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.
5. Stack Fitting: ASTM A 48/A 48M, gray-iron, hubless-pattern, wye branch with neoprene O-ring at base and gray-iron plug in thermal-release harness. Include PVC protective cap for plug.
6. Special Coating: Corrosion resistant on interior of fittings.

2.04 MISCELLANEOUS SANITARY DRAINAGE PIPING SPECIALTIES [S]

A. Air-Gap Fittings
   1. Standard: ASME A112.1.2, for fitting designed to ensure fixed, positive air gap between installed inlet and outlet piping.
   2. Body: Bronze or cast iron.
   3. Inlet: Opening in top of body.
   4. Outlet: Larger than inlet.
   5. Size: Same as connected waste piping and with inlet large enough for associated indirect waste piping.

B. Vent Caps:
   1. Description: Cast-iron body with threaded or hub inlet and vandal-proof design. Include vented hood and setscrews to secure to vent pipe.
   2. Size: Same as connected stack vent or vent stack.

2.05 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, enclosure type and efficiency requirements for motors.
   1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
   2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Division 26 “Electrical”.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Comply with requirements in other Division 22 Sections for piping joining materials, joint construction, and basic installation requirements.

B. Install backwater valves in building drain piping. For interior installation, provide cleanout deck plate flush with floor and centered over backwater valve cover, and of adequate size to remove valve cover for servicing.

C. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise indicated:
   1. Size same as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
   2. Locate at each change in direction of piping greater than 45 degrees.
   3. Locate at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.
   4. Locate at base of each vertical soil and waste stack.

D. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor. Cleanouts on 6” and smaller pipes shall be provided a minimum clearance of 18” for rodding. Cleanouts on 8” and larger pipes shall be provided a minimum clearance of 36” for rodding.

E. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

F. Install floor drains at low points of surface areas to be drained. Set grates of drains flush with finished floor, unless otherwise indicated.
   1. Position floor drains for easy access and maintenance.
   2. Set floor drains below elevation of surrounding finished floor to allow floor drainage. Set with grates depressed according to the following drainage area radii:
      a. Radius, 30 Inches or Less: Equivalent to 1 percent slope, but not less than 1/4-inch total depression.
      b. Radius, 30 to 60 Inches: Equivalent to 1 percent slope.
      c. Radius, 60 Inches or Larger: Equivalent to 1 percent slope, but not greater than 1-inch total depression.
   3. Install floor-drain flashing collar or flange so no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes where penetrated.
   4. Install individual traps for floor drains connected to sanitary building drain, unless otherwise indicated.

G. Install fixture air-admittance valves on fixture drain piping.

H. Install air-admittance-valve wall boxes recessed in wall.

I. Install through-penetration firestop assemblies in plastic [**conductors**] [**and**] [**stacks**] at floor penetrations.

J. Assemble open drain fittings and install with top of hub [**1 inch**] [**2 inches**] <**Insert dimension**> above floor.

K. Install floor-drain, trap-seal primer fittings on inlet to floor drains that require trap-seal primer connection.
   1. Exception: Fitting may be omitted if trap has trap-seal primer connection.
   2. Size: Same as floor drain inlet.

L. Install air-gap fittings on draining-type backflow preventers and on indirect-waste piping discharge into sanitary drainage system.

M. Install sleeve flashing device with each riser and stack passing through floors with waterproof membrane.

N. Install vent caps on each vent pipe passing through roof.

O. Assemble components of FOG disposal systems and install on floor. Install trap, vent, fresh-air inlet, and flow-control fitting according to authorities having jurisdiction. Install shelf fastened to reinforcement in wall construction and adjacent to unit, unless otherwise indicated. Install culture bottle, culture metering pump, timer, and control on shelf. Install tubing between culture bottle, metering pump, and chamber.

P. Install grease interceptors, including trapping, venting, and flow-control fitting, according to authorities having jurisdiction and with clear space for servicing.
   1. Above-Floor Installation: Set unit with bottom resting on floor, unless otherwise indicated.
   2. Flush with Floor Installation: Set unit and extension, if required, with cover flush with finished floor.
   3. Recessed Floor Installation: Set unit in receiver housing having bottom or cradle supports, with receiver housing cover flush with finished floor.
   4. Install cleanout immediately downstream from interceptors not having integral cleanout on outlet.

Q. Install grease removal devices on floor. Install trap, vent, and flow-control fitting according to authorities having jurisdiction. Install control panel adjacent to unit, unless otherwise indicated.

R. Set concrete grease interceptors plumb and level. Install manhole access covers flush with finished grade.

S. Install oil interceptors, including trapping, venting, and flow-control fitting, according to authorities having jurisdiction and with clear space for servicing.

T. Install solids interceptors with cleanout immediately downstream from interceptors that do not have integral cleanout on outlet. Install trap on interceptors that do not have integral trap and are connected to sanitary drainage and vent systems.

U. Install drain trough to allow ready access for removal and cleaning of lint screen.

V. Install wood-blocking reinforcement for wall-mounting-type specialties.

W. Install traps on plumbing specialty drain outlets. Omit traps on indirect wastes unless trap is indicated.

3.02 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. FOG Disposal Systems: Connect inlet and outlet to unit, connect flow-control fitting and fresh-air inlet piping to unit inlet piping, and connect vent piping between trap and media chamber. Connect electrical power.

D. Grease Interceptors: Connect inlet and outlet to unit, and connect flow-control fitting and vent to unit inlet piping. Install valve on outlet of automatic drawoff-type unit.

E. Grease Removal Devices: Connect controls, electrical power, factory-furnished accessories, and inlet, outlet, and vent piping to unit.

F. Oil Interceptors: Connect inlet, outlet, vent, and gravity drawoff piping to unit; flow-control fitting and vent to unit inlet piping.

G. Ground equipment according to Section 22 05 26 "Grounding and Bonding for Electrical Systems."

H. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

3.03 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:

1. FOG disposal systems.
2. Grease interceptors.
3. Grease removal devices.
4. Oil interceptors.
5. Solids interceptors.

B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit. Comply with requirements for nameplates and signs in Section 22 05 53 “Painting and Identification for Plumbing Piping and Equipment."

3.04 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.05 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION

SECTION 22 1413

FACILITY STORM DRAINAGE PIPING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Pipe, tube, and fittings.
   2. Specialty pipe fittings.
   3. Encasement for underground metal piping.

1.03 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure unless otherwise indicated:
   1. Storm Drainage Piping: [**10-foot head of water**]
   2. Storm Drainage, Force-Main Piping: [**50 psig**]

B. Delegated Design: Design seismic restraints for above ground piping including comprehensive engineering analysis by a qualified professional engineer using performance requirements and design criteria according to [**SEI/ASCE 7"Minimum Design Loads for Buildings and Other Structures".**]

1.04 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Comply with requirements Division 01 and Section 22 04 00 "General Requirements for Plumbing".

B. LEED Submittal:
   1. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.

C. Shop Drawings: For [**controlled-flow**] roof drainage system. Include calculations, plans, and details.

D. Delegated Design Submittal: For seismic restraints of above ground piping including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.05 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF/ANSI 14, "Plastics Piping System Components and Related Materials," for plastic piping components. Include marking with "NSF-drain" for plastic drain piping and "NSF-sewer" for plastic sewer piping.

1.06 PROJECT CONDITIONS

A. Interruption of Existing Storm-Drainage Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
   1. Notify [**Architect**] days in advance of proposed interruption of storm-drainage service.
   2. Do not proceed with interruption of storm-drainage service without [**Architect's**] permission.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 HUB-AND-SPIGOT, CAST-IRON SOIL PIPE AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following: **AB&I Foundry, Charlotte Pipe and Foundry, Tyler Pipe**. Cast iron pipe and fittings shall be manufactured in the USA bear the Collective Trademark of the Cast Iron Soil Pipe Institute.

B. Pipe and Fittings: ASTM A 74, [**Service**] classes.

C. Gaskets: ASTM C 564, rubber.

D. Calking Materials: ASTM B 29, pure lead and oakum or hemp fiber.

2.03 SPECIALTY PIPE FITTINGS

A. Transition Couplings:
   1. General Requirements: Fitting or device for joining piping with small differences in OD's or of different materials. Include end connections same size as and compatible with pipes to be joined.
   2. Fitting-Type Transition Couplings: Manufactured piping coupling or specified-piping-system fitting.
   3. Unshielded, Nonpressure Transition Couplings:
      a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) Dallas Specialty & Mfg. Co.
         2) Fernco Inc.
         3) Mission Rubber Company; a division of MCP Industries, Inc.
         4) Plastic Oddities; a division of Diverse Corporate Technologies, Inc.
      b. Standard: ASTM C 1173.
      c. Description: Elastomeric, sleeve-type, reducing or transition pattern. Include shear ring and corrosion-resistant-metal tension band and tightening mechanism on each end.
      d. Sleeve Materials:
         1) For Cast-Iron Soil Pipes: ASTM C 564, rubber.
         2) For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
         3) For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.
   4. Shielded, Nonpressure Transition Couplings:
      a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) Cascade Waterworks Mfg. Co.
         2) Mission Rubber Company; a division of MCP Industries, Inc.
         3) <**Insert manufacturer's name**>.
      b. Standard: ASTM C 1460.
      c. Description: Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
   5. Pressure Transition Couplings:

a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1) Cascade Waterworks Mfg. Co.
   2) Dresser, Inc.
   3) EBAA Iron, Inc.
   4) Ford Meter Box Company, Inc. (The)
   5) JCM Industries, Inc.
   6) Romac Industries, Inc.
   7) Smith-Blair, Inc.; a Sensus company.
   8) Viking Johnson; c/o Mueller Co.
   9) <**Insert manufacturer's name**>.
b. Standard: AWWA C219.
c. Description: Metal, sleeve-type couplings same size as, with pressure rating at least equal to and ends compatible with, pipes to be joined.
d. Center-Sleeve Material: [**Manufacturer's standard**]
e. Gasket Material: Natural or synthetic rubber.
f. Metal Component Finish: Corrosion-resistant coating or material.

B. Dielectric Fittings:
1. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
2. Dielectric Unions:
   a. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      1) Capitol Manufacturing Company.
      2) Central Plastics Company.
      3) Hart Industries International, Inc.
      4) Jomar International Ltd.
      5) Matco-Norca, Inc.
      6) McDonald, A. Y. Mfg. Co.
      7) Watts Regulator Co.; a division of Watts Water Technologies, Inc.
      8) Wilkins; a Zurn company.
   b. Description:
      1) Standard: ASSE 1079.
      2) Pressure Rating: [**150 psig**] at 180 deg F.
      3) End Connections: Solder-joint copper alloy and threaded ferrous.

2.04 ENCASEMENT FOR UNDERGROUND METAL PIPING

A. Standard: ASTM A 674 or AWWA C105.

B. Material: [**High-density, crosslaminated PE film of 0.004-inch** minimum thickness.

C. Form: [**Sheet**] [**or**] [**tube**].

D. Color: [**Black**] [**or**] [**natural**].

PART 3 - EXECUTION

3.01 EARTH MOVING

A. Comply with requirements for excavating, trenching, and backfilling specified in **[Section 22 04 00 "General Requirements for Plumbing"**] [**Section 31 20 00 "Earth Moving"**].

3.02 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations from layout are approved on coordination drawings.

B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping at indicated slopes.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Install piping to allow application of insulation.

J. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

K. Make changes in direction for storm drainage piping using appropriate branches, bends, and long-sweep bends. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

L. Lay buried building storm drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.

M. Where trenches are excavated such that the bottom of the trench forms the bed for the pipe, solid and continuous load bearing support shall be provided between joints. Bell holes, hub holes and coupling holes shall be provided at points where the pipe is joined. Such pipe shall not be supported on blocks to grade.

N. Install storm drainage piping at the following minimum slopes unless otherwise indicated:
   1. Building Storm Drain: 2 percent downward in direction of flow for piping NPS 2 and smaller; 1 percent downward in direction of flow for piping NPS 3and larger.

O. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
   1. Install encasement on underground piping according to ASTM A 674 or AWWA C105.

P. Install steel piping according to applicable plumbing code.

Q. Install aboveground copper tubing according to CDA's "Copper Tube Handbook."

R. Install aboveground PVC piping according to ASTM D 2665.

S. Install underground PVC piping according to ASTM D 2321.

T. Install engineered [**controlled-flow**] [**siphonic**] drain specialties and storm drainage piping in locations indicated.

U. Install underground, ductile-iron, force-main piping according to AWWA C600. Install buried piping inside building between wall and floor penetrations and connection to storm sewer piping

outside building with restrained joints. Anchor pipe to wall or floor. Install thrust-block supports at vertical and horizontal offsets.

1. Install encasement on piping according to ASTM A 674 or AWWA C105.

V. Install force mains at elevations indicated.

W. Plumbing Specialties:

1. Install backwater valves in storm drainage gravity-flow piping. Comply with requirements for backwater valves in Section 22 14 23 "Storm Drainage Piping Specialties."
2. Install cleanouts at grade and extend to where building storm drains connect to building storm sewers in storm drainage gravity-flow piping. Install cleanout fitting with closure plug inside the building in storm drainage force-main piping. Comply with requirements for cleanouts in Section 22 14 23 "Storm Drainage Piping Specialties."
3. Install drains in storm drainage gravity-flow piping. Comply with requirements for drains in Section 22 14 23 "Storm Drainage Piping Specialties."

X. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

Y. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves in Section 22 04 00 “General Requirements for Plumbing”.

Z. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons in Section 22 04 00 "General Requirements for Plumbing Piping".

3.03 JOINT CONSTRUCTION

A. Hub-and-Spigot, Cast-Iron Soil Piping Gasketed Joints: Join according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.

B. Hubless, Cast-Iron Soil Piping Coupled Joints: Joints for hubless cast iron soil pipes and fittings shall conform to CISPI 310, latest revision and be certified by NSF for compliance to CISPI 310.

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

D. Join copper tube and fittings with soldered joints according to ASTM B 828 procedure. Use ASTM B 813, water-flushable, lead-free flux and ASTM B 32, lead-free-alloy solder.

E. Plastic, Nonpressure-Piping, Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:

1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
2. PVC Piping: Join according to ASTM D 2855 and ASTM D 2665 Appendixes.

3.04 SPECIALTY PIPE FITTING INSTALLATION

A. Transition Couplings:

1. Install transition couplings at joints of piping with small differences in OD's.
2. In Drainage Piping: [**Unshielded**] nonpressure transition couplings.
3. In Aboveground Force-Main Piping: Fitting-type transition couplings.
4. In Underground Force-Main Piping:
   a. NPS 1-1/2 and Smaller: Fitting-type transition couplings.
   b. NPS 2 and Larger: Pressure transition couplings.

B. Dielectric Fittings:

1. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

2. Dielectric Fittings for **NPS 2** and Smaller: Use dielectric.
3. Dielectric Fittings for **NPS 2-1/2 to NPS 4**: Use dielectric flanges**.**
4. Dielectric Fittings for **NPS 5** and Larger: Use dielectric flange kits.

3.05 VALVE INSTALLATION

A. General valve installation requirements are specified in Section 22 05 23 "General-Duty Valves for Plumbing Piping."

B. Shutoff Valves: Install shutoff valve on each sump pump discharge.
   1. Install gate or full-port ball valve for piping NPS 2 and smaller.
   2. Install gate valve for piping NPS 2-1/2 and larger.

C. Check Valves: Install swing-check valve, between pump and shutoff valve, on each sump pump discharge.

D. Backwater Valves: Install backwater valves in piping subject to backflow.
   1. Horizontal Piping: Horizontal backwater valves.[**Use normally closed type unless otherwise indicated.**]
   2. Install backwater valves in accessible locations.
   3. Comply with requirements for backwater valves in Division 22 Section "Storm Drainage Piping Specialties."

3.06 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements for seismic-restraint devices in Section 22 05 48 “Vibration and Seismic Controls for Plumbing Piping and Equipment”.

B. Comply with requirements for pipe hanger and support devices and installation in Section 22 05 53 "Hangers and Supports for Plumbing Piping and Equipment."
   1. Install [**carbon-steel**] <**Insert material**> pipe hangers for horizontal piping in noncorrosive environments.
   2. Install [**stainless-steel**] [**fiberglass**] pipe hangers for horizontal piping in corrosive environments.
   3. Install [**carbon-steel**] pipe support clamps for vertical piping in noncorrosive environments.
   4. Install stainless-steel pipe support clamps for vertical piping in corrosive environments.
   5. Vertical Piping: MSS Type 8 or Type 42, clamps.
   6. Individual, Straight, Horizontal Piping Runs:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer than 100 Feet if Indicated: MSS Type 49, spring cushion rolls.
   7. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   8. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support horizontal piping and tubing within 12 inches of each fitting [**valve,**] and coupling.

D. Support vertical piping and tubing at base and at each floor.

E. Rod diameter may be reduced one size for double-rod hangers, with 3/8-inch minimum rods.

F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 2: 60 inches with 3/8-inch rod.
   2. NPS 3: 60 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
   4. NPS 6 and NPS 8: 60 inches with 3/4-inch rod.
   5. NPS 10 and NPS 12: 60 inches with 7/8-inch rod.
   6. Spacing for 10-foot pipe lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches.

G. Install supports for vertical cast-iron soil piping every 15 feet.

H. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4: 84 inches with 3/8-inch rod.
   2. NPS 1-1/2: 108 inches with 3/8-inch rod.
   3. NPS 2: 10 feet with 3/8-inch rod.
   4. NPS 2-1/2: 11 feet with 1/2-inch rod.
   5. NPS 3: 12 feet with 1/2-inch rod.
   6. NPS 4 and NPS 5: 12 feet with 5/8-inch rod.
   7. NPS 6 and NPS 8: 12 feet with 3/4-inch rod.
   8. NPS 10 and NPS 12: 12 feet with 7/8-inch rod.

I. Install supports for vertical steel piping every 15 feet.

J. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4: 72 inches with 3/8-inch rod.
   2. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
   3. NPS 2-1/2: 108 inches with 1/2-inch rod.
   4. NPS 3 to NPS 5: 10 feet with 1/2-inch rod.
   5. NPS 6: 10 feet with 5/8-inch rod.
   6. NPS 8: 10 feet with 3/4-inch rod.

K. Install supports for vertical copper tubing every 10 feet.

L. Install hangers for PVC piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 2: 48 inches with 3/8-inch rod.
   2. NPS 3: 48 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 48 inches with 5/8-inch rod.
   4. NPS 6 and NPS 8: 48 inches with 3/4-inch rod.
   5. NPS 10 and NPS: 48 inches with 7/8-inch rod.

M. Install supports for vertical PVC piping every 48 inches.

N. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.07 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect interior storm drainage piping to exterior storm drainage piping. Use transition fitting to join dissimilar piping materials.

C. Connect storm drainage piping to roof drains and storm drainage specialties.
   1. Install test tees (wall cleanouts) in conductors near floor, and floor cleanouts with cover flush with floor.
   2. Install horizontal backwater valves [**with cleanout cover flush with floor**]
   3. Comply with requirements for [**cleanouts**] [**and**] [**drains**] in Section 22 14 23 "Storm Drainage Piping Specialties."

D. Connect force-main piping to the following:
   1. Storm Sewer: To exterior force main.
   2. Sump Pumps: To sump pump discharge.

E. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

F. Make connections according to the following unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.

2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3.08 IDENTIFICATION

A. Identify exposed storm drainage piping. Comply with requirements for identification in Section 22 07 00 "Identification for Plumbing Piping and Equipment."

3.09 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
   1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in.
   2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test storm drainage piping according to plumbing code:
   1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
   2. Leave uncovered and unconcealed new, altered, extended, or replaced storm drainage piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
   3. Storm Drainage System Water Test: A water test shall be applied to the storm drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less than a 10-foot head of water. In testing successive sections, at least the upper 10 feet of the next preceding section shall be tested so that no joint or pipe in the building except the uppermost 10 feet of the system shall have been submitted to a test of less than a 10 foot head of water. This pressure shall be held for at least 15 minutes. The system shall then be tight at all points.
   4. Storm Drainage System Air Test: An air test shall be made by forcing air into the system until there is a uniform gauge pressure of 5 psi or sufficient to balance a 10-inch column of mercury. This pressure shall be held for a test period of at least 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperature or the seating of gaskets shall be made prior to the beginning of the test periods. **Plastic piping shall not be tested with air unless manufacturer literature states air testing is acceptable**.
   5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
   6. Prepare reports for tests and required corrective action.

E. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
   1. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
   2. Cap and subject piping to static-water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.

3. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
4. Prepare reports for tests and required corrective action.

3.10 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

3.11 PIPING SCHEDULE

A. Flanges and unions may be used on aboveground pressure piping unless otherwise indicated.

B. Aboveground storm drainage piping shall be the following:
   1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.

C. Underground storm drainage piping shall be the following:
   1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.

D. Aboveground storm drainage force mains shall be the following:
   1. Galvanized-steel pipe, pressure fittings, and threaded joints.

E. Underground storm drainage force mains shall be the following:
   1. Ductile-iron, mechanical-joint piping and mechanical joints.

END OF SECTION

SECTION 22 14 23

REINFORCED CONCRETE STORM SEWERS AND APPURTENANCES

PART 1 - GENERAL

1.01 SCOPE

A. The work includes the construction of reinforced concrete pipe storm sewers and other miscellaneous drainage structures and appurtenances.

1.02 SUBMITTALS

A. Submit to the Architect/Engineer in conformance with the requirements of the CONDITIONS OF THE CONTRACT.

1.03 RELATED WORK SPECIFIED ELSEWHERE

A. Section 31 23 33 -Trenching and Backfilling

PART 2 - PRODUCTS

2.01 MATERIALS

A. Reinforced Concrete Pipe: Reinforced concrete pipe shall conform to the current specifications for reinforced concrete pipe, ASTM Designation C76 of the class shown on the plans. If not otherwise shown on the plans, all reinforced concrete pipes shall be Class III. All pipe shall be machine made by a process that will provide for uniform placement of zero slump concrete in the form and compaction by mechanical devices which will assure a dense concrete in the finished product.

B. Concrete for Inlets and Appurtenances: Reinforced concrete for inlets shall have a minimum compressive strength at twenty-eight (28) days of 4,000 pounds per square inch and a minimum cement content of five (5) sacks of cement per cubic yard of concrete.

C. Mortar: Mortar for pipe joints and connections to other drainage structures shall be composed of one (1) part by volume of Portland cement and two (2) parts of sand.

PART 3 - EXECUTION

3.01 BEDDING

A. All pipe shall receive embedment per the detail on the plans.

3.02 EXCAVATION

A. Excavation for storm sewer pipes shall consist of performing all excavation of every description and of whatever substance is encountered to the depth required. All excavated material which is not required for backfill or fill shall be removed and disposed of by the Contractor. All excavation shall be made by open cut; banks of trenches shall be kept as nearly vertical as possible and, if required, shall be properly sheeted and braced. For pipes having an inside diameter of thirty-three (33") inches or less, the trench

shall be excavated a minimum of sixteen (16") inches wider than the outside diameter of the pipe. The trench shall be excavated a minimum of sixteen (16") inches wider than the outside diameter of the pipe so that a clear space of not less than eight (8") inches is provided on each side of the pipe.

B. Cold Applied, Preformed Plastic Gaskets. These preformed gaskets may be used for sealing tongue and groove concrete pipe sewers. The gasket shall be produced from blends of refined hydrocarbon resins and plasticizing compounds reinforced with inert mineral filler and shall contain no solvents, irritating fumes, or obnoxious odors. The gasket joint sealer shall not depend on oxidizing, evaporating, or chemical action for its adhesive or cohesive strength and shall be supplied in extruded rope form of suitable cross section. The gasket joint sealer shall be protected by a removable two-piece wrapper designed so that one-half may be removed longitudinally without disturbing the other half to facilitate application. Preformed gaskets shall be Ram-Nek, as manufactured by K T. Snyder Co., Inc. of Houston, Texas, or approved equal.

3.05 BACKFILL

A. After the bedding has been prepared and the pipes installed as required, backfill shall be placed in accordance with Section 32 13 13. If the material, when tested, fails to meet the density requirements, the backfill shall be required to be removed and replaced to meet the proper density.

B. Backfill shall not be placed until the Architect/Engineer or his representative has observed the trench and authorized the placing of backfill. All debris shall be removed from the trench prior to beginning the backfilling operations. Sheet, shoring and bracing shall be pulled and removed during the progress of the backfilling in such a manner to protect the trench and the pipe.

C. Backfilling shall then be brought up to an elevation slightly above the original ground level to allow for subsequent settlement. The top surface of slopes of all backfill shall be neatly graded off in a workmanlike manner, and where select topsoil, sod, or other material is removed and piled separately, such material shall be carefully replaced in a manner satisfactory to the Architect/Engineer. The top one (1') foot of backfill material shall be of as good quality as the original topsoil which was removed.

3.06 DRAINAGE STRUCTURES

A. Inlets: Inlets shall be constructed as shown on the drawings. Excavation shall be made with appropriate equipment with a minimum of interference with adjacent improvements and existing utilities. After installation of inlets, all excavated areas which are not occupied by the inlet shall be backfilled with selected materials from the excavation. The backfill material shall be compacted to not less than ninety-five (95%) percent to one hundred (100%) percent of standard density, in accordance with AASHTO T-99.

END OF SECTION

SECTION 22 1423

STORM DRAINAGE PIPING SPECIALTIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Roof drains.
   2. Miscellaneous storm drainage piping specialties.
   3. Cleanouts.
   4. Trench drains.
   5. Channel drainage systems.
   6. Through-penetration firestop assemblies.

1.03 SUBMITTALS

A. Product Data: For each type of product indicated [S]. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

1.04 QUALITY ASSURANCE

A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

PART 2 - PRODUCTS

2.01 METAL ROOF DRAINS

A. Refer to plumbing drawings for type of storm roof drains

2.02 CLEANOUTS [S]

A. Floor Cleanouts
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but not limited, to the following:
      a. Interior Finished Areas: **Josam 57000-22, Jay R. Smith, 4033L, Zurn ZN-1400**, nickel bronze top.
      b. Interior Finished Areas: **Josam 58460-A, Jay R. Smith 4333C, Zurn ZN-1454**, nickel bronze top, flashing flange.
      c. Interior Equipment Rooms and Concrete Floors of Unfinished Areas on Grade: **Josam 57000-X-CI-22, Jay R. Smith 4231, Zurn Z-1400 HD** cast iron frame and cover.
      d. Interior Equipment Rooms and Unfinished Spaces Above Slab on Grade: **Josam 58460A, Jay R. Smith 4333, Zurn Z-1455,** cast iron frame and cover, flashing flange.
      e. Interior Equipment Rooms with Isolation Slabs Above Structural Slab. **Josam series 29000 drain body with pipe extension and 57000 X-C1-22 cleanout, Jay R. Smith No. 9350, Zurn No. Z626,** cast iron construction elastomeric gaskets.
      f. **Josam series 2900 drain body with pipe extension and 57000-X-C1-22 cleanout, Jay R. Smith No. 9350, Zurn Z-626,** Cast iron Construction elastomeric gaskets.
   2. Standard: ASME A112.36.2M. **Cleanouts shall be manufactured in the USA.**
   3. Size: Same as connected branch or as indicated on the Drawing.
   4. Type: **[Cast-iron soil pipe with cast-iron ferrule]**

5. Body or Ferrule Material: Cast iron.
6. Clamping Device: **[Not required]**
7. Outlet Connection: **[Threaded]**
8. Closure: Brass plug with tapered threads.
9. Adjustable Housing Material**: [Cast iron]** with threads [**screws or other device].**
10. Frame and Cover Material and Finish: Nickel-bronze, copper alloy, Painted cast iron or Polished bronze.
11. Frame and Cover Shape: Round.
12. Top-Loading Classification**: [Heavy Duty]**
13. **R**iser: ASTM A 74, Service class, cast-iron drainage pipe fitting and riser to cleanout.

B. Wall Cleanouts:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Painted Drywall and Finished Masonry Walls: **Josam 58600-PLG, Jay R. Smith 4472, Zurn Z-1468**.
   b. Plastered Walls: **Josam 58640, Jay R. Smith 4930-Smooth, Zurn ZN-1447**, nickel bronze frame and cover.
2. Standard: ASME A112.36.2M, for cleanouts. Include wall access. **Cleanouts shall be manufactured in the USA.**
3. Size: Same as connected drainage piping.
4. Body Material: [**Hub-and-spigot, cast-iron soil-pipe T-branch**] required to match connected piping.
5. Closure: Countersunk, drilled-and-threaded, brass plug.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
7. Wall Access: Round, flat, chrome-plated brass or stainless-steel cover plate with screw.

C. Outside Cleanouts:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but not limited to, the following: **Josam 55000-Z-22, Jay R. Smith 4233, Wade 6000-NH-X, Zurn Z-1400 NH.**
2. Standard: ASME A112.36.2M**. Cleanouts shall be manufactured in the USA.**
3. Size: Same as branch or as indicated on Drawings
4. Type: Adjustable Housing
5. Body Material: Cast Iron
6. Closure Plug: Brass with taper thread
7. Frame and Cover: Round Cast Iron
8. Top Loading Classification: Heavy Duty
9. Outlet: No-Hub or spigot

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install primary roof drains at low points of roof areas according to roof membrane manufacturer's written installation instructions. Roofing materials are specified in Division 07 Sections.

1. Install flashing collar or flange of roof drain to prevent leakage between drain and adjoining roofing. Maintain integrity of waterproof membranes where penetrated.
2. Install expansion joints, if indicated, in roof drain outlets.
3. Position roof drains for easy access and maintenance.

B. Install secondary roof drains at normal roof elevation to prevent ponding around drains.

C. Install downspout adapters on outlet of back-outlet parapet roof drains and connect to sheet metal downspouts.

D. nstall discharge [elevation indicated on the drawings] [conductor nozzles at exposed bottom of conductors where they spill onto grade].

E. Install cleanouts in aboveground piping and building drain piping according to the following instructions unless otherwise indicated:
   1. Use cleanouts the same size as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
   2. Locate cleanouts at each change in direction of piping greater than 45 degrees.
   3. Locate cleanouts at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.
   4. Locate cleanouts at base of each vertical soil and waste stack.

F. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.

G. Set outside cleanouts flush with finished grade and provide 18” square by 6” deep concrete apron around cleanout.

H. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

I. Install horizontal backwater valves in floor with cover flush with floor.

J. Install drain-outlet backwater valves in outlet of drains.

K. Install test tees in vertical conductors and near floor.

L. Install wall cleanouts in vertical conductors. Install access door in wall if indicated.

M. Install trench drains at low points of surface areas to be drained. Set grates of drains flush with finished surface unless otherwise indicated.

N. Assemble channel drainage system components according to manufacturer's written instructions. Install on support devices so that top will be flush with adjacent surface.

O. Install through-penetration firestop assemblies in plastic conductors at concrete floor penetrations.

P. Install sleeve flashing device with each conductor passing through floors with waterproof membrane.

Q. Install yard drains with 8”W X 6”D concrete apron around Drain. Comply with requirements detailed on the Drawings and specified in Section 03 33 00 “Cast In Place Concrete”.

3.02 CONNECTIONS

A. Comply with requirements for piping in Section 22 14 13 “Facility Storm Drainage Piping”. Drawings indicate general arrangement of piping, fittings, and specialties.

3.03 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION

SECTION 22 3300

ELECTRIC, DOMESTIC-WATER HEATERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Commercial, electric, storage, domestic-water heaters.
   2. Domestic-water heater accessories.

1.03 SUBMITTALS

A. Product Data: For each type and size of domestic-water heater indicated [S]. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories**.** Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing.

B. LEED Submittal:
   1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with ASHRAE/IESNA 90.1, Section 7, "Service Water Heating."

C. Shop Drawings:
   1. Wiring Diagrams: For power, signal, and control wiring.

D. Seismic Qualification Certificates: For commercial domestic-water heaters, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Product Certificates: For each type of [**commercial**] electric, domestic-water heater, from manufacturer.

F. Domestic-Water Heater Labeling: Certified and labeled by testing agency acceptable to authorities having jurisdiction.

G. Source quality-control reports.

H. Field quality-control reports.

I. Operation and Maintenance Data: For electric, domestic-water heaters indicated [O/M], to include in emergency, operation, and maintenance manuals. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

J. Warranty: Sample of special warranty.

1.04 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1.

C. ASME Compliance: Where ASME-code construction is indicated, fabricate and label commercial, domestic-water heater storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

D. NSF Compliance: Fabricate and label equipment components that will be in contact with potable water to comply with NSF 61, "Drinking Water System Components - Health Effects" and NSF 372, "Drinking Water System Components- Lead Content".

1.05 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

1.06 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of electric, domestic-water heaters that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including storage tank and supports.
      b. Faulty operation of controls.
      c. Deterioration of metals, metal finishes, and other materials beyond normal use.
   2. Warranty Periods: From date of Substantial Completion.
      a. Commercial, Large Volume Electric Storage, Domestic-Water Heaters:
         1) Storage Tank: Five year non pro-rated with additional five year pro-rated.
         2) Controls and Other Components: [**Three**] years.
      b. Commercial, Electric, Storage, Domestic-Water Heaters:
         1) Storage Tank: Three years.
         2) Controls and Other Components: One year.
      c. Commercial, Light-Duty, Storage, Electric, Domestic-Water Heaters:
         1) Storage Tank: Three years.
         2) Controls and Other Components: One year.
      d. Residential, Electric, Storage, Domestic-Water Heaters:
         1) Storage Tank: [**Six**] years.
         2) Controls and Other Components: [**Six**] years.
      e. Electric, Tankless, Domestic-Water Heaters:] [**Five**] year(s).
      f. Thermal Expansion Tanks: [**Five**] years.

PART 2 - PRODUCTS

2.01 COMMERCIAL, ELECTRIC, DOMESTIC-WATER HEATERS [S] [O/M]

A. Commercial, Large Volume Electric, Storage, Domestic-Water Heaters EWH-1
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following: **Cemline, EHB Series,**
   2. Standard: UL 1453.
   3. Storage-Tank Construction: ASME-code, steel [**vertical**] arrangement.
      a. Tappings: Factory fabricated of materials compatible with tank and piping connections. Attach tappings to tank before testing.
         1) NPS 2 and Smaller: Threaded ends according to ASME B1.20.1.
         2) NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel and stainless-steel flanges, and according to ASME B16.24 for copper and copper-alloy flanges.
      b. Pressure Rating: 150 psi.
      c. Interior Finish: “Stonesteel” Hydraulic cement applied over wire mesh.
   4. Factory-Installed Storage-Tank Appurtenances:
      a. Thermometer.
      b. Pressure Gage

c. 11” x 15” Manhole
d. Drain Valve: Corrosion-resistant metal complying with ASSE 1005.
e. Insulation: Comply with ASHRAE/IESNA 90.1.
f. Jacket: Steel with enameled finish.
g. Heating Elements: Electric, individually mounted bolt-on immersion type.
h. Temperature Control: Adjustable thermostat.
i. Base: Structural I-Beam [**Horizontal heaters only]**
j. Safety Controls: High-temperature-limit and low-water cutoff devices or systems.
k. Relief Valves: ASME rated and stamped for combination temperature-and-pressure relief valves. Include one or more relief valves with total relieving capacity at least as great as heat input, and include pressure setting less than domestic-water heater working-pressure rating. Select one relief valve with sensing element that extends into storage tank.

5. Special Requirements: NSF 5 construction.
6. Capacity and Characteristics;
   a. Capacity: **80 gal**
   b. Recovery: **<24 gph> at [100 deg. F] >** temperature rise.
   c. Temperature Setting: **[140 deg F]**
   d. Power Demand: **<insert kilowatts>**
   e. Heating Elements: **<insert number>**
   f. Kilowatts Each Element: **<insert killowatts>**
   g. Number of stages: **<insert number>**
   h. Volts: **[208]**
   i. Phases: **[three]**
   j. Hertz: 60

2.02 DOMESTIC-WATER HEATER ACCESSORIES [S]

A. Thermal Expansion Tanks:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. AMTROL Inc.
      b. Flexcon Industries.
      c. Honeywell International Inc.
      d. Pentair Pump Group (The); Myers.
      e. Smith, A. O. Water Products Co.; a division of A. O. Smith Corporation.
      f. State Industries.
      g. Taco, Inc.
   2. Description: Steel pressure-rated tank constructed with welded joints and factory-installed butyl-rubber diaphragm. Include air precharge to minimum system-operating pressure at tank.
   3. Construction:
      a. Tappings: Factory-fabricated steel, welded to tank before testing and labeling. Include ASME B1.20.1 pipe thread.
      b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
      c. Air-Charging Valve: Factory installed.
   4. ASME Thermal Expansion Tank No. **TET-1**
      a. Working-Pressure Rating: [**150 psig**]
      b. Capacity Acceptable: [**2 gal.**] minimum.
      c. Air Precharge Pressure: 40 psig.

B. Drain Pans: Corrosion-resistant metal with raised edge. Comply with ANSI/CSA LC 3. Include dimensions not less than base of domestic-water heater, and include drain outlet not less than NPS 3/4 with ASME B1.20.1 pipe threads or with ASME B1.20.7 garden-hose threads.

C. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1[**or ASHRAE 90.2**].

D. Heat-Trap Fittings: ASHRAE 90.2.

E. Manifold Kits: Domestic-water heater manufacturer's factory-fabricated inlet and outlet piping for field installation, for multiple domestic-water heater installation. Include ball, butterfly, or gate type shutoff valves to isolate each domestic-water heater and [**calibrated**] balancing valves to provide balanced flow through each domestic-water heater.

1. Comply with requirements for ball or gate type shutoff valves, check valves and balancing valves in Section 22 05 23"General-Duty Valves for Plumbing Piping."

F. Pressure-Reducing Valves: ASSE 1003 for water. Set at 25-psig-maximum outlet pressure, unless otherwise indicated.

G. Combination Temperature-and-Pressure Relief Valves: ASME rated and stamped. Include relieving capacity at least as great as heat input, and include pressure setting less than domestic-water heater working-pressure rating. Select relief valves with sensing element that extends into storage tank.

H. Pressure Relief Valves: ASME rated and stamped. Include pressure setting less than domestic-water heater working-pressure rating.

I. Vacuum Relief Valves: ANSI Z21.22/CSA 4.4.

J. Shock Absorbers: ASSE 1010 or PDI-WH 201, Size A water hammer arrester.

K. Domestic-Water Heater Stands: Manufacturer's factory-fabricated steel stand for floor mounting, capable of supporting domestic-water heater and water. Include dimension that will support bottom of domestic-water heater a minimum of 18 inches above the floor.

L. Domestic-Water Heater Supports: Factory-fabricated steel wall mounted unit with welded gussets and brackets, front rings for threaded rod support capable of supporting domestic-water heater and water.

2.03 SOURCE QUALITY CONTROL

A. Factory Tests: Test and inspect domestic-water heaters specified to be ASME-code construction, according to ASME Boiler and Pressure Vessel Code.

B. Hydrostatically test [**commercial**] domestic-water heaters to minimum of one and one-half times pressure rating before shipment.

C. Electric, domestic-water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Division 01 Section "Quality Requirements" for retesting and reinspecting requirements and Division 01 Section "Execution" for requirements for correcting the Work.

D. Prepare test and inspection reports.

PART 3 - EXECUTION

3.01 DOMESTIC-WATER HEATER INSTALLATION

A. Commercial, Electric, Domestic-Water Heater Mounting: Install commercial, electric, domestic-water heaters on concrete base. Comply with requirements for concrete bases specified in Section 03 30 00 "Cast-in-Place Concrete"

1. Exception: Omit concrete bases for commercial, electric, domestic-water heaters if installation on stand, bracket, suspended platform, or directly on floor is indicated.
2. Maintain manufacturer's recommended clearances.
3. Arrange units so controls and devices that require servicing are accessible.
4. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
5. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

6. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
7. Install anchor bolts to elevations required for proper attachment to supported equipment.
8. Anchor domestic-water heaters to substrate.

B. Residential, Electric, Domestic Water Heater Mounting: Install residential, electric, domestic-water heaters **concrete base**. Comply with requirements for concrete bases specified in, Section 03 30 00 “Cast-in-Place Concrete”.

1. Maintain manufacturer's recommended clearances.
2. Arrange units so controls and devices that require servicing are accessible.
3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.
5. Anchor domestic-water heaters to substrate.

C. Install electric, domestic-water heaters level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.

1. Install shutoff valves on domestic-water-supply piping to domestic-water heaters and on domestic-hot-water outlet piping. Comply with requirements for shutoff valves in Section 22 05 23"General-Duty Valves for Plumbing Piping."

D. Install combination temperature-and-pressure relief valves in top portion of storage tanks. Use relief valves with sensing elements that extend into tanks. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic-water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

E. Install water-heater drain piping as indirect waste to spill by positive air gap into open drains or over floor drains. Install hose-end drain valves at low points in water piping for electric, domestic-water heaters that do not have tank drains. Comply with requirements for hose-end drain valves in Section 22 11 19 "Domestic Water Piping Specialties."

F. Install thermometers on outlet piping of electric, domestic-water heaters. Comply with requirements for thermometers in Section 22 11 19"Domestic Water Piping Specialties."

G. Assemble and install inlet and outlet piping manifold kits for multiple electric, domestic-water heaters. Fabricate, modify, or arrange manifolds for balanced water flow through each electric, domestic-water heater. Include shutoff valve and thermometer in each domestic-water heater inlet and outlet, and throttling valve in each electric, domestic-water heater outlet. Comply with requirements for valves and thermometers in Section 22 05 23"General-Duty Valves for Plumbing Piping."

H. Install piping-type heat traps on inlet and outlet piping of electric, domestic-water heater storage tanks without integral or fitting-type heat traps.

I. Fill electric, domestic-water heaters with water.

J. Charge domestic-water compression tanks with air.

3.02 CONNECTIONS

A. Comply with requirements for piping in Section 22 11 16"Domestic Water Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where installing piping adjacent to electric, domestic-water heaters, allow space for service and maintenance of water heaters. Provide proper support for thermal expansion tanks and piping. Arrange expansion tanks piping for easy removal of domestic-water heaters.

3.03 IDENTIFICATION

A. Identify system components. Comply with requirements for identification in Section 22 05 53 "Painting and Identification for Plumbing Piping and Equipment."

3.04 FIELD QUALITY CONTROL

A. Perform tests and inspections.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
   2. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   3. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Electric, domestic-water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Division 01 Section "Quality Requirements" for retesting and reinspecting requirements and Division 01 Section "Execution" for requirements for correcting the Work.

C. Prepare test and inspection reports.

3.05 DEMONSTRATION

A. [**Train**] Owner's maintenance personnel to adjust, operate, and maintain [**commercial**] electric, domestic-water heaters.

END OF SECTION

SECTION 22 4000

PLUMBING FIXTURES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:

1. Water closets.
2. Lavatories.
3. Sinks.
4. Showers.

1.04 SUBMITTALS

A. Product Data: For each type of plumbing fixture indicated [S]. Include selected fixture and trim, fittings, accessories, appliances, appurtenances, equipment, and supports. Indicate materials and finishes, dimensions, construction details, and flow-control rates. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Operation and Maintenance Data: For plumbing fixtures indicated [O/M] to include in emergency, operation, and maintenance manuals. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

D. Warranty: Special warranty specified in this Section.

1.3 DEFINITIONS

A. ABS: Acrylonitrile-butadiene-styrene plastic.

B. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

C. Cast Polymer: Cast-filled-polymer-plastic material. This material includes cultured-marble and solid-surface materials.

D. Cultured Marble: Cast-filled-polymer-plastic material with surface coating.

E. Fitting: Device that controls the flow of water into or out of the plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads and tub spouts, drains and tailpieces, and traps and waste pipes. Piping and general-duty valves are included where indicated.

F. FRP: Fiberglass-reinforced plastic.

G. PMMA: Polymethyl methacrylate (acrylic) plastic.

H. PVC: Polyvinyl chloride plastic.

I. Solid Surface: Nonporous, homogeneous, cast-polymer-plastic material with heat-, impact-, scratch-, and stain-resistance qualities.

1.05 QUALITY ASSURANCE

A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.

1. Exception: If fixtures, faucets, or other components are not available from a single manufacturer, obtain similar products from other manufacturers specified for that category.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"[**; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act";**] for plumbing fixtures for people with disabilities.

D. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.

E. NSF Compliance for fixture materials that will be in contact with potable water: NSF 61, "Drinking Water System Components - Health Effects" and NFS 372, "Drinking Water System Components - Lead Content".

F. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.

G. Comply with the following applicable standards and other requirements specified for plumbing fixtures:

1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
2. Plastic Bathtubs: ANSI Z124.1.
3. Plastic Lavatories: ANSI Z124.3.
4. Plastic Laundry Trays: ANSI Z124.6.
5. Plastic Mop-Service Basins: ANSI Z124.6.
6. Plastic Shower Enclosures: ANSI Z124.2.
7. Slip-Resistant Bathing Surfaces: ASTM F 462.
8. Solid-Surface-Material Lavatories and Sinks: ANSI/ICPA SS-1.
9. Stainless-Steel Commercial, Handwash Sinks: NSF 2 construction.
10. Stainless-Steel Residential Sinks: ASME A112.19.3.
11. Vitreous-China Fixtures: ASME A112.19.2M.
12. Water-Closet, Flush Valve, Tank Trim: ASME A112.19.5.
13. Water-Closet, Flushometer Tank Trim: ASSE 1037.

H. Comply with the following applicable standards and other requirements specified for [**lavatory**] [**and**] [**sink**] faucets:

1. Backflow Protection Devices for Faucets with Side Spray: ASME A112.18.3M.
2. Backflow Protection Devices for Faucets with Hose-Thread Outlet: ASME A112.18.3M.
3. Diverter Valves for Faucets with Hose Spray: ASSE 1025.
4. Faucets: ASME A112.18.1.
5. Hose-Connection Vacuum Breakers: ASSE 1011.
6. Hose-Coupling Threads: ASME B1.20.7.
7. Integral, Atmospheric Vacuum Breakers: ASSE 1001.
8. NSF Potable-Water Materials: NSF 61.
9. Pipe Threads: ASME B1.20.1.
10. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
11. Supply Fittings: ASME A112.18.1.
12. Brass Waste Fittings: ASME A112.18.2.

I. Comply with the following applicable standards and other requirements specified for [**shower**] faucets:

1. Backflow Protection Devices for Hand-Held Showers: ASME A112.18.3M.
2. Combination, Pressure-Equalizing and Thermostatic-Control Antiscald Faucets: ASSE 1016.
3. Deck-Mounted Bath/Shower Transfer Valves: ASME 18.7.
4. Faucets: ASME A112.18.1.
5. Hand-Held Showers: ASSE 1014.
6. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445.
7. Hose-Coupling Threads: ASME B1.20.7.
8. Manual-Control Antiscald Faucets: ASTM F 444.
9. Pipe Threads: ASME B1.20.1.
10. Pressure-Equalizing-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
11. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
12. Thermostatic-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.

J. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:

1. Atmospheric Vacuum Breakers: ASSE 1001.
2. Brass and Copper Supplies: ASME A112.18.1.
3. Dishwasher Air-Gap Fittings: ASSE 1021.
4. Manual-Operation Flushometers: ASSE 1037.
5. Plastic Tubular Fittings: ASTM F 409.
6. Brass Waste Fittings: ASME A112.18.2.
7. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.

K. Comply with the following applicable standards and other requirements specified for miscellaneous components:

1. Disposers: ASSE 1008 and UL 430.
2. Dishwasher Air-Gap Fittings: ASSE 1021.
3. Flexible Water Connectors: ASME A112.18.6.
4. Floor Drains: ASME A112.6.3.
5. Grab Bars: ASTM F 446.
6. Hose-Coupling Threads: ASME B1.20.7.
7. Off-Floor Fixture Supports: ASME A112.6.1M.
8. Pipe Threads: ASME B1.20.1.
9. Plastic Shower Receptors: ANSI Z124.2.
10. Plastic Toilet Seats: ANSI Z124.5.
11. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.06 WARRANTY

A. Special Warranties: Manufacturer's standard form in which manufacturer agrees to repair or replace components of whirlpools that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Structural failures of unit shell.
   b. Faulty operation of controls, blowers, pumps, heaters, and timers.
   c. Deterioration of metals, metal finishes, and other materials beyond normal use.
2. Warranty Period for Commercial Applications: [**Three**] year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 WATER CLOSETS [S]

FLUSH VALVE TYPE

A. WC-**1**Water Closets:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **American Standard, Crane Kohler Sloan , Zurn .**
2. Description **Wall**-mounting, back-outlet, vitreous-china fixture designed for flushometer valve operation.
    a. Style: Flushometer valve.
        1) Bowl Type: Elongated with [**siphon-jet**] design.
        2) Design Consumption: **[1.28 gal./flush]** >.
        3) Color: **White**.
3. Flushometer: **Sloan , Delany , Zurn >.** Include brass body with corrosion-resistant internal components, control stop with check valve, vacuum breaker, copper or brass tubing, and polished chrome-plated finish on exposed parts.
    a. Internal Design: [**Diaphragm**] operation.
    b. Style: [**Exposed**]].
    c. Inlet Size: NPS 1.
    d. Trip Mechanism: [**lever-handle actuator**]
    e. Consumption: [**1.28 gal./flush**]
    f. Tailpiece Size: [**NPS 1-1/4]** length to top of bowl.
    g. Handicap accessible handle assembly mounted on the side of the compartment with the most clear floor space.
4. Toilet Seat: **Church , Beneke , Olsonite ,** for water-closet-type fixture.
    a. Material: Molded, solid plastic[**with antimicrobial agent**].
    b. Configuration: [**Closed**] cover.
    c. Size: Elongated.
    d. Hinge Type: [**CK, check**]
    e. Class: [**Standard commercial**]
    f. Color: **White**
5. Mounting Height: **[15”]**floor to rim.

2.02 LAVATORIES [S]

A. L- **1** Lavatories:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **American Standard, Crane , Kohler , [Other] <insert model>.**
2. Description: [**Accessible, wall**] fixture.
    a. Type: [**With back**]
    b. Size: [**20 by 18 inches**] rectangular.
    c. Faucet Hole Punching: [**Three holes, 2-inch centers**]
    d. Faucet Hole Location: [**Top**]
    e. Pedestal: [**Not required**]
3. Faucet: **Chicago T&, Zurn,** [**Two-handle mixing**] valve. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes; coordinate outlet with spout and fixture receptor.
    a. Finish: [**Polished chrome plate**]
    b. Maximum Flow Rate: **0.5 gpm**
    c. Centers: [**4 inches**] [**8 inches**] [**Adjustable**].
    d. Mounting: [**Deck, concealed**]
    e. Valve Handle(s): [**Knob**]].
    f. Inlet(s): [**NPS 1/2 male shank**] [**NPS 1/2] female shank**].
    g. Spout: [**Rigid, gooseneck**] type.
    h. Spout Outlet: [**Aerator**]
    i. Operation: [**Compression, manual**]].
    j. Drain: [**Pop up**]
    k. Water Tempering Valve: Tempering Valve is specified in Section 22 11 19 “Domestic Water Piping Specialties”,

B. Lavatory Fittings:

1. Description: Chrome finish brass lavatory supply assembly [**copper sweat**] ½ x OD 3/8, brass "Quarter Turn" ball valve angle stops with convertible – [**conventional**] handle, chrome finish copper flexible risers, chrome finish steel escutcheons; [**NPS 1-¼**] chrome finish cast brass ground joint swivel "P"-Trap with cleanout plug, cast brass slip nuts, 17 gage chrome finish tubular extension to wall, chrome finish steel box or bell wall flange.
2. Description: Chrome finish brass lavatory supply assembly [**copper sweat**]] ½ x OD 3/8, brass "Quarter Turn" ball valve straight stops, [**wheel handle**] chrome finish copper flexible risers, chrome finish steel escutcheons; **NPS 1-½**] chrome finish cast brass ground joint swivel "P" Trap with cleanout plug, cast brass slip nuts, 17 gage chrome finish tubular extension to wall, chrome finish steel box or bell wall flanges.

C. Protective Shielding Piping Enclosures:

1. For each L-1 > lavatory, the drain and water supplies shall be insulated with protective shielding enclosures from bottom of lavatory to wall.
2. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **Truebro "Lav Guard" 102 W with accessory 105 as required, Plumberex "Pro-Extreme" X4333 with accessory X4114 as required, McGuire "Prowrap" 2125WC or 2125 PW WC as required.**
3. Description: Manufactured plastic enclosure for covering plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with [**ICC/ANSI A117.1**] [**ADA**] requirements.

D. Lavatory Supports for Stud and Drywall Partitions:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: [CONCEALED ARM SUPPORT] **Josam Series 17100, Jay R. Smith Series 0700, Jay R. Smith Series 0800, Zurn Series Z-1231**] [WALL HANGER PLATE] **Josam Series 17550, Jay R. Smith Series 0800, Zurn Series Z-1224.**
2. Description: Type [**I, lavatory carrier with concealed arms and tie rod**] [**II lavatory carrier with hanger plate and tie rod**] for wall-mounting, lavatory-type fixture. Include steel uprights with feet.
3. Accessible-Fixture Support: Include rectangular steel uprights.

E. Lavatory Supports for Masonry Walls:

1. Description: Rectangular steel plates 20"L x 4" H x 1/8"D located on back side of partition where lavatories are mounted against pipe spaces to hold supporting bolts for wall hangers. Locate plate in wall construction where no pipe space exists behind fixture.
2. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following [CONCEALED ARM SUPPORT] **Josam Series 17120-BP, Jay R. Smith Series 0728, Zurn Series Z-1254** [WALL HANGER SUPPORT] **Josam Series 17590, Jay R. Smith Series 0826, Zurn Series Z-1259**.
3. Description: Rectangular steel plates complete with bolts, nuts, washers, located on back side of partition for wall mounting, lavatory type fixture. Locate plate in wall construction where no pipe space exists.

2.03 SINKS [S]

A. S-**1**Sinks:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **Elkay <insert model>, Just <insert model>, [Other] <insert model>**
2. Description: One bowl, classroom, counter-mounting, stainless-steel kitchen sink.
   a. Overall Dimensions: [**25"x17"**] [**8"**] depth.
   b. Metal Thickness: [**20 gage**] [

c. Drain: 3-1/2-inch [**chrome plated brass**].
1) Location: [**Centered in bowl**] >.
d. Punching: [**One**]
e. Supplies: NPS 1/2 chrome-plated copper **[loose key]** with stops.
f. Drain Piping: NPS 1-1/2 chrome-plated, cast-brass P-trap; 17 gage- thick tubular brass waste to wall; [**continuous waste;]** and wall escutcheon(s).

3. Faucet: **Chicago T&S Zurn**] Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes; coordinate outlet with spout and fixture receptor.
a. Body Material: Commercial, solid brass
b. Finish: **Polished chrome plate**.
c. Maximum Flow Rate: [**2.2 gpm**] unless otherwise indicated.
d. Mixing Valve: Two-lever handle.
e. Centers: [**4 inches**] [**8 inches**] [**Single hole**] [**Adjustable**].
f. Mounting: Deck]
g. Handle(s): [**Lever**]
h. Inlet(s): [**NPS 1/2 male shank**]
i. Spout Type: [**Rigid gooseneck**]
j. Spout Outlet: **Aerator**.
k. Vacuum Breaker: Not required.
l. Operation: [**Compression, manual**]
4. Bubbler: **Elkay LK1141A, Just JSB-10-VR-FLX,** chrome plated, lead free construction, flexible guard, self closing bush button actuator.

B. Disposers:
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **In-Sink-Erator Kitchen Aid Maytag**
2. Description: [**Batch**] [**Continuous**]-feed household, food-waste disposer. Include reset button; wall switch; corrosion-resistant chamber with jam-resistant, cutlery- or stainless-steel grinder or shredder; NPS 1-1/2 outlet; quick-mounting, stainless-steel sink flange; antisplash guard; and combination cover/stopper.
a. Type: [**Batch**] [**Continuous**]-feed household.
b. Model: [**Not applicable**] [**Sound-insulated chamber**] [**Sound-insulated chamber and stainless-steel outer shell**].
c. Motor: 115-V ac, 1725 rpm, [**1/2**] hp with overload protection.

C. Dishwasher Air-Gap Fittings,
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Brass Craft Mfg. Co.; a Subsidiary of Masco Corporation.
b. Dearborn Brass; a div. of Moen, Inc.
c. Geberit Manufacturing, Inc.
d. Sioux Chief Manufacturing Company, Inc.
e. Watts Brass & Tubular; a division of Watts Regulator Co.
2. Description: Fitting suitable for use with domestic dishwashers and for deck mounting; with plastic body [**chrome-plated**]; and capacity of at least 5 gpm; and inlet pressure of at least 5 psig at a temperature of at least 140 deg F. Include 5/8-inch- ID inlet and 7/8-inch- ID outlet hose connections.
3. Hoses: Rubber and suitable for temperature of at least 140 deg F.
a. Inlet Hose: 5/8-inch ID and [**48 inches**] long.
b. Outlet Hose: 7/8-inch ID and [**48 inches**] long.

D. Protective Shielding Piping Enclosures,
1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

Truebro "Lav Guard" 102 W with accessory 105 as required, Plumberex "Pro-Extreeme"X4333 with accessory X4114 required, McGuire "Prowrap" PW2150 with accessory PW"155" W/C as required.

2. Description: White manufactured plastic enclosure for covering plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with [**ADA**] [**ICC/ANSI A117.1**] requirements.

2.04 SHOWERS [S]

A. SH-**<insert number>** Showers,:

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, Freedom Showers
2. Description: [**Accessible,**] Refer to plumbing schedules.
   a. Size: [**Refer to schedules on plumbing drawings**
   b. Color: **White**.
   c. Drain Location: [**Center**]].
   d. Accessibility Options: Include grab bar and HPDE fold down Seat.
   e. Drain: Grid, NPS 2.
   f. Finish: [**Polished chrome plate**] >.
   g. Maximum Flow Rate: [**2.5 gpm**] unless otherwise indicated.
   h. Mounting: Concealed.
   i. Backflow Protection Device for Hand-Held Shower: Required.
   j. Handle: Metal Lever.
   k. Antiscald Device: [**Integral with mixing valve**]
   l. Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.
   m. Supply Connections: [**NPS 1/2**]
   n. Shower Head Type: Hand held, slide-bar mounted.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before plumbing fixture installation.

B. Examine cabinets, counters, floors, and walls for suitable conditions where fixtures will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Assemble plumbing fixtures, trim, fittings, and other components according to manufacturers' written instructions.

B. Install off-floor supports, affixed to building substrate, for wall-mounting fixtures.

1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
2. Use carrier supports without waste fitting for fixtures with tubular waste piping.
3. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.

C. Install back-outlet, wall-mounting fixtures onto waste fitting seals and attach to supports.

D. Install floor-mounting fixtures on closet flanges or other attachments to piping or building substrate.

E. Install wall-mounting fixtures with tubular waste piping attached to supports.

F. Install floor-mounting, back-outlet water closets attached to building floor substrate and wall bracket and onto waste fitting seals.

G. Install counter-mounting fixtures in and attached to casework.

H. Install fixtures level and plumb according to roughing-in drawings.

I. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.

1. Exception: Use ball, gate, or globe valves if supply stops are not specified with fixture. Comply with requirements for valves specified in Section 22 05 23 "General-Duty Valves for Plumbing Piping."

J. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.

K. Install tubular waste piping on drain outlet of each fixture to be indirectly connected to drainage system.

L. Install flushometer valves for accessible water closets and urinals with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.

M. Install tanks for accessible, tank-type water closets with lever handle mounted on wide side of compartment.

N. Install toilet seats on water closets.

O. Install trap-seal liquid in dry urinals.

P. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

Q. Install water-supply flow-control fittings with specified flow rates in fixture supplies at stop valves.

R. Install faucet flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

S. Install shower flow-control fittings with specified maximum flow rates in shower arms.

T. Install traps on fixture outlets.

1. Exception: Omit trap on fixtures with integral traps.
2. Exception: Omit trap on indirect wastes, unless otherwise indicated.

U. Install disposer in outlet of each sink indicated to have disposer. Install switch where indicated or in wall adjacent to sink if location is not indicated.

V. Install dishwasher air-gap fitting at each sink indicated to have air-gap fitting. Install [**in sink deck**] [**on countertop at sink**] <**Insert location**>. Connect inlet hose to dishwasher and outlet hose to disposer.

W. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Comply with requirements for escutcheons specified in Section 22 04 00 “General Requirements for Plumbing”.

X. Set [**bathtubs**] [**shower receptors**] [**and**] [**service basins**] in leveling bed of cement grout.

Y. Seal joints between fixtures and walls, floors, and countertops using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Sealants are specified in Division 07 Section "Joint Sealants."

3.03 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.

C. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

3.04 FIELD QUALITY CONTROL

A. Verify that installed plumbing fixtures are categories and types specified for locations where installed.

B. Check that plumbing fixtures are complete with trim, faucets, fittings, and other specified components.

C. Inspect installed plumbing fixtures for damage. Replace damaged fixtures and components.

D. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

E. Install fresh batteries in sensor-operated mechanisms.

3.05 ADJUSTING

A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.

B. Operate and adjust [**disposers**] [**and**] [**controls**]. Replace damaged and malfunctioning units [**and controls**].

C. Adjust water pressure at [**faucets**] [**and**] [**flushometer valves**] to produce proper flow and stream.

D. Replace washers and seals of leaking and dripping faucets and stops.

E. Install fresh batteries in sensor-operated mechanisms.

3.06 CLEANING

A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:

1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
2. Remove sediment and debris from drains.

B. After completing installation of exposed, factory-finished fixtures, faucets, and fittings, inspect exposed finishes and repair damaged finishes.

3.07 PROTECTION

A. Provide protective covering for installed fixtures and fittings.

B. Do not allow use of plumbing fixtures for temporary facilities unless approved in writing by Owner.

END OF SECTION

SECTION 22 4700

WATER COOLERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section includes:

1. Electric water coolers.

1.03 DEFINITIONS

A. Accessible [**Water Cooler**]: Fixture that can be approached and used by people with disabilities.

B. Water Cooler: Electrically powered fixture for generating and delivering cooled drinking water.

1.04 SUBMITTALS

A. Product Data: For each fixture indicated [S]. Include rated capacities, furnished specialties, and accessories. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

B. Operation and Maintenance Data: For fixtures indicated [O/M] to include in emergency, operation, and maintenance manuals. Comply with requirements in Division 01 and Section 22 04 00 “General Requirements for Plumbing”.

1.05 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"[**; , "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act";**] for fixtures for people with disabilities.

C. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

D. ARI Standard: Comply with ARI 1010, "Self-Contained, Mechanically Refrigerated Drinking-Water Coolers," for water coolers and with ARI's "Directory of Certified Drinking Water Coolers" for type and style classifications.

E. ASHRAE Standard: Comply with ASHRAE 34, "Designation and Safety Classification of Refrigerants," for water coolers. Provide HFC 134a (tetrafluoroethane) refrigerant, unless otherwise indicated.

PART 2 - PRODUCTS

A.

2.02 ELECTRIC WATER COOLERS [S]

A. EWC-**1** Electric Water Coolers:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: **Elkay Haws Oasis**
2. Description: ARI 1010, Type PB, pressure with bubbler, [**Style F, freestanding**] water cooler.
   a. Cabinet: [**All stainless steel**]
   b. Bubbler: One, with adjustable stream regulator, located on deck.
   c. Control: [**Push button**]
   d. Supply: NPS 3/8 with ball, gate, or globe valve.
   e. Filter: One or more water filters complying with NSF 42 and NSF 53 for cyst and lead reduction to below EPA standards; with capacity sized for unit peak flow rate.
   f. Drain: Grid with NPS 1-1/4 minimum horizontal waste and trap complying with ASME A112.18.2.
   g. Cooling System: Electric, with [**precooler,**] hermetically sealed compressor, cooling coil, air-cooled condensing unit, corrosion-resistant tubing, refrigerant, corrosion-resistant-metal storage tank, and adjustable thermostat.
      1) Capacity: [**5 gph**] of 50 deg F cooled water from 80 deg F inlet water and 90 deg F ambient air temperature.
      2) Electrical Characteristics: [**1/6**] hp; 120-V ac; single phase; 60 Hz.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before fixture installation. Verify that sizes and locations of piping and types of supports match those indicated.

B. Examine walls and floors for suitable conditions where fixtures are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATIONS

A. Use carrier off-floor supports for wall-mounting fixtures, unless otherwise indicated.

B. Use mounting frames for recessed water coolers, unless otherwise indicated.

C. Set freestanding and pedestal drinking fountains on floor.

D. Set remote water coolers on floor, unless otherwise indicated.

E. Use chrome-plated brass or copper tube, fittings, and valves in locations exposed to view. Plain copper tube, fittings, and valves may be used in concealed locations.

3.03 INSTALLATION

A. Install off-floor supports affixed to building substrate and attach wall-mounting fixtures, unless otherwise indicated.

B. Install mounting frames affixed to building construction and attach recessed water coolers to mounting frames, unless otherwise indicated.

C. Install fixtures level and plumb. For fixtures indicated for children, install at height required by authorities having jurisdiction.

D. Install water-supply piping with shutoff valve on supply to each fixture to be connected to water distribution piping. Use ball, gate, or globe valve. Install valves in locations where they can be easily reached for operation. Comply with requirements for valves are specified in Section 22 05 23 "General-Duty Valves for Plumbing Piping."

E. Install trap and waste piping on drain outlet of each fixture to be connected to sanitary drainage system.

F. Install pipe escutcheons at wall penetrations in exposed, finished locations. Use deep-pattern escutcheons where required to conceal protruding pipe fittings. Comply with requirements for escutcheons are specified in Section 22 04 00 “General Requirements for Plumbing”.

G. Seal joints between fixtures and walls and floors using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Sealants are specified in Division 07 Section "Joint Sealants."

3.04 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.

C. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

3.05 FIELD QUALITY CONTROL

A. Water Cooler Testing: After electrical circuitry has been energized, test for compliance with requirements. Test and adjust controls and safeties.

1. Remove and replace malfunctioning units and retest as specified above.

3.06 ADJUSTING

A. Adjust fixture flow regulators for proper flow and stream height.

B. Adjust water cooler temperature settings.

3.07 CLEANING

A. After completing fixture installation, inspect unit. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean fixtures, on completion of installation, according to manufacturer's written instructions.

END OF SECTION

SECTION 23 0010

HVAC GENERAL REQUIREMENTS

PART 1 - GENERAL

1.01 SUMMARY

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Work Included:

Every item of labor, materials, equipment and appurtenances for installing complete new Heating, Ventilating and Air Conditioning Systems included in Division 23 of the Specifications.

1.02 DRAWINGS

A. The mechanical Drawings are diagrammatic in nature and show the general arrangement of all ductwork, piping, equipment and appurtenances and shall be followed as closely as actual building construction and the work of other trades will permit. Because of the small scale of the mechanical Drawings, it is not feasible to indicate all offsets, fittings and accessories that may be required. The Contractor shall investigate the construction conditions affecting the work and provide fittings and accessories as required to meet actual conditions.

B. Where discrepancies in scope of work as to which Trade provides specific items, such as starters, disconnects, flow switches, electrical control components, etc. exist, such conflicts shall be reported to the Engineer. If such action is not taken, the Contractor, as applicable, shall furnish such items as part of his work, for complete and operable systems and equipment, as determined by the Engineer.

1.03 REGULATIONS AND STANDARDS

A. The completed installation and all materials and equipment shall conform to local ordinances and codes, other regulations and standards listed herein or in related sections. These are intended as a minimum and shall be exceeded if required by the specifications or the Drawings. In the event of conflict between the codes, standards, or regulations, and information contained in the Contract Documents, the applicable code, standards, or regulation shall take precedence.

B. Refer to Division 01 and Supplementary Instructions to Bidders for construction permitting requirements.

1.04 INSPECTION CERTIFICATES

A. The Contractor shall furnish three copies of certificates of final acceptance to the Engineer from all inspection authorities having jurisdiction.

1.05 SUBSTANTIAL COMPLETION INSPECTION

A. The Engineer will visit the site for the purpose of conducting a substantial completion inspection once the following items have been met by the Contractor:

1. All HVAC systems shall be complete, operational and under automatic control.
2. HVAC systems cleaning, balancing, and testing as described in Section 23 05 93 shall be complete and the final report shall be approved by the Engineer.
3. Letters, signed by representatives of the manufacturer, for the boiler, chiller, cooling tower, heat pump, and air conditioning unit shall be provided attesting that their respective equipment has been started, tested, and set to operate safely and at the control points required as an integral part of the systems in which they are installed.
4. A letter, signed by a representative of the temperature controls manufacturer as described in Section 23 09 00, shall be provided attesting that the installation of the temperature controls system is complete, proper control of all equipment, valves, dampers, and the like

has been verified, set points have been established to provide proper control of installed equipment, and graphics are accurate with real time data.

5. The Contractor shall provide certification from an authorized official of the equipment manufacturer(s) stating that all refrigerant piping as described in Section 23 20 00 and specialties have been installed in accordance with the manufacturer's recommendations.
6. The noise and vibration control supplier as described in Section 23 05 48 shall provide a letter stating that all items have been installed properly and that all equipment is adequately isolated and/or restrained.
7. The Contractor shall attest by letter that all equipment has been wired and tested to verify that the indicated sequence of motor control is established, that all safety controls function properly, that all motor protective devices are sized correctly, and that the systems are operating at the proper set points.
8. Certificate of inspection for all boilers and pressure vessels shall have been completed.
9. The Contractor shall attest by letter, the quantity of glycol required to bring the system to the specified percentage. Letter shall state the total volume of glycol added to the system and shall include the total system volume as calculated from the percentage.
10. Completed filter change log for all units operated during Construction. Refer to temporary requirements hereinafter.
11. A certificate of test to the Engineer and AHJ for all refrigeration systems containing 55 pounds or more of refrigerant. The certificate shall give the test date, name of the refrigerant, test medium and the field test pressure applied to the high-pressure side and the low-pressure side of the system. The certification of test shall be signed by the Contractor and shall be made part of the public record.

B. All discrepancies noted in the substantial completion report shall be corrected prior to the final inspection. The Contractor shall provide a detailed item-by-item description of all corrections made for each item on the substantial completion discrepancy list prior to scheduling final inspection by the Engineer. Additional visits required after the final inspection, for the reason that previously documented discrepancies had not been corrected at the time of the final inspection, will be made at the Contractor's expense.

1.06 ASBESTOS

A. Asbestos Free Materials: The intention of these Drawings and specifications is that there are no asbestos-containing materials installed on this project. To the best of the Architects and Engineers knowledge, none of the material or equipment specified herein or shown on the Drawings contains asbestos. The Contractor shall make every effort to prevent any asbestos materials from being installed in or used on the construction of the project. At the completion of the project, the Contractor shall certify by letter that to the best of his knowledge, no asbestos-containing materials were used for or in the construction of this project.

B. Existing Materials:

1. Contractor shall review the Owners asbestos management plan to ensure suspected asbestos containing materials are under surveillance.
2. Discovery: If during the construction of this project, work involving friable asbestos is suspected, or encountered, all work in this area shall be discontinued and the Owner or the Owner's representative, shall be notified immediately and the Owner with his own forces or by separate contract shall be responsible for complete investigation, removal, and disposition of the friable asbestos hazard in accordance with applicable laws and regulations. If the Contractor claims that delay or additional cost is involved because of such action by the Owner, he shall make such claim as provided elsewhere in the Contract Documents.
3. Removal: All work involving the removal of friable asbestos will be done under a separate contract.

1.07 MATERIALS AND WORKMANSHIP

A. Equipment and material used in the project shall be new and undamaged. The mechanical installation shall fit into the space allotted and shall allow adequate and acceptable clearances

for entry, servicing and maintenance. Similar types of equipment shall be the products of the same manufacturer unless specified otherwise. Work shall be performed by mechanics or tradesmen skilled in the trade involved.

B. All ductwork, piping and conduit shall be installed in a neat and organized manner, parallel to other work and the nearest building elements, unless specifically shown otherwise on the Drawings.

C. Equipment and materials shall be suitable for use in the environment in which they are installed. Equipment exposed to outside conditions shall be adequately protected from the weather, manufactured from materials suitable for outdoor use, and designed specifically for use in outdoor environments.

1.08 SUBMITTALS

A. Submit shop drawings, product data and samples in accordance with Division 01 for all items as specified in related sections of these specifications. One (1) electronic (PDF) copy of the submittal shall be submitted. One (1) electronic (PDF) copy of the submittal will be returned to the Contractor. If additional copies are required, they will be the responsibility of the Contractor. Where drawings are submitted, the Contractor shall submit a minimum of two (2) sets of full scale prints. One (1) copy will be marked and returned to the Contractor, and the Contractor shall be responsible for all additional copies required for his use. All submittal data shall be correctly identified to show project name, and the exact model, style or size of item being submitted. Improperly identified submittals will not be reviewed by the Engineer. Each item submitted for review shall bear the Subcontractor's stamp which states that they have reviewed the submission, that it is complete, and that in their opinion it meets the contract requirements. Contractor's stamp shall identify the specification section, paragraph, and page number for which the submittal is being made. Shop drawings will be reviewed only for general compliance with the Contract Documents. Review will not include correctness of details, proper configuration, utility connections, dimensions, sizes, quantities, and the like. Any submission which has not been reviewed and stamped by the M/E Subcontractor will not be reviewed by the Engineer. No reviews prior to award of Contract will be considered or accepted. Re-submissions of shop drawings, product data and samples shall include the entire original submittal. Partial submittals will not be reviewed by the Engineer.

B. Submissions will be stamped by the Engineer in one of the following ways:

"No Exceptions Taken"	No exceptions are taken and subject to compliance\ with the Contract Documents.
"Make Corrections Noted"	Minor corrections are noted and a re-submittal is not required subject to compliance with the corrections and the Contract Documents.
"Correct and Resubmit "	The submitted material, method or system meets the intent of the specifications, yet has insufficient data to determine compliance with the Contract Documents. Re-submittal is required.
"Rejected"	The submitted material, method or system does not meet the intent of the specifications, or has insufficient data to determine compliance with the Contract Documents.

C. Submission Procedures:

1. If a submission is satisfactory to the Engineer, the Engineer will annotate the submission, "No Exceptions Taken" or "Make Corrections Noted" and transmit the electronic copy to the Contractor. If a resubmission is required, the Engineer will annotate the submission

“Correct and Resubmit” or "Rejected" and transmit the electronic copy to the Contractor for appropriate action.

2. The Contractor shall revise and resubmit submissions as required by the Engineer until submissions are acceptable to the Engineer.
3. Approval of a working and/or shop drawings by the Engineer will constitute acceptance of the subject matter for which the drawing was submitted and not for any other structure, material, equipment or appurtenances indicated as shown.
4. The Engineer's review of the Contractor's submissions shall in no way relieve the Contractor of any of his responsibilities under the Contract. An approval of a submission shall be interpreted to mean that the Engineer has no specific objections to the submitted material, subject to conformance with the Contract Documents.
5. Where as-built drawings, record drawings and specifications are available and when provided to the Contractor for use in performing the work, the Contractor shall verify the content of such drawings and specifications, the suitability of their use in performing the work and their accuracy for the purposes in which the Contractor intends to use any record or historical documents which may be obtained. In no case shall the Contractor assume that such documents reflect a true and accurate record of the construction. Acceptance of any such materials, records, and/or drawings shall in no way result in additional cost to the Owner should an error and/or omission in these documents result in additional costs to the Contractor.
6. When major equipment being submitted is a different manufacturer or model than the basis of design, the shop drawing shall include sketches of the proposed equipment and associated service clearances overlaid against other equipment and architectural features.
7. All scheduled EER, IEER, capacities and face areas are minimum accepted values. All scheduled amps, kW, and HP are maximum accepted values that allow scheduled capacity to be met.
8. On the first pages of all submittals, the Contractor shall provide a table showing all individual specification section paragraphs and drawings that apply to the equipment/component and a statement for each paragraph and drawing that the requirements have been met. The table shall be similar in format to the following, but shall include all relevant specification paragraphs and drawings:

Section 23 07 00 (example)	
1.2 A	Comply
1.2 B	Comply
1.3 A	Comply
1.3 B	Comply
1.3 C	Comply
1.4 A	Comply
1.4 A.1	Comply
1.4 A.2	Comply
Drawing M0.01	Comply

D. Equivalents: Manufacturers, trade names, and model numbers indicated herein and on Drawings shall be interpreted as establishing a standard of quality and shall not be construed as limiting competition. Unless definitely stated otherwise and upon complying with Division 01, the Contractor may use any article which, in his judgment is equal to that specified and is

accepted by the Engineer. (The ten day prior approval requirements of Instructions to Bidders (AIA Document A701) are waived for this Division of the Specifications, and unless stated otherwise the Contractor may use items that he deems as equivalent in quality and performance to the specified item subject to final acceptance of substituted items by Engineer upon his review of shop drawings.) Where three (3) or more manufacturers are named in the specifications for any item, the Contractor shall use one of the named manufacturers. No others will be reviewed or accepted. Manufacturers listed first in these specifications and on Drawings were used as a basis of design. It will be the responsibility of the Contractor to verify all connections, physical sizes, capacities, etc. of all other manufacturer's items, both named or proposed. If the equipment necessitates changes in ductwork, piping, wiring or other building systems from that indicated on the Drawings, the Contractor shall be responsible for all additional costs included and notify other trades. Where such changes are required, detail drawings indicating all required changes shall be submitted for review at the same time the manufacturers drawings are submitted for approval.

E. Shop drawings, diagrams, catalog data and such other data necessary to fully describe and substantiate compliance with these specifications shall be submitted for all equipment and materials where specifically required by specification and all items identified with an [S] behind the product title. Submittals not required by the Contract Documents will not be reviewed.

F. Operation and Maintenance manual(s) shall be submitted in accordance with Division 01 and shall include a complete product index in each volume, installation and maintenance data, sequence of controls, parts lists, a copy of all approved shop drawings and the name, address and telephone number of supplier or nearest representative. All mechanical devices, equipment and systems marked [O/M] in these specifications shall be included and all other such mechanical items that will require servicing before the duration of its useful life has been reached. Manual(s) shall be presented to the Engineer for review and transmittal to the Owner before final payment is recommended.

1.09 WARRANTY

A. The Contractor shall provide a warranty for a period of one year for all work provided under the Contract to include, but not necessarily limited to, all systems, equipment, materials, and workmanship. This shall not be construed to limit any extended warranty periods of longer than one year for specific items or systems specified elsewhere in the Contract Documents.

B. The warranty period shall commence on the date of acceptance by the Owner and shall cover all parts and labor as required to fulfill the warranty at no cost to the Owner.

C. Refer to Division 01 for additional warranty requirements.

D. Information on all warranties shall be included in the O&M Manuals specified herein to be provided to the Owner.

E. In phased construction, warranties shall not begin until substantial completion of the FINAL phase. Contractor shall maintain all new equipment and systems until that time. Owner will maintain all existing equipment and systems. Where new systems are connected to existing, the Contractor and Owner shall determine coordination of maintenance responsibilities at the preconstruction meeting.

1.10 EXCAVATION AND BACKFILLING

A. General: Excavation and backfilling shall be as specified in Division 31. Backfilling shall not commence until all tests have been performed and all utility systems conform to the Contract Documents.

B. Protection of Existing Utilities: Existing utility lines to be retained, whether known or unknown and uncovered during excavation operations, shall be protected from damage during excavation and backfilling, and if damaged, shall be restored to original condition.

1.11 INTERRUPTION OF UTILITY SERVICES

A. It is necessary that close liaison be maintained with the Administrative Authorities in all matters affecting interruptions of any utility services serving the facility and existing buildings. Prior to interrupting any utility service, the Administrative Authorities shall be consulted and interruptions for connections made at a time (or times) suitable to the Administrative Authorities. Work shall be laid out and planned to limit the interruption times to a minimum.

1.12 COORDINATION OF WORK

A. General: The Contract Documents indicate the extent and general arrangement of the mechanical systems. The Contractor shall be responsible for the coordination and proper relation of the mechanical work to the building structure and to the work of other trades. No additional compensation or extension of completion time will be granted for extra work caused by the lack of coordination.

B. Cooperation: The Contractor shall provide dimensions and locations of all openings, shafts and similar items to the proper trades and install work as required so as not to interfere with, or delay, the building construction.

C. Locations of lines and equipment shall be determined from actual field measurements. The outlines of the building shown on the mechanical Drawings are intended only as a guide to indicate relative locations of the mechanical work. Refer to architectural and structural Drawings for building construction details. The Contractor shall determine the exact routing and location of his systems prior to fabrication or installation of any system component. Accurate measurements and coordination shall be completed to verify dimensions and characteristics for the installation of each system.

D. Unless necessitated by equipment access or otherwise indicated in the Contract Documents, all piping, ductwork, and conduit concealed above ceilings and in finished or utility spaces shall be routed as high as possible.

E. Offsets, transitions and changes of direction in all systems shall be made as required to maintain proper headroom and pitch of sloping lines whether or not indicated on the drawings. The Contractor shall provide manual air vents and drains as required for his work to affect these offsets, transitions and changes in direction, as applicable.

F. Cutting and Patching: See Division1.

G. (Cutting and Patching: Unless stated otherwise, the Mechanical Trade shall do all cutting necessary for the installation of his work. All work should be installed sufficiently in advance of new construction in order to permit installation of supports, sleeves, and similar items without cutting. Patching and repair work shall exactly match new and existing adjacent work in all respects and shall not be obvious as patching. Cutting which will in any way affect the building structure shall not be performed without permission of the Architect-Engineer. The Mechanical Trade is responsible for patching where he does cutting. Patching shall be done to the satisfaction of the Architect-Engineer.)

H. Roughing-In: Verify the locations of other buildings machines, door swings, block coursing, alignment of tile end and other similar features before roughing-in for mechanical equipment components and/or controls.

I. Damage to Other Work: Each Contractor is responsible for damage to other work caused by his work or workmen. Repairing of damaged work shall be done by the Contractor who installed the work, and as directed by the Architect-Engineer; the cost of which shall be paid for by the Contractor responsible for the damage.

1.13 EQUIPMENT INSTALLATION

A. General: Equipment shall be installed in accordance with manufacturer's instructions to conform with the details and application indicated. Where manufacturer's recommendations or

installation instructions require options or accessories not specified, they shall be included and installed by the Contractor.

B. Supports: Provide necessary supports for all equipment and appurtenances as required; this includes but is not limited to frames or supports for items such as tanks, compressors, boilers, plumbing fixtures, pumps, valves, fans, and other similar items requiring supports. Floor mounted equipment in Equipment Rooms shall be set on 4-inch high concrete foundation pads unless shown otherwise. All pads shall be poured such that the top of the pad is level. Foundation drawings, bolt setting information and foundation bolts shall be furnished by the subcontractors furnishing the equipment for all equipment required to have concrete foundations. Concrete for foundations shall be provided by mechanical subcontractor unless indicated otherwise. Except where indicated in Section 23 05 48, all equipment shall be anchored to concrete pads. (Provide additional structural steel supports under air handlers where required to achieve correct elevation for (steam traps and) cooling coil condensate drains. Structural supports shall be firmly anchored to concrete housekeeping pads. Air handler or vibration isolators shall be firmly anchored to structural supports.) Rooftop equipment, ductwork, and piping shall be set on pre-manufactured curbs anchored to the roof and flashed into the roofing system. Rooftop equipment, ductwork, piping, etc. shall be anchored to the curb except where vibration isolation is installed between the curb and the equipment. Unless otherwise noted, outdoor equipment (on grade) shall be installed on 4-inch thick cast-in-place concrete equipment pads.

C. Service Area: All equipment and appurtenances shall be located to permit adequate service clearance in accordance with manufacturer's recommendations and as otherwise required. Service clearance shall include but not be limited to service and removal of filters, coils, motors, controls and removal of equipment sections. Service clearance shall include adequate space for rodding and removing tubes from boilers, chillers, and heat exchangers. All piping, ductwork, and other equipment shall be located outside of the service area or shall be flanged for easy removal to facilitate equipment service. All equipment shall be located with sufficient distance from building features, structural components, and the equipment of other trades. Service clearance in front of electrical panels shall be minimum as required by National Electric Code (NEC) where applicable. Equipment requiring service and located above ceiling shall be located within two feet of the ceiling vertically to allow for proper maintenance access.

D. Temporary Requirements: Temporary filters shall be provided for all fans that are operated during construction. Return openings, grilles, and registers shall be provided with temporary filters to prevent the intrusion of dust and particulate into the return air ductwork. Temporary filter shall have a minimum efficiency of MERV 8 in accordance with ASHRAE 52.2. Contractor shall provide a written report detailing the location and type of filter being used for approval by Engineer prior to operating any unit during construction. Report shall also include a filter change interval and log along with pictures of all the interiors of any units intended to be operated. Photos shall include the upstream side of all coils and energy recovery devices. Openings in equipment shall be kept plugged at all times until connection is made to the system. The ends of all pipes, ducts and equipment openings shall be kept plugged or capped properly with approved devices. Approved devices are items such as specially molded plastic caps, pipe plugs, test plugs and sheet metal caps.

E. All equipment indicated to be installed exposed within finished spaces shall be installed such that all conduit, piping, and appurtenances are concealed. Air conditioning units utilizing gravity condensate drains shall be installed at an elevation necessary for the specified pipe slope.

1.14 EXISTING EQUIPMENT

A. General: Care shall be exercised to protect all existing equipment to be reused. The Contractor shall remove from operation all equipment that is shown to be reused and provide adequate protection including but not limited to prevention of corrosion, protection of seals, prevention of leaking, and prevention of internal/external contamination. All electronic

components shall be protected from weather and moisture, deterioration and loss of programming.)

B. SLEEVES AND INSERTS

C. General: Sleeves and inserts shall be provided and correctly located in the structure, as require for the work.

D. Inserts shall be steel and proper size for loads encountered.

E. Sleeves shall be provided for all pipes passing through concrete or masonry walls, partitions, concrete beams or slabs installed during construction of the wall, partition, beam or slab. Sleeves through existing concrete walls and slabs may be omitted if wall or slab can be core drilled and properly sealed in a manner acceptable to the Engineer. Sleeves placed horizontally in walls or in any position in beams shall be standard weight ASTM A53 steel pipe of length equal to thickness of wall or beam. Those placed vertically in non-waterproof floors shall be 20 gauge galvanized sheet steel of length equal to thickness of slab, flared and nailed to the form, or fastened to reinforcing fabric and filled with sand during pouring to prevent deformation. Sleeves occurring in floors of rooms where hose bibs or floor drains occur, and in pipe spaces, shall be standard weight steel pipe projecting 2" above the finished floor except in Equipment Rooms they shall project four (4) inches above floor. Sleeves in floors with waterproof membrane shall be provided with flanges or flashing rings and shall be clamped or flashed into membrane. All sleeves (and core drilled openings) shall be of sufficient diameter to clear bare or covered pipes by 1/4" all around except sleeves on lines subject to movement by expansion which shall clear the bare pipe or insulation on insulated pipe at least one inch all around. Pipes through exterior walls below grade and above footings shall be installed in sleeves having a minimum size of two larger pipe diameters and sealed watertight with flexible synthetic rubber seals. Sleeve shall have anchor and water stop plate. The entire assembly shall be tightened and adjusted and made watertight. Sleeves for pipes and conduit, penetrating fire (and smoke) rated partitions, walls and floors shall be sealed in accordance with the terms of U.L. Listed Through-Penetration Firestop Systems XHEZ as published in the U.L. Fire Resistance Directory. Penetrations shall exactly conform to details of the Firestop System indicated for the type of partition, wall and floor construction encountered. All penetrations through non-fire resistance rated floor assemblies and through the ceiling membrane of non-fire resistance rated roof assemblies shall be fire blocked with tightly packed mineral-wool insulation secured in place. All penetrations through equipment room walls and other areas of noise or heat generation shall be tightly sealed with mineral fiber rope. All penetrations through draft stop partitions shall be sealed to maintain the integrity of the partition. All firestopping and draft stopping of sleeves for mechanical work shall be provided under Division 23.

1.15 PENETRATIONS THROUGH PRE-CAST HOLLOW-CORE SLAB SYSTEM

A. General: Contractor shall coordinate work with the pre-cast system. Refer to architectural and structural documents for details. Installation of work shall be in strict accordance with the pre-cast system manufacturer's recommendations, as approved by the Architect.

B. Openings: Holes in the slabs made in the field shall be made by the trade involved. Openings shall be made only through hollow cells, shall not exceed the width of the hollow cells, and shall not penetrate the webs between the cells or the pre-stressed strands unless prior approval is obtained from the Architect and the slab manufacturer. Holes shall not exceed 6" diameter without approval. Certain holes for pipe and duct shafts may be pre-cut. See structural Drawings for locations.

C. Cutting holes: Holes may be drilled or cut and trimmed with a chisel. Generally, holes will be made by cutting the outline of the hole through the lower portion of the slab from the underside and then cutting out the top side. All holes shall be made prior to the installation of the topping slab.

D. Sleeves: Sleeves are not required through pre-cast system slabs except where required to support packing material at hollow cores. Sleeves are required to be placed through concrete topping slab on top of the pre-cast slabs.

E. Supports: Hangers shall be supported from inserts or approved sockets, or toggle bolts in core slab construction. Hanger spacing shall be such that weight on hanger does not exceed 250 pounds for any one hanger. All hanger rods shall be minimum 3/8 inch in diameter. Where hanger rods must extend through slab, they shall be secured by two bolts over steel washers or plates on top of the slab in the floor fill or roof insulation space. Washers or plates shall not be less than 2" size and 1/4" thick. Larger plates are required for larger pipe supports. Cumulative thickness of plates, washers and bolts shall be 1/4" less than thickness of topping slab.

F. Explosives: Inserts set with explosives shall not be used.

1.16 ESCUTCHEONS

A. Where pipes pass through floors, walls or ceilings in finished rooms, they shall be fitted with chromium plated escutcheons of suitable pattern to effectively cover the rough opening. Where sleeves project above floors, special deep type escutcheons shall be provided.

1.17 ACCESS DOORS

A. Provide for all concealed valves, controls, dampers, junction boxes, equipment, or any item requiring access. Doors shall be of sufficient size and so located that the concealed items may be serviced or completely removed and replaced. Doors required for Mechanical work shall be furnished as a part of this Division to the General Contractor for installation. The Mechanical Contractor shall provide locations of all access doors such that service may be safely performed from a ladder, lift, or platform without the need for support from the ceiling system. Doors in acoustic tile ceilings shall be furnished in multiples of tile sizes. Doors are not required in exposed grid type ceilings where tiles are removable. Doors shall be metal access doors with cam lock, style to match ceiling or wall construction. Doors occurring in rated construction shall be fire rated U.L. labeled access doors correlated to preserve the integrity of the rated construction. Doors leading to concealed spaces shall be provided with means to open from the inside. Doors shall be prime finish steel except those in toilets, shower rooms, locker rooms, kitchens and other similar areas shall be stainless steel with brushed finish.

1.18 ELECTRICAL WIRING AND EQUIPMENT

A. Wiring, low voltage (100 volts or less) control wiring shall be provided as a part of (Section 23 09 00 Instrumentation and Control for HVAC) (Division 23) in strict accordance with Division 26 and shall be in accordance with manufacturer's recommendations to comply with the sequence of control indicated. Verify that wiring of all motors and controls required by equipment furnished is accomplished for the correct sequence of operation.

B. Wiring, line voltage (101 volts or higher) power or control wiring shall be furnished and installed under Division 26.

C. Disconnects shall be provided for each item of equipment under Division 26 unless specified otherwise in other sections.

D. Miscellaneous manual or automatic control and protective or signal devices required for the sequence of operation indicated for mechanical equipment shall be provided under the section of the specifications where the item of equipment is specified unless indicated otherwise.

1.19 PROTECTION FROM MOVING PARTS

A. Belts, pulleys, chains, gears, shafts, couplings and other rotating or moving parts located so that any person may come in close proximity thereto shall be fully enclosed or properly guarded.

1.20 RECORD OF UNDERGROUND LINES

A. Maintain a continuously updated record of underground utility installation deviations from the Contract Drawings. At Project Closeout, submit a Record Underground Utilities package consisting of:
   1. Record drawings in PDF, clearly marking deviations and including dimensions.
   2. Native CAD/BIM files for drawings/models that were originally issued in CAD/BIM formats (DWG and/or model format), updated to reflect as-installed conditions.
   3. Field-verified dimensions showing:
   4. Locations of cleanouts.
   5. Distances from building face (or established control line) to outside sewers, mains, and manholes.
   6. Utility routes, sizes, and depths/elevations, referenced to project datum and fixed, permanent site/building features.
   7. Include contractor certification that record information reflects as-installed conditions based on field measurements taken prior to backfill.

1.21 CHARTS AND DIAGRAMS

A. General: Material as listed below shall be provided by the Contractor and shall be mounted in separate hardwood frames where directed in the field or folded and stored in a plastic document folder and located in the control cabinets. All charts, diagrams and schemes shall be photographic positives prepared from original tracings. A copy of charts and diagrams shall be included with O/M manuals.

B. Automatic Temperature Control Diagrams identified as to name, sequence of operation, location and number of systems. Components of a control system shall be identified as to location, function, temperature setting and manufacturer's part number.

C. Electric Sequence Control Diagrams of entire Mechanical system.

D. Charts for identification of valves.

E. Thermal Envelope Certificate: A permanent thermal envelope certificate shall be provided. Certificate shall be posted on a wall in the space where the space conditioning equipment is located, a utility room, or other approved location. If located on an electrical panel, the certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. A copy of the certificate shall also be included in the construction files for the project. The certificate shall include the following:
   1. R-values of insulation installed in or on ceilings, roofs, walls, foundations and slabs, basement walls, crawl space walls and floors and ducts outside conditioned spaces.
   2. U-factors and solar heat gain coefficients (SHGC) of fenestrations.
   3. Results from any building envelope air leakage testing performed on the building.
   4. Where there is more than one value for any component of the building envelope, the certificate shall indicate the area weighted average value where available. If the area-weighted average is not available, the certificate shall list each value that applies to 10 percent or more of the total component area.

1.22 INSTRUCTION OF OWNER'S REPRESENTATIVE

A. Contractors shall instruct the representative of the Owner in the proper operation and maintenance of all elements of the Mechanical systems. Competent representatives of the Contractor shall spend such time as necessary to fully prepare the Owner to operate and maintain the Mechanical and Electrical systems.

1.23 COMMISSIONING OF HVAC SYSTEMS:

A. Commissioning of this project will be coordinated and managed by the Owner's Commissioning Agent. Refer to the Commissioning Plan and Division 01 for the scope and requirements for commissioning of mechanical systems.

1.24 CONSTRUCTION STATUS REPORT

A. Each item of discrepancies noted on Construction Status Report prepared by the Engineer shall be answered in detail in writing by the Contractor before payment can be recommended.

1.25 GRAPHICS DATABASE

A. This project's Computer Aided Design & Drafting (CADD) drawing files may be obtained through the Architect/Engineer for use in preparing computer graphics specific to this project. See Appendix A at the end of this Section for Letter of Indemnification and ordering instructions.

1.26 DEMOLITION

A. Contractor shall visit site before bidding to determine extent of demolition.

B. Removal of Ducts, Piping and Equipment: Remove all ductwork and piping connections, plugging outlets, etc., such that are not required for present equipment and fixtures, or are not reused or needed for reconnecting new equipment and fixtures. Remove all equipment, fixtures, etc., indicated to be removed, or not reused or needed after the renovations are complete.

C. Where piping, conduit, ductwork or other similar items passing through rated assemblies are removed; the assemblies shall be patched in accordance with UL so as to maintain the integrity of the assembly.

D. Where demolition of equipment, pipes, conduit, ducts or other components occurs in a finished space, all ceilings, floors, walls, and casework or other affected building elements shall be patched to match existing finishes and construction.

E. The Owner will select and retain such existing equipment and materials which are indicated to be removed and not reused, as he desires. All other existing equipment and materials indicated to be removed and not reused shall become the property of the Contractor, who shall promptly remove them from the premises. All existing equipment and fixtures indicated to be relocated shall be disconnected, removed, relocated and reconnected. All equipment and fixtures shall be protected from damage during demolition.

F. Miscellaneous: In all altered portions of the buildings, the Contractor shall remove or alter as necessary all existing mechanical work that is not coordinated to operate with the new construction. Demolition shall not begin until the work schedule is approved by the owner. The work shall be scheduled to prevent any disruption to the normal operations of the building.

G. Demolition shall be closely coordinated with the construction phasing plans to maintain operation of all existing systems until such time the planned demolition can be fully completed.

H. General Scope of Demolition:

1.27 PHASING OF WORK

A. Coordinate phasing requirements with Division 01.

B. The Mechanical Contractor is required to fully understand the phasing of work and to coordinate his work accordingly.

C. Where phasing of the work requires appurtenances not otherwise indicated on the Drawings, they shall be provided as part of the Contract. This includes, but is not limited to; isolation valves, temporary ducting, temporary piping, and similar.

D. During renovation, sections of the existing building may continue to be occupied. The Contractor shall be responsible for retaining existing HVAC systems to serve the occupied sections of the building, otherwise the contractor shall provide temporary systems for the occupied sections of the building capable of maintaining current temperature and humidity setpoints.

E. The Contractor shall fully comprehend the need to operate HVAC systems during construction and shall seal off ductwork serving areas under construction, including providing temporary filters on all air inlets.

F. Temporary HVAC systems shall be sized as noted on drawings or if no size provided, shall be of sufficient capacity to protect the Owners property from freezing and high humidity. In new work areas, capacity shall be such to allow for proper drying and application of finishes.

G. During renovation, portions of the renovated building may be reoccupied as sections become complete. The Contractor shall maintain HVAC for the occupied sections of the building for the remainder of the project.

H. Any necessary shut downs shall be limited in scope and duration and shall be fully coordinated with, and preapproved by, the Owner.

I. (The addition of glycol to the system shall only occur after the last piece of equipment has been installed. Prior to that point, temporary control sequences for freeze protection shall be utilized.)

J. All airside systems shall be tested and balanced at the end of the phase in which they are installed. In addition, each air system shall be backchecked as part of the final phase. Backcheck shall constitute a sampling of no less than 25% of each of the system components (air terminals and equipment). Where more than 25% of the sampled items do not meet the previous submitted values for any individual system, the entire system shall be rebalanced.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

END OF SECTION

APPENDIX A
LETTER OF INDEMNIFICATION

Project Name:

Project Location:

At the Contractors request, Stratus will provide electronic files of the Revit Models for their convenience and use, subject to the following terms and conditions:

Stratus electronic files are compatible with Autodesk Revit Product version for which they were designed. Autocad files will be provided in the Autocad 2018 DWG format. Stratus makes no representation as to the compatibility of these files with your hardware or your software.

Data contained on these electronic files is part of Stratus's instruments of service and shall not be used by you or anyone else receiving this data through or from you for any purpose other than as a convenience in the preparation of project layout for the referenced project. Any other use or reuse by you or by others will be at your sole risk and without liability or legal exposure to Stratus. You agree to make no claim and hereby waive, to the fullest extent permitted by law, any claim or cause of action of any nature against Stratus, its officers, directors, employees, agents, or subconsultants which may arise out of or in connection with your use of the electronic files.

Furthermore, you shall, to the fullest extent permitted by law, indemnify and hold harmless Stratus from all claims, damages, losses, and expenses, including attorney's fees arising out of or resulting from your use of these electronic files.

These electronic files are not Contract Documents. Significant differences may exist between these electronic files and corresponding hard copy Contract Documents due to Addenda, Change Orders, or other revisions. Stratus makes no representation regarding the accuracy or completeness of the electronic files you receive. In the event that a conflict arises between the signed documents prepared by Stratus and the electronic files, the signed Contract Documents shall govern. You are responsible for determining if any conflict exists. By your use of these electronic files, you are not relieved of your duty to fully comply with the Contract Documents, including and without limitation, the need to check, confirm, and coordinate all dimensions and details, take field measurements, verify field conditions and coordinate your work with that of other contractors for the project.

The use of the Revit Model files prepared by the Engineer shall not in any way negate the Contractor's responsibility for coordination with other trades or for the proper checking and coordination of dimensions, details, member sizes and gage, and quantities of materials as required to facilitate complete and accurate fabrication and erection.

All information added to the drawings by the Contractor shall be in a distinctively heavier pen weight and different font, such that all Contractor information can be clearly distinguished from the original files.

Any information added by the Contractor, which represents a proposed change to the original design, shall be clearly identified by flagging or other distinctive presentation. Because of the potential that the information presented on the electronic files can be modified, unintentionally or otherwise, Stratus reserves the right to remove all indicia of its ownership and/or involvement for each electronic display.

Under no circumstances shall delivery of the electronic files for use by you deemed a sale by Stratus, and Stratus makes no warranties, either expressed or implied, of merchantability and fitness for any particular purpose. In no event shall Stratus be liable for any loss of profit or any consequential damages.

The Engineer believes that no licensing or copyright fees are due to others on account of the transfer of the Revit Model files, but to the extent any are, the Contractor will pay the appropriate fees and hold the Engineer harmless from such claims as may arise.

Any purchase order number provided by the Contractor is for the Contractor's accounting purposes only. The Contractor's purchase order terms and conditions are void and are not a part of this agreement.

The Recipient further agrees that the drawing files will only be used in graphics preparation for the above-referenced project.

SECTION 23 0100

OPERATION AND MAINTENANCE OF HVAC SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Related Documents: Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. To aid the continued instruction of operating and maintenance personnel, and to provide a source of information regarding the products incorporated into the work, furnish and deliver the data described in this section and in pertinent other sections of these specifications.

C. Related Sections:

1. Section 23 00 10 – HVAC General Requirements
2. Section 23 05 00 – Common Work Results for HVAC
3. Section 23 20 00 – HVAC Piping and Pumps
4. Section 23 30 00 – HVAC Air Distribution
5. Section 23 80 00 – Decentralized HVAC Equipment

1.02 SUBMITTALS

A. Unless otherwise directed in other sections, or in writing by the Engineer, submit three copies of the final manual to the Engineer for approval prior to indoctrination of operation and maintenance personnel.

B. Operation and Maintenance manual(s) shall be submitted in accordance with Division 1 and shall include a complete product index in each volume, installation and maintenance data, sequence of controls, parts lists, a copy of all approved shop drawings and the name, address and telephone number of supplier or nearest representative. All mechanical devices, equipment and systems marked [O/M] in these specifications shall be included and all other such mechanical items that will require servicing before the duration of its useful life has been reached. Motor driven equipment shall include data for the motor. Manual(s) shall be presented to the Engineer for review and transmittal to the Owner before final payment is recommended.

1.03 QUALITY ASSURANCE

A. In preparing data required by this section, use only personnel who are thoroughly trained and experienced in the operation and maintenance of the described items, completely familiar with the requirements of this section, and skilled communicating the essential data.

PART 2 - PRODUCTS

2.01 INSTRUCTION MANUALS

A. Where instruction manuals are required to be submitted under other sections of these specifications, prepare in accordance with the provisions of this section.

B. Format:

1. Hard Copy
   a. Size: 8-1/2" x 11"
   b. Paper: White bond, at least 20 lb. weight.
   c. Text: Typed (Hand printed or written is not acceptable)

d. Drawings: 11" x 8-1/2" preferable; bind in with text; foldouts are acceptable; larger drawings are acceptable if folded to fit within the manual and provide a drawing pocket inside rear cover or bind in with text.
e. Fly Sheets: Separate each portion of the manual with neatly prepared Fly Sheets or tabbed index sheets briefly describing the contents of the ensuing portion. Fly sheets or index tabs may be in color.
f. Binding: Use heavy-duty plastic covers with binding mechanism concealed inside the manual; 3-ring binders are required. All binding is subject to the Engineer's approval.

2. Electronic
a. A single PDF file shall be provided for the entirety of Division 23. Individual PDF files of each section are not acceptable and will not be reviewed.
b. All submissions must be provided with a digital table of contents with linked bookmarks to allow for quick access to each section. Table of Contents shall be ordered by specification section. Bookmarks shall be linked to the fly sheets of the corresponding section.
c. All PDF's must be searchable utilizing the standard search function of a PDF viewer.
d. Where native PDF files are available from a vendor, those shall be used. Scanned versions of these documents are not acceptable.
e. Fly Sheets: Separate each portion of the manual with neatly prepared digital Fly Sheets briefly describing the contents of the ensuing portion. Fly sheets shall include the equipment type, applicable specification section, and address and telephone number of equipment supplier or nearest representative. Table of contents bookmarks shall point to the related fly sheet.

C. Provide front and back covers for each manual, using durable plastic material approved by the A.E, and clearly identified on the front cover with at least the following information:

OPERATING AND MAINTENANCE INSTRUCTIONS FOR

(Item/system name and description)

(Name and address of Contractor and sub-contractor)

(General subject of this manual)

(Name and address of Engineer)

(Engineer's approval and date approved)

D. Contents:

Neatly prepared and typewritten detailed table of contents.
Complete instructions regarding operation and maintenance of all equipment involved including lubrication, disassembly, and reassembly.
Complete nomenclature of all parts of all equipment.
Complete nomenclature and part number of all replaceable parts, name and address of nearest vendor, and all other data pertinent to procurement procedures.
Copy of all guarantees and warranties issued.
Manufacturer's bulletin, cuts, and descriptive data, where pertinent, clearly indicating the precise items included in this installation and deleting, or otherwise clearly indicating, all manufacturers' data with which this installation is not concerned.
Such other data as required in pertinent sections of these specifications.

PART 3 - EXECUTION

3.01 INSTRUCTION MANUALS

A. Revisions:

1. Following the indoctrination and instruction of operation and maintenance personnel, review all proposed revisions of the Manual with the Engineer.

3.02 TRAINING

A. Upon completion of the work and at a time designated by the Owner`s representative, provide a formal training session for the Owner`s operating personnel to include location, operation, and maintenance of all mechanical equipment and systems.

END OF SECTION

SECTION 23 0500

COMMON WORK RESULTS FOR HVAC

PART 1 - GENERAL

1.01 SUMMARY

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. Common Motor Requirements for HVAC Equipment
2. Variable Frequency Drives
3. Expansion Fittings for HVAC Piping
4. Meters and Gages for HVAC Piping
5. General-Duty Valves for HVAC Piping
6. Hangers and Supports for HVAC Piping and Equipment

C. Related Sections:

1. Division 01 -- Commissioning
2. Section 23 00 10 – HVAC General Requirements
3. Section 23 05 48 – Vibration and Seismic Controls for HVAC Systems
4. Section 23 05 53 – Identification for HVAC Piping and Equipment
5. Section 23 05 93 – Testing, Adjusting and Balancing for HVAC
6. Section 23 09 00 – Instrumentation and Control for HVAC
7. Section 23 20 00 – HVAC Piping and Pumps
8. Section 23 30 00 – HVAC Air Distribution
9. Section 23 80 00 – Decentralized HVAC Equipment

1.02 REFERENCES

A. General: The following standards or codes form a part of this specification to the extent indicated by the reference thereto.

B. American Society of Mechanical Engineers (ASME):

C. ASME 95 Boiler and Pressure Vessel Code

D. B16.3 Malleable Iron Threaded Fittings

E. B16.4 Cast Iron Threaded Fittings

F. B31.9 Building Services Piping

G. National Electrical Manufacturers Association (NEMA)

H. Underwriters Laboratories, Inc. (UL)

1.03 COMMISSIONING OF HVAC SYSTEMS:

A. The Contractor shall provide contact information to the Commissioning Agent indicated in Division 1 for all major items of Equipment.

B. Provide additional submittal copy of major equipment for Commissioning Agent specified in Division 1.

1.04 SUBMITTALS

A. Submit shop drawings and product data in accordance with Division 1 and Section 23 00 10.

B. Shop drawings, diagrams, catalog data and such other data necessary to fully describe and substantiate compliance with these specifications shall be submitted for all equipment and materials marked with notation set forth in Section 23 00 10.

C. Operation and maintenance data shall be submitted in accordance with Division 1, for all items of equipment and materials marked with notation set forth in Section 23 01 00.

PART 2 - PRODUCTS

2.01 COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT

A. Motors shall be provided in place as an integral part of the driven equipment, ready for electrical connections. Motors shall be in accordance with NEMA Standards and of design suitable for the starting and running characteristics of the driven equipment. Motors over 5 HP shall be "premium" efficiency as defined by NEMA MG-1, latest edition.

B. All three phase motors over 5 HP shall be provided with minimum power factor of 90%. Power factor correction capacitors shall be provided if required and shall be furnished to the electrical subcontractor for installation. Shop Drawing submittals for motors over 5 HP shall list efficiency and power factor. Unless specified otherwise, all motors shall have continuous duty classification, 40° Centigrade ambient temperature, shall have enclosure suitable for indicated application and shall be wound for 120 volt, single phase, 60 cycle current, except motors above 1/2 horsepower (unless indicated otherwise) shall be wound for 200V or 230V/460V as required by the secondary voltage specified for main service in Division 26. Each motor shall be selected and rated at the voltage indicated so that the driven load does not exceed the nameplate rating and service factor of the motor. All motors 460V/480V 20 HP and above and 208V/230V 10 HP and above shall be wound for wye-delta (6 or 12 lead) starting with capabilities of being wired for across-the-line starting.

C. Motors for use with variable frequency drives (VFD):
   1. Dual-Mode Suitability: Provide motors suitable for operation from PWM VFD output and for full-voltage across-the-line operation when operating on bypass.
   2. Inverter Duty / Insulation: Motors shall be Inverter Duty suitable for VFD applications in accordance with NEMA MG 1, Part 31 (latest edition), minimum Class F insulation system.
   3. Thermal Protection / Coordination: Provide motor thermal protection suitable for VFD operation. Where motors are furnished with embedded thermal devices (thermistors/RTDs), provide wiring/terminations for connection to the VFD/motor protection inputs so thermal protection remains effective in both VFD and bypass modes.
   4. Bypass Coordination: Motor nameplate data (voltage, phase, Hz, FLA, service factor) shall match scheduled equipment and be coordinated with the VFD and bypass assembly. Provide motor leads/termination arrangement compatible with the specified bypass scheme and across-the-line starting.
   5. Speed Range / Cooling: Motors shall be capable of continuous operation over a minimum 4:1 speed range (60 Hz down to 15 Hz) without exceeding motor temperature rise limits. Where operation below 15 Hz or sustained low-speed torque is required, provide auxiliary cooling or select a motor rated by the manufacturer for the required range.
   6. Bearing Current Mitigation: Motors for VFD service shall include bearing-current mitigation: shaft grounding device and/or insulated bearing arrangement as recommended by the motor manufacturer for inverter-fed service to prevent premature bearing failure.
   7. Power Factor Correction: Do not install power factor correction capacitors on the load side of a VFD. Provide capacitors only on the line side where required and coordinated with the VFD manufacturer and harmonic mitigation strategy.
   8. Harmonics (System Requirement): Coordinate VFD selection and any mitigation so harmonic distortion at the Point of Common Coupling (PCC) complies with IEEE Std 519 (latest edition).

D. Where 2-speed motors are indicated for motors above 1/2 horsepower, motors shall have two separate windings.

E. Motor starters and motor protective switches shall be provided under Division 26 except where specified to be furnished specifically with the driven equipment. Accessories such as auxiliary contacts, hand-off-automatic switches, start-stop switches, pilot lights, control power

transformers and other similar items shall be provided in or on the controllers as required by the control sequence indicated. Starting equipment, unless factory mounted on the equipment, shall be installed under Division 26.

2.02 VARIABLE FREQUENCY DRIVES [S] [O/M]:

A. Variable Frequency Drives (VFD) shall convert primary power to adjustable voltage/frequency three phase AC power for stepless motor control from 5% to 105% of motor base speed. Units shall be pulse-width-modulation (PWM) type. Units shall be UL listed and suitable for installation in return air plenums, complete with Hand/Off/Auto switch, Run or Stop switch and display to indicate unit status, frequency and fault diagnostics. Unit shall have automatic soft restart after power outage, soft start/stop, and interface provisions for start/stop and control from the DDC system specified in Section 23 09 00 interconnections. Unit shall have all motor protective devices as required by NEC. Unit shall have line circuit breaker, bypass switch, motor thermal overload relay, phase-loss protection, ground-fault protection, harmonic compensated load side reactor and control transformer.

B. All drives provided for the project shall be supplied by the same manufacturer, including those installed with equipment at the factory. The VFD shop drawing shall be inclusive of all drives on the project.

C. Drives shall be suitable for operation without damage to the connected motor. Drives shall have multiple, adjustable deadbands across the entire speed range for operation of connected equipment without vibration. Units shall have display on each drive to indicate all faults and diagnostics.

D. Drives shall be matched to driven motors in accordance with motor and drive manufacturers' recommendations.

E. Drives shall be suitable for speed control by the DDC System specified in Section 23 09 00 using any of the following signals, 3-15 psi, 0-5 vdc, 0-10 vdc or 4-20 ma dc.

F. Drives shall be provided with current sensing device to indicate abnormal conditions such as broken belt.

G. Where wiring to the driven motor exceeds 150 feet or as otherwise recommended by the manufacturer, a load side drive filter shall be furnished and installed. Where drives have remote disconnects at the driven motor, a run contact shall be provided to stop the drive without harm if the remote disconnect is opened.

H. Drives shall be installed in NEMA classified cabinets suitable for the location in which installed. Units located outdoors shall be NEMA 3R or NEMA 4.

I. Harmonics: The drives provided shall not add significant voltage harmonic distortion to the electrical system. If voltage harmonic distortions exceed 5%, line reactors or isolation transformers shall be provided in a separate enclosure.

J. VFD shall be provided with communication interface to allow two-way communication with the DDC System specified in Section 23 09 00.

K. Warranty: Provide parts and labor warranty for a period of five (5) years.

L. Installation and Start-up:

1. The services of a qualified manufacturer's technical representative shall supervise the contractor's installation, testing, and start-up of all the drives furnished under this specification. A maximum total of one (1) supervision day (8 hours) shall be provided by the manufacturer's representative.
2. System start-up shall include a checkout of vibration at various frequencies through field observation and manufacturer's data on the driven equipment. Frequency deadbands shall be set-up for each point of equipment vibration.
3. Upon acceptance of the drive equipment, training of the operators shall consist of one (1) training day (8 hours).

2.03 EXPANSION FITTINGS FOR HVAC PIPING

A. (Expansion joints [S] shall be equal to Adsco RBJ Ram-Pak slip-type, single direction, 4" minimum traverse, 150 lb service, flanged ends, with base, suitable for steam or hot water service.)

B. Expansion joints [S] shall be Flexonic internally guided, corrugated bellows, expansion compensator, type H or HB, 2" minimum stroke, suitable for steam or hot water service. (Grooved pipe couplings and expansion compensators shall provide for expansion in grooved piping systems.) (Expansion joints may be used in lieu of pipe loops in hot or cold water recirculating systems.)

C. Anchors and guides for pipe shall be provided as indicated or as required at the job site to localize expansion and contraction of pipe. Anchors shall consist of heavy steel or brass collars bolted or welded to the pipe and rigidly connected to the building structure unless indicated otherwise. Anchor braces shall not be attached in places where they will damage or injure the structure during installation or by the weight or expansion force of the pipe line after installation. Detail drawings of pipe anchors shall be approved before anchor installation. (Where grooved piping system is used, follow grooved piping manufacturer's recommendations for anchors, guides and supports.)

D. Flexible pipe joints at chillers, pumps, air handling units or other pieces of equipment isolated from the structure by vibration isolators as specified elsewhere shall be pipe line size and shall be Flexonics standard 125 psi, Series PCS, stainless steel or bronze, flanged, screw or sweat type connectors with longitudinally welded stainless steel bellows and braided jacket.

2.04 METERS AND GAGES FOR HVAC PIPING

A. Thermometers ([S]) shall be 5" diameter adjustable angle, industrial type complete with stainless steel case, bezel, union (or 360° swivel) and stem, shatterproof lens, brass well, aluminum scale plate with black numbers and accurate to +1°F.

B. Pressure gauges ([S]) shall be equal to Ashcroft bourdon tube type suitable for 125 psi service. Gauges shall be not less than 4" dial type with aluminum case and bar stock needle type gauge cock. (Siphon shall be provided on steam gauges.) Gauges shall be graduated in feet of water and psi. Minimum range 1.5 times normal operating pressure.

2.05 GENERAL-DUTY VALVES FOR HVAC PIPING

A. General: Valves shall be Apollo, Bray, Center Line, Crane, Jenkins, Jamesbury, Nibco, Hays, Milwaukee, Stockham, Viega, (Victualic), or Weco. All valves shall be suitable for (150) (300) psi working pressure. Class 125 is not acceptable. Valves shall have threaded (or grooved) connections; except where flanges are specified they shall have fully lugged flanged connections suitable for dead-end service connections, and where installed in hard drawn copper lines they may have sweat connections. All valves shall be line size for the piping section indicated.

1. Equipment Service Valves over 4" ([S]): Valves shall be carbon steel or iron body fully lugged flanged high performance butterfly (HPBV) double offset type with 316 stainless steel disc and reinforced PTFE or RTFM replaceable seats, pressure assisted for tight shutoff. Butterfly valves shall provide bi-directional service, with downstream flange removed, and API 609 blow-out proof stem retention. Valves shall have upper and lower stem bearings of 316 stainless steel with PTFE seals.
2. Equipment Service Valves up to and including 2" ([S]): Valves shall be full port ball valves with stainless steel ball, 2-piece or 3-piece, brass body, bronze body, LF bronze body, or iron body, or shall be HPBV.
3. Equipment Service Valves 2-1/2" to 4" ([S]): Valves shall be full port ball valves with chromium plated brass ball, 2-piece or 3-piece, brass body, bronze body, LF bronze body, or iron body, or shall be HPBV.

4. Piping Branch Line Service Valves over 4" ([S]): Valves shall be iron body fully lugged flanged butterfly disc type with aluminum-bronze disc and EPT Nordel seats.
5. Piping Branch Line Service Valves up to and including 4" ([S]): Valves shall be full port ball valves, as specified for equipment service valves.
6. All valves for chilled water service shall have integral insulated handle equal to Nibco Nibseal. All valves for hot water service shall have stem extension for lever handle operator to accommodate up to 2" thick insulation.
7. Valves 4" and larger for steam service ([S]): Valves shall be fully lugged flanged HPBV type with carbon steel body and disc and reinforced PTFE seal ring.
    a. Operators for butterfly valves 6" and smaller shall be locking type manual lever with memory stop. Operators for butterfly valves 8" (VCU 4") and over shall be gear operator type with hand wheel, or chain wheel type as required for location where installed above 7 feet. Gear head shall have indicator to show disc position.
    b. Butterfly valves shall meet ANSI B16.34, B16.10, and B16.5, MSS-SP68, and API 609 standards.
    c. (Valves for steam and condensate return service up to and including 3" shall be forged steel, bolted bonnet.)
8. Globe valves ([S]) shall be all brass or bronze, with brass disc except globe valves over 2" size may be butterfly valves as specified above, under service valves. Non-rising stems are not acceptable.

B. Check valves ([S]) shall be brass or iron body, swing type, regrinding seat and shall be suitable for (125) (250) psi working pressure. (Check valves for condensate return service shall be forged steel body, swing type, regrinding seat and shall be suitable for 125 psi working pressure.)

C. Balancing cocks ([S]) shall be all brass or bronze, venturi type, plated ball valves with Teflon seats, Tee handles, memory stops, and temperature/pressure ports. All balancing cocks shall be suitable for positive shut-off at 125 psi working pressure.

D. Circuit setter [S] [O/M] shall be Bell & Gossett, Armstrong, or Taco. Those 2-1/2" and smaller shall be bronze, ball type or brass, globe type balancing valves. Valves 3" and larger shall be cast iron globe or ball type. All circuit setters shall have provisions for connecting a portable differential pressure meter. Meter connections shall have built-in check valves. An integral pointer shall register degree of valve opening. Each balance valve shall be constructed for 125 lbs. working pressure at 250°F. Furnish one differential meter model RO-2 complete with meter, cutoffs, piping, fitting and dual hoses. Circuit setters shall not be intended for use as shutoff valves. A circuit setter with memory stop is not a substitute for service valves.

E. Automatic Flow Control Valves [S] [O/M] shall be Griswold, Flow Design, Hays Fluid Controls, or Bell & Gossett and shall be provided at all (chilled water cooling coils) (and hot water heating coils). Valves shall be automatic pressure compensating type and factory set to provide specified flow rates within ten (10) percent regardless of system pressure. Valves shall be selected to provide specified flow rates with a minimum pressure differential of 2 psig. Where system differential exceeds 32 psig, valves shall be selected for a range of 4-57 psig. Valve body shall be suitable for use with piping system and internal working parts shall be stainless steel, nickel plated brass or elastomeric diaphragm. All valves shall be provided with union and pressure-temperature test ports suitable for connecting differential pressure measuring devices. All valves shall be wye configuration for removal of controlling element without removing valve from piping. Each valve shall be identified as to direction of flow and flow rate. Each valve shall be provided with strainer in piping upstream of the coil. Strainer shall be hose end blowdown valve as hereinafter specified. One differential pressure meter shall be provided complete with dual hose kit, valves, flow conversion chart and carrying case. Meter and accessories shall be turned over to the Owner upon final acceptance of the project. Valves shall be suitable for use with glycol/water configuration specified.

F. Triple Duty Valves [S]: Units shall be equal to Bell & Gossett straight pattern type for installation in vertical piping as indicated. Units shall provide functions of check valve, throttling valve, shut-off valve and calibrated valve with differential pressure ports. Valves shall be suitable for 125

psig and 250°F service. Valves shall be fitted with brass or bronze seat, replaceable bronze disc, stainless steel stem and spring. Valve rating shall not exceed 5 feet of water pressure drop at 100% flow and shall not exceed manufacturer's recommendations.

G. Thermostatic Radiator Valves ([S]) shall be equal to Danfoss series RA 2000 specifically for use with low pressure steam baseboard radiators. Valve shall be brass or bronze, straight type for horizontal mounting. Valve shall be rated for maximum 250°F and 15 psig steam pressure. Operator shall be tamper-resistant, valve mounted type with sensor and graduated dial.

H. Safety Valves [S]:
   1. Steam pressure relief valves for reducing stations shall be equal to Spirex-Sarco, bronze or cast iron body, manual test lever, suitable for steam service of sufficient capacity to relieve the full discharge capacity of the connected reducing valve. Discharge port of relief valves shall be pipe full size to 6" above roof and shall be supported so that no strain is on the valve. Valve shall be set to relieve at 5 psi above indicated operating pressure.
   2. Safety relief valves for water heating and cooling systems shall be equal to Watts ASME rated, series 740 or 174A. Valves for heating systems shall be sized to relieve the full heating capacity of the heater installed in the heating system at set pressure of 5 psi over operation pressure. Valves for cooling systems shall be 125 psi set pressure, 3/4" x 1" size. Pipe discharge port full size to floor and support so that no strain is on the valve body.

2.06 HANGERS AND SUPPORTS FOR HVAC DUCTWORK, PIPING AND EQUIPMENT

A. Suspended horizontal piping shall be supported by adjustable wrought steel clevis hangers except that straight runs of hot piping (>100°F) with 40 ft. or more between anchor and expansion device shall be supported on roller type hangers or supports. See Section 23 07 00 for calcium silicate hanger inserts at clevis hangers. All piping connected to motor driven reciprocating or rotating equipment shall have vibration isolation hangers as specified in Section 23 05 48. Protection saddle, welded to pipe, shall be provided at each roller support except on chilled water lines, saddle shall be external metal shield with calcium silicate preformed section as specified in Section 23 07 00, vapor sealed. Calcium silicate inserts may be omitted for pipe smaller than 2 inches. Where supports bear on copper pipe they shall be copper plated. Chain, strap or other makeshift devices will not be permitted as hangers of supports.

B. Maximum pipe support spacing for steel piping shall be ten feet on center, -copper and brass tubing 1-1/4" and smaller shall be supported six feet on center (except where grooved couplings are used, no pipe length shall be left unsupported between any two grooved couplings). (Galvanized steel angles or channels shall be provided 10 feet on center across top of tunnels for support of pipes as indicated.)

C. Vertical steel piping shall be guided or supported in the center of each riser and not over 15 feet on center, copper or brass tubing shall be supported at not over 10 feet on center; and supported at the base of each riser and/or at the top of each riser as required by the piping run. All vertical piping shall be guided or braced where required to prevent lateral movement. Bracing shall include auxiliary stanchions where piping is not in close proximity to suitable structure. (Where grooved couplings are used, guides shall be placed on every other pipe length.)

D. Refrigerant piping smaller than 3/4" shall be supported using B-Line Armafix clamps by Cooper Industries or equal.

E. Rigid support sway bracing shall be provided at changes in direction greater than 45 degrees for all pipe 4 inches and larger.

F. Pipe and suspended equipment hanger rods shall be attached to the top chord only on steel joists and beams by joist or beam clamps without welding. Welding of support rods and connection at any place other than the top chord will not be permitted unless written approval is granted by the Engineer and the Architect. C-clamp hangers shall be limited to 50 lb. or less

when used at joists. Threaded rod shall be used through joist chords for loads greater than 50 lb.

G. Pipe and suspended equipment supported from concrete structure shall be high-strength screw anchor and threaded rod system. Anchor shall be zinc plated, heat treated, carbon steel with integral flanged head to accept threaded rod. Anchor shall be selected to provide a minimum safety factor of 2 for the load to be supported and shall be approved for use in cracked and uncracked concrete applications. Anchor shall be Simpson Strong-Tie Titen HD or equal.

H. Duct supports shall consist of not less than 1" by 1/16" galvanized strap iron hangers spaced not over 4 feet on center, except medium and high pressure flat-oval ducts wider than 48 inches shall be supported by trapeze angles. Straps shall be lapped across the bottom ducts a minimum of 1 inch. Ductwork shall be supported from the building structure. Ductwork shall not be supported from the ceiling system or any other building services. Heavy ductwork such as medium or high pressure duct supported by hanger rods, shall be attached to the top chord only on steel joists and beams by joist or beam clamps without welding. Welding of support rods and connection at any place other than the top chord will not be permitted unless written approval is granted by the Engineer and the Architect. All ductwork shall be braced as required to prevent lateral movement.

I. Roof mounted (piping and) duct supports shall be factory fabricated mounting pedestals as manufactured by Roof Products and Systems, Inc. (RPS) or equal. Pedestals shall be minimum 12 inches high, complete with equipment rail, slide channel "U" shaped mounting brackets, 18 gauge threaded galvanized rods, lateral spacer bracket and galvanized slide assembly. Supports shall be located to adequately support duct with no more than 4 feet of duct unsupported. (Piping shall be secured to supports using accessories furnished by the support manufacturer.)

J. Where piping is to be installed on an existing roof, pipe supports shall be pre-manufactured rubber pedestal supports, manufactured specifically for mounting on top of existing roofing systems. Pedestals shall be minimum 2.5 inches high complete with galvanized steel slide channel attached to the base. Two ½ inch diameter threaded rods 10 inches in length shall attach a galvanized steel slide channel to the base channel with the pipe being secured by a rigid steel pipe clamp. The support height shall be adjustable to accommodating a sloping pipe. Rooftop support shall be equal to RTSPUCES Rooftop Support Systems manufactured by Eberl Iron Works, Inc.

K. (See Section 23 00 10 for special support requirements for Wooden Structure. Connection at any location other than those specified will not be permitted unless written approval is granted by the Engineer and the Architect. Drilling or cutting of wooden trusses shall not be permitted.) (See Section 23 00 10 for special support requirements for Pre-manufactured Light Gauge Metal Structure. Welding and connection at any location other than those specified will not be permitted unless written approval is granted by the Engineer and the Architect.)

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install products in accordance with manufacturer's recommendations.

B. Support riser piping independently from the connected horizontal piping.

C. Hangers shall be spaced so that the supported load does not exceed the load recommended by the manufacturer. The supported load shall not overstress the building structural members. Where required hangers for the suspension of heavy items do not correspond with the building structural members, provide supplemental steel members fastened to the building structural members.

D. Valves in horizontal lines shall be installed with stems horizontal or above. Flanged butterfly valves shall be provided with spacer or spool piece between valve and adjacent appurtenance.

Isolation service valves shall be installed on each side of each major piece of equipment such as a (pump,) (converter,) (cooling tower,) (boiler,) (chiller,) (condenser,) (heating coil,) (cooling coil,) and other similar items; and at any other points indicated or required for draining, isolation or sectionalizing purposes. Control valves shall be installed in accordance with control manufacturer's recommendations. (Radiator valve shall be provided on each convector or radiator.)

E. Install all thermometers and gages such that they can be easily readable standing on floor. Gages subject to vibration or physical damage shall be adequately supported and protected.

F. Where pressure/temperature ports are indicated on the drawings, they shall be provided with full port gauge cocks that allow penetration of instrument probes.

G. All outdoor water piping that does not contain glycol shall be provided with heat trace under insulation. All accessories shall be provided as necessary for a complete operating system.

H. (Where grooved piping is used, the Contractor shall provide appropriate means of accommodating thermal expansion in accordance with the manufacturer's recommendations.)

I. Butterfly valves in horizontal lines shall be installed with the stem horizontal.

END OF SECTION

SECTION 23 05 48

VIBRATION AND SEISMIC CONTROLS FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. Vibration Isolators
2. Inertia Bases
3. (Seismic Restraints) ***SEE IBC SECTION 1600 AND ASCE-7 FOR REQUIREMENTS

C. Related Sections:

1. Section 23 00 10 – HVAC General Requirements
2. Section 23 20 00 – HVAC Piping and Pumps
3. Section 23 30 00 – HVAC Air Distribution
4. Section 23 80 00 – Decentralized HVAC Equipment
5. Division 26 - Electrical

1.02 QUALITY ASSURANCE

A. All vibration control apparatus shall be supplied by a single recognized manufacturer. The supplier of noise and vibration control equipment shall supervise, inspect and approve the installation of their equipment. The supplier shall submit a letter to the Engineer at the conclusion of the project stating that all items have been installed properly and that all equipment is adequately isolated.

1.03 SHOP DRAWINGS

A. Submit shop drawings and product data in accordance with Division 1.

B. Shop drawings, cuts, diagrams, catalog data sheets or such other data necessary to fully describe and substantiate compliance with the specifications shall be submitted for all (seismic restraints,) vibration isolation equipment and materials. The Contractor shall submit drawings for review stating the static deflection, load capacity and location of the isolators, inertia slab dimensions and installation instructions.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Kinetics Noise Control, Vibration Mountings and Control, Inc., Vibration Eliminator Co., Mason Industries, Vibro-Acoustics or Amber/Booth Company.

B. Model numbers used in this specification are those of Kinetics Noise Control and are included to establish a standard of quality.

2.02 SEISMIC RESTRAINTS [S]

A. All Division 23 systems, components and their attachments shall be designed and constructed to resist vibrations resulting from emergency storm shelter conditions. Shop drawings shall detail each type of restraint and shall include all supporting calculations. Restraints shall include, but not be limited to, snubbers, sway bracing and anchors.)

2.03 ISOLATOR TYPES

A. Floor Mounted Equipment:

1. Type S spring vibration isolators shall be free-standing, unhoused, laterally stabile, steel springs, wound using high strength heat treated spring alloy steel, and shall have a horizontal spring stiffness equal to or greater than 1.0 times the rated vertical spring stiffness. Springs shall be selected to provide the tabulated minimum operating static deflections and shall provide a 50% overload capacity before reaching a solid state. Springs shall be designed to reach a solid state before exceeding the spring steel fatigue point. Springs used to isolate floor mounted equipment shall include a drilled and tapped steel top load plate, and a steel bottom load plate bonded to a 1/4" thick ribbed neoprene noise stop pad. Each spring mount shall include a steel leveling bolt, locknuts, and washers for attachment to supported equipment. Type S units shall be Kinetics Model FDS. Springs shall have the following minimum outside diameters:

Spring Deflection,	Rated Capacities, Lbs.		
Inches	Up to 370	371 to 1600	1601 to 11000
Up to 1.5	1.75" dia.	3.00" dia.	3.00" dia.
1.51 to 2.25	3.50"	5.0"	5.0"

2. Type 3, vertically restrained, spring mounts shall incorporate a single spring vibration isolator having all of the characteristics of Type S spring isolators as previously specified in a steel mount assembly designed to limit vertical movement of isolated equipment. If equipment loads are reduced or equipment is subject to external loads, vertical movement shall be limited without degrading the vibration isolation of the spring element during normal equipment operating conditions. The mounts shall have a flat steel top load plate, for welding to supporting equipment, vertically restrained by noise isolated bolts, connected to steel channel and drilled plated assemblies welded to a steel base plate. The base plate shall be bonded to a 1/4" thick ribbed neoprene noise stop pad and drilled for bolting to supporting structures. Type 3 units shall be Kinetics FLS.
3. Type 1 fiberglass isolators shall be precompressed molded fiberglass noise and vibration isolation pads, individually coated with a flexible moisture impervious elastomeric membrane. The fiberglass pads shall have been stabilized by ten (10) compression cycles to three (3) times the maximum published load. Load range and natural frequency shall be as recommended by the isolator manufacturer for each specific application. But, in no case shall a natural frequency higher than 12 Hz be provided for applications intended to isolate sound, nor higher than 15Hz for applications intended to isolate impact noise and shock. Type 1 units shall be Kinetics Model KIP.
4. Type N neoprene isolation mounts shall incorporate a cast-in tapped steel load plate, to permit bolting to supported equipment. The neoprene pad shall be molded using 2500 psi tensile strength, oil resistant compounds, and shall have no color additives in the compound. The neoprene isolator shall be selected to achieve the minimum operating static deflection tabulated, while not exceeding the published load capacity for the isolator used. Each neoprene isolation mount shall be externally color coded to identify load capacity, and shall incorporate a cast-in drilled steel anchor/base plate. Type N units shall be Kinetics Model RD.
5. Type NIP neoprene isolation pads shall be single rib or crossed, double rib neoprene in shear pads in combination with steel shims. Neoprene pads shall be molded using 2500 psi tensile strength, oil resistant compounds. Type NIP units shall be Kinetics Model NPS, NPD, NGS, or NGD.

B. Suspended Equipment:
1. Type 2 hangers shall consist of a steel spring and a elastomer-in-shear isolator placed in series and encased in a welded steel bracket. The spring element of the hangers shall meet all specified characteristics of a "Type S" spring as previously specified. Springs shall be color coded for ease of load capacity identification and removable for field correction of overloaded hangers. The elastomer noise stop pad shall be selected to operate within the published load range for the pad for each spring capacity when placed in the bracket used. The hanger bracket shall be designed to carry five (5) times overload without failure, and

shall allow up to 15° rod misalignment without metal to metal contact. Type 2 units shall be Kinetics Model SRH.

2. Type F hangers shall consist of an elastomer-in-shear isolator encased in a welded steel bracket. The elastomer shall be bonded to the hanger bracket and shall be selected to support the load within its published load rating. The hanger bracket shall be designed to carry a five (5) times overload without failure and allow up to 15° rod misalignment without short circuiting. Type F hanger shall be Kinetics Model RH.

2.04 BASE TYPES

A. Type 7 inertia bases shall consist of a concrete slab, cast into a prefabricated inertia base frame assembly designed and supplied by the isolation materials manufacturer. Frames shall be welded steel channel with a depth greater than 8% of the longest dimension, a minimum of 6" thick, and shall include welded-in 1/2" steel reinforcing rods on 8" centers each way. Prelocated equipment anchor bolts shall be fixed into position, and housed in steel bolt sleeves allowing minor bolt location adjustment. Isolator support brackets, when required, shall be welded into the corners of perimeter channel frames with 1/2" reinforcing rods 1-1/2" above bottom of brackets running continuous in two directions between isolator brackets. Where bases are used under pumps, the base shall be large enough to support riser elbows. Type 7 bases shall be Kinetics Model CIB-L or CIB-H.

B. Type B equipment bases shall consist of structural support members, with welded on isolator support brackets, and prelocated and drilled anchor bolt holes, designed and supplied by the isolation materials manufacturer. The structural steel bases shall have beams of minimum section depth equal to 8% of the longest span between support isolators, a minimum of 6", and shall be of sizes and shapes required for equipment to be supported. Isolator support brackets shall be welded to the structural beam base as required to provide the lowest possible mounting height of supported equipment. Anchor bolt holes shall be prelocated and drilled into all equipment bases to bolt down equipment. The structural steel bases shall provide a rigid, distortion free mounting base for supporting equipment, which allows no excessive differential motion between driven equipment components. Type B bases shall be Kinetics Model SFB or SBB.

C. Type 8 bases shall be prefabricated extruded aluminum rail system using 1" deflection Type S free standing stabile springs and a continuous elastomeric air and water seal. All metal parts shall be non-corrosive or zinc plated. Each rail system shall be designed and sized specifically to fit the roof curb and the equipment proposed to receive the isolation rails. The upper portion of the equipment rail shall be designed to continuously support the weight of the equipment provided. Springs shall be spaced to provide a uniform 1" static deflection when equipment is mounted on the isolation rails. All rail sections shall be designed and arranged to shed water outward and shall be watertight. Type 8 bases shall be Kinetics Model KSR.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Equipment: All equipment listed hereinafter shall be isolated from the structure and fixed parts by means of resilient vibration and noise isolators. Isolators for floor and roof mounted equipment shall be solidly anchored to the support base or floor and to the supported equipment unless indicated otherwise.

B. Piping and Conduit: All piping and electrical conduit connected to the chillers (including refrigerant piping), pumps, air handling units, or other pieces of moving equipment which are isolated from the structure by spring type vibration isolators shall be isolated from these units by flexible pipe connectors and shall be suspended on isolation hangers to a point 10 feet away. Use Type 2 hangers for suspended piping, Type S mounts for floor mounted piping. Flexible pipe connectors are specified as part of the piping work.

C. Ductwork: Flexible connections shall be incorporated in the ductwork adjacent to all air moving units as part of the sheet metal work. Ductwork shall be suspended on Type F hangers for a distance of (10) (20) (30) feet from these units (, except isolators shall not be required beyond wall surrounding the equipment room).

3.02 EQUIPMENT WITH INTERNAL ISOLATION

A. Where air handling units have fan and motor assembly internally isolated from the unit casing, using both spring isolators and flexible fan discharge connections, external isolators for the air handling unit shall not be provided.

END OF SECTION

SECTION 23 0553

IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY

A. Related Documents: Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. Prepare and paint Division 23 accessories, ductwork, piping and miscellaneous materials located in Equipment Rooms, Boiler Rooms, pipe trenches and other utility areas housing mechanical equipment and materials.
2. Prepare and paint Division 23 accessories, ductwork, piping, and miscellaneous materials exposed to view (including behind acoustic baffles, etc.). Color and finish shall be per Architects Finish Schedule or as selected by Architect during construction.
3. Identification of piping in exposed and accessible locations.
4. Marking and designation of equipment.

C. Work Not Included:

1. Painting of ductwork, piping or equipment located on the building exterior.
2. Painting of ductwork, piping or equipment exposed in finished areas other than those listed under WORK INCLUDED above.
3. (Painting of existing equipment, piping or ductwork.)

D. Related Sections:

1. Section 09 90 00 – Painting and Coating
2. Section 23 00 10 – HVAC General Requirements
3. Section 23 05 00 – Common Work Results for HVAC
4. Section 23 07 00 – HVAC Insulation
5. Section 23 09 00 – Instrumentation and Control for HVAC
6. Section 23 20 00 – HVAC Piping and Pumps
7. Section 23 30 00 – HVAC Air Distribution
8. Section 23 80 00 – Decentralized HVAC Equipment
9. Division 26 - Electrical

1.02 REFERENCED STANDARDS:

A. General: The following standards or codes (latest edition) form a part of this specification to the extent indicated by the reference thereto.

B. American National Standards Institute (ANSI):

1. ANSI A13.1 Scheme for Identification of Piping Systems

C. American Society for Testing and Materials (ASTM):

1. ASTM E 84 Standard Test Method for Surface Burning Characteristics of Building Materials
2. ASTM C 411 Standard Test Method for Hot-Surface Performance of High-Temperature

D. National Fire Protection Association (NFPA):

1. Standard 255 Method of Test of Surface Burning Characteristics of Building Materials

E. Underwriters Laboratories, Inc. (UL)

1. Standard 723 Tests for Surface Burning Characteristics of Building Materials

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Except as otherwise specified, materials shall be the products of the following manufacturers:
   1. Sherwin-Williams
   2. Pratt and Lambert
   3. Pittsburgh Paints (PPG)
   4. Benjamin Moore
   5. Porter Paints
   6. Seton Identification Products

2.02 MATERIALS:

A. Deliver all paints and materials to the project site in their unopened original containers with all labels intact and legible at the time of use.

B. All coatings exposed to supply and return airstreams and where applied to exposed surfaces in a return air plenum, shall have a composite flame spread rating not exceeding 25, and a smoke developed rating not exceeding 50 as tested under procedure ASTM E-84 (latest) and UL 723 (latest). Coatings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411, latest edition.

C. Sherwin-Williams Industrial Maintenance Coatings System 4000 products are listed below to establish color and a standard of quality.
   1. All Hangers and Supports: One coat Series 54 Gloss Black Alkyd Enamel.
   2. Ducts:
      a. Interior duct behind all grilles, registers and diffusers shall be painted with one coat of flat black prime or flat black finish paint.
      b. Exposed in equipment rooms and other unfinished areas such as storage areas and utility type spaces; uninsulated galvanized steel ducts shall be chemically prepared and primed with one coat of Galvite B50W3 Primer. Aluminum ducts and insulated ducts with aluminum jacket shall be primed with one coat of No. B50Y1 Zinc Chromate Primer. Canvas or paper insulation jacket shall be primed with one coat of No. B28W200 Wall Primer. Finish with Series 54 Alkyd Gloss Enamel, gray No. SW4028 Gypsum applied in sufficient number of coats to effectively cover the prime coat.
   3. Piping: Exposed in equipment rooms and where connections are made to equipment located in storage rooms and other utility type areas.
      a. Priming:
         1) Insulation Canvas or Paper Jacket: One coat No. B28W200 Wall Primer.
         2) Insulation Aluminum Jacket: One coat No. B50Y1 Zinc Chromate Primer.
         3) Bare Iron or Steel or Copper: One coat No. B50Y1 Zinc Chromate Primer.
         4) Galvanized Steel: Pipes and ductwork shall be chemically prepared and primed with one coat of Galvite B50W3 Primer.
         5) Asphalt Coated Pipe: One coat No. B28W200 Wall Primer.
      b. Finish: All pipe lines and the supports or hangers therefore, shall be finished with Series 54 Alkyd Gloss Enamel, gray No. SW4028 Gypsum applied in sufficient number of coats to effectively cover the prime coat. Painting of pipe hangers is specified hereinbefore.
      c. Materials shall be as recommended by the manufacturer for the surface to be finished.
      d. Unless otherwise specified, primer shall be by the same manufacturer as the finish coat.
      e. Materials shall not be thinned or cut except as recommended by the coating manufacturer. Thinners shall be by the same manufacturer as the primer and finish coat.

D. Valve tags ([S]) shall be neat circular brass with designations stamped thereon, attached with solid brass jack chain to each valve stem or handle.

E. Each item of equipment such as pumps, air handlers, etc., and equipment control devices such as motor starters, disconnect switches, etc. shall be properly marked with laminated engraved plastic nameplates ([S]) fastened with sheet metal screws, bolts or permanent adhesive. Pressure sensitive tape is not acceptable.

F. All piping, insulated and uninsulated, shall be identified ([S]) with Seton Setmark or equal wrap around piping system markers and arrow flow directional marker. Markers shall be pre-coiled, semi-rigid plenum-rated plastic or polyester with sealed color graphics. Markers shall be minimum 12 inches long with 1-¼ inch high letters, formed to cover entire circumference of the pipe. Markers shall be attached to piping using plenum-rated plastic tie wraps. Pipe identification shall use the same designations or abbreviations used on the drawings. Marker colors shall be in accordance with ANSI.

PART 3 - EXECUTION

3.01 WORKMANSHIP:

A. The work shall be accomplished by qualified mechanics skilled in the painting trade. Painting of equipment, piping, ductwork and other materials shall not commence until all testing is complete and systems are ready for operation. Materials shall be applied according to manufacturer's directions. All containers shall be securely closed when not in use. Flammable materials shall not be stored on premises. Flammable waste shall be disposed of daily in devices approved for such purposes. Materials shall be evenly spread, and smoothly flowed on without runs or sags. Each coat shall be thoroughly dry before application of succeeding coats.

3.02 PROTECTION OF WORK:

A. The painters shall protect all adjacent surfaces with drop covers during the process of painting. Upon completion, paint spots, if any, shall be removed from all surfaces.

3.03 PREPARATION OF SURFACE:

A. Surfaces to be painted shall be completely dry before applying paint. Metal surfaces shall be cleaned with mineral spirits before applying materials. Rust and scale shall be removed by wire brushing or sanding. Galvanized surfaces shall be chemically pretreated with crystalline (zinc phosphate) phosphate in strict accordance with the manufacturer's recommendations. Surfaces shall not be painted when the temperature is, or is likely to be, near the freezing point, nor when they are exposed to hot sun.

B. IDENTIFICATION OF PIPES AND EQUIPMENT:

C. Equipment: After all other painting is completed, each piece of equipment shall be properly identified with nameplates. Identification symbols and designations shall be the same as shown on the Contract Documents. Where equipment is installed above lay-in ceilings (VAV boxes, cabinet unit heaters, fan coil units, dampers, or similar), an additional plastic nameplate shall be adhered to the face of the T-bar support so that it can be identified from within the space.

D. Apply piping system markers after completion of required insulation and finishes on piping systems. Markers shall be applied in the following locations and where identified by the Engineer:

1. At each valve and at connection to equipment.
2. At every tee and branch connection.
3. At each riser including branch risers from mains.
4. At each side of a pipe passage through floors, walls and partitions.
5. Every 15 feet on straight runs of piping mains and branches.
6. Within 6 feet of elbows (each side).
7. At access doors or similar points that permit view of concealed piping.
8. Markers shall be provided on all piping above lay-in ceilings.

9. Provide arrow markers showing direction of flow incorporated into, or adjacent to, each piping system marker.
10. Apply all piping system markers where view is unobstructed, and legends can be read and easily identified.
11. Apply all tags and piping system markers in accordance with the supplier's instructions.
12. The termination of concealed condensate piping shall be marked to indicate whether the piping is connected to the primary or secondary drain.

END OF SECTION

SECTION 23 0593

TESTING, ADJUSTING AND BALANCING FOR HVAC

PART 1 - GENERAL

1.01 SUMMARY

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. Cleaning
2. Adjusting and Balancing

C. Related Sections:

1. Division 01 -- Commissioning
2. Section 23 00 10 – HVAC General Requirements
3. Section 23 05 00 – Common Work Results for HVAC
4. Section 23 07 00 – HVAC Insulation
5. Section 23 09 00 – Instrumentation and Control for HVAC
6. Section 23 20 00 – HVAC Piping and Pumps
7. Section 23 30 00 – HVAC Air Distribution
8. Section 23 80 00 – Decentralized HVAC Equipment

1.02 REFERENCES

A. General: The following publications listed below, form a part of this specification to the extent indicated by the reference thereto.

B. Sheet Metal and Air Conditioning Contractors National Association, Inc. (SMACNA):

C. Balancing and Adjustment Manual

D. Associated Air Balancing Council (AABC):

E. National Standards for Total System Balance

F. National Environmental Balancing Bureau (NEBB):

G. Procedural Standards for Testing, Balancing and Adjusting of Environmental Systems.

1.03 QUALIFICATIONS

A. For the air conditioning, heating and ventilation systems the Contractor shall obtain the services of a qualified, independent testing organization specializing in total system air and water testing and balancing. The Contractor shall be responsible for making changes in pulleys, belts and dampers where necessary to obtain the required air volume as determined by the Testing and Balancing Contractor. The Testing and Balancing Contractor shall provide all labor, engineering and test equipment required to adjust, test and balance all heating, ventilating, air conditioning and exhaust systems as hereinafter specified. All personnel involved in the execution of the work under the balancing contract shall be experienced and factory trained specifically in the total balancing of mechanical systems, as well as being regular employees of the Balancing Contractor. The Test and Balance Contractor shall work in close coordination with the Controls Contractor to ensure that the system is operating as designed and to aid in adjusting setpoints as necessary for proper system operation.

B. (For the air conditioning, heating and ventilation systems the Contractor shall provide all services for total system air and water testing and balancing. The Contractor shall be responsible for making changes in pulleys, belts and dampers where necessary to obtain the required air volume. The Contractor shall provide all labor, engineering and test equipment required to adjust, test and balance all heating, ventilating, air conditioning and exhaust systems

as hereinafter specified. All personnel involved in the work shall be experienced and trained specifically in the total balancing of mechanical systems.)

1.04 TAB COORDINATION AND RESPONSIBILITIES

A. The TAB Agent shall provide the following:
   1. All instrumentation used in the course of testing and balancing shall be accurate and shall have been calibrated within the six months prior to commencing test and balance work for this project.
   2. (Where existing air or hydronic systems are to be renovated, the TAB Contractor shall provide a complete measurement of air and water flow for systems indicated to remain prior to any construction or demolition of existing systems. For air systems, the data shall be taken and recorded for each piece of air handling equipment serving the area of renovation and those indicated on the drawings for ductwork or other mechanical renovations. Data shall be provided as outlined for balancing data hereinafter. For hydronic systems, pump flow data for each system shall be provided as well as flow to each terminal device being modified, replaced, or removed. Any discrepancies in the data shall be reported to the Architect/Engineer prior to commencing any mechanical work.)
   3. The TAB Agent shall conduct a pre-TAB inspection two weeks prior to commencing the test and balance. The TAB Agent shall notify the Contractor in writing of any deficiencies that would affect the ability to successfully complete the test and balance or result in an incomplete or unacceptable report.
   4. During the course of the test and balance, the TAB Agent shall immediately notify the Contractor of any equipment or system discrepancies discovered that need to be corrected prior to the satisfactory completion of the test and balance procedures.
   5. Equipment settings, including damper positions, valve positions, fan speed controls, and similar devices shall be marked to show final settings.

B. The Contractor shall provide the following:
   1. Prior to the commencement of testing and balancing, the installation of building systems shall be fully complete. Building controls systems shall be complete, operational, and verified by the Contractor.
   2. The Contractor shall resolve any discrepancies noted by the TAB Agent in the Pre-TAB Inspection prior to commencing the test and balance. The Contractor shall provide written confirmation of the corrective action that was taken to correct each deficiency.
   3. The Contractor shall make available qualified personnel during the period in which the test and balance is being conducted for the purpose of problem resolution and controls support.
   4. The Contractor shall resolve any deficiencies noted by the TAB Agent prior to the submission of the report and prior to any subsequent visits required by the TAB Agent.

1.05 SUBMITTALS

A. Prior to commencing work under this section, the Contractor shall submit the name of the testing organization, a proof of certification by the Associated Air Balance Council or National Environmental Balancing Bureau, and a list of five local projects on which testing and balancing has been completed for two years, for approval by the Architect/Engineer. The submittal shall include TAB procedures proposed for the systems specific to this project.

B. Contract Documents Examination Report: Within 90 days from Contractor's Notice to Proceed, based on examination of the Contract Documents as specified in the "Examination" Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices. As part of the submittal, the Contractor shall provide a list of any conditions where balancing or testing cannot be accomplished due to access or other project conditions.

C. Heating, Air Conditioning and Ventilation Systems Balance and Performance Data: At a time no later than the Substantial Completion Inspection, the Contractor shall provide the

Architect/Engineer with two (2) typewritten copies of schedules containing air and water system balance and performance data.

D. Equipment and System Verification: Letters, signed by representatives of boiler, chiller, cooling tower, heat pump, air conditioning unit, and temperature control manufacturers, shall attest that their respective equipment installed on this project has been started, tested and set to operate safely and at the control points required as an integral part of the systems specified herein. The Contractor shall attest by letter that all equipment has been wired and tested to see that the indicated sequence of motor control is established, that all safety controls function properly, that all motor protective devices are sized correctly and that the systems are operating at the points set on the controls. The Engineers will not conduct a site visit for the purpose of determining the status of final payment until these letters are received.

E. Test data shall be submitted for all equipment and systems where specifically required by this specification and all items identified with [TD] behind the product data.

1.06 COMMISSIONING OF HVAC SYSTEMS

A. Participate in Commissioning Meetings designated by the Commissioning Agent.

B. Participate in resolving controls issues identified by the Commissioning Agent.

C. Notify Commissioning Agent a minimum of 2 weeks in advance of start-up of Testing, Adjusting and Balancing (TAB) work. Arrange and attend meeting between Commissioning Agent and TAB agency for review of TAB procedures, TAB work plan, and TAB schedule. Refer to Division 1 for complete scope of Commissioning work.

D. Provide Commissioning Agent with a copy of preliminary and final balance reports.

1.07 CONDITIONS

A. Partial Testing: As much as practical, systems shall be tested as complete systems. Tests on portions of a system will be permitted to facilitate proper progress scheduling. When systems are tested in segments, a system diagram indicating portion tested and a separate and complete report including the date of test is required for each segment.

B. Concealed Work:

1. All concealed work shall be tested and approved by the Architect/Engineer prior to the application of insulation or construction of chase walls.
2. Covering shall not be applied to any piping nor shall any piping be concealed or covered until pipes have been tested, all leaks stopped, retested and approved.
3. Where ductwork is inside a shaft or chase, TAB agent shall coordinate with Contractor to make the required traverses before shaft walls are closed in, or shall make provisions to allow for traverse to be done at a later date through fire rated (where required) access door of adequate size for full traverse.

C. (Work in Existing Buildings: Where new piping systems are connected to existing systems, test the new system prior to making connections to existing system. Connections to existing systems are not to be tested unless required by local authorities.)

PART 2 - PRODUCTS

2.01 GENERAL

A. All equipment, instruments, materials and utilities required for cleaning, testing and balancing of the air and hydronic systems shall be provided by the Contractor.

2.02 INSTRUMENTATION

A. All instruments used by this Contractor shall be accurately calibrated and maintained in good working condition.

2.03 TESTS OF MATERIALS

A. Manufacturers' certificates will be accepted in lieu of tests of materials. If individual laboratory tests are desired by the Architect-Engineer, they will be secured by this Contractor and paid for by the Owner.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine the Contract Documents to become familiar with Project requirements and to identify conditions in the design that may preclude proper TAB of systems and equipment.
   1. Contract Documents are defined in the General Conditions and Supplementary Conditions.
   2. Verify that balancing devices required for proper TAB are indicated in the Contract Documents, including, but not limited to, test ports, gauge cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers.
   3. Verify that the quantity, location, and accessibility of balancing devices are adequate for effective balancing and for efficient operation of systems and equipment.

B. Examine approved submittals for HVAC systems and equipment before beginning TAB. Where approved submittals differ from the Contract Documents, include changes to capacities, flow rates, pressure drops, quantities, and other pertinent performance data in the TAB plan. Where approved by the Engineer, use approved submittal data as the basis for TAB.

C. Examine design data, including HVAC system descriptions, stated design assumptions, sequences of operation, control diagrams, and control philosophies. Identify discrepancies, omissions, and conditions that may affect the ability to perform accurate TAB.

D. Examine equipment performance data, including fan curves and pump curves, and relate the data to Project conditions and installed system configurations. Identify conditions that may cause system effects or otherwise reduce equipment performance below scheduled or submitted values. For air systems, evaluate apparent system-effect conditions using AMCA 201, Fans and Systems, Sections 7 through 10, or SMACNA's HVAC Systems--Duct Design, Sections 5 and 6. Report discrepancies, concerns, and observations in the Contract Documents Examination Report.

E. Examine system and equipment installations to verify that they are complete and that specified cleaning, testing, startup, and commissioning activities required for TAB have been performed. Do not begin TAB procedures on systems that are incomplete or not ready for operation, except to document deficiencies. TAB work performed before systems are complete, operational, and ready for TAB, or before identified deficiencies are corrected, is preliminary only and shall not constitute final TAB or be grounds for accepting TAB work as complete.

F. Examine available system and equipment startup reports, factory test reports, and field test reports affecting TAB work.

G. Examine HVAC system and equipment installations to verify that balancing devices are installed where indicated, are accessible, and are suitable for effective TAB. Report deficiencies in Deficiency Reports.

H. Examine the Project for required makeup air paths and transfer openings that directly affect exhaust system performance, including transfer grilles, door undercuts, and similar provisions serving closets, toilet rooms, and equipment rooms.

I. Examine systems for functional deficiencies that cannot be corrected through TAB procedures or that will impair, prevent, or delay accurate TAB. Promptly notify Contractor and Engineer of deficiencies observed before and during TAB procedures. Report deficiencies in Deficiency Reports. Deficiencies include, but are not limited to, the following:
   1. Incorrect location or orientation of control valves.
   2. Three-way valves installed incorrectly for intended mixing or diverting service.

3. Incorrect control valve size or Cv.
4. Circulating pumps installed in reverse.
5. Heating-water and chilled-water coils installed in the wrong location or orientation.
6. Heating-water and chilled-water coils piped incorrectly, including reversed supply and return connections or incorrect service to the coil.
7. Missing or inaccessible pressure ports.
8. Missing or inaccessible circuit setters or balancing valves.
9. Missing diffusers or return-air grilles.
10. Missing or inaccessible balancing dampers.
11. Missing transfer openings or air pathways.
12. Sheet metal ductwork or flexible ductwork installed in a manner that restricts airflow.

J. Examine HVAC equipment to verify that clean filters are installed, bearings are lubricated as required, belts are aligned and properly tensioned, and controls are installed and functional so that equipment is ready for operation.

K. Examine terminal units, including VAV units, to verify accessibility and proper installation and operation of controls. Report deficiencies in Deficiency Reports.

L. Examine plenums used for supply air to verify that they are adequately sealed and that penetrations and openings are sealed.

M. Examine strainers to verify that screens are clean and perforations are proper for the intended service.

N. Examine heat-transfer coils for proper piping arrangement and for clean, undamaged fins. Verify correct flow direction. Report deficiencies in Deficiency Reports.

O. Examine pump suction piping to verify that entrained air is not present.

P. Examine equipment to verify proper installation and operation of safety interlocks and controls.

Q. Examine automatic temperature-control system components affecting TAB to verify the following:
1. Dampers, valves, and other controlled devices are operated by the intended controller.
2. Dampers and valves are positioned consistent with controller commands.
3. Dampers and valves operate freely through the full required stroke and provide the intended shutoff or failsafe position.
4. Automatic modulating and shutoff valves, including two-way valves and three-way mixing and diverting valves, are properly connected, oriented, and accessible for service.
5. Thermostats and humidistats are located to avoid adverse influence from sunlight, drafts, and cold surfaces.
6. Sensors are located to sense only the intended conditions.
7. Interlocked systems operate as intended.
8. Adverse temperature or airflow conditions attributable to controls are identified and reported.

3.02 CLEANING

A. Each boiler shall be cleaned in accordance with manufacturer’s instructions before being connected to the system.

B. Equipment shall be wiped clean to remove all dust, oil, dirt or paint spots. Trash, plaster, mortar or paint shall be removed from all coils, plenums and end pockets.

C. Heating Piping, Cooling Piping and Ductwork shall be thoroughly blown out or flushed and cleaned of all foreign matter before connections are made to equipment. Temporary bypasses shall be provided around coils, control valves, ice tanks, heat exchangers and other similar items to prevent trash from being flushed into these items. Care shall be taken at time of installation to prevent pipe compound, scale or other objectionable matter from entering the piping systems. Strainers shall be cleaned. After all construction dirt has been removed from the building, new filters shall be installed in all air units.

3.03 ADJUSTING AND BALANCING:

A. Equipment: Before attempting to adjust and balance the air and water systems, the Contractor shall verify that the following items have been completed and are correct.
   1. Motor and bearings are properly lubricated.
   2. Direction of rotation of motors.
   3. Belt tension.
   4. Electric current flow in each phase of motors and electric heating elements.
   5. Motor protective devices are sized to properly protect installed motors.
   6. Thermostats, controls, accessories and other items requiring setting or adjustment shall be set as indicated.

B. Air System Balancing Procedure:
   1. Place all related supply, exhaust and return air systems in operation with the fans running at design RPM.
   2. Establish system conditions for the maximum demand in airflow; generally, a cooling application. Variable volume systems shall be set and balanced such that the systems are operating at minimum static pressure necessary to maintain proper airflow at the terminal devices.
   3. Measure supply air volumes by means of the duct traverse method, making a minimum of sixteen (16) readings. Test holes shall be in straight duct as far as possible downstream from elbows, takeoffs, dampers, etc. Seal duct access holes with metal snap-in plugs. The use of duct tape to seal access holes will not be permitted.
   4. Adjust balancing dampers for required branch duct air quantities. Ducts with multiple branches shall have at least one branch with volume damper(s) completely open.
   5. Adjust grilles and diffusers to within deviations listed below of individual requirements specified, and also adjust so as to minimize drafts and sound in all areas. Restriction imposed by flow regulating devices in or at terminals shall be minimal. Final measurement of air quantity shall be made after optimum air pattern has been achieved.

System Type	CFM Range	Allowable Deviation
Supply\Return	0-50	+ or –5 CFM
	50-1,000	+ or – 10%
	>1,000	+ or – 5%
Exhaust / 100% OA Supply	0-50	+ 5 CFM
	50-1,000	+ 10%
	>1,000	+ 5%

   6. The total air delivery in any particular fan system shall be obtained by adjustment of the particular fan speed. The drive motor of each fan shall not be loaded over the corrected full load amperage rating of the motor involved. Where belt drive fans are used in conjunction with VFD's, the fan speed shall be adjusted by changing pulleys such that fan speed to achieve design airflow occurs at 60 Hz. These sheave and pulley changes shall be included in the Contractors scope of work.
   7. Adjust quantity of air on each zone to the values given in the specifications and/or plans.
   8. If the total system fan volume (supply, return, exhaust, relief) and outdoor air volume are not within plus or minus 5% of the design capacity at design RPM, determine the reason by reviewing all system conditions, procedures and recorded data. Check and record the air pressure drop across filters, coils, eliminators, sound traps, etc., to see if excessive loss is occurring. Particularly study duct and casing conditions at the fan inlet and outlet.
   9. Any changes that are required for the final balancing results will be provided for by the respective Contractors who supplied and installed such equipment under their contractual obligations. Such changes may encompass, but are not necessarily restricted to, the changing of pulleys, belts, dampers or adding dampers or access holes.

3.04 BALANCE AND PERFORMANCE DATA REPORT [TD]:

A. General: Each heating, ventilating and air conditioning system shall be operated and tested continuously for at least two consecutive days to verify that the system is operating satisfactorily and safely and that all equipment is producing the required capacity. To be successful, this test must be conducted with all controls in automatic position and all lights on or off to simulate day time or night time use of the building. Submit two typewritten copies of reports covering air and water system balance and performance. Reports must be received by the Architect-Engineer at least one week prior to the Contractor's request for a substantial completion inspection. Reports that contain deficiencies related to incomplete or improper system installation will be rejected by the Engineer without further review.

B. Calibration Data: The report shall include a list of all instrumentation used and the date of the most recent calibration for each instrument.

C. Balance Data: The following balance data shall be provided. Design and actual water and air flows shall be provided in tabular form.
   1. All Air Handling and Air Conditioning Equipment Used for Heating, Cooling and Ventilating:
      a. System nomenclature and identification.
      b. Nameplate information: Manufacturer, model and serial number, horsepower, rpm, voltage, phase, maximum amperage.
      c. Fan speed.
      d. Static pressure profile – reading between all components and total external static pressure.
      e. Outside, return, and supply air quantities.
      f. Actual running motor amperage.
      g. For all VAV units, provide location of downstream static pressure sensor, set point (if applicable), and reading.
      h. For all VAV units, provide VFD speed setting (Hz) at both minimum and maximum flow (at final balanced condition).
      i. Final fan operating point plotted on appropriate fan curve.
   2. Fans:
      a. System nomenclature and identification.
      b. Nameplate information: Manufacturer, model and serial number, horsepower, rpm, voltage, phase, maximum amperage.
      c. Fan speed.
      d. Total external static pressure.
      e. Air quantity.
      f. Actual running motor amperage.
      g. Final fan operating point plotted on appropriate fan curve.
   3. Air Outlet and Inlet:
      a. Room identification.
      b. Manufacturer.
      c. Size.
      d. Free area factor.
      e. Air quantity.
      f. Velocity.
   4. Kitchen Hoods:
      a. Nameplate information: Manufacturer, model and serial number.
      b. Total exhaust airflow, total supply airflow (where applicable).
      c. Hood face velocities.

D. Performance Data: The following information shall be recorded twice each day and twice each night during the performance test. Reading shall be taken for each item at a different time each succeeding day at least two hours later than the time the reading was taken on the preceding day.
   1. All Air Handling and Air Conditioning Equipment Used for Heating, Cooling and Ventilating (except for unit heaters, VAV boxes, and cabinet unit heaters):

a. System nomenclature and identification.
b. Dry bulb and wet bulb temperatures entering and leaving all coils.
c. Water flow through all coils.
d. Water temperatures entering and leaving all coils.
e. Water pressure drop through all coils.
f. (Test all electric heating coils for operation of low airflow interlock.)

2. Heat pumps:
   a. System nomenclature and identification.
   b. Nameplate information: Manufacturer, model and serial number.
   c. Dry bulb and wet bulb temperatures entering and leaving indoor and outdoor coils.
3. Domestic water heater:
   a. Nameplate information: Manufacturer, model and serial number.
   b. Boiler water flow.
   c. Boiler water temperatures entering and leaving heat exchanger.
   d. Storage tank temperature and setpoint.
4. Space Pressurization:
   a. Measure and record space pressurization in corridor served by each major air handling unit.
   b. Coordinate with Controls Contactor for fan speed adjustments to achieve space pressurization setpoint of 0.05” w.c. (adjustable).
5. Temperature: Each Room in Building. Temperature measurements shall be taken with the Contractor’s calibrated equipment. Trended data from the temperature control system is not acceptable.

E. Control Setting: During the performance and balance tests, control settings may require adjustment, and if so, shall be adjusted to produce the best balanced system operation. The final setting of each operating and safety control shall be recorded. This shall include, but not be limited to, thermostats, limit controls, damper position switches, firestats, freezestats, humidistats, aquastats and other similar items.

3.05 HVAC SYSTEMS FINAL TESTS:

A. Upon completion of the work, in accordance with these drawings and specifications, the Contractor shall make a final test in the presence of the Architect-Engineer. With all equipment energized and all controls in automatic position, the systems and equipment specified herein shall be proven to operate safely and to heat and cool the structure uniformly. If not, adjustments and corrections shall be made until satisfactory operation is achieved.

3.06 HVAC SYSTEM POST ACCEPTANCE TESTS:

A. Should completion of the building occur at such time that the required performance test must be conducted and test data recorded and submitted during a season when both heating and cooling system performance cannot be checked, the Contractor shall perform the tests and record all such data as is available with system operating automatically under the prevailing weather conditions. That part of the system portion which cannot be recorded because of the prevailing weather shall be delayed until the weather is appropriate at which time the remaining part of the required tests shall be conducted and data recorded accordingly. Portions of the tests may not be delayed without written consent of the Engineer.

END OF SECTION

SECTION 23 07 00

HVAC INSULATION

PART 1 - GENERAL

1.01 SUMMARY

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. Piping Insulation
2. Ductwork Insulation
3. Equipment Insulation

C. Related Sections:

1. Section 23 00 10 – HVAC General Requirements
2. Section 23 05 00 – Common Work Results for HVAC
3. Section 23 20 00 – HVAC Piping and Pumps
4. Section 23 30 00 – HVAC Air Distribution
5. Section 23 80 00 – Decentralized HVAC Equipment

1.02 SUBMITTALS:

A. Submit shop drawings in accordance with Division 1 and Section 23 00 10.

B. Submit shop drawings and catalog data for each type of material proposed for this project. Indicate thickness of material for individual services, and installation methods.

1.03 REFERENCES:

A. General: The following standards or codes (latest edition) form a part of this specification to the extent indicated by the reference thereto.

B. American Society for Testing and Materials (ASTM):

ASTM E 84 Standard Test Method for Surface Burning Characteristics of Building materials.

ASTM C 411 Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation

C. National Fire Protection Association (NFPA):

Standard 255 Method of Test of Surface Burning Characteristics of Building Materials

D. Underwriters Laboratories, Inc. (UL)

Standard 723 Tests for Surface Burning Characteristics of Building Materials

PART 2 - PRODUCTS:

2.01 GENERAL

A. Acceptable Manufacturers:

1. Manville, Owens Corning, Armstrong, IMCOA, Knauff or Certain-Teed except where specific manufacturer is named.

B. All insulation materials, jackets and fitting covers shall have a composite flame spread rating not exceeding 25, and a smoke developed rating not exceeding 50 as tested under procedure ASTM E-84-75, NFPA 255 and UL 723. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411.

2.02 MATERIALS

A. Piping:
   1. Cold Water (0°-95°F): Fine heavy density fibrous glass or rigid phenolic foam insulation with factory applied foil-scrim-white kraft paper vapor barrier jacket, molded to conform to piping, 0.24 btu•in./sq.ft./°F/hr. maximum “K” value at 75° F.
   2. Hot Water (100°-225°F): Fine heavy density fibrous glass, rigid phenolic foam or calcium silicate insulation with general purpose jacket, molded to conform to piping, 0.25 btu•in./sq.ft./°F/hr. maximum “K” value at 75°F.
   3. Hot Water (100°-225°F), Steam and Steam Condensate: Fine heavy density fibrous glass or calcium silicate insulation with general purpose jacket molded to conform to piping, 0.30 btu•in./sq.ft./°F/hr. maximum “K” value at 200°F (mean).
   4. (Cold Water), Refrigerant, and Interior Condensate Drain Piping: Closed cell flexible elastomeric insulation, 0.28 btu•in./sq.ft./°F/hr maximum “K” value at 75°F for thicknesses 1.5” and greater, and 0.25 btu•in./sq.ft./°F/hr maximum “K” value at 75°F for thicknesses 1” and less. Maximum water vapor transmission rating of 0.08 perms-inch for thicknesses 1.5” and greater and 0.05 perms-inch for thicknesses 1” and less. Insulation located outside the building shall have a selective finish to protect insulation from ultra violet (UV) solar radiation, unless specifically designed to withstand UV radiation. All piping exposed to view in finished spaces shall be provided with coating suitable for painting or tinting to match surroundings. (Insulation on underground and underfloor piping shall be closed cell polyolefin, 1” thick, with water vapor transmission rating of 0 perms-inch.)

B. Ductwork:
   1. Exposed Rectangular Ducts: Rigid fibrous glass insulation, 3.0 lb. density, 0.24 btu•in./sq.ft./°F/hr. maximum “K” value at 75°F, with factory applied reinforced aluminum foil vapor barrier. (Insulation to be exposed in public, finished areas shall have factory applied reinforced white Kraft all service jacket for painting.)
   2. Grease Duct: Refer to Specification Section 23 30 00.
   3. Dryer Vents concealed above ceilings: Wrap shall be Firemaster DryerWrap as manufactured by Morgan Thermal Ceramics or equivalent by 3M or Unifrax. Wrap shall be ½ inch thick, 8 PCF, and shall be listed and labeled by UL in accordance with ASTM E84 and E814.
   4. Round Ducts, Flat Oval Ducts and Concealed Rectangular Ducts: Flexible fibrous glass insulation, 1.0 lb. density, 0.27 btu•in./sq.ft./°F/hr. maximum “K” value at 75°F, with factory applied reinforced aluminum foil vapor barrier.
   5. Acoustic Lining (where indicated and/or noted on Drawings): Fiberglass insulation, 0.26 btu•in./sq.ft./°F/hr. maximum “K” value at 75°F, absolute roughness of exposed surface shall not exceed 0.005 ft., coated to prevent erosion at air velocities up to 2000 fpm, 1.5 lbs/cu.ft. minimum density. Noise reduction co-efficient shall average not less than 0.60 when tested by Acoustical Material Association procedure mounting 6. Liner shall be provided with EPA approved biocide in the erosion coating to protect against microbial growth. Liner shall meet or exceed requirements of ASTM G21 (fungi resistance) and ASTM G22 (bacterial resistance). Acoustic lining shall be one inch thick unless specifically noted otherwise.
   6. Acoustic Lining (where indicated and/or noted on Drawings): NBR/PVC-based closed cell flexible elastomeric insulation, similar to K-Flex Duct Liner Gray, 0.25 btu•in./sq.ft./°F/hr. maximum “K” value at 75°F, suitable for use at air velocities up to 4,000 fpm, 3.0 lbs/cu.ft. minimum density. Noise reduction co-efficient shall average not less than 0.55 when tested in accordance with ASTM C423. Liner shall have a water vapor permeability of less than 0.06 perm-in when tested in accordance with ASTM E96, and shall meet or exceed the requirements of UL 181, ASTM G21, and ASTM C1338 for mildew and fungi resistance. Acoustic lining shall be one inch thick unless specifically noted otherwise.

C. Duct and Equipment lagging [S] shall by Kinetics KNM mass-loaded. Limp, vinyl barrier material and shall consist of a single layer of loaded vinyl noise barrier. The loaded vinyl noise barrier shall have a density of 1.0 PSF or 2.0 PSF, as noted on the Drawings, and a thickness of .10 inches for 1 PSF type and .20

inches for 2 PSF type. STC rating shall be 26 or greater for 1 PSF type and 31 for 2 PSF type. All materials shall be suitable for installation in a plenum.

D. Hot and Cold Equipment: Rigid fibrous glass insulation molded or fitted to conform to equipment, 0.24 btu•in./sq.ft./°F/hr. maximum “K” value at 75°F.

E. Sealants, Mastics and Adhesives: Products either manufactured by or recommended by the insulation material manufacturer.

PART 3 - EXECUTION:

3.01 PREPARATION

A. Do not install insulation before piping(, medium/high pressure ductwork) and equipment have been tested and approved.

B. Ensure surface is clean and dry prior to installation. Ensure insulation material is undamaged and dry before application. Finish with system at operating conditions and temperature.

3.02 INSTALLATION

A. General: Ensure insulation is continuous through inside walls and partitions. Insulated piping passing through (smoke barriers,) smoke partitions, fire walls, fire partitions, and fire rated floors shall have insulation of type, thickness and density to match U.L. Through-Penetration Firestop Systems as specified in Section 23 00 10 under Sleeves and Inserts. Insulated piping passing through nonfireresistance rated floors shall be fireblocked as specified in Section 23 00 10 under Sleeves and Inserts. Insulated ducts passing through smoke partitions and fire rated assemblies where a fire damper is not required shall be insulated with calcium silicate for a length equal to twice the thickness of the wall with all voids between the sleeve and duct insulation tightly packed with mineral-wool insulation or U.L. approved packing with sealant. All penetrations through equipment room walls and other areas of noise or heat generation shall be tightly sealed with mineral fiber rope. Finish insulation neatly at hangers, supports and other protrusions.

B. Piping:

1. General:
   a. All pipe insulation (except refrigerant piping) shall be secured with outward clinching stainless steel staples and sealer.
   b. All fittings and valves shall be insulated and jacketed with the same material as the adjacent piping or it may be finished with a smooth coat of approved insulating cement and jacketed with an approved recovering cloth and vapor sealed. Where PVC fitting covers are used, insulation shall be wrapped tightly using sufficient quantities to prevent deformation of covers.

OR

   c. Use mitered segments of insulation on elbows and oversized insulation on valves and tees coated with two coats of vapor barrier mastic, reinforced with glass fabric extending two inches onto adjacent pipes, and same diameter as adjoining covering. No plastic materials on fittings will be allowed.
   d. Mitering of straight pipe insulation to form elbows will not be acceptable or allowed.
   e. All jacket joints and seams shall be lapped not less than 2”.
   f. Insulation exposed to weather (and insulation exposed to abuse in finished spaces) shall be covered with minimum 0.016 aluminum jacket with all joints sealed weather-tight.
   g. Insulation at pipe hangers shall include H-Block Pipe Support insulation as manufactured by ICA Insulation. Supports shall be pre-formed sections of molded fiberglass, minimum 12” long, quantity as suggested by the manufacturer for a given pipe size. Insulation shall be ASTM E84 25/50 rated and shall have a service

temperature rating of -120°F to +1000°F. Supports shall have a minimum density of 18 lb. cu./ft. and a maximum “k” value of .30. Pipe hangers shall be oversized to enclose pipe and insulation. Provide sheet metal saddle between hanger and insulated pipe. Supports shall be placed between the bottom of the pipe to be supported and the metal shield. On pipe sizes above 5" IPS, supports should be oriented along the bottom 60° arc of the system. The thickness of the support should be the same thickness as the insulation system. For pipes smaller than 1.5”, supports may be metal saddles only.

h. (Insulation at pipe hangers for exterior condenser water shall be calcium silicate in preformed sections 12” long enclosing pipe around entire circumference. Pipe hangers shall be oversized to enclose pipe and insulation. Provide sheet metal saddle between hanger and insulated pipe.)

i. (Insulation at pipe hangers shall be Insuguard Pipe Saddle by Armacell. Supports shall be minimum 12” in length and constructed from a polypropylene copolymer. Support shall be UV resistant and have a service range of -40°F to 178°F. The surface shall be non-adhesive to allow for linear expansion of thermal insulation. Entire support shall be UL-723 and ASTM E84 classified. Saddle shall come complete with top cover, similar to Insucover by Armacell, constructed of the same materials as the saddle, to provide a full 360°F of coverage. Elastomeric and other foam insulations shall be installed without stretching or compressing individual lengths. Where new pipe insulation is installed, new supports shall also be provided.)

j. Elastomeric and other foam insulations shall be installed without stretching or compressing individual lengths.

k. (Jacket all exposed insulated piping, fittings and equipment with 8 oz. Canvas jacket pasted on smoothly with Foster 95-90 adhesive and the entire outer surface shall receive one flooding brush coat of Foster 81-42 fire retardant white coating.)

2. Cold Piping:
   a. Insulation shall be terminated one inch each side of unions and flanges. Larger size removable sections of insulation shall be secured over the flange or union and lapped over the pipe insulation not less than 3” each side of pipe insulation termination point.
   b. All joints, voids and punctures in jacket and all exposed edges of insulation material shall be vapor sealed.
3. Hot Piping:
   a. Insulation shall be terminated neatly at unions, flanges, and valves. All exposed edges of insulation materials shall be sealed.
   b. All unions and flanges shall be insulated per MICA Plate 2-135.
   c. All valves shall be insulated per MICA Plate 2-130, 2-530, or 2-135.
   d. Where heating coils are located downstream from cooling coils and at variable air volume units, piping shall be insulated continuously up to the coil. Insulation shall be vapor sealed and installed as specified for cold piping for a distance of 5 feet from the coil.
4. Refrigerant Piping: Cover all valves and fittings with equivalent thickness of insulating material. All edges shall be tightly butted. Seal all joints vapor tight.

C. Ductwork:
1. External:
   a. Rigid duct insulation shall be secured to rectangular ducts with mechanical fasteners such as metal stick clips or cupped head weld pins located a maximum of 3” from each edge and spaced a maximum of 12” on center each way. All insulation joints shall be tightly butted. All joints, voids and punctures in facing shall be sealed vapor tight with pressure sensitive foil tape and mastic.
   b. Flexible duct insulation shall be provided with a minimum 2” facing flap overlapping adjacent and connecting insulation. Seams shall be stapled approximately 6” on center with ½” outward clinching staples. Where rectangular ducts are 24” in width or greater, insulation shall be secured to the bottom of the duct with mechanical

fasteners to prevent sagging. All insulation joints shall be tightly butted. All joints, voids and punctures in facing shall be sealed vapor tight with mastic.

2. Internal: The lining shall be applied to cut-to-size pieces fastened to the entire interior of the duct with mastic, stick clips and speed washers. Edges and joints shall be coated with fire resistant mastic. External duct insulation is not required on ducts with internal lining unless noted otherwise. Where elastomeric lining is used, mechanical fasteners shall be used in addition to the adhesive in accordance with SMACNA guidelines. (External duct insulation shall be provided on all ducts with, or without internal lining in unheated attic spaces and where exposed to outside conditions.)
3. Ductwork exposed to outside conditions shall be insulated as specified herein and covered with minimum .025 inch thick aluminum jacket with seams lapped a minimum 3", sealed with silicon caulk. Covers shall be neatly finished and completely watertight.
4. Where duct mounted heating coils are located downstream from cooling coils and at variable air volume terminal units the coil shall be provided with vapor-sealed external duct insulation on sides, top and bottom.
5. Where ductwork is indicated to have internal acoustic lining, sheet metal drops to diffuser and register necks shall be unlined and shall be externally insulated.
6. The top of all diffusers shall be insulated to cover the entire top surface area, including flex duct transitions, and vapor sealed
7. (See Section 23 30 00 for insulation on kitchen exhaust ducts.)

D. Hot Equipment: Apply insulation with edges tightly butted, joints staggered and secured in place by steel bands not over 12" on center. Provide sufficient clearance around openings for normal operation of equipment. Finish with two 1/2" thick coats of insulating cement over chicken wire. Second coat shall be mixed 2 to 1 by weight with Portland cement and troweled smooth.

E. Boiler Breeching: Insulation shall be similar to that specified for Hot Equipment except insulation shall be held away from breeching at least one inch with angles, welded studs or clips.

F. Cold Equipment: Insulation shall be secured in place with 16 gauge annealed tie wire, finish with 1/2" thick coat of insulating cement and vapor barrier mastic applied over entire body.

G. Chilled Water Pumps: Install .040 aluminum enclosure with all seams and joints soldered watertight and lined with 2-inch thick rigid fiberglass insulation board and spring latches. Enclosure shall be fabricated and installed to facilitate removal for servicing pump and components. As an alternate, custom fit insulating blankets, similar to those manufactured by Fit Tight Covers, may be utilized.

H. (Damaged Insulation: All existing thermal coverings that are removed or damaged during construction shall be replaced or repaired to not less than original condition. Repaired sections shall provide equal or better thermal performance and vapor protection.)

I. (Patching: Where existing control, monitoring or other penetrating devices are removed from ductwork or piping, the insulation shall be patched to match thickness, type and finish of existing insulation.)

J. (Where existing insulation has been removed under the scope of asbestos removal, insulation shall be replaced as indicated for new work. Refer to the drawings for the extent of the existing piping to be reinsulated.)

3.03 INSULATION THICKNESS SCHEDULE

A. Piping:

Type	Size, Inches	Insulation Thickness, Inches
Chilled water	1" and Under	1
	1-1/2"	1-1/2

	2” and Over	2
Ice System Water	All	1-1/2
Condenser Water (Exposed to Outside)	All	1-1/2
Heating Water	1-1/4” and Under	1-1/2
	1-1/2” and Over	2
	*Runouts 1” and Under	1
Steam & Condensate Return	1-1/4” and Under	2-1/2
	1-1/2”	3
	2” and Over	4
Refrigerant Suction	All	1
Heat Pump Refrigerant Liquid	All	1
Waste Lines Carrying Condensate from A/C Units, Ice Makers, etc.	All	1/2

*Runouts to individual terminal units less than 4 feet in length (between the control valve and coil for HVAC piping).

B. Ductwork:

Type	Insulation Thickness Inches, External
Outside Air Intake and Untempered Supply	2
Supply (Heating and Cooling)	1-1/2
Return (Equip. Room Only)	1-1/2
Plenums	1-1/2
Exhaust (Between MOD & Louver)	2
Supply & Return Exposed to Outside Air Conditions (& in Attic Space)	2

C. Hot Equipment:

Type	Insulation Thickness, Inches
Converters	2
Expansion Tanks	1
Hot Water Storage Tanks	2
Air Separator	1

D. Cold Equipment:

Type	Insulation Thickness, Inches
Chilled Water Pumps	2
Compression Tanks	1
Air Separator	1

END OF SECTION

SECTION 23 0800

COMMISSIONING OF HVAC

PART 1 - GENERAL

1.01 SUMMARY

A. Related Documents: Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. Coordination and Cooperation with Commissioning Agent and participation in the commissioning process indicated in Section 019113.
2. Providing for commissioning work in the project construction schedule.
3. Commissioning work shall be a team effort to ensure that all mechanical equipment and systems have been completely and properly installed, function together correctly to meet the design intent, and document system performance parameters for fine-tuning of control sequences and operational procedures. Commissioning shall coordinate system documentation, equipment start-up, control system calibration, testing and balancing and performance testing.
4. The commissioning team shall be made, up of representatives from the owner, design professionals, major equipment suppliers, and construction trades. The trades represented on the commissioning team shall include, but not be limited to, sheet metal, piping and fitting, controls, test and balance, and electrical. The lead person for each trade who will actually perform or supervise the work is to be designated as the representative to the commissioning team.

C. Related Sections:

1. Section 23 00 10 – HVAC General Requirements
2. Section 23 05 00 – Common Work Results for HVAC
3. Section 23 05 53 – Identification for HVAC Piping and Equipment
4. Section 23 05 93 – Testing, Adjusting, and Balancing for HVAC
5. Section 23 09 00 – Instrumentation and Control for HVAC
6. Section 23 20 00 – HVAC Piping and Pumps
7. Section 23 30 00 – HVAC Air Distribution
8. Section 23 80 00 – Decentralized HVAC Equipment
9. Section 24 00 10 – Commissioning Requirements of HVAC Systems

1.02 SUBMITTAL DATA:

A. Require all equipment suppliers to provide data required by the Commissioning Agent of type and in quantities as indicated in Section 24 00 10.

1.03 CONTRACTOR RESPONSIBILITIES:

A. General: Division 23 contractor responsibilities shall include active participation in the commissioning process as defined in Section 24 00 10 to facilitate successful completion of the contract. Ensuring all subcontractors and equipment suppliers cooperate in the Commissioning process. The Contractor shall coordinate with the Commissioning Agent to produce complete, operating systems, properly adjusted and tuned for comfortable operation and optimum efficiency.

B. Commissioning is primarily the responsibility of the Commissioning Agent indicated in Section 24 00 10, with support for start-up, testing, and support for commissioning, the responsibility of Division 23 contractor. The commissioning process does not relieve Division 23 contractor from participation in the process or diminish the role and obligations of Division 23 contractor to complete all portions of the work in a satisfactory and fully operational manner. In general, Division 23 is to perform all check-outs, start-ups, testing, adjusting and balancing with the

Commissioning Agent witnessing all tests and performing verification tests as follow-up. The Commissioning Agent will also serve as an additional reviewer of all equipment and material installations for compliance with the Contract.

C. Division 23 contractor shall be an active member of the Commissioning Team composed of representatives from the Owner, Architect/Engineer, Contractor, contractor's trades and major equipment suppliers.

D. See Section 24 00 10 for additional Division 23 responsibilities.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.01 Division 23 Commissioning Responsibilities:

A. Identify a Division 23 Contractor's representative to the Commissioning team within one month after award of Contract. The representative shall have authority to make decisions on behalf of the Contractor.

B. Participate in Commissioning Meetings designated by the Commissioning Agent.

C. Performance verification tests shall be conducted as appropriate during cooling season and during heating season. Provide qualified personnel for participation in commissioning tests including seasonal testing required after initial commissioning.

D. Provide qualified personnel from each trade for participation in commissioning meetings as designated by the meeting agenda.

E. Participate in resolving issues identified by the Commissioning Agent.

F. Correct identified deficiencies to fulfill contract and warranty requirements.

G. Provide copies of all Contract documentation to the Commissioning Agent.

H. Participate in Owner Training as set up by the Commissioning Agent.

I. Inspect, check and confirm the correct and complete installation of all equipment in accordance with verification checklists as provided by, or as approved by the Commissioning Agent. Contractor's standard quality control verification checklists may be used, however minimum requirements shall be as indicated under Section 24 00 10, system Verification Checklists. Copies of all Contractor's completed, signed verification checklists shall be furnished to the Commissioning Agent.

J. Notify Commissioning Agent a minimum of 2 weeks in advance of scheduled equipment and system verifications and start-ups. See Section 24 00 10 for listing of systems and subsystems to be evaluated by the Commissioning Agent in the commissioning process.

K. Notify Commissioning Agent a minimum of 2 weeks in advance of start-up of Testing, Adjusting and Balancing (TAB) work. Arrange and attend meeting between Commissioning Agent and TAB agency for review of TAB procedures, TAB work plan and TAB schedule.

L. Notify Commissioning Agent a minimum of 2 weeks in advance of controls work of Section 23 09 00 for the following procedures:

1. Point-to-point wiring check-out,
2. Owner verification of controls graphics, setpoints and alarms,
3. System start-up and check-out,
4. Initial system tuning,
5. Owner training.

M. Correct all construction and equipment deficiencies found during the commissioning process where in accordance with the Contract. Where any correction, improvement or change is

outside of the Contract, as agreed by the Commissioning Team, prepare and submit a contract change proposal for the work in a timely manner. The Owner may elect to accept, reject or negotiate such contract change proposals.

END OF SECTION

SECTION 23 0900

INSTRUMENTATION AND CONTROL FOR HVAC

PART 1 - GENERAL

1.01 SUMMARY

A. Related Documents: Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections apply to this Section.

B. Work Included:

1. Complete System of Automatic Controls
2. Electric Appurtenances
3. Direct Digital Controls (DDC)
4. (Pneumatic Actuation)

C. Related Sections:

1. Division 01 -- Commissioning
2. Section 23 00 10 – HVAC General Requirements
3. Section 23 05 00 – Common Work Results for HVAC
4. Section 23 05 53 – Identification for HVAC Piping and Equipment
5. Section 23 05 93 – Testing, Adjusting, and Balancing for HVAC
6. Section 23 09 93 – Sequence of Operations for HVAC Controls
7. Section 23 20 00 – HVAC Piping and Pumps
8. Section 23 30 00 – HVAC Air Distribution
9. Section 23 80 00 – Decentralized HVAC Equipment
10. Division 26 – Electrical
11. Division 27 – Electrical

1.02 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Division 1 and Section 23 00 10.

B. Provide complete shop drawings, catalog data sheets and such other data necessary to fully describe and substantiate compliance with these specifications for all control items and systems included in this section.

C. Shop drawings shall indicate the exact location(s) of the outdoor temperature sensor(s).

D. Operation and maintenance data shall be submitted in accordance with Division 1, for all items of equipment and materials indicated in this Section.

E. Application Software Documentation: Contractor shall provide a blueprint documentation of the software application program for each stand-alone digital controller. Documentation shall include block software flowchart showing the interconnection between each of the control algorithms and sequences. A program listing shall be printed on the same blueprint, along with the program flowchart, and description of the sequence of operation. This blueprint shall be stored and maintained in each stand-alone digital controller. System acceptance shall not be completed until this documentation is provided and located in each panel.

F. Control System Diagrams – Provide schematic diagrams for each controlled system. Illustrate the relationship between control system and controlled equipment. Show all control elements.

G. Contractor shall provide the Owner with all engineering software/modules, passwords, documentation, communications cords, product engineering documentation, as-built/submittal drawing documentation, and Owner training on operation and maintenance of the control system at the time that the job is turned over and operational. Documentation shall include network architecture with all controllers identified in architecture, point list identifying the termination and function of point to each controller, and a brief sequence of operation. Warranty

of all control work will begin when job is complete and communicating with the Owner's BAS network, not when the structure or space becomes occupied.

1.03 QUALITY ASSURANCE:

A. System Integrator Qualifications
   1. The HVAC Control System shall be furnished, engineered, and installed by licensed Controls Contractor or System Integrator (SI). All work provided under this section shall be provided by direct employees of the SI or under the direct supervision of the SI personnel.
   2. The SI must be regularly engaged in the installation of Niagara Framework based systems as specified herein. The SI shall have a minimum of 5 years experience in the sales, installation, engineering, programming, servicing and commissioning of BAS.
   3. The SI must be an authorized factory direct representative in good standing of the manufacturer of the proposed hardware and software components.
   4. The SI shall have an office that is staffed with a minimum of 4 technicians who have successfully completed the factory authorized training of the proposed manufacturers hardware and software components and have successfully completed a Niagara Framework approved course. SI must provide proof of required training. The SI capabilities shall include engineering and design of controls systems, programming, electrical installation of control systems, trouble shooting and service.
   5. The SI shall submit a list of no less than three (3) similar projects, which have similar Building Automation Systems as specified herein installed by the SI. These projects must be on-line and functional such that the Owner's/User's representative can observe the system in full operation.

B. When all temperature controls have been installed, the temperature control contractor shall completely commission the system to verify that all systems and components are operating in accordance with the specifications. Where corrections or adjustments to the controlled equipment are required, the temperature control contractor shall document such changes to the Contractor and recheck the control system once the changes have been made.
   1. All equipment and subsystems shall be operated through all specified modes of control and sequences of operation, including full load and part load conditions.
   2. All physical valve and damper positions shall be visually verified to correspond with the positions indicated by the controls software.
   3. All instrumentation shall be properly calibrated.

C. Final point-to-point check-out and commissioning of the Temperature Control System shall be by the temperature control manufacturer or its exclusive authorized representative.

D. At the completion of this project, the Contractor shall submit a letter to the Engineer stating that all controls have been installed as specified, that each system has been calibrated and that each system is operating in a safe and efficient manner. Included with the letter, the Contractor shall provide a printout of all status control and monitoring points for a 48-hour period at 4-hour intervals, one printout of each type of report available, and a copy of the completed start-up checklist used by the technician during system verification.

E. Communication gateways are prohibited, except for on-board controllers/cards that are standard options of packaged equipment such as boilers, boiler draft controllers, etc.

F. All software tools needed for full functional use, including programming/configuration of controllers, network management and expansion, and graphical user interface use and development, of the BAS described within these specifications shall be provided to the Owner or his designated agent. Any licensing required by the manufacturer now and into the future, including changes to the licensee of the software tools and the addition of hardware corresponding to the licenses, to allow for a complete operational system for both normal day-to-day operation and servicing shall be provided. Any such changes to the designated license holders shall be made by the manufacturer upon written request from the Owner or their agent.

G. The Owner shall be named license holder of all software associated with any and all work on the project. In addition, the Owner shall receive ownership of all job specific configuration documentation, data files, and application-level software developed for the project. This shall include all custom, job specific software code, database and documentation for all configuration and programming that is generated for a given project and/or configured for use with the NAC, PEC or CC controllers, and any related LAN/WAN/Intranet and Internet connected routers, switches or other devices. Any and all required ID's and passwords for access to any component shall be provided to the Owner.

H. The SI shall provide a minimum 5-year Tridium software maintenance agreement (SMA) with the license under this section.

I. All contractor-provided controllers must be BACnet-based. All BACnet devices shall be BTL (BACnet Testing Laboratory) certified, no exceptions.

J. The Niagara 4 network backbone shall be configured with a Niagara 4 configuration tool, with a fully open license.

1.04 SCOPE OF WORK:

A. Furnish and install complete direct digital temperature control systems (DDC). The DDC system shall consist of one or more programmable BACnet DDC controllers communicating over a BACnet Network to the Network Area Controller. All programming of the programmable BACnet Controllers and the Network Area Controller shall be provided by the contractor.

B. Furnish new hydronic system control valves and damper actuators for installation by the Mechanical Contractor as indicated.

C. Provide programmable equipment controllers and configurable controllers including all required sensors, transmitters, switches and related field control interface wiring as indicated on the drawings.

D. Provide all programming, checkout and graphics generation to fully integrate the mechanical equipment into the Owner's Facility Management System. Graphical User Interface programming shall conform to the following:

1. Graphical User Interface programming shall reside in and be served from the Network Area Controller. Programming shall not be contained in or dependent upon a remote server.
2. Program a Graphical User Interface (GUI) web page (screen) on the Network Area Controller for the replacement mechanical equipment/systems. In addition to all data being graphically depicted on the mechanical equipment's schematic diagram on the GUI screen, each point of data shall also include a clear English language description adjacent to its graphical depiction.
3. Graphical User Interface web page shall depict as a minimum:
4. All hardware inputs/outputs associated with each piece of mechanical equipment.
5. All adjustable setpoints associated with the equipment's sequence of operation.
6. Access to any relevant schedule, programs, trends associated with each piece of mechanical equipment.

E. The direct digital control system shall be comprised of a network of various independent, stand-alone digital controllers, together with Centralized Control Stations, and Centralized Host Stations as specified to provide centralized access and facility wide control functions. The stand-alone digital controllers shall be interconnected in a communicating network to provide facility wide access and sharing of information. A Local Area Network (LAN) shall be provided to interconnect the stand-alone digital controllers for high-speed data transmission within the building.

1. The Temperature Controls Subcontractor shall provide technical support for the Testing and Balancing Subcontractor. The technicians shall be fully qualified in all aspects of the system and shall have extensive knowledge of the project. Support shall include, but not be limited to the following:
   a. Assistance in determining hydronic and air systems pressure setpoints.

b. Assistance in determining proper automatic damper positions for all air handling units, air conditioning units, and VAV units.
c. Simulating conditions as necessary for proper and optimized testing and balancing of the air and hydronic systems

F. Programming shall be provided in accordance with commonly accepted industry standards and practices to ensure proper and efficient control of all equipment and systems. Where ASDC's with factory programming are not capable of operating systems in the sequence described herein, the Contractor shall provide a digital controller with custom programming.

G. Programming shall be provided to accomplish the sequence of operations as described in Section 23 09 93. Changes to the operational sequences shall be made only with written approval from the Engineer.

H. Graphical transitions from page to page will be through an on the page button system. All graphical pages will have a button that references the Main Floor Plan page, Section of Floor Plan page that the equipment space temperature is displayed on and the graphical page of the equipment that serves that piece of equipment being displayed. I.e., a VAV box graphic should have a transfer button for the Main Floor Plan, the Section of Floor Plan that its space temperature is displayed on and the RTU/AHU that supplies its primary air. Chilled Water transfer buttons will be provided on all Floor Plan pages, RTU/AHU pages and each other respectively. A Nav Tree driven system is not acceptable primary transfer option. It can be used as a secondary/backup to the button transfer system.

I. The Main graphic of the building will be representative of the actual floor plan. It is preferred for the space temperatures of all equipment to be displayed on the Main graphic along with the button transfers. The space temperature will also be a transfer button to that respective piece of equipment's graphic. If the amount of data is to great for the main page to accommodate. The Main graphic can be used as a graphics representation of the building's layout that also provides transfers to appropriate sections of floor plans. Each floor plan section will depict the respective space temperature for the areas they serve, the space temperatures will also be transfer buttons to the respective equipment graphic, and the buttons necessary to transfer to the major equipment relevant to the section of floor plan.

J. Electrical Coordination:
1. BAS Contractor shall coordinate the location of all control panels with Division 26 and 27. All power circuits and communication network/devices necessary for the control panels shall be provided within the Contract.
2. Power wiring indicated (device and circuit designation indicated) on the drawings shall be provided under Division 26.
3. The BAS manufacturer shall be responsible for coordinating the required voltage for all motor operated dampers associated with fans. The damper actuator shall match the voltage of the associated fan for all fans.
4. The BAS manufacturer shall be responsible for power wiring not indicated (device or circuit designation not indicated) on the Drawings. It shall be the BAS contractor's responsibility to review the Contract Documents to determine the extent of power wiring included in Division 26 and to provide additional power wiring as required. Work shall be in accordance with Division 26 specifications and all local, state and national codes and ordinances.
5. The BAS manufacturer shall be responsible for data cabling not indicated (device not indicated) on the Drawings. It shall be the BAS contractor's responsibility to review the Contract Documents to determine the extent of data cabling included in Division 27 and to provide additional data cabling as required. Work shall be in accordance with Division 27 specifications and all local, state and national codes and ordinances.
6. Where the contractor performing work under this section requires an additional circuit for power wiring to a device or panel under section above, an RFI shall be issued requesting approval to use an available circuit in the nearest panel. Once approval is granted, all wiring and conduit from the breaker to the device or panel shall be provided under this section of the specifications.

7. Where the contractor performing work under this section requires an additional communication network\device under section above, an RFI shall be issued requesting approval to use an available opening in the nearest switch. Once approval is granted, all cabling and conduit from the switch to the device shall be provided under this section of the specifications.

1.05 COMMISSIONING OF HVAC SYSTEMS:

A. Refer to Division 1 for work of Commissioning Agent and coordination with work of Division 23.

B. Notify Commissioning Agent a minimum of two weeks in advance of controls work for the following procedures:
   1. Point-to-point wiring check-out,
   2. Owner verification of controls graphics, setpoints, and alarms,
   3. System start-up and check-out,
   4. Initial system tuning,
   5. Owner training.

C. Provide all trending of all points as requested by the Engineer and Commissioning Agent, and as required to demonstrate changing system operation.

D. When all temperature controls have been installed, the temperature control contractor shall completely commission the system to verify that all systems and components are operating in accordance with the specifications. Where corrections or adjustments to the controlled equipment are required, the temperature control contractor shall document such changes to the Contractor, and recheck the control system once the changes have been made.

E. All equipment and subsystems shall be operated through all specified modes of control and sequences of operation, including full load and part load conditions.

F. All physical valve and damper positions shall be visually verified to correspond with the positions indicated by the controls software.

G. All instrumentation shall be properly calibrated.

H. Final point-to-point check-out and commissioning of the Temperature Control System shall be by the temperature control manufacturer or its exclusive authorized representative.

I. At the completion of this project, the Contractor shall submit a letter to the Engineer stating that all controls have been installed as specified, that each system has been calibrated and that each system is operating in a safe and efficient manner. Included with the letter, the Contractor shall provide a printout of all status control and monitoring points for a 48-hour period at 4-hour intervals, one printout of each type report available, and a copy of the completed start-up checklist used by the technician during system verification.

1.06 SPARE PARTS:

A. Provide spare controllers of the following types and quantities:
   1. Air Handlers – one (1) of each type controller
   2. VAV Controllers – two (2)
   3. Fan Powered VAV Controllers – ten (10)
   4. Fan Coil Units – one (1)
   5. Damper Actuators – one (1) of each size/type
   6. Valve Actuators – one (1) of each size/type)

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. The Network Area Controller(s) for this project shall be Tridium JACE(s) utilizing the Niagara 4 framework. No equals shall be accepted for the network area controller or its software. Local

programmable DDC controllers, whether application specific (such as terminal unit controllers) or programmable, shall be BACnet utilizing ASHRAE 135 protocol. Distech Controls is the only acceptable manufacturer of the local DDC controllers and other electric/electronic actuation and controls required for this project. The BAS installation contractor must have at least two Niagara 4 Certified Engineers on staff.

B. Installation shall be by qualified employees or its local authorized representative. Technicians performing the programming, checkout and graphical screen generation of the Network Area Controller(s) and centralized host station shall be Tridium Niagara 4 certified. Certificates of completion of the Niagara 4 Framework Certification Program for Technicians who will perform this work shall be submitted to the Engineer.

2.02 SYSTEM REQUIREMENTS:

A. The system shall be a complete system of automatic temperature regulation of the DDC type with electric and electronic accessories and components as indicated. (The system shall be backwards-compatible with the Owner's existing operating and control systems.)

B. The software shall not require any licensing fees or annual fees. The host must be able to support a minimum of 50 simultaneous users with the ability to expand the system to accommodate an unlimited number of users.

C. All control items except thermostats, sensors and transmitters located in rooms shall be properly identified with engraved plastic nameplates permanently attached.

D. Room thermostat, sensor and transmitter locations shall be coordinated to align vertically or horizontally with adjacent light switches or control instruments. Room thermostats and sensors with setpoint adjustment shall be mounted with bottom 4'-0" above the floor. Room thermostats and sensors without setpoint adjustment shall be mounted with bottom 5'-4" above the floor.

E. All components and materials shall be UL or ASTM rated for use in air plenums.

F. The use of multiplexed inputs is prohibited. Each physical input may not have physical device attached. The use of resistor ladders or other circuits to connect multiple devices to the same input will not be allowed.

2.03 MATERIALS:

A. Sensors, Transmitters and Thermostats:
   1. Temperature sensors for the Direct Digital Control (DDC) System shall be precision RTD's or thermistor. Accuracy shall be plus or minus 1 degree F over the entire control range. Sensors for pipe applications shall be immersion type, provided with pipe well. Sensors for duct application shall be of the averaging type, with a 5 foot or a 22 foot length element. Duct element length shall be adequate to serpentine across the entire duct area. Where sensors are located downstream of fans or at least 10 duct diameters downstream of coils, elbows, junctions, or dampers, single point sensors may be used. Outdoor temperature sensors shall be provided with sunshield of copper or painted aluminum on a northern exposure. Space temperature sensors shall be compatible with unit controller and shall be provided in a decorative metal or plastic enclosure. Sensors located in gymnasiums or multi-purpose rooms shall be provided with heavy-duty wire guards. (Sensors located in public spaces such as corridors and public toilets shall be recessed type with flush mounted stainless steel blanking cover.) (Space sensors shall be provided with set-point adjustment) (and override switch/button.) (Where wireless space sensors are used, battery life shall be 7.5 years or greater with lithium batteries. Sensors shall be provided with lithium batteries.)
   2. Differential pressure transmitters for measuring duct system pressures, shall have an approximate range of no greater than two times the maximum operating pressures of the duct system.
   3. Differential pressure sensors for measuring space static pressure relative to outside static pressure shall have a range of -0.1 to 0.1" w.c. and an accuracy of +1%. The low port shall

be connected to an outside air static sensing probe, such as a Dwyer A-306, designed to mitigate the effects of wind. The high port shall be connected to a tube terminating through the ceiling into the occupied space.

4. Differential pressure transmitters for measuring hydronic system differential pressure shall be Alerton WPR2 or Senva PW30 dual remote sensor type. Each sensor shall be based on a ceramic capacitive sensing element with ¼"-18NPT male fittings. Unit shall be complete with a 5 year warranty.
5. Humidity sensors shall provide a range of 0-100% relative humidity and an accuracy of plus or minus 2% RH from 0 to 93.8% RH at 25 degrees Celsius. Accuracy shall be plus or minus 1% RH within 10% RH of the user setpoint. Operating temperatures shall be from -40 degrees Fahrenheit to +176 degrees Fahrenheit. The unit shall not be damaged when exposed to 100% relative humidity.
6. High temperature thermostat for detection of excessive temperature in the duct shall be U.L. listed, manual reset type with an adjustable temperature setting. Set at 136°F.
7. Low temperature thermostat for detection of low temperature in the duct shall be manual reset type with 20' temperature sensitive element, located downstream from the coil. If any portion of the element senses a temperature below its setting, the contacts shall break. Set at 35°F. Units shall be double pole for connection to the fan starter circuit and for monitoring by the DDC.
8. Electric thermostats shall be line voltage type complete with auto-off switch. The thermostat shall be rated for 6 amps at 120 volts.
9. Remote bulb electric thermostats shall be equipped with a liquid-filled capillary tube 8' long. The electrical rating shall be 10 amps at 120 volts.
10. Surface-mounted aquastats shall have adjustable set point and 10° differential. Contacts shall be rated 10 amps at 120 volts.
11. Sensors mounted in walk-in freezers and coolers shall be BAPI thermobuffer type, model BA/*-TB. Sensors shall be installed in a fluid filled chamber to eliminate temperature spikes. Sensor shall be stainless steel type, 0.4°F accuracy, with a 4" long glycol filled chamber. Glycol shall be the same as specified hereinafter.
12. Flow switches for water shall be McDonnell Miller.
13. Garage door position switches shall be Honeywell 959 XTP Overhead Door Contact. Contact shall permanently affix to both the door and the floor. Contacts shall have a rating of 100mA at 28VDC and use a Form A, SPST, normally closed internal reed switch. Contact shall be rated for use between -40°F and 194°F.
14. Carbon dioxide sensors shall be auto-calibration type with LCD display. Units shall utilize non-dispersive infrared (NDIR) and shall have a range of 0-2000 ppm CO2. Units shall have accuracy of ±3%. Operating range shall be 32°F to 122°F. Outputs shall be 0-10 VDC or 4-20 mA. Unit housings shall be suitable for installation in return air plenums (where applicable) and shall have a standard one (1) year element warranty with lifetime warranty on calibration.
15. Space mounted combination carbon dioxide/relative humidity/temperature sensors. Where the drawings indicate multiple space sensors at a single location, a combination sensor shall be used. The combination sensor shall provide the functions matching the sensor annotations on the drawings. Operating range shall be 32°F to 122°F. Outputs shall be 0-10 VDC or 4-20 mA. Unit shall be provided with a one (1) year warranty.
    a. Temperature accuracy shall be + 1 degree. Sensors shall be provided with set-point adjustment and override switch/button.
    b. Carbon dioxide sensing (where indicated) shall be auto-calibration type with utilizing non-dispersive infrared (NDIR) with gold-plated optical chamber. Range shall be 0-2000 ppm CO2. Units shall have accuracy of ±3%. Field replaceable carbon dioxide element shall be provided with a lifetime warranty on calibration.
    c. Humidity sensors (where indicated) shall provide a range of 10-90% relative humidity and an accuracy of plus or minus 2% RH with an operating range of 0 to 100% RH at 25 degrees Celsius. Field replaceable relative humidity element shall be provided with a one (1) year warranty.

d. (Where wireless space sensors are used, battery life shall be 7.5 years or greater with lithium batteries. Sensors shall be provided with lithium batteries.)

16. Current relays shall be Hawkeye H608 Series or approved equal. Units shall be self-induced powered, solid state electronic with status and power LED's and binary output. Units shall be automatically self adjusting to detect loss-of-load and under current conditions (broken belt, etc.) with a range of 3 to 135 amps. Units shall be suitable for use with variable frequency drives, automatically compensating for changes in frequency and voltage. Operating range shall be 5°F to 185°F. Units shall have a limited five (5) year warranty. Where relays are used on ECM fans less than 1 hp, they shall be Senva ECMSet Pro series or approved equal and have a trip adjustment range of .03 to .50 amps and an amperage range of 0 to 50 amps.
17. Airflow measuring stations
    a. The manufacturer shall have a minimum of ten years experience producing products of this type. Provide products by Ebtron Inc. Alternative manufacturers may be submitted as a substitution in accordance with Division 1 specification requirements. Superior performance or lower cost to the owner must be provided. Acceptance shall be at the sole discretion of the Engineer. In addition to other required warranties provide 3 years on parts from the date of unit shipment. Unless otherwise noted Ebtron model numbers shall be as follows:
        1) Model GTx116-PC for ducts and plenums.
        2) Model GTx116-F for fan inlet applications.
    b. Measurement devices shall consist of one or more sensor probe assemblies and a single, remotely mounted, microprocessor-based transmitter. Each sensor probe assembly shall contain one or more independently wired sensor housings. The airflow and temperature readings, calculated for each sensor housing, shall be equally weighted and averaged by the transmitter prior to output. Pitot tubes and arrays are not acceptable. Vortex shedding flow meters are not acceptable. The measuring device shall be UL listed as an entire assembly.
    c. The number of sensor housings provided for ducts and plenums shall be as follows:

Area (Sq. Ft.)	Sensors
<2	4
2 to <4	6
4 to <8	8
8 to <16	12
>16	16

    d. The transmitter shall have a 16 character alpha-numeric display capable of displaying airflow, temperature, system status, configuration settings and diagnostics. Configuration settings and diagnostics shall be accessed through a pushbutton interface on the main circuit board. Airflow shall be field configurable to be displayed as a velocity or a volumetric rate. Transmitter shall:
        1) Independently monitor and average up to 16 individual airflow and temperature readings.
        2) Displaying the airflow and temperature readings of individual sensors on the LCD display.
        3) Have a power switch and operate on 24 VAC (isolation not required), and use a switching power supply fused and protected from transients and power surges.
        4) Have operating temperature range of -20° F to 120° F and be protected from weather and water.
        5) Communicate with the BAS using one of the following options:
            a) Fuse protected and isolated linear field selectable 0- 10VDC and 4-20mA (4-wire) analog output signal.
            b) RS-485: Field selectable BACnet-MS/TP, ModBus-RTU.
            c) Base-T Ethernet: Field selectable BACnet Ethernet, BACnet-IP, ModBus TCP and TCP/IP
            d) LonWorks Free Topology

e. The manufacturer's authorized representative shall review and approve placement and operating airflow rates for each measurement location indicated. A written report shall be submitted to the architect should any measurement location not meet the manufacturer's placement requirements.

18. Water Flow Sensor/Transmitter
    a. The flow sensor shall be an insertion type with a non-magnetic, spinning impeller (paddle wheel) as the only moving part. The sensor sleeve will be brass with the sensor housing being glass-filled PPS. The impeller shall be glass-filled nylon or Tefzel® with a UHMWPE or Tefzel® sleeve bearing. The shaft material shall be tungsten carbide. The flow sensor shall be supplied with a 2" full bore gate valve in brass and a nipple threaded for a 2" NPT connection. A bleed valve and three ethylene-polypropylene O-Rings shall be supplied with the 2" NPT adapter portion of the sensor. A removable installation tool shall be attachable to the sensor for insertion or removal of the flow sensor from the pipe. The sensor will have all electronics epoxy-sealed with a 2-conductor, shielded cable extending out through a ½" conduit connection on the top of the sensor. Insertion of the sensor into any pipe size shall be a fixed 1 ½" depth from the inside wall to the end of the sensor housing. The sensor shall operate in line pressures up to 200 psi and liquid temperatures up to 220° F, and operate in flows of 1 foot per second to 30 feet per second in pipes of 3" diameter up to 40" diameter with linearity of ± 1% and repeatability of ± 1%. This sensor shall be equal to Data Industrial Model 225. The detachable installation tool shall be Model HTT.
    b. The analog flow transmitter shall be a loop powered device capable of transmitting a linear 4 - 20 mA signal proportional to frequency. The unit shall be microprocessor controlled with no switches or potentiometers to set. The transmitter shall meet ISA Class L, H and U non-isolated requirements. All circuitry shall be encapsulated in a 3.65" by 1.50" low profile epoxy body to meet MIL spec M.1-146058C type AR, for humidity, moisture and fungus resistance. Operating range shall be 32° F to 158°F. All programming, including flow sensor selection, pipe size, flow range setting, response time and filtering shall be set digitally via a computer using Windows based software with a programming kit (disk and cable). The transmitter shall be easily programmed in the field using a lap top computer. The transmitter shall have a ground lug to maximize EMI protection when necessary. The transmitter may be mounted directly on any Data Industrial 200 Series insertion flow sensor or up to 500 feet remotely from the sensor, on a DIN Rail, as a panel mount or in a weather proof or NEMA 4X enclosure. The analog transmitter shall be equal to Data Industrial Model 310-00.
    c. Flow meters for the measurement of water associated with the HVAC system (including domestic water makeup to HVAC) shall be Onicon F-1000 series or equal. Provide inline style (F-1134 or F-1101) for all pipes 1" and less, Single Turbine insertion style for pipe 1.25" to 2" (F-1100), and Dual Turbine (F-1200) shall be provided for all pipes 2.5" and greater. Unit shall come complete with D-100 Flow display, or equal, to allow local indication of flow. Provide all accessories required for tie-in to BAS system specified, including any required transmitters, data acquisition devices, and programming.
    d. Flow meters for the measurement of domestic water shall be Sensus Omni C2 Series or Badger Meter Recordall Compound Series Meter. Meters shall consist of a combination of an AWWA Class II turbine meter for measuring high rates of flow and a nutating disc type positive displacement by-pass meter for measuring low rates of flow. An automatic valve shall direct flows through the disc meter at low flow rates and through the turbine meter at high flow rates. At high flow rates, the automatic valve shall also serve to restrict the flow through the disc meter to minimize wear. Meters shall comply with the lead-free requirements as defined by the 2014 provisions of the Safe Drinking Water Act which changes the definition of lead-free from the current 8.0% to not more than a weighted average of 0.25% lead when used with respect to the wetted surfaces of pipes, pipe fittings, plumbing fittings, and fixtures. A strainer shall be provided for the disc meter. It shall be easily removable and have an effective

straining area of at least double the disc meter inlet. Provide all accessories required for tie-in to BAS system specified, including any required AMI/AMR encoders, transmitters, data acquisition devices, and programming.

19. Gas Flow Meters:
    a. Flow meters for the measurement of gas shall be Onicon F-5500 series or equal. Unit shall be inline (1-1/4" or less) or insertion type (1-1/2" and larger) and utilize direct digital control sensing circuitry to measure thermal mass flow. Ambient temperature range shall be -40°F to 158°F, and shall have a maximum pressure drop of 0.5" W.C. (H2O) in 1-1/2" diameter pipe. Full line size flow conditioner shall be provided upstream of all sensors. Unit shall be provided with both a 4-20mA analog output and a RS485 BACnet MS/TP interface. All wetted components shall be 316 stainless steel.

B. Valves shall be sized by the control manufacturer and shall have threaded connections except valves over 2" which shall have flanged connections. Valve packing shall be U-cup silicone or reinforced Teflon except where indicated. Maximum allowable pressure drop shall be 5 psi for water valves and 60% of inlet steam pressure for steam valves. All valves shall be equipped with positive positioners where indicated.
    1. DDC valve actuators shall be electronic, low voltage modulating type, hydraulic or gear train, with spring return. Actuators shall be sized to provide smooth and positive operation and tight shutoff against full design system pressure. Valves for VAV boxes shall be drive-open, drive-closed type.
    2. (Control valves for the (chilled water) (and) (heating water) system(s) shall be pressure independent actuated ball valves with ultrasonic flow sensor. Basis of design is Belimo ePIV. Actuator provided by controls contractor. Valve shall be sized to allow the maximum flow of the coil being served at a 5 psi pressure differential.)
    3. (Control valves shall bronze globe valve with stainless steel trim, pneumatic actuator with low pressure pilot positioner, proportional, spring return to closed position at steam converter and chilled water cooling coil, and spring return to open position at hot water heating coils. Actuators shall be sized to provide smooth and positive operation and tight shutoff against full design system pressure.)
    4. Valves for steam or heating water service shall be normally open type. Valves for cooling water service shall be normally closed type. Valve bodies 2" and smaller shall be bronze or high grade red brass in sizes 1/2" through 2". Valve bodies 2-1/2" and larger shall be iron.
    5. All modulating valves shall have a minimum rangeability of 25 to 1. Steam control valves shall have linear flow characteristics and water valves shall be equal percentage type. All modulating valves 4" and below shall be globe type. Modulating valves larger than 4" shall be butterfly type. (Modulating valves 2" and smaller may be ball type.)
    6. All valves shall have stainless steel stems with replaceable packing, stem, seats and disk (,ball) or plug.
    7. The pressure characteristics of all valves shall be the same or better than the piping in which installed and shall be suitable for the design system pressures indicated. Valve bodies shall have minimum ratings of 125 psig water service (and 30 psig steam service) unless noted otherwise.
    8. Cooling tower diverting (hot water heating reset mixing) valve shall be Continental, Fisher, or accepted equal, water butterfly valve. Valves and electric (pneumatic) actuator shall be factory mounted and linked on a cast iron "T" ready for installation in the condenser water line.

C. Dampers and Damper Motors:
    1. Control dampers shall be Ruskin Model CD36 low leakage type manufactured specifically to control the air flow in heating, ventilating and air conditioning systems. Frames shall be made of galvanized sheet steel, formed into channels and riveted. In addition to the rigid frame construction, corner brackets shall be used to maintain alignment of the damper. Blades shall consist of formed galvanized sheets, formed for extra strength to withstand high velocities and static pressures. Square or hex blade pins shall be furnished to assure non-slip pivoting of the blades when a damper is used as a single module or is

interconnected with others. Motor operated dampers shall be Class 1A with maximum leakage rate of 4 cfm/ft2 at 1.0 inch water gauge when tested in accordance with AMCA 500D. Maximum blade width shall be 8".

2. Damper actuators shall be provided for all automatic dampers. Damper actuators controlled from the DDC shall be electronic (pneumatic) modulating type, low voltage, spring return and shall be of sufficient capacity to operate the connected damper. Outside air and relief air damper actuators shall be spring return normally closed. Line voltage motors shall be two-position type.

D. Transformers are required for low voltage control items. Control manufacturer shall provide transformers with adequate capacity to operate connected equipment.

E. (Panels: Control cabinets shall be furnished for each a.c. unit, major equipment components and elsewhere as indicated. Control cabinets shall be fabricated of extruded aluminum or steel. The cabinets shall have a face panel for flush mounting gauges, switches, pilot lights, etc. and sub-panel for mounting controllers, relays, etc. Controls which require manual positioning or visual indication shall be flush mounted and identified with engraved nameplates on the face panel. Controls which are required to be accessible only for maintenance and calibration are to be mounted on the sub-panel in the cabinet. Each item shall be identified by engraved nameplates.)

F. Miscellaneous relays, transformers, switches and other devices shall be provided as required for the sequence of control indicated. Relays shall be located adjacent to the controlled device such as motor or motor starter. Relays may be located within starters and equipment control panels where space is available and where approved by NEC. Relays outside of the controlled device shall be provided with NEMA enclosure suitable for location where installed.

G. Disconnect Switches shall be provided for each 120V power connection to Stand-Alone Digital Controllers, Application-Specific Digital Controllers and all other electronic devices provided under this Section.

H. Uninterruptible power supply (UPS) with power conditioning shall be provided for each Building Network Controller and Stand-Alone Digital Controller. UPS power shall be capable of providing a minimum of 15 minutes backup power.

I. Direct Digital Control System:
   1. The Network Area Controller shall be a Tridium JACE (or JACES as required) utilizing the most current release Niagara 4 Framework. No "equals" shall be accepted.
   2. Interoperable BACnet Controller (IBC):
      a. Controls shall be microprocessor based Interoperable BACnet Controllers (IBC) in accordance with the ANSI/ASHRAE Standard 135-2004. The application control program shall be resident within the same enclosure as the input/output circuitry, which translates the sensor signals. The system supplier must provide a PICS document showing the installed systems compliance level to the ANSI/ASHRAE Standard 135-2004, to the Engineer.
      b. The IBCs shall communicate with the NAC via an Ethernet connection at a baud rate of not less than 10Mbps or via the RS485 connection at a baud rate of not less than 38 Kbps.
      c. The IBC sensor shall connect directly to the IBC and shall not utilize any of the I/O points of the controller. The IBC Sensor shall provide a two-wire connection to the controller that is polarity and wire type insensitive. The IBC Sensor shall provide a communications jack for the connection to the BACnet communication trunk to which the IBC controller is connected. The IBC Sensor, the connected controller, and all other devices on the BACnet bus shall be accessible by the POT.
      d. All IBCs shall be fully application programmable and shall at all times maintain their BACnet Level 3 compliance. Controllers offering application selection only (non-programmable), require a 10% spare point capacity to be provided for all applications.

All control sequences within or programmed into the IBC shall be stored in non-volatile memory, which is not dependent upon the presence of a battery, to be retained.

e. The Controls Contractor supplying the IBC's shall provide documentation for each device, with the following information at a minimum:
   1) BACnet Device; MAC address, name, type and instance number
   2) BACnet objects; name, type and instance number

3. Network Area Controller:
   a. The network area controller (NAC) shall provide the supervisory control functions over the control devices connected to the NAC. It shall be capable of executing application control programs to provide: calendar functions, scheduling, trending, alarm monitoring and routing, time synchronization, integration of BACnet controller data, network management functions for all BACnet based devices.
   b. The NAC shall support standard web browser access via the intranet/internet. It shall support a minimum of 16 simultaneous users.
   c. The NAC shall provide alarm recognition, storage; routing, management, and analysis to supplement distributed capabilities of equipment or application specific controllers.
   d. The NAC shall be able to route any alarm condition to any defined user location whether connected to a local network or remote via dial-up, telephone connection, or wide-area network.
   e. Alarm generation shall be selectable for annunciation type and acknowledgement requirements including but limited to: to alarm, return to normal, to fault.
   f. Provide for the creation of an unlimited number of alarm classes for the purpose of routing types and or classes of alarms, i.e.: security, HVAC, fire, etc.
   g. Provide timed (schedule) routing of alarms by class, object, group, or node.
   h. Provide alarm generation from binary object "runtime" and /or event counts for equipment maintenance. The user shall be able to reset runtime or event count values with appropriate password control.
   i. Alarms shall be annunciated in any of the following manners as user defined: screen message text, email of the complete alarm message to multiple recipients.
   j. Provide the ability to route and email alarms based on: day of week, time of day, recipient.
   k. Pagers via paging services that initiate a page on receipt of email message.
   l. Graphic with flashing alarm object(s).
   m. Printed message, routed directly to a dedicated alarm printer.
   n. The following shall be recorded by the NAC for each alarm (at a minimum): time and date, location (building, floor, zone, office number, etc.), equipment (air handler #, accessway, etc.), acknowledge time, date, and user who issued acknowledgement.
   o. Defined users shall be given proper access to acknowledge any alarm, or specific types or classes of alarms defined by the user.
   p. A log of all alarms shall be maintained by the NAC and/or a server (if configured in the system) and shall be available for review by the user.
   q. Provide a "query" feature to allow review of specific alarms by user defined parameters.
   r. A separate log for system alerts (controller failures, network failures, etc.) shall be provided and available for review by the user.
   s. An error log to record invalid property changes or commands shall be provided and available for review by the user.

4. Graphical User Interface (GUI) Software:
   a. Operator workstations must be capable of supporting any BACnet compliant product. The operator shall not be able to distinguish the DDC points from different manufacturers when commanding, monitoring points or acknowledging alarms.
   b. The software shall provide a multi-tasking type environment that allows the user to run several applications simultaneously. The GUI software shall run on a Windows 10 64-bit operating system. The operator shall be able to work in Microsoft Word, Excel, and other Windows based software packages, while concurrently annunciating on-line FMCS alarms and monitoring information. If the software is unable to display several

different types of displays at the same time, the FMCS contractor shall provide at least two operator workstations at each location specified.

c. Color-graphic operator interface: Color-graphic interface shall be driven by software allowing the operator to access any system information via a "system penetration" method. "System penetration" shall allow the operator to begin at an entire site plan color-graphic display and progressively select portions of the site plan to be chosen for closer inspection or selection of a more detailed color-graphic display of a desired portion of the facility. The operator shall be able in this manner to "penetrate" to any desired system information without being required to enter any commands via the keyboard.

d. Dynamic color graphic displays: color graphic floor plan displays and system schematics for each piece of mechanical equipment including air handling units, chilled water systems, hot water systems shall be provided to optimize system performance analysis and speed alarm recognition. All mark numbers for equipment, controller and sensor designations shall exactly match those indicated on the contract drawings. All building and floor plan graphic conceptuals shall be approved by the owner prior to creation of screen graphics. Colorgraphic display shall include, but not be limited to: the real-time value display of any connected point in the network of stand-alone digital controllers, the alarm status condition of any desired system alarm point, any software parameter such as setpoints for control sequences, minimum position adjustments, or throttling ranges.

e. Graphic screens shall have the capability to contain objects for text, real-time values, animation, color spectrum objects, logs, and graphs. Html or xml document links, schedule objects, hyperlinks to other URL’s, and links to other graphic screens.

f. Graphics shall support layering and each graphic object shall be configurable for assignment to a layer. A minimum of six layers shall be supported.

g. Modifying common application objects, such as schedules, calendars, and set points shall be accomplished in a graphical manner.

h. Schedule times will be adjusted using a graphical slider, without requiring any keyboard entry from the operator.

i. Holidays shall be set by using a graphical calendar, without requiring any keyboard entry from the operator.

j. Commands to start and stop binary objects shall be done by mouse command from the pop-up menu. No entry of text shall be required.

k. Adjustments to analog objects, such as set points, shall be done by mouse command using a graphical slider to adjust the value. No entry of text shall be required.

l. System configuration. At a minimum, the GUI shall permit the operator to perform the following tasks, with proper password access: create, delete or modify control strategies, add/delete objects to the system, tune control loops through the adjustment of control loop parameters, enable or disable control strategies, generate hard copy records or control strategies on a printer, select points to be alarmable and define the alarm state, select points to be trended over a period of time and initiate the recording of values automatically.

m. On-line help. Provide a context sensitive, on-line help system to assist the operator in operation and editing of the system. On-line help shall be available for all applications and shall provide the relevant data for that particular screen. Additional help information shall be available through the use of hypertext. All system documentation and help files shall be in html format.

n. Security. Each operator shall be required to log on to that system with a user name and password in order to view, edit, add, or delete data. System security shall be selectable for each operator. The system administrator shall have the ability to set passwords and security levels for all other operators. Each operator password shall be able to restrict the operators’ access for viewing and/or changing each system application, full screen editor, and object. Each operator shall automatically be logged off of the system if no keyboard or mouse activity is detected. This auto log-off time

shall be set per operator password. All system security data shall be stored in an encrypted format.

5. Web Browser Clients:
   a. The system shall be capable of supporting an unlimited number of clients using a standard web browser such as Microsoft Edge, Google Chrome, or Mozilla Firefox. Systems requiring additional software (to enable a standard web browser) to be resident on the client machine, or manufacture-specific browsers shall not be acceptable.
   b. The web browser software shall run on any operating system and system configuration that is supported by the web browser. Web page access and control shall be from system network area controllers, not from the workstation. This prevents the problem of no access to web pages if the workstation is turned off.
   c. The web browser shall provide the same view of the system, in terms of graphics, schedules, calendars, logs, etc., and provide the same interface methodology as is provided by the graphical user interface. Systems that require different views or that require different means of interacting with objects such as schedules, or logs, shall not be permitted. The browser shall include background refresh software to all real-time updates without use of a refresh button. No additional software shall be required at the remote internet location other than a standard web browser.
   d. The web browser client shall support at a minimum, the following functions: user log-on identification and password shall be required. If an unauthorized user attempts access, a blank web page shall be displayed. Security using encryption techniques to prevent unauthorized access shall be implemented.
   e. Graphical screens developed for the GUI shall be the same screens used for the web browser client. Any animated graphical objects supported by the GUI shall be supported by the web browser interface.
   f. Html programming shall not be required to display system graphics or data on a web page. Html editing of the web page shall be allowed if the user desires a specific look or format.
   g. Storage of the graphical screens shall be in the network area controller (NAC), without requiring any graphics to be stored on the client machine. Systems that require graphics storage on each client are not acceptable.
   h. Real-time values displayed on a web page shall update automatically without requiring a manual “refresh” of the web page.
   i. Users shall have administrator-defined access privileges. Depending on the access privileges assigned, the user shall be able to perform the following:
      1) Modify common application objects, such as schedules, calendars, and set points in a graphical manner. Schedule times will be adjusted using a graphical slider, without requiring any keyboard entry from the operator. Holidays shall be set by using a graphical calendar, without requiring any keyboard entry from the operator.
      2) Commands to start and stop binary objects shall be done by right-clicking the selected object and selecting the appropriate command from the pop-up menu. No entry of text shall be required.
      3) View logs and charts.
      4) View and acknowledge alarms.
   j. The system shall provide the capability to specify a user’s (as determined by the log-on user identification) home page. Provide the ability to limit a specific user to just their defined home page. From the home page, links to other views, or pages in the system shall be possible, if allowed by the system administrator.
   k. Graphic screens on the web browser client shall support hypertext links to other locations on the internet or on intranet sites, by specifying the uniform resource locator (URL) for the desired link.
6. Programmable Equipment Controllers (PEC):
   a. Programmable Equipment Controllers (PEC’s) shall be stand-alone, multi-tasking, real-time digital control processors.

b. The PEC must communicate peer-to-peer with the all of the network configurable and programmable controllers sharing alarming and scheduling information.
c. Programming of the PEC shall be accomplished by using graphical software that incorporates drag and drop capabilities. The PEC software database must be able to execute all of the specified mechanical system controls functions. The programming software shall be able to bundle software logic to simplify control sequencing. All values, which make up the PID output value, shall be readable and modifiable at a workstation or portable service tool. Each input, output, or calculation result shall be capable of being shared/bound with any controller or interface device on the network.
d. PEC's shall be able to execute custom, job-specific processes defined by the user, to automatically perform calculations and special control routines.
    1) A single process shall be able to incorporate measured or calculated data from and all other PEC's on the network. In addition, a single process shall be able to issue commands to points in any and all other PEC's or Configurable Controllers (CC) on the BACnet network.
    2) Process shall be able to generate operator message and advisories to operator I/O devices.
e. Each PEC shall support firmware upgrades without the need to replace hardware.
f. Each PEC shall continuously perform self-diagnostics, which include communication diagnosis and diagnosis of all components.
g. In the event of the loss of normal power, there shall be an orderly shutdown of all PEC's to prevent the loss of database or operating system software. Non-volatile memory shall be incorporated for all critical controller configuration data and battery backup shall be provided to support the real-time clock and all volatile memory for a minimum of 72 hours.
    1) Upon restoration of normal power, the PEC shall automatically resume full operation without manual intervention.
    2) All PEC's control programming and databases must be stored in Flash memory, therefore eliminating data loss, downtime and re-load time.
    3) Provide a separate PEC for each major piece of HVAC equipment or system such as chiller plants, air handlers, etc. All system points shall reside on a single controller.

7. Configurable Controllers (CC):
    a. Each Configurable Controller (CC) shall operate as a stand-alone BACnet compliant controller capable of performing its specified control responsibilities independent of other controllers in the network. Each CC shall be a minimum 16-BIT microprocessor based, multi-tasking, multi-user, real time digital control processor.
    b. Flash memory reloads or updating of an existing control algorithm shall be completed over the network.
    c. Network access shall be accomplished at the CC room sensor of the CC. Where applicable; system wide node access shall be available from connecting to the room sensor jack. Systems that do not have a system access jack from the room sensor shall provide a dedicated network jack next to each room sensor.
    d. Controllers shall include all inputs and outputs necessary to perform the specified control sequences. Analog and digital outputs shall be industry standard signals such as 0-10V and 3-point floating control allowing for interface to a variety of industry standard modulating actuators. The CC inputs shall consist of industry standards types such as 10K thermistor, 0-10V, 4-20mA and DI. Inputs shall be electrically isolated from outputs, communications and power. All inputs shall be provided with an auto-calibrate function to eliminate sensing errors.
    e. Each CC shall support firmware upgrades without the need to replace hardware. All controller sequences and operation shall provide closed loop control of the intended application. Closing control loops over the network in not acceptable.
    f. The CC must be mounted remotely from the room sensor. CC's that are wall mounted with integral room sensors are not acceptable.

g. The control program shall reside in the CC. The application program configuration information shall be stored in non-volatile memory with no battery backup.
h. After a power failure the CC must run the control application using the current setpoints and configuration. Reverting to default or factory setpoints are not acceptable.
i. The CC design must support pre-wiring of the hardware components where the electronics are not exposed to the harsh construction phase environment.
j. The CC design must also support an integrated controller/actuator design for the VAV/CV zone level installations where the controller processing and I/O are contained within a single 3point floating actuator housing.
k. Programmable Communicating Thermostat (PCT). Must be available with and without scheduling configuration directly at the thermostat, through the usage of a concealed button or via the network. Must contain two digital inputs, and, depending on the model up to three remote sensor inputs must be available. All models with scheduler must contain a SPST auxiliary switch, which can be used to control lighting or disable the economizer function. The PCT must be capable of communication via native BACnet.

8. Unitary Control Interfaces:
   a. Where unitary controls of packaged equipment are capable of communicating with the specified control system, they may be integrated into the network in lieu of Stand-Alone Digital Controllers, but only if the unitary controller is provided with full software interface documentation. All specified functions and monitoring points shall be provided as specified in the Drawings and/or sequence of operations. Where required control points, monitoring points and full software interface documentation are not provided as part of the unitary controls, DDC control and monitoring shall be provided.
9. Portable Operator Interface (Laptop or Notebook Computer): Provide one portable operator interface for the Owner's use in on-site analysis and control of stand-alone units and network. Unit shall operate on batteries as well as AC line voltage, and shall provide minimum 15.6-inch WLED display with 1920 x 1080 resolution. Unit shall be provided with the latest version of Windows 11 Professional™ operating system, Intel Core i5 processor at 2.2 GHZ or higher, minimum 1.0 TB SATA hard drive, 8 GB of DDR3L SDRAM memory, Ethernet card capable of 10/100/1000 megabits, and an 802.11ax compatible wireless LAN card. Unit shall provide a full size typewriter-style keyboard, with a minimum of eight programmable function keys and thumb pad. Unit shall be provided with a data communications cable for direct connection to the stand-alone control unit or network. Interface ports shall support RJ-11, RJ-45, RS-232, RS-485, or all types as required to interface with specified controllers.
   a. Unit shall have a never expiring fully license copy of all software that is needed to communicate to any control equipment provided for this project. All cables and interface devices that are required to provide communication shall also be provided. Software that does not have a never expiring license will provide a minimum of 5 years of software license and upgrade plan coverage. Niagara 4 workbench shall have the capability to communicate with a minimum of twenty (20) Jace 4 NAC's simultaneously.

J. Control Panels shall be a fully electronic analog control or digital control system, providing all control functions for the equipment specified to be controlled from that panel. Each control panel shall serve one or more equipment systems. Multiple control panels serving a single piece of equipment are prohibited. Each control point shall serve a single, distinct input or output. Control functions to be performed by control panels are as described hereinafter in the sequences of operation and on the drawings. Each panel shall service one or more equipment systems.

K. All signals between the DDC control panel and the monitored or controlled devices shall be low voltage (less than 100 volts).

L. Sensing of temperature, humidity, differential pressure, and all other inputs shall be industry standard signals by one of the following types:

1. 0-20 mA
2. 4-20 mA
3. 0-5 VDC
4. 0-12 VDC
5. Resistance Signals

All inputs shall be compatible with the controllers used, and with the requirements for readout of variables.

M. On/Off Outputs: The control panel shall internally provide test points for the circuit driving the equipment contactor, for troubleshooting the low voltage circuit to the contactor. All relays or digital output modules shall provide a pilot light or LED display of this same status.

N. Modulating Outputs shall be industry standard 0-5 VDC, 0-12 VDC or Milliamp outputs of 0-20 mA or 4-20 mA, or drive open/drive closed type modulating outputs. Drive open/drive closed type controllers shall include sufficient components and control algorithms.

O. Standard Software Function Libraries: Complete libraries of control algorithms for DDC, Energy Management, and Facilities Management functions shall be resident for all stand-alone digital controllers and shall be drawn from for the creation of the application programming.

P. Energy Management Control: The network of stand-alone controllers shall individually perform Time of Day Scheduling, Optimum Start/Stop, Enthalpy Optimization, and all Control Optimization strategies, such as Supply Air Reset, and Soft Start Ramp-up, for their connected systems of equipment. Coordination of strategies involving multiple systems of equipment shall be performed by sharing of necessary data between the stand-alone controllers on the communicating network.

Q. Electric Demand Limiting Control: The stand-alone controllers shall have the capability to communicate and provide coordination for global electric demand limiting control. Demand limiting algorithm shall be resident within a selected stand-alone digital controller and shall issue load shed commands to the network for control of specific items of equipment. Demand limiting shall be sliding window demand control with a minimum of three user definable time of day demand limit setpoints. Multiple load shed tables shall be definable, and be shed for rotational or sequential restoration as appropriate for the loads within each designated shed table. The stand-alone digital controller to which electrical consumption meters may be installed shall provide for daily, and monthly formatted reports of metered electrical consumption. Reports shall be individually named and identified with a title line definable for each report, and shall provide information as detailed as hourly KWH consumption, daily peak hour of consumption, daily time of peak demand, demand setpoint in use at time of peak, daily degree days, and outside air temperature and relative humidity at time of peak. Reports shall be created to provide individual reporting as desired by the Owner for multiple facility meters, multiple sites, or aggregate facility metering combining multiple meters. System shall have capability to designate reports for automatic print, or call-up for report printout on demand, as well as upload to selected centralized host system for historically archiving.

R. Alarm Occurrence Status: Alarm condition reports shall provide a printout listing the status of specific items associated with the equipment generating the alarm. Report shall be routed to a specific printer or combination of printers at the Centralized Host Station or the on-site programming unit. Report shall record time and status information and allow operational personnel to use this information to diagnose the alarm situation.

S. Telecommunications Support: Each building network shall be provided with the necessary equipment, programming, and connections to communicate with remote host computers through one auto dial/auto answer modem and through an Ethernet connection to the Owner's LAN/WAN.

T. Remote Access and Notification: The system shall be installed such that access to the entire facility can be accomplished through both the modem and the Owner's LAN/WAN. The modem and Ethernet connection shall each be capable of providing the following functions:

1. Access to the entire facility control system by the Contractor to provide service and diagnostic support.
2. Access by the Owner from off-site for similar purposes, and for remote operation, monitoring, and adjustment of facility functions.
3. Notification of desired exceptions and alarms to multiple remote sites scheduled as necessary for business hours, or off-hours reporting.

U. Off Hours Exception Reporting shall provide the Owner a means of specifying up to two remote sites for which off hours exceptions shall be reported. Selection of the site to be connected shall be programmed by the Temperature Controls Subcontractor as directed by the Owner, and set to change automatically per time of day and day of week.

V. Generally, the stand-alone digital controller and control panel shall be located on or near the unit, which they control as indicated on the Drawings.

W. Lightning arrestors shall be provided on all wiring, which exists or enters the building. Arrestors shall be located adjacent to the protected equipment.

X. (Control tubing shall be run in a neat and workmanlike manner, of sufficient size, and fastened securely to the building structure. All tubing in finished spaces shall be run concealed. Where exposed in unfinished spaces, tubing shall be run either parallel to or at right angles to the building structure. The piping system shall be tested and made tight under a pressure of 30 psi and leakage shall not exceed 10 psi in 12 hours.

1. Tubing shall be hard drawn copper where exposed and hard or soft drawn copper tubing where concealed. Fittings shall be solder joint type except at final connection to apparatus where brass compression type fittings shall be used.
2. Tubing installed inside panels, unit enclosures and terminal runs to equipment of less than one foot in length shall be single tube type F.R. polyethylene.)

Y. (Current to Pneumatic Transducers:

1. Units shall convert a voltage or current signal from an electronic controller into a pneumatic output pressure signal. Units shall be two-pipe high volume type, with integral potentiometer for field span adjustment, zero adjustment screw and auto-manual switch with separate increase/decrease pushbuttons. Units shall be equipped with inline air filter and field mounting kit.)

Z. As a part of this contract the Temperature Control Subcontractor shall provide forty (twenty four) (sixteen) (eight) hours of classroom instruction in operation, programming and maintenance of the system to owners operating and maintenance personnel. Instructors shall be fully qualified in all aspects of the system. Training shall be scheduled as required by the owner and shall take place at an owner-designated location. Training shall be video recorded and provided to the Owner in DVD format.

PART 3 - EXECUTION

3.01 WORK BY OTHERS:

A. All line voltage wiring (101 volts or more) shall be furnished and installed as a part of Divisions 26 and 27.

B. All low voltage wiring (100 volts or below) shall be furnished and installed as an integral part of this section of the specification in strict accordance with Divisions 26 and 27. (Refer to Divisions 26 and 27 for special requirements of separation between Control and Instrumentation wiring from Communications/Data Cabling.)

C. All dampers, valves, immersion wells and pipe pressure tappings will be installed by the Mechanical Contractor.

D. All relays, firestats, sensors, annunciators, alarms, or other electrical devices not indicated to be installed by Divisions 26 and 27, shall be installed under Division 23. Coordinate with Divisions 26 and 27 for locations as necessary.

E. BAS Contractor shall coordinate the location of all control panels with Divisions 26 and 27. All power circuits and communication network/devices necessary for the control panels shall be provided within the Contract.

3.02 GENERAL SEQUENCE REQUIREMENTS:

A. Refer to Section 23 09 93 for Sequence of Operation for HVAC Controls.

B. Sequences of operation, flow diagrams, and points list are complementary. All control strategies shall be satisfied even if some of the required control points, alarm, or software have been inadvertently left off of the points list or flow diagram. Similarly, control points, alarm, and software strategies indicated on the points list shall be provided even if a written sequence or flow diagram device has been inadvertently omitted.

3.03 INTERFACE WITH PACKAGED UNITARY EQUIPMENT CONTROLLERS:

A. Where packaged equipment is indicated elsewhere within the Contract Documents to provide unitary control with BACNET or similar interface, the DDC shall communicate with and monitor the packaged controllers. Coordinate with available equipment protocols, BACNET MS/TP (or BACNET IP if approved by Owner). At a minimum, the DDC system shall:

1. Provide signals to the packaged controllers for occupancy and all setpoints necessary. Setpoints adjustment shall be available through the graphics interface. Occupancy scheduling shall be as indicated for equipment with DDC control.
2. Monitor all unit alarms and provide an alarm within the BAS of any alarm conditions within the unit. Alarm indications shall be specific to the type alarm occurring with the unit.
3. Monitor all points indicated within this section, all points indicated within the respective equipment specifications and all points shown on the controls schematic Drawings. Additional points shall include monitoring of actual unit percent capacity or stages of capacity where available. Where any control or data point is not provided within the equipment controls, the DDC shall provide the necessary input/output, sensor, etc. necessary for control or monitoring of that point.
4. Provide graphics displays for all packaged equipment to include: all points indicated within this section, all points indicated within the respective packaged equipment specifications, and all points shown on the controls schematic Drawings. The main graphics display for the respective unit shall include all points shown on the controls schematic Drawings. Any data available in excess of that indicated above shall be available outside the main graphics screen.

3.04 INTERFACE WITH VARIABLE FREQUENCY DRIVES

A. Where variable frequency drives are provided, the DDC shall communicate with and monitor the drive. Coordinate with available equipment protocols, BACNET MS/TP (or BACNET IP if approved by Owner). At a minimum, the DDC system shall:

1. Provide speed and start stop signals to the drive.
2. Monitor all unit alarms and provide an alarm within the BAS of any alarm conditions within the unit. Alarm indications shall be specific to the type alarm occurring with the unit.
3. Monitor all points indicated within this section, all points indicated within the respective equipment specifications and all points shown on the controls schematic Drawings.
4. Provide graphics displays for all drives to include: all points indicated within this section, all points indicated within the respective equipment specifications, and all points shown on the controls schematic Drawings. The main graphics display for the respective unit shall include all points shown on the controls schematic Drawings. Any data available in excess of that indicated above shall be available outside the main graphics screen.

3.05 SYSTEM MONITORING AND ALARM

A. The DDC shall provide an alarm for the following points as applicable to each unit, system, or piece of equipment. Where points occur in more than one unit or system, an alarm shall be provided for each system in which it occurs. The alarm indication shall be specific as to the

parameter that has either exceeded or fallen below limits or provides indication that the system is not operating as commanded. The alarm indication shall identify the system in which the alarm occurs. Limits for alarm indication shall be coordinated with the Owner's representative and shall not be so tight as to cause nuisance alarms.

1. Economizer Fault Detection and Diagnostic (FDD) alarms
2. High/low discharge air temperature for all VAV units (adj.)
   Low: Setpoint minus 5°F for a period of greater than 10 min.
   High: Setpoint plus 5°F for a period of greater than 10 min.
3. Return air humidity (adj.)
   Greater than 60% for a period greater than 10 min.
4. Discharge static pressure for all units (exceeds high limit) (setpoint + 0.5") adj.
5. Differential static pressure across filters (0.75") adj.
6. Minimum outside airflow on VAV units
   Below setpoint for a period of greater than 10 min.
7. High return or space CO2 (adj.)
   Greater than 1,200 ppm for a period greater than 10 min.
8. VFD alarm indication
9. Current relays
10. High/low space temperature
    High: 85° adj.
    Low: 45° adj.
11. Duct smoke detectors
12. VAV box low airflow condition (adj.)
    15% below scheduled minimum
13. Differential pressure across fans or pumps (adj.)
    High: Setpoint + 5 psi
    Low: Setpoint – 5 psi
14. Chilled water system supply water temperature (adj.)
    High: Setpoint + 5°F
    Low: Setpoint – 5°F
15. Chiller supply water temperatures (adj.)
    High: Setpoint + 5°F
    Low: Setpoint – 5°F
16. Chiller alarms
17. Low condenser water basin temperature (adj.)
    Below 35°F for greater than 5 min.
18. Boiler alarm(s)
19. Heating water system supply temperature
    High: Setpoint + 5°F
    Low: Setpoint – 5°F
20. Server Room Temperature Alarm (adj.)
    Greater than 80°F
21. Air Handler Freeze Protection (Mixed air temperature < 34°F) adj.
22. Glycol low level
23. Float switch alarms
24. Activation of generator
25. Gas Detection System alarms
26. Kitchen refrigerator temperature alarm
    High: 40° adj.
    Low: 28° adj.
27. Kitchen freezer temperature alarm
    High: 40° adj.
    Low: 18° adj.

3.06 PLACING IN SERVICE AND ACCEPTANCE

A. Prior to final acceptance and authorization for final payment by the Owner, Control System "punch list" inspections shall be made by representatives of the Owner's construction, maintenance, and energy management departments. This is not to preclude that punch lists shall be made by the Contractor to check the completion of his work prior to final "punch lists" inspection. The punch lists inspections shall be in three parts. An inspection shall be performed and punch list (Installation Punch List) prepared regarding the physical installation of the BAS equipment, wiring, etc., and separate punch list shall be prepared regarding the graphics interface (Graphics Punch List); and a third punch list shall be prepared regarding the software programming and systems performance verification at the site (Site Performance Verification Punch List).

1. Graphics Acceptance:
    a. Contractor shall perform self-review of graphics prior to requesting graphics review by Engineer. At a minimum, prior to requesting a Graphics/Programming Punch List inspection, all required "head end" software and graphics at the server shall be installed and functioning; graphics shall be accessible and demonstrated at the school. This work shall be performed prior to building occupancy.
    b. Graphics checklist, provided by Engineer to Contractor shall be completed by Contractor and returned to Engineer indicating that the Graphics are ready for review by Engineer. Engineer will provide review comments to Contractor. Contractor shall acknowledge that any corrective work cited in the review comments has been completed. Engineer will validate Contractor’s response and acknowledge acceptance of Graphics when appropriate.

3.07 MINIMUM DDC GRAPHICS:

A. At a minimum, the following DDC graphics shall be provided. Examples of all utilized graphics shall be sent as a stand-alone submittal for approval. All graphics must align with existing DISD graphics and standards.

1. Floor Pans
    a. Overview of entire building.
    b. Floor plan for each floor.
    c. Zone plan for each zone.
2. All screens
    a. Outside air temperature & humidity
    b. Animations for all active equipment (feedback status, not command)
    c. Add an “Active Alarm” button. This button should access a report that displays all current active alarm messages.
    d. All setpoint adjustments and alarming as defined in the individual equipment sequence of operation specifications shall be incorporated into the graphics package.
    e. All static and dynamic values of all inputs, outputs and setpoints for the area or equipment being displayed.
3. Air Handler Summary Screen with:
    a. Fan Status
    b. Fan Speed
    c. CHW, HW Valve % Command and Position
    d. Electric Heat % Command and Output
    e. OA Damper Position
    f. Discharge Air Temperature
    g. Down-Duct Static Pressure (VAV Units)
    h. Hyperlink to each Air handler full screen
4. Floor Plan Screens
    a. All VAV boxes Color coded by air handler
    b. Hyperlinks to the individual air handlers serving each floor area
    c. Small floor plan of entire building in upper left corner with hyperlink to each individual floor section

5. Each Air Handler Screen
    a. Occupancy Status
    b. Heat/Cool Status
    c. Economizer Status
    d. Dehumidification Status
    e. Outside air Enthalpy
    f. Return air Enthalpy
    g. All Damper Positions
    h. Minimum OA Flow Setpoint
    i. Actual OA Flow
    j. Discharge air temperature setpoint, or Space temperature setpoint
    k. Down-duct pressure setpoint
    l. Fan discharge static reading and setpoint (unless binary switch in which case a tripped condition shall alarm the DDC with specific overpressure indication)
    m. CO2 setpoints
    n. Energy Wheel Animation (Where wheel is present)
    o. List of exhaust fans associated with each system with link to exhaust fan screen
    p. All monitored points
6. Chilled Water System
    a. Outside air wet bulb for water cooled systems
    b. Chiller percent loaded or RLA
    c. Chiller Run status with animation
    d. System Chilled water setpoint
    e. System Condenser Water setpoint
7. All piping pressure setpoints
    a. Outside Air temperature enable setpoint with onscreen adjustment capability.
    b. All monitored points
    c. Link to full BACnet points
8. Heating Water System
    a. Boiler Run Status with Animation
    b. System Heating Water Setpoint with Reset Schedule On Screen
    c. All Piping Pressure Setpoints
    d. Outside Air temperature enable setpoint with onscreen adjustment capability.
    e. All Monitored Points
9. Each VAV Box and Heat pump
    a. Occupancy Status
    b. Heat/Cool Status
    c. % damper open
    d. Min and Max airflow setpoints in both heating and cooling mode.
    e. Space temperature setpoint
    f. Space CO2 if applicable
    g. Color coded to indicate associated AHU system
    h. All monitored Points
10. Exhaust Fan Summary Screen
    a. Status (feedback, not command)
    b. Command
11. Data Rooms
    a. Monitor space temperature only, with alarm

B. Dynamic temperature values, humidity values, air or water flow values and status indication shall be shown in their actual respective locations and shall automatically update to represent current conditions without operator intervention. Setpoints (heating, cooling, humidity, CO2, supply air temp, supply static, differential pressure, etc.), shall be shown in a data block adjacent to the actual displayed dynamic values.

C. All engineering units related to displayed data shall be configured to provide easily understood representations of the equipment operation.

1. Valves and dampers shall have Open % for modulating control and Open/Close for 2-position control
2. Temperatures shall be displayed in ºF
3. Humidity shall be displayed in %RH
4. CO2 levels shall be displayed in PPM
5. Fans, pumps and other motors shall be displayed as On/Off

D. A Menu button located on the overall floor plan graphic should access a Main Menu screen with individual buttons to access the: Special Activity schedules; Chiller; Pumps; AHUs, RTUs, ERUs, Air Terminal Units, Exhaust Fan; etc. Additionally, this main menu should have buttons to access sub-menus for, Reports, Histories, Graphs, etc.

E. From each detailed graphic the operator is to be able to return to the floor plan graphic and menu screen.

F. In addition to the floor plan and mechanical system flow schematics, provide tabular listings of all equipment statuses and space temperature sensors for quick access and review.
1. All temperature, humidity, CO2 values are to be dynamic and change colors for normal, hi or low alarm.
2. The mechanical room group is to list all pertinent chilled water and hot water system equipment statuses and water temperatures. The list is to have a button to access chiller plant and boiler plant schematic flow graphics.
3. Each zone group list shall include the room numbers in sequential order with the room temperature and humidity valves listed. All room numbers are to be hot buttons to directly access the unit or equipment graphic.

G. Graphics portrayed on a screen shall be scaled to fit the screen so that all diagrams and data are viewable without scrolling.

H. On-line notepad: Provide on-line notepad accessible from systems graphic screen. Notepad shall have two functions:
1. Sequence of operations as approved in “As-Built” documents shall be provided. Sequence shall be displayed when notepad is accessed from equipment graphic screen; e.g. when viewing the graphic screen for an air handling unit, clicking on the “Notepad” button will display a “pop-up” window with the text of the sequence of operation pertinent to that AHU. On-screen editing and saving of the sequence shall be possible.
2. Notes, in addition to sequences of operations, may be entered and saved

I. Overridden Points:
1. Overridden points should be highlighted against a yellow background when overridden and a neutral color when not overridden.
2. Provide a school/building specific record of currently overridden points retrievable by operator command.

3.08 INSTALLATION

A. The location of all control items on the exterior of the building shall be approved by the Architect prior to installation.

B. Where the condition occurs, provide insulated sub bases for all space temperature sensors located on exterior walls.

C. All sensors located in equipment, ductwork and piping shall be installed with appropriate fittings such that devices are securely attached to coils, duct, pipe, or similar and are not free to move, rotate, or become dislodged. The use of adhesives for attachment is not permitted.

3.09 TREND REQUIREMENTS

A. A minimum of two (2) complete sets of trends shall be submitted for review. Trends must be delivered to the Engineer and Commissioning Authority at least fourteen (14) days prior to a scheduled on-site performance verification of the facility. Trends shall be submitted illustrating

systems operations when the building is operating in the cooling mode (summer) and the heating mode (winter). The intent of this is to determine whether installed software is functioning and equipment performing as intended.

1. Central plant and global control points must be included in all runs of trends.
2. Trends shall be presented at hourly intervals for a 24 hour period, unless directed otherwise. Systems being monitored shall be operated with an occupancy schedule; i.e. indications that a system was scheduled off for the 24 hours of the trends and remained off are of no value. Occupancy schedules, zone overrides, and all system setpoints (both calculated and manual inputs) shall be provided with the trends and shall be in accordance with SCPS standards and/or directions. Trends shall be submitted with English language point descriptor column header, engineering units provided for each point (e.g. °F, ppm, %RH, CFM, psig, amps, etc.); lengthy point path names as column headers are not acceptable. Print the time and point data information in its respective column for all values for that point. Digital points (commands and statuses) shall be presented as On/Off, Open/Closed (not 0/1); damper, valves shall be trended as % open (not 2-10 or 4-20); temperatures shall be in °F to tenths of a degree.
3. Prior to submitting a set of trends to SCPS, the Contractor shall perform a self review to identify and correct problems. Where trends indicate problems, discrepancies, and/or deficiencies and the Contractor has performed corrections, partial trends may be submitted as addenda or inserts with the original set of complete building trends indicating that the problem has been corrected. For example, if the complete set of building trends largely indicates that the control system functions properly, but an air handling unit was not running when commanded on; an addendum or insert trend for this air handling unit may be provided with the original complete set that indicates proper operations after the unit was made to run. All global and central plant points shall be included for the time period of the addendum trends. Include contractor review comments with trends submission.
4. To assure that trends suitably demonstrate appropriate operations, heating trends shall be run when outdoor air drops to an occurrence of at least 35°F during the trend period, cooling season trends can be run whenever outdoor air rises to an occurrence of at least 85°F during the trend period.
5. Predicated upon the discrepancies discerned by the engineer’s review of trends, subsequent complete or partial trends may be required.
6. The following constitutes those items that, at a minimum and as applicable, shall be included in a trend submittal:
    a. Outdoor air: Drybulb temperature (wall and roof locations), humidity, CO2, enthalpy.
    b. Phase, Voltage: Trends should indicate time and duration of any occurrence of power interruption and normal power resumption.
    c. Incoming Power: Kw, Kwh
    d. Overrides: Run status
7. Chilled Water System:
    a. Supply/Return water temperature chiller
    b. Flow (GPM)
    c. Pumps commands, status, speed, system pressure
    d. Chiller command, status, alarm
8. Incremental Units (FCUs and CUHs)
    a. Space temperature actual and setpoint
    b. Supply air temperature
    c. Supply fan command and status
    d. Heating command
    e. Cooling valve command (FCU only)
    f. Condensate overflow alarm
9. Rooftop Units (as applicable)
    a. Occupied/unoccupied command
    b. OA CFM
    c. Supply and exhaust fan statuses, exhaust fan speed
    d. Alarm status

e. Outdoor air temperature, humidity, & dewpoint
f. All unit temperatures
g. All unit humidities
h. Space temperature, humidity, CO2, static pressure
i. Controlling setpoint (supply, space or effective temperature and/or humidity)
j. All damper positions
k. Recovery wheel command
l. Operating mode (occ/unocc, econ, dehumid, etc.)
m. Condensate overflow alarm

10. VAV terminals
    a. Space or discharge (controlling) temperature
    b. Valve position
    c. CFM
    d. Discharge air temperature
    e. Fan status
11. Split AC units – Monitored space temperature
12. Exhaust Fans (where BAS controlled and/or monitored):
    a. Scheduled run/enabled status
    b. Actual run status or enabled status

3.10 SERVICE AND GUARANTEE

A. The entire control system shall be serviced and maintained in first class condition by the control manufacturer for a period of one year after acceptance at no extra cost to the Owner.

END OF SECTION

SECTION 23 0993

SEQUENCE OF OPERATIONS FOR HVAC CONTROLS

PART 1 - GENERAL

1.01 SUMMARY

A. Related Documents: Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections apply to this Section.

B. Work Included:

1. Sequence of Operations for HVAC Systems

C. Related Sections:

1. Division 01 -- Commissioning
2. Section 23 00 10 – HVAC General Requirements
3. Section 23 05 00 – Common Work Results for HVAC
4. Section 23 05 53 – Identification for HVAC Piping and Equipment
5. Section 23 05 93 – Testing, Adjusting, and Balancing for HVAC
6. Section 23 09 00 – Instrumentation and Control for HVAC
7. Section 23 20 00 – HVAC Piping and Pumps
8. Section 23 30 00 – HVAC Air Distribution
9. Section 23 80 00 – Decentralized HVAC Equipment

1.02 GENERAL REQUIREMENTS

A. Programming shall be provided in accordance with commonly accepted industry standards and practices to ensure proper and efficient control of all equipment and systems.

B. Control sequences shall be accomplished in accordance with control drawings and the sequences specified in this section and described on the drawings. It is the intent of this section to utilize sequences included in pre-programmed controllers when such sequences provide the intended operation. Where factory programming is incapable of providing the sequence specified in the Contract Documents, a custom controller with custom programming shall be provided.

1.03 SUBMITTALS

A. Refer to Section 23 09 00, Instrumentation and Control for HVAC.

1.04 WARRANTY

A. Refer to Section 23 09 00, Instrumentation and Control for HVAC.

1.05 COMMISSIONING OF HVAC SYSTEMS:

A. Refer to Section 23 09 00, Instrumentation and Control for HVAC.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.01 GENERAL SEQUENCE REQUIREMENTS:

A. Set points: All control setpoints shall be provided with appropriate deadbands where necessary to prevent the excessive cycling of equipment, valves, dampers, etc.

B. Failure of Digital Control System: The control system shall be installed to fail safe to the heating mode.

1. All air handling and air conditioning units shall fail on with outside air damper closed, heating valves open to the coil and the reset valve open to the boilers.
2. Night setback shall fail to day (occupied) mode.
3. Heating water system shall fail with boiler energized to boiler control and heating water pump on.
4. All interlocked exhaust fans shall be de-energized with the dampers closed.

C. Unoccupied Period Freeze Protection: When outdoor air temperature falls below 35°F during unoccupied periods, the following sequence shall occur.
1. Heating (and chilled) water pumps shall be energized (pumps should be energized whenever any space requires heat).
2. All air unit heating (and cooling) valves shall be fully open when the fan is off.
3. All outdoor air dampers shall be closed and verified.
4. All exhaust fans shall be de-energized with dampers closed (should already be de-energized during unoccupied periods).

D. Unoccupied Periods: At times when the building is unoccupied, the DDC shall control all systems to maintain an adjustable night setting for both heating and cooling. Unless otherwise specified, all outside air dampers shall be closed and all exhaust fans shall be de-energized. Where fan powered VAV boxes are utilized, night heating shall be performed as required by the individual terminal units without energizing the associated air handling units. Terminal units such as cabinet unit heaters and fan coil units shall cycle the fans as necessary to maintain unoccupied setpoints. The DDC shall stagger the occupied/unoccupied schedules for all air handling units to prevent large fluctuations in heating or cooling demand. Activation of the manual override on a space temperature sensor, where applicable, shall result in the following: the space temperature setpoint shall be indexed to the occupied setpoint for that space and the system serving that space shall be indexed to the occupied mode. All other spaces shall be maintained at unoccupied temperature setpoints.

E. Morning Warm-up: All air systems shall bring space up to occupied temperature before opening outside air dampers as part of the optimal start sequence.

F. System Start-up: Following any type of system shutdown, the DDC shall stagger the starting of all electrical loads to reduce electric peak demand.

G. System Shut-down: At any time air systems are de-energized, the DDC shall disable all ancillary systems dependent upon air movement such as electric heaters, humidifiers and direct expansion cooling. Ancillary systems required for freeze protection (except electric coils) shall remain operational.

H. Direct Expansion (DX) Cooling: Where the Sequence of Operation calls for DDC control of refrigeration compressors, condensing units or packaged compressor-cooling, the DDC shall provide “minimum-on” and “minimum-off” times in accordance with the equipment manufacturer’s recommendations.

I. Duty/Standby and Lead/Lag Control: All equipment indicated to be operated as duty/standby or lead/lag shall be sequenced based on run time and alternated bi-monthly or as otherwise required in accordance with the Owner’s preferred schedule. Sequencing shall occur as scheduled without the need for shutdown, if necessary. Sequencing for individual equipment shall occur so as not to impact the operation of the entire system. The DDC shall automatically energize the standby or lag device in the event of a failure in the duty or lead equipment.

J. Smoke Detection Control: Upon activation of an air handling unit duct smoke detector, all fan powered VAV boxes associated with that unit shall be deenergized.

K. Refer to the Electric Sequence Controls Schematics on the drawings for automatic control of fans, ancillary heating equipment, and other similar items. The following hard-wired interlocks shall be provided in addition to any others indicated on the Electric Sequence Controls Schematics:

1. Activation of kitchen hood suppression system as sensed by the suppression system microswitch shall energize the kitchen hood exhaust fan and de-energize the kitchen hood make-up air unit (where applicable).
2. Boiler firing shall be inhibited unless combustion air dampers have been opened and verified open through actuator limit switches.
3. Emergency boiler shutoff shall de-energize all boilers upon activation of the emergency break glass switch provided under Division 26.
4. Activation of duct smoke detectors shall de-energize associated supply fans and return/relief fans (where applicable).
5. Where refrigerant machines are installed in the same room as fuel fired devices, the detection of a refrigerant leak, as sensed by the refrigerant monitor, shall prevent and terminate the firing of all fuel fired appliances.
6. Where refrigerant machines utilizing an A2L refrigerant are installed in a room, the detection of a refrigerant leak shall signal an alarm and activate the ventilation system.
7. Low air flow condition indicated by the air flow switch shall prevent the operation of electric heating coils.
8. Cooling coil condensate drain pans shall be provided with safety switches to de-energize the unit and alarm the DDC upon accumulation of water.

L. All screen graphics for systems with economizers shall show calculated values of enthalpy for outdoor air and return air.

3.02 SEQUENCE OF OPERATION:

A. Refer to Drawings for Sequences of Operation

END OF SECTION

SECTION 23 2000

HVAC PIPING AND PUMPS

PART 1 - GENERAL

1.01 SUMMARY

A. Related Documents: Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. Pipe and Pipe Fittings
2. Miscellaneous Piping Specialties

C. Related Sections:

1. Division 01 -- Commissioning
2. Section 23 00 10 – HVAC General Requirements
3. Section 23 05 00 – Common Work Results for HVAC

1.03 COMMISSIONING OF HVAC SYSTEMS:

A. The Contractor shall provide contact information to the Commissioning Agent indicated in Division 1 for all major items of Equipment.

B. Provide additional submittal copy of major equipment for Commissioning Agent specified in Division 1.

1.04 SUBMITTALS:

A. Submit shop drawings, product data and samples in accordance with Division 1 and Section 23 00 10.

B. Shop drawings, diagrams, catalog data and such other data necessary to fully describe and substantiate compliance with these specifications shall be submitted for all equipment and materials marked with notation set forth in Section 23 00 10.

C. Operation and maintenance data shall be submitted in accordance with Division 1, for all items of equipment and materials marked with notation set forth in Section 23 00 10.

D. IGSHPA Installation Manuals: Submit one copy of each manual to the Engineer.

E. Equipment:

1. All equipment furnished to complete the work shall be in good operating condition and capable of safely and efficiently performing the work required in a timely fashion. The Contractor shall provide qualified operating personnel for the operation of this equipment.
2. The Contractor shall furnish and install at the Contractor's own expense, all fuel, oil, hydraulic fluid, grease, cable, repair parts, including worn or broken tools, and all other supplies, bits and parts or personnel necessary for the efficient operation of each piece of equipment.

F. Permits, Laws and Regulations:

1. The Contractor shall procure and pay for all permits, licenses, inspections, or approvals necessary for the execution of the contract.
2. The Contractor shall comply with all laws, ordinances, rules, orders, and regulations relating to the performance of the work, the protection of property, the maintaining of surface passageways to buildings, fences, and/or other facilities.
3. All applicable Federal and State laws and regulations, municipal ordinances, and the rules and regulations of all authorities having jurisdiction over the project shall apply to the contractor throughout and they shall be deemed to be included in the contract as a part, therefore, the same as though herein written out in full.
4. All regulations of the Occupational Safety and Health Act are in effect on this contract. It will be the Contractor's responsibility to make himself aware of all appropriate County, State and Federal regulations that apply to this contract.
5. Any violations incurred from improper execution of the above shall be paid by the Contractor. Loss of time on the project from such violations will not be tolerated.

G. Water Supply:

1. The Contractor shall supply potable water as necessary to perform the work. The equipment will include pumps, water trucks or trailers, storage tanks and all other items

necessary to provide an adequate supply of potable water. The source shall be subject to approval of the Engineer.

H. Project Conditions:
   1. Protection: During test work, protect controls, gages and accessories which are not designed to withstand test procedures. Do not utilize permanently installed gages for field testing of systems.

I. Sequencing and Scheduling:
   1. Transmit written notification of proposed date and time of operational tests to the Owner's representative at least 5 days in advance of such tests.
   2. Perform cleaning and testing work in the presence of the Owner's representative.

J. Warranty:
   1. Manufacturer's Warranty: Minimum 25-year warranty for polyethylene piping. Special Warranty: 25 years for butt fusion welds in polyethylene piping against leakage.

PART 2 - PRODUCTS

2.01 PIPE AND FITTINGS:

A. Material Standards:
   1. Steel pipe shall be manufactured in accordance with ASTM A53 and shall be so labeled.
   2. Copper pipe shall be manufactured in accordance with ASTM B88 and shall be so labeled.
   3. HDPE pipe shall be manufactured in accordance with AWWA and shall be so labeled.
   4. Polypropylene (PP) pipe shall be manufactured in accordance with ASTM F2389 and shall be so labeled.

B. Refrigerant piping shall larger than ¾" shall be type "ACR" hard drawn copper tubing, pipe ¾" and smaller shall be soft copper refrigerant tube. Pipes shall be factory cleaned, dehydrated and capped with wrought copper fittings. Provide all accessories including, but not limited to, refrigerant duty ball type shutoff valves, solenoid valves, expansion valves, moisture indicating sight glass, replaceable core filter dryers, access ports with gasketed screw-on covers for charging and measuring subcooling, hot gas bypass valve (where indicated) and other accessories recommended by the refrigeration equipment manufacturer. Expansion valves shall be balanced port, externally equalized type. Provide heat exchangers for subcooling and suction line accumulator as recommended by the manufacturer. All components shall be selected and sized for the lowest pressure drop at the capacities indicated. Prior to offering the system for final acceptance, the Contractor shall submit a written certification from an authorized official of the equipment manufacturer stating the complete system, to include refrigerant piping, has been installed in accordance with the manufacturer's recommendations.

C. Provide utility location tape 12 inches to 24 inches above buried piping outside the building, consisting of polyethylene plastic and metallic core or metallic-faced, acid-and alkali-resistant, polyethylene plastic warning tape manufactured specifically for warning and identification of buried utility lines. Provide tape on rolls, 3 inch minimum width, for the intended utility with warning and identification imprinted in bold black letters continuously over the entire tape length. Warning and identification to read, "CAUTION, BURIED (intended service) LINE BELOW" or similar wording.
   1. Warning Tape for Metallic Piping: Acid and alkali-resistant polyethylene plastic tape. Minimum thickness of tape shall be 0.003 inch. Tape shall have a minimum strength of 1500 psi lengthwise, and 1250 psi crosswise, with a maximum 350 percent elongation.
   2. Detectable Warning Tape for Non-Metallic Piping: Polyethylene plastic tape with minimum thickness of 0.004 inch. Tape shall have a minimum strength of 1500 psi lengthwise and 1250 psi crosswise. Tape shall be manufactured with integral wires, foil backing, or other means of enabling detection by a metal detector when tape is buried up to 3 feet deep. Encase metallic element of the tape in a protective jacket or provide with other means of corrosion protection.

2.02 MISCELLANEOUS PIPING SPECIALTIES:

A. Dielectric fittings such as couplings or flanges shall be installed to isolate pipes of non-ferrous metal where connection is made to ferrous metal. Isolation shall be accomplished by use of a brass converter fitting of threaded brass or bronze couplings (not unions), or flanged joints with gaskets and bolt bushings. Materials shall withstand pressure and temperature as required. Valves of the same materials may also be used.

B. Drains shall be accessible and shall consist of 3/4" ball valves with hose thread adapters, cap and chain unless indicated otherwise.

C. Escutcheons shall be the split pattern chromium plated bronze or steel. Special height escutcheons shall be provided where extended sleeves are used. Escutcheons shall be sized to cover the entire opening.

D. Water seals (Trap) shall be provided on condensate drain from each air handling unit. Seal shall be of sufficient depth to prevent blowout or siphoning of water and shall be configured as indicated on the Drawings. Where drains are installed concealed within the building construction, a label shall be provided at the termination point indicating if the drain is from a primary or secondary drain. The label shall be located within three feet of the termination. Where piping is concealed within walls or behind hard ceilings, shield plates shall be installed between the pipe and the finished face of the framing members to prevent damage from nails or screws.

E. Pipe sleeves shall be installed as outlined in SECTION 23 00 10 HVAC GENERAL REQUIREMENTS.

PART 3 - EXECUTION

3.01 PIPING INSTALLATION:

A. General: Sleeves and sealant shall be provided where pipes pass through floors, partitions or walls as outlined in Section 23 00 10, HVAC GENERAL REQUIREMENTS. Pipe shall be cut accurately to measurements established at the job site and worked into place without springing or forcing, properly clearing all windows, doors and other openings. Pipe in finished areas shall be concealed. Excessive cutting or other weakening of the building structure to facilitate piping installation will not be permitted. Each end of each piece of pipe shall be reamed. Pipe shall be installed to permit free expansion and contraction without damage to joints or hangers. Changes in direction shall be made with fittings(, except that bending of pipe will be permitted provided a hydraulic or mechanical bender is used and wide sweep bends are formed.) (Bent pipe showing kinks, wrinkles, or other malformations will not be acceptable). Bushings and all thread nipples will not be allowed.

B. All piping shall be installed with sufficient pitch to insure adequate drainage and all high points in water lines shall be provided with (auto-air) (manual-air) vents, all low points with drains. (Steam and condensate lines shall slope a minimum of 1 inch in 40 feet in direction of flow unless indicated otherwise. Low points in steam lines and points at the end of a pipe run shall be provided with drip stations. Pipe size changes in steam lines shall be made with eccentric reducers with outlet on bottom. Branches from steam mains shall take off from the top of the main.) Cooling coil condensate drain lines shall slope 1/8" per foot in direction of flow. (Pipe extending through the roof shall be properly flashed.)

C. Bull head tee piping connections shall not be used in supply or return arrangements.

D. Piping connections to equipment shall be provided with unions or flanges. Banked water coils shall be piped in reverse return arrangement with a balancing cock in the return leg of each coil. (Steam coils shall be trapped individually.) (Vacuum breaker shall be provided at steam supply connection to each steam coil or steam bundle.) Boilers shall not be connected into the piping systems until they have been thoroughly cleaned internally in accordance with the manufacturer's instructions and not until they can be fired under a fairly continuous load.

Connections shall not be made to any equipment until the piping systems have been cleaned completely and are free of all dirt.

E. A suction diffuser shall be provided at the suction connection to each base mounted pump; maximum water pressure drop shall not exceed 2.5 feet w.g. at full pump flow. Suction diffusers shall have start-up screen.

F. Open ends of pipe lines or equipment shall be properly capped or plugged during installation to keep dirt or foreign material out of the system.

G. Escutcheons shall be provided where exposed pipes pass through finished walls or floors.

H. Miscellaneous piping terminating at floor drains or in the air shall be resiliently anchored to protect against fatigue or damage incurred as a result of vibration or abuse.

I. Provide P/T ports in the supply and return piping at all coils, heat exchangers, pumps, and where otherwise indicated on the drawings.

J. All piping to a coil or heat exchanger shall be the full size of the runout indicated with a reducer as necessary at the coil connection. This shall include all appurtenances except control valves.

K. All underground piping shall be installed minimum 3'-0" below grade and minimum 4'-0" below roadways unless otherwise indicated on the Drawings.

L. Grooved pipe fittings shall not be allowed on this project.

M. Joints:

1. Copper tubing shall be cut square, ends reamed and all filings and dust wiped from interior of pipe. Joints shall be soldered with solder drawn through the full fitting length. Excess solder shall be wiped from joint before solder hardens. Solder shall be 95/5 composition – 50/50 will not be allowed. All solder joints shall have piping surfaces sanded or brushed. Self-cleaning solder flux as a substitute for sanding or brushing is not acceptable. In lieu of soldered fittings in hydronic piping, Viega ProPress (no substitute) fittings may be used for copper pipe 2" and smaller.
2. Threaded joints shall be made with tapered threads properly cut. Joints shall be made tight with a stiff mixture of litharge and glycerin or other approved thread joint compound applied with a brush to the male threads only. Not more than three threads shall show after the joint is made up. The use of thread protectors for pipe couplings is not acceptable. Expanding self-hardening pipe dope ("expando") shall not be used.
3. Welded Joints:
    a. Welded joints shall be fusion-welded by qualified welders in accordance with American National Standard B31.1.06, Chapter 5, unless otherwise required. Changes in direction of piping shall be made with welding fittings only. Mitering or notching pipe to form elbows and tees or other similar type construction will not be permitted. The contractor shall wire brush and paint welded pipe welds before insulation is applied. (Saddle type welding outlets may be used for equipment take-off's from the mains.)
    b. All pipe welding shall be done only by competent and experienced welders. High test welding rods suitable for the material to be welded are to be used throughout. All welds shall be built up to a thickness of 1 ½ times pipe wall thickness. All tees, branches, reducers or specialties that may be required in welded piping shall be carefully laid out by welders, using templates, and the joints shall have carefully matched intersections and shall be properly spaced. Finished pass on all welds shall be a smooth continuous weld cap. Multiple "stringers" on horizontal welds will not be acceptable.
    c. During welding, all piping shall be securely clamped in place so that true alignment is held throughout the welding process. Where there is apt to be distortion, proper allowance shall be made so that the sections to be joined will be in proper alignment after the weld is completed. Care shall be exercised to prevent the occurrence of

protruded metal into the pipe. All welds shall be of sound metal, free from laps, cold shuts, gas pockets, oxide inclusions and similar defects.

d. Adequate protection blankets, screens, etc. shall be provided during cutting and welding to protect existing adjacent surfaces.

4. Flanges and unions shall be faced true and made square and tight. Unions shall be (125) (300) psi service, bronze seat type. Flanges shall be ASA Standard 125 psi service with red rubber gaskets (150 psi service with high temperature gaskets). Unions or flange joints shall be provided on each side of each valve 2-1/2" or larger and in each line immediately preceding the connection to each major piece of equipment such as a (pump,) (converter,) (cooling tower,) (boiler,) (chiller,) (condenser,) (heating coil,) (cooling coil) and other similar items.

3.02 REFRIGERANT PIPING:

A. All refrigerant piping shall be sized, installed, and routed in accordance with the refrigeration equipment manufacturer's recommendations.

B. All piping joints and the inside of all piping shall be clean. Burnish all mating surfaces until all dirt, oxide, or other debris is removed. Using no flux, braze all joints using hard solder equal to Stay-Bright for pipe 2 inches and below or Stay-Silver for pipe larger than 2 inches. Remove all internal components from refrigerant accessories which may be subject to heat damage prior to brazing. Joints for copper tubing for ductless split systems smaller than ¾" may be flared fittings.

C. Before charging, refrigerant lines shall be thoroughly cleaned and purged. Refrigerant lines shall be pulled down to a vacuum of 500 microns and then pressure tested according to the manufacturer's instructions before charging with refrigerant.

D. All filters from filter dryers shall be replaced after 48 hours of system operation and prior to final acceptance.

E. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper resistant caps or shall be otherwise secured to prevent unauthorized access.

F. Exposed refrigerant pipe installed in open spaces that afford passage shall be not less than 7' - 6" above the finished floor.

G. Where piping used in A2L or B2l systems is located in concealed locations such as in studs, rafters, joists, or similar member spaces, and located less than 1.5" from the nearest edge of the member, piping shall be continuously protected by shield plates in accordance with Code. Plates shall be made of steel, minimum 16 gauge, and shall cover the area of the tube plus the area extending not less than 2" beyond both sides of the piping.

H. Stop valves shall be provided and installed in all refrigerant piping systems that contain more the 6.6 pounds of refrigerant. Stop valves shall be installed at the suction inlet of each compressor, compressor unit, or condensing unit, as well as the discharge outlet of each compressor, compressor unit, or condensing unit, and the outlet of each liquid receiver. Stop valves shall be identified as required by Code.

I. The Contractor shall issue a certificate of test to the Engineer and AHJ for all systems containing 55 pounds or more of refrigerant. The certificate shall give the test date, name of the refrigerant, test medium and the field test pressure applied to the high-pressure side and the low-pressure side of the system. The certification of test shall be signed by the Contractor and shall be made part of the public record.

3.03 CONTROL ACCESSORIES:

A. Control valves, pipe wells and pressure tappings shall be furnished under Section 23 09 00 and installed as work of this Section.

END OF SECTION

SECTION 23 3000

HVAC AIR DISTRIBUTION

PART 1 - GENERAL

1.01 SUMMARY

A. Related Documents: Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. HVAC Ductwork
2. Air Duct Accessories
3. HVAC Fans
4. Special Exhaust Systems
5. Air Terminal Units
6. Air Outlets and Inlets
7. Wall Louvers
8. Brick Vents
9. Roof Vents
10. Ventilation Hoods

C. Related Sections:

1.03 DEFINITIONS:

A. Duct Sizes: Sizes shown on Drawings are actual sheet metal dimensions. For acoustically lined ducts, sizes indicated are actual sheet metal sizes allowing for 1" thick acoustic lining. For double wall ductwork, sizes indicated are inside dimensions.

B. Low Pressure Ductwork: Static pressure rating less than 2" w.g. and velocities less than 2000 fpm.

C. Medium Pressure Ductwork: Static pressure rating less than 6" w.g. and velocities greater than 2000 fpm and all ductwork upstream of VAV boxes.

D. High Pressure Ductwork: Static pressure rating over 6" w.g. and velocities greater than 2000 fpm.

1.04 COMMISSIONING OF HVAC SYSTEMS:

A. The Contractor shall provide contact information to the Commissioning Agent indicated in Division 1 for all major items of Equipment.

B. Provide additional submittal copy of major equipment for Commissioning Agent specified in Division 1.

1.05 SUBMITTALS:

A. Submit shop drawings, product data and samples in accordance with Division 1 and Section 23 00 10.

B. Shop drawings, diagrams, catalog data and such other data necessary to fully describe and substantiate compliance with these specifications shall be submitted for all equipment and materials marked with notation set forth in Section 23 00 10.

C. Operation and maintenance data shall be submitted in accordance with Division1, for all items of equipment and materials marked with notation set forth in Section 23 01 00.

D. All fans for use with Variable Frequency Drives (VFD) shall have critical speed and multiples of critical speed indicated on each submittal.

1.06 SPARE PARTS

A. Each fan powered terminal box and make-up air fan shall be provided with 3 sets of filters. At end of construction each unit shall be provided with a clean filter and one set shall be turned over to the Owner as spares.

B. Each filter grille shall be provided with 3 sets of filters. At end of construction each unit shall be provided with a clean filter and one set shall be turned over to the Owner as spares.

C. Each belt driven piece of equipment shall be provided with one spare set of belts to be turned over to the Owner at the end of construction.

PART 2 - PRODUCTS

2.01 HVAC DUCTWORK

A. Materials:

1. Sheet Metal Ducts: Trademarked galvanized steel, lock forming quality, having zinc coating of 0.90 ounces per square foot for each side (G90, ASTM A653 and A653M).
2. All ductwork without external insulation, exposed to view in finished, non-utility spaces shall have paint-grip or galvaneal coating to accept field painting.
3. Fasteners: Use rivets and bolts throughout; sheet metal screws may be used on low pressure ducts.
4. Sealants: United McGill “United Duct Sealer” or equal. Water and fire resistant when dry, compatible with mating materials. Where sealants are used on exposed ductwork, composition shall be designed to prevent bleed-through of finish paint, or sealant shall be pre-painted with a coating impervious to bleed-through.
5. All duct and accessory materials shall have a composite flame spread rating not exceeding 25, and a smoke developed rating not exceeding 50 as tested under procedure ASTM E-84-75, NFPA 255 and UL 723. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411.
6. (Fibrous Glass Ducts: 1 inch thick rigid fibrous glass with aluminum foil, glass scrim and kraft paper jacket vapor barrier, 0.23 btu/in./sq.ft./°F./hr. maximum “K” value at 75°F.)
7. (PVC Ducts: Rectangular duct will be formed from Type I Grade I PVC extruded sheet material. Corners will be heat bent and seams thermal fused where applicable. Where heat bending and thermal fusion is not possible, corner welding with PVC filler rod will be utilized. Where the developed length is 120" or less, 3/16" material will be used. Above 120", 1/4 sheet will be used. Both 45° and 90° elbows will be 2 pieces, square throat. The 90° elbows will have turning vanes made from PVC extruded duct material. Transitions will be tapered and will be the same material thickness as the duct. They will be concentric unless otherwise noted. Branches will enter main run at 45° angle only unless otherwise specified. Couplings will be sleeve type only. Overall length is 6" and will be the same thickness as the duct. Flanges for 3/16" wall duct will be 1-1/2" x 3/16" PVC Type I angle. Flanges for 1/4" wall duct, 2" x 1/4" Type I PVC angle will be used. Bolt holes will be 5/16" diameter on approximate 4" centers. Bolting, gaskets and flexible connections will be the same as the round duct standards. End caps and access panels will be the same as the round duct standards. Reinforcement, if required, will be per SMACNA Fourth Edition, 2020, for the particular water gauge specified. Joining can also be accomplished with the bell (coupling) and spigot method, flanging or field welding.)

B. Fabrication:

1. All ductwork shall conform accurately to the dimensions indicated on plans and shall be fabricated and installed in accordance with ASHRAE Guide and Data Books and SMACNA Duct Construction Standards, except that sheet metal gauges and zinc coating shall not be lighter than specified under this Section.
2. All rectangular sheet metal ducts over 18” wide shall be cross-broken for rigidity.
3. Reinforcing angles, stiffeners and tie-rods for all sheet metal ducts shall be provided where required to prevent sagging, buckling, and vibration in accordance with the latest SMACNA Duct Construction Standards Publication. Reinforcing for flat oval duct shall be provided as specified for rectangular duct in accordance with the latest SMACNA Duct Construction Standards Publication.
4. Lap metal ducts in direction of air flow. Hammer down edges and slips to leave smooth interior surface.
5. Where square elbows are indicated on the Drawings, curved elbows may be used provided the centerline radius is not less than 1-1/2 times the width of duct and as space allows.
6. Provide turning vanes in all square elbows. Provide air foil type turning vanes on all ducts more than 24” wide. Mitered round elbows (2-piece) shall not be used unless specifically indicated. Mitered round elbows shall have airfoil turning vanes.

7. Transitions shall be made with a slope ratio of 4:1, except at equipment divergence and convergence shall not exceed a slope ratio of 3:1.
8. All duct joints and seams shall be mechanically tight, and sealed with sealant or gaskets to provide a substantially airtight system.
9. All duct liners shall be installed using fasteners in strict accordance with SMACNA Duct Construction Standards. Fastener pins shall be clinched pin type or welded pin type. The use of adhesive type pins is not acceptable. All liners shall have transverse edges coated with adhesive, all corners lapped and butted or folded.
10. Duct liners at fan discharges shall be lapped on outside of fan discharge flange or shall have metal nosing on leading edge. Fastening pin length shall be equal to liner thickness.
11. Provide easements where low pressure ductwork conflicts with piping and structure. Where easement exceeds 10% duct area, split into two ducts maintaining original duct area.
12. Plenums and Casings (Site Fabricated Units) [S]: Construct of galvanized steel panels joined by standing seams on outside of casing. Rivet or bolt all seams and joints on approximately 6" centers and seal with sealant. Reinforce with steel angles and provide diagonal bracing. Access doors shall be 36" x 18" with frame welded to plenum, three brass hinges and three brass tension fasteners operable from either side of door.
13. (Fibrous glass ductwork may be substituted for internally or externally insulated or uninsulated low pressure sheet metal ductwork when approved by Engineer.)
14. Ductwork associated with clothes dryer exhaust shall have smooth interior finish with joints running in the direction of airflow. (Ductwork associated with commercial clothes dryer shall be installed with a minimum 6 inches to combustible materials.)
15. All radiused elbows shall have centerline radius (R = 1.5 D), and shall be stamped or pressed smooth radius or minimum five gore type. Adjustable gore type fittings are not acceptable.
16. All locking regulator shall be Rossi Everlock, Elgen Super Standoff, or Windgate Sure-Loc HD, unless noted otherwise.

C. Low Pressure Ducts:
1. Sheet Metal Gauges:
a. Rectangular Ducts:

Max. Dimen., In.	Min. Gauge
Up to 30	24
31 to 54	22
55 to 84	20
85 and Over	18

b. Round Ducts:

Duct Diameter, In.	Min. Gauge
Up to 24	26
25 to 30	24
31 to 36	22
37 to 50	20
51 to 60	18
61 to 84	16

D. Medium and High Pressure Ducts:
1. Sheet Metal Gauges:
a. Rectangular Ducts:

Max. Dimen., In.	Min. Gauge
Up to 18	22
19 to 48	20
49 to 72	18
73 to 96	16
97 to 144	14

b. Round Ducts (Factory Made With Spiral Lock Seams equal to United McGill):

Duct Diameter, In.	Min. Gauge

Up to 26	24
28 to 36	22
38 to 50	20
51 to 60	18
61 and Over	16

c. Flat-Oval Ducts (Factory Made With Spiral Lock Seams equal to United McGill):

Max. Width, In.	Min. Gauge
9 to 24	24
25 to 48	22
49 to 70	20
71 and Over	18

2. Fittings shall be minimum 20 gauge on flat oval, but not less than 2 gauges heavier than ductwork in which it is installed on round and flat oval. Fittings for duct sizes 5" round and below may be minimum 24 gauge.
3. All take-offs shall be full body pre-manufactured 45° conical lateral type or alternate pre-manufactured fitting with equivalent loss coefficient. The use of field-installed or factory lateral taps or manifolds is not acceptable.
4. All elbows shall have centerline radius (R = 1.5 D), and shall be stamped or pressed smooth radius or minimum five gore type. Adjustable gore type fittings are not acceptable.

E. Flexible Ducts [S]: Flexible Ducts shall be Flexmaster Type 1M or Thermaflex type M-KE. Duct shall incorporate acoustic rated CPE or PE inner liner, 1" thick fiberglass insulation, and reinforced metalized vapor barrier. Maximum C factor shall be 0.24 btu/hr/sq.ft./°F at 75°F mean temperature. Duct shall have a working pressure of not less than 6 inches w.g. for positive pressure and 1 inch w.g. for negative pressure and suitable for velocities up to 4000 fpm. Vapor transmission shall be less than 0.05 Perm when tested in accordance with ASTM E96, Procedure A. The entire assembly shall be rated and marked as UL 181 Class 1. Flame Spread Rating shall not exceed 25 and Smoke Developed Rating shall not exceed 50 when tested in accordance with ASTM E-84-75, NFPA 255, and UL 723. Minimum duct insertion loss at 2500 fpm for a 10-foot length of straight duct shall be as listed below when tested in accordance with ADC FD-72 R1

Duct Insertion Loss, dB

Octave Band	2	3	4	5	6
Frequency, Hz	125	250	500	1000	2000
6 inch duct	7	19	34	37	38
8 inch duct	8	13	29	35	36
12 inch duct	20	26	27	33	26

(Flexible Ducts [S]: Mechanically corrugated single ply aluminum with continuous watertight lock seams, self-supporting with 1" thick fiber glass insulation, maximum C factor of 0.23 btu/hr./sq.ft./°F at 75°F mean temperature, and minimum 4 mil seamless vapor barrier jacket, reinforced aluminum foil, metalized polyester laminate. Duct shall have a working pressure of not less than 8 inches w.g. and suitable for velocities up to 5000 fpm. The entire assembly shall be rated and marked as UL 181 Class 1.)

F. Special Ducts:

Underfloor ducts shall be Monroe PVS, plastic coated steel duct. The underfloor duct shall have 4 X 1 coating, 4 mils of PVS coating on the outside and 1 mil PVS coating on the inside. All joints and fittings are to be constructed of PVS material. All sections shall be joined with sleeve sections attached with sheet metal screws. All joints shall be effectively sealed with PVS sealant and PVS tape to provide water tight connections. A PVS sealant shall be applied to any and all damaged or otherwise unprotected areas such as scratches, sheet metal screws, etc. to provide a total protected duct system. All underground duct systems shall be sloped to a drainage point as indicated on Drawings.)

1. All kitchen exhaust ducts carrying grease laden air (and all supply ducts located within 18" of a type I exhaust hood) shall be provided as indicated below:
    a. Where fire-rated enclosures are required: Grease ducts shall be factory fabricated, double wall, insulated grease duct [S] as manufactured by Metal-Fab, Metalbestos, or Hart & Cooley. Duct shall be suitable for 0" clearance to combustibles. Duct shall consist of minimum 0.035" thick stainless steel inner wall, minimum 0.024" aluminized steel outer wall, and high temperature ceramic insulation. Duct shall be classified under UL 1978 and UL 2221 and shall comply with NFPA-96. Duct system shall be one or two hour rated as required by VUSBC. Grease duct system shall include all supports, fittings, roof penetrations, expansion joints, etc. as necessary for a full and proper installation. Grease duct shall be installed in strict accordance with manufacturer's instructions. Shop drawing shall include a sketch showing the assembly of all sections.
    b. Where fire-rated enclosures are not required: Grease duct shall be field fabricated ductwork constructed from 16 gauge black sheet steel with all joints, seams and penetrations welded liquidtight. Mechanical fasteners shall not be used for assembly or support where such fasteners could penetrate the duct walls. Ducts shall run continuous from the hood connection to the exhaust fan connection a minimum of 40 inches above the roof. Ductwork shall be tested prior to installing any coverings. Two layers of fire wrap [S] shall be applied to the outside of the ducts. Fire wrap shall be Firemaster FastWrap XL as manufactured by Morgan Thermal Ceramics or equivalent by 3M or Unifrax. Fire wrap shall be 1-½ inches thick and shall be listed and labeled by UL in accordance with ASTM E 2336 for zero clearance to combustibles. Listed and labeled liquidtight access doors shall be provided by the fire wrap manufacturer and installed in the side of each horizontal section of duct for cleaning purposes. Access doors shall be a minimum of 12 inches and as otherwise outlined in the applicable code. Access door spacing shall not exceed 20 feet. Prior to Substantial Completion, the Contractor shall provide a letter from the fire wrap manufacturer stating that the fire wrap and grease duct access doors have been installed in accordance with manufacturer's installation instructions and that installation complies with the UL listing.
2. Watertight ducts shall be fabricated from copper sheets with soldered seams and joints or stainless steel sheets with brazed seams and joints. Thickness of material and fabrication shall be as required for low pressure systems except that thickness of material shall be suitable for soldering, brazing or welding without deformation or burning of the metal. All joints shall be watertight and low points shall be provided with drain tubes. Provide waterstops with drain tubes where indicated on plans.
3. Fume Exhaust Ducts: All ducts from fume hoods to their terminal point shall be stainless steel with welded seams and joints. Material thickness and fabrication shall conform to the requirement prescribed for low pressure ducts. Provide pressure test port at fan suction with positive closure.
4. Darkroom Hood Exhaust Ducts: All ducts from hoods to their terminal point shall be PVC. Material thickness and fabrication shall conform to the requirement prescribed hereinbefore.
5. All exposed round and flat oval ductwork (and concealed premanufactured ductwork indicated to be lined) shall be double-walled internally insulated duct with perforated internal liner, 1" acoustic insulation and paint grip or galvaneal coating on exterior. Provide all fittings and adapters to match lined duct. Insulation shall have K factor of 0.27 btu/hr./sq.ft./in./°F at 75°F mean temperature and minimum noise attenuation of 1.54 dB/ft. at a center frequency of 1000 Hz and 2000 fpm in 24" diameter duct. Ductwork shall be United McGill Acousti-K27 or approved equal. Joint mastic shall be totally concealed within fitting couplings.
6. (All exposed round and flat oval ductwork, concealed premanufactured ductwork indicated to be lined, all medium pressure supply ductwork (round, flat oval and rectangular) indicated to be lined and all return ductwork exposed outside shall be double-walled internally insulated duct with perforated internal liner, 1" acoustic insulation and paint grip

or galvaneal coating on exterior. Supply ductwork exposed outside shall be double-walled internally insulated duct with perforated internal liner, 2" thick acoustic insulation and paint grip or galvaneal coating on exterior. Provide all fittings and adapters to match lined duct. Insulation shall have K factor of 0.27 btu/hr./sq.ft./in./°F at 75°F mean temperature and minimum noise attenuation of 1.54 dB/ft. at a center frequency of 1000 Hz and 2000 fpm in 24" diameter duct. Ductwork shall be United McGill Acousti-K27 or approved equal. Joint mastic shall be totally concealed within fitting couplings. Refer to paragraph 2.02 O. for exterior exposed ductwork finish requirements.)

7. Provide a 4-inch diameter galvanized steel exhaust duct for all residential clothes dryers. Duct shall discharge outside the building and terminate with a weatherproof wall cap. Connection at wall shall be a recessed noncombustible metal wall box or wall receptacle. Coordinate exact location of wall box with dryer provided for flush installation of dryer to wall. Coordinate location with Owner where dryer is not in Contract. Wall box shall have paintable surface, shall have hidden nailing flanges, contain gas line connection when gas dryer is provided.
8. Where residential clothes dryer ducts are indicated to terminate through a flat roof, Contractor shall provide and install a roof jack, similar to the in-o-vate technologies DJK486U, and a minimum 12" tall insulated roof curb as specified for fans. Where residential clothes dryer ducts are indicated to terminate though a sloped roof, Contractor shall provide and install a roof jack, similar to in-o-vate technologies DJK486.

2.02 AIR DUCT ACCESSORIES

A. Access Doors:

1. Doors for low pressure rectangular ductwork shall be galvanized steel, 20 gauge rigid type, 12" X 16" minimum size unless noted otherwise, except where size of duct will not accommodate this size, they shall be as large as possible. Door shall have gasket, two hinges, and two compression latches with outside and inside handles. Provide insulated doors where installed in insulated ductwork.
2. Doors for round or flat-oval low, medium or high pressure ductwork shall be a complete factory mounted, duct section/access door assembly constructed of minimum 20 gauge galvanized steel. Access door shall match within two inches the diameter of duct and shall be complete with gasket, insulated door with handle, compression clips and chain retainer.

B. Fire dampers [S] shall be provided in accordance with the National Fire Protection Association Standard No. 90A. Dampers shall be UL 555 approved (for dynamic air systems), factory fabricated and assembled, and shall consist of 24 gauge, or heavier, interlocking curtain or rotating damper blades, fusible link and linkage, and 22 gauge, or heavier, galvanized steel frame. Dampers shall be tested for closure under airflow conditions and shall be labeled for maximum airflow and direction of flow. Where fire dampers are located in walls behind sidewall grilles, the fire damper shall be designed and UL listed for flush installation of the grille. Where fire dampers are located in watertight ductwork, fire dampers shall be constructed of 304 stainless steel; all duct/sleeve connections shall be sealed watertight with sealant in accordance with the terms of the UL Listing. Entire unit shall be securely anchored in structure where opening is made. Free area of fire damper for medium/high velocity ducts shall equal the cross section area of duct in which installed. Free area of fire damper for conventional velocity ducts shall be not less than 75% of the cross section area of duct in which installed. Dynamic fire dampers shall be rated for velocities up to 2000 fpm and pressures up to 4.0 in. wg. Fire dampers shall be furnished to the job site with instructions detailing UL approved installation method.

C. Radiation (Fire) Dampers [S] shall be UL 555C Classified for use in U.L. Fire Rated Floor/Ceiling and Roof/Ceiling assemblies to provide fire and heat protection where HVAC ducts and air devices penetrate the ceiling portion (rated gypsum board or rated acoustic tile) of the assembly or the rated portion of wooden joist protection for a Through Ceiling Membrane Penetration. Ceiling Radiation Dampers shall be selected in accordance with the size of the opening to be protected. Damper units shall consist of a minimum 24 gauge galvanized steel frame and minimum 24 gauge blades as required for the area of the opening. Blades shall be

protected with U.L. Classified insulation as required and shall contain no asbestos. Fusible links shall be rated for 165°F. Where the ceiling opening is larger than the ceiling radiation damper, a U.L. classified insulating blanket shall be provided to cover the entire space between the radiation damper and the ceiling system. Ceiling Radiation Dampers shall be furnished to the job site with instructions detailing U.L. approved installation method.

D. Gravity dampers shall be Airline type CBD counter balanced back draft damper constructed of felt edged aluminum blades. Set to open at .10" H2O. Maximum leakage rate shall be 20 cfm/ft2 at 1.0 inch water gauge when tested in accordance with AMCA 500D.

E. Dampers:
   1. General:
      a. Fabricate of galvanized steel.
      b. Where manual dampers occur behind or above finished portions of hard ceilings or walls, a remote cable operated damper by Young Regulator Co. shall be provided.
      c. Where dampers are located in accessible spaces, operators shall be locking type quadrant operators. Quadrant operators shall be installed on 1-1/2" high 4 bend galvanized steel bracket so that duct insulation may be extended and sealed under the quadrant operator.
      d. End of damper rod on each damper shall be grooved to show damper position.

F. Manual Volume Dampers shall be Ruskin model MD35, opposed blade multi-louver (single blade for dampers under 11" nominal) construction 16 gauge minimum with molded synthetic or stainless steel bearings, galvanized channel iron frame and maximum blade width of 8 inches. Axles shall be positively locked into blades to prevent slippage or loosening. Damper blades shall be interlocking type with linkage, control shaft, and standoff locking regulator (Rossi Everlock, Elgen Super Standoff, or Windgate Sure-Loc HD).

G. Rectangular branch take-off connections from mains shall be made using 45 degree entry fittings per SMACNA 1995 figure 2-6. Grille and register connections to mains shall be made using 45 degree entry fittings where space allows. Where diffuser, register or grille is located too close to the main, air deflectors shall be used. Air deflectors shall be factory fabricated. Adjustable deflectors shall be complete with worm gear operator when behind grilles, an extension rod and concealed regulator when above plaster ceilings, or self-locking lever type regulator when accessible. Locking regulator shall be Rossi Everlock, Elgen Super Standoff, or Windgate Sure-Loc HD.

H. Instrument Test Holes: Holes, with patches, in ducts and plenums shall be provided where directed or necessary for using pitot tubes for taking air measurements for balancing the air systems. At locations where ducts or plenums are insulated and on all medium and high pressure ductwork die cast collars with threaded neoprene caps shall be provided.

I. Apparatus Connections: At points where sheet metal connections are made to fans or where ducts of dissimilar metal are connected, provide a flexible connection of neoprene coated canvas of sufficient length to eliminate transmission of vibration. Flexible connections shall be securely fastened and air tight.

J. Duct Sleeves: Provide sleeved openings for all ducts, except where sleeves are furnished as part of a listed fire damper, smoke damper, or combination fire-smoke damper assembly. Sleeves for wall openings shall be 1 inch larger than the overall duct dimensions. Sleeves for floor openings shall be 1/4 inch larger than the overall duct dimensions. Fill the annular space between the duct or duct insulation and the sleeve full depth with mineral-fiber rope insulation. Where penetrations occur in assemblies required to maintain a fire-resistance rating, smoke resistance, or both, provide penetration-sealing materials and installation methods required to maintain the rating and integrity of the construction. Seal penetrations through corridor walls, smoke partitions, and draftstop partitions as required to maintain the integrity of the construction. Where fire dampers or combination fire-smoke dampers are required, provide sleeves sized to suit the damper assembly and install dampers in accordance with the damper manufacturer's listed installation instructions and applicable listing requirements. Do not install

packing, sealant, or firestopping materials at damper sleeves unless specifically permitted by the listed installation. In finished areas, provide flanges at each opening; flanges shall be constructed of 20-gauge galvanized sheet metal and shall be not less than 3 inches wide.

K. Prefabricated curbs shall be provided where ductwork above roof penetrates roof surface, sized to match ductwork and duct supports. Curbs shall be insulated type, 12 inches high complete with mounting flange and integral cant strip where acceptable to roofing manufacturer. Outer shell shall be mitered and welded continuously to form a rigid leakproof shell; inner shell shall be solid metal similarly constructed. Wood nailing strips shall be bolted to top of curb shell to provide means for securing flashing material to the curb. Curb shall be constructed of galvanized steel. Ductwork and insulation cover shall be counterflashed to the curb. Curb sidewalls shall be fully insulated to minimum R-5. Top of curb shall be gasketed for airtight fit of rooftop unit.

L. High Efficiency Take Offs (HETOs) [S] shall be 24 gauge G90 galvanized steel, welded and riveted construction. Each fitting shall have conical bell-mouth duct fitting, locking groove, insulation guard, adjustable damper with 3/8" square shaft, u-bolt, nylon bushings, and standoff locking regulator (Rossi Everlock, Elgen Super Standoff, or Windgate Sure-Loc HD).

M. All wire mesh, woven metal fabric, bird screens, and similar items shall be constructed from corrosion resistant, galvanized steel or aluminum.

N. (All ductwork exposed above the roof shall be field-coated with water-based fluid-applied material that incorporates heat reflecting, refracting, and dissipating ceramic particles in durable and adhesive coating, equal to ASTEC #900. Coating shall be applied in strict accordance with the manufacturer's instructions, to a minimum total dry film thickness of 12 mils.)

O. (Acoustic Lining [S]: Fiberglass insulation, 0.26 btu/in./sq.ft./°F./hr. maximum "K" value at 75°F, absolute roughness of exposed surface shall not exceed 0.005 ft., coated to prevent erosion at air velocities up to 2000 fpm, 1.5 lbs/cu. ft. minimum density. Noise reduction co-efficient shall average not less than 0.60 when tested by Acoustical Material Association procedure mounting 6. Liner shall be provided with EPA approved biocide in the erosion coating to protect against microbial growth. Liner shall meet or exceed requirements of ASTM G21 (fungi resistance) and ASTM G22 (bacterial resistance). Acoustic lining shall be one inch thick unless specifically noted otherwise.)

P. (Acoustic Lining: See Section 23 07 00.)

2.03 HVAC FANS [S] [O/M]

A. Roof fans and sidewall fans shall be equal to model indicated, roof or sidewall vent type, power exhaust fans having backward curved composite, aluminum, or steel blade centrifugal fan, directly connected as indicated to motor in fully enclosed air cooled motor compartment, outside of exhaust air stream. Fan and motor housing shall be aluminum. Provide electronically commutated motors (ECM) for all fans unless otherwise noted. ECM motor shall be suitable for connection to DDC system specified in 23 09 00 where required. All ECM motors shall be complete with means to adjust the speed of the fan either through the DDC system or at the fan. All ECM motors shall be speed controllable down to 20% of full speed (80% turndown). ECM motor shall be a minimum of 85% efficient at all speeds. Each fan shall be complete with bird screen and motor operated dampers. Each fan shall be tested and rated in accordance with AMCA Standard #210. Each fan motor shall be factory wired to a terminal strip mounted in a junction box attached inside the motor housing. A weather resistant switch or disconnect, with thermal overload, shall be provided in wiring between the terminal strip and motor connection. A thermally protected motor is NOT an acceptable alternative. Where a disconnect switch with thermal overload is not available from the manufacturer, the Contractor shall provide and install the necessary circuit protection. All motor operated damper actuators shall be coordinated to operate off the same electrical circuit as the associated fan, transformers shall be provided as required. (Explosion-proof motor and non-sparking wheel shall be provided where indicated.) (Fans indicated for fume service shall have all parts coated with a corrosion resistant finish

suitable for service indicated. Shop drawings shall include a letter from the factory stating the name of finish to be used and the suitability of the finish for service indicated.) (Multi-speed motors shall be provided where indicated.)

B. Centrifugal fans shall be Vent Set type with centrifugal fan wheel direct connected to motor. Fan and motor shall be mounted on a common base. Fan wheel shall be steel. Rubber in shear type vibration isolators shall be provided for entire unit. Motors shall be open drip proof sleeve bearing type.

C. In-Line fans shall be straight through blower complete with backward curved non-overloading steel or aluminum blades, direct drive, motor mounted out of the airstream, square steel enclosure, (rubber in shear vibration isolators) and disconnect switch with thermal overload wired to motor. Unit shall be suitable for mounting at any angle. Bearings shall be pre-lubricated and sealed at the factory. Power unit shall be accessible without disconnecting ductwork. (Entire unit shall be finished with baked on epoxy paint.) All motor operated damper actuators shall be coordinated to operate off the same electrical circuit as the associated fan, transformers shall be provided as required. Verify duct size at installation location.

D. Kitchen hood exhaust fan shall be upblast type of spun aluminum construction with backward inclined or airfoil blades, containing a built-in grease trough with grease collection pan, and having a motor compartment completely isolated from airstream. A weather resistant switch or disconnect with thermal overload shall be provided in wiring between the terminal strip and motor connection. Fan shall be U.L. 705 and U.L. 762 listed for grease removal and shall have a non-sparking wheel. Fan shall be hinged at or above the curb to allow inspection and cleaning of the inside of the fan and ductwork. Provide safety cable as required by the weight of the equipment.

E. Bathroom exhaust fans shall be equal to Nutone complete with aluminum inlet grille, fan and motor, (solid state variable speed controller with positive off,) discharge duct, backdraft damper in discharge outlet and (wall) (roof) cap.

F. Ceiling exhaust fans shall be complete with aluminum inlet grille with white finish coat, twin wheeled power unit with shaded pole motor, acoustic line steel housing with integrally wired junction box and disconnects for fan motor, (solid state variable speed controller with positive off,) and backdraft damper in discharge outlet.

G. Roof type supply fans shall be of model indicated, down discharge type, having (centrifugal) (propeller blade) fan directly or belt connected as indicated to motor. Fan and motor housing shall be steel or aluminum. Each fan shall be complete with bird screen, filters and motor operated dampers. Each fan shall be tested and rated in accordance with AMCA Standard #210. Each fan motor shall be factory wired to a terminal strip mounted in a junction box attached inside the motor housing. A weather resistant switch or disconnect with thermal overload shall be provided in wiring between the terminal strip and the motor connection. (Explosion-proof motor and non-sparking wheel shall be provided where shown.) (Multi-speed motors shall be provided where shown.)

H. All motor operated dampers shall be Class 1A with maximum leakage rate of 4 cfm/ft2 at 1.0 inch water gauge when tested in accordance with AMCA 500D.

I. Prefabricated curbs shall be insulated type, 12-14 inches high complete with mounting flange, integral cant strip, and rack or flange to support dampers. Outer shell shall be mitered and welded continuously to form a rigid leakproof shell, inner shell shall be solid metal similarly constructed. Wood nailing strips shall be bolted to top of curb shell to provide means for securing flashing material to the curb. Curb shall be constructed of (aluminum) (galvanized steel). Curb sidewalls shall be fully insulated to minimum R-5. Top of curb shall be gasketed for airtight fit of rooftop unit.

J. See PART 1 for spare parts requirements.

2.04 AIR OUTLETS AND INLETS [S]:

A. Acceptable Manufacturers:
   1. Standard Products: Price, Metal Industries, Krueger, Tuttle and Bailey, and Titus.
   2. Stainless Steel Products: Price, Keyes, and Anemostat.
   3. Security Products: Price, Metal Industries, Krueger, Keyes and Titus.

B. General:
   1. All devices shall be commercial grade and shall be constructed of steel or aluminum as indicated on the drawings.
   2. Manufacturer shall certify cataloged performance and ensure correct application of each air device to provide air pattern, velocity, pressure drop and sound characteristics NC suitable for space installed. Shop drawings shall include a fully itemized list of each devices air quantity, size, accessories, border style, pressure drop, throw ft, and sound level NC. Inclusion of the manufacturers catalog data is not acceptable. Shop Drawings without this information will not be reviewed.
   3. All devices located in ceilings shall have white baked enamel finish. Devices at other locations shall have prime finish suitable for painting or anodized aluminum unless noted otherwise.
   4. Maximum air outlet noise level shall not exceed NC25. Where the indicated size does not allow for an NC25, provide next largest size device. Where device in question is a linear slot diffuser, the number of slots shall be increased while holding the specified slot width and diffuser width the same.
   5. Provide sponge rubber seal around edges of all supply registers and grilles.
   6. All border styles shall be coordinated with the ceiling and\or wall in which they are installed. Where a discrepancy exists in the Drawings, the border type most suitable for the ceiling\wall type shall be submitted and discrepancy noted in the submission.

C. Diffusers:
   1. Round ceiling diffusers shall be adjustable fixed louver faced perforated (surface) (recess) mounted type complete with equalizing grid, volume control unit and anti-smudge ring.
   2. Square ceiling diffusers shall be welded steel or aluminum as indicated on the drawings, removable core, louver face, complete with volume control unit and adjustable vanes for down-discharge pattern.
   3. Strip diffusers shall be extruded aluminum adjustable pattern, recessed type complete with volume control, mounting frames, mounting yokes, mounting strips and accessories.
   4. Light troffer diffusers shall be (single) (double) plenum type constructed of galvanized steel low profile oval side inlet, 1/2” internal acoustical insulation, with damper and air pattern blade. Diffusers shall be finished matt black inside and shall be matched and coordinated with lighting fixtures specified in Section ELECTRICAL WORK.
   5. Drum Louvers shall be extruded aluminum adjustable pattern, recessed type complete with volume control, mounting frames, mounting yokes, mounting strips and accessories.
   6. Variable Air Volume Ceiling Diffusers shall be a complete thermally powered diffuser suitable for lay-in installation in a 24x24 exposed grid ceiling system. Diffusers shall sense room air temperature using induction of room air to a concealed thermal element. Diffusers shall have removable cover with all controls accessible from the unit face. Diffuser shall include one thermal changeover element, at least one thermal room element for heating and cooling, adjustable setpoint from 70 to 78°F and modulating diffusion blades or modulating damper to provide a complete self-contained installation. Diffusers shall alternately provide VAV cooling with VAV heating or constant volume heating unit (complete with appearance panel matching surrounding ceiling) to provide a complete self-contained installation.

D. Registers and Grilles:
   1. Return and exhaust registers shall be aluminum, unless noted otherwise, complete with 45 degree fixed airfoil vanes at not more than 1/2 inch centers. Provide 1 or 1-1/4 inch margin, 1/8 inch beveled frame with concealed screw holes. Damper shall be opposed blade face operated type with removable key. Units on watertight ducts shall be all

polished stainless steel or aluminum with baked enamel finish, including damper, linkage, core and frame.

2. Return or exhaust registers (floor mounted) shall be extruded aluminum linear grille with 0° fixed deflection grille bars. Grille bars shall be spaced at not more than 7/16 inches on center. Grille shall be complete with 1" margin frame with countersunk screw holes. Damper shall be factory mounted opposed blade face operated type with removable key.
3. Return Filter grilles shall be heavy duty aluminum with fixed horizontal blades spaced at 1/2" centers and set 45°. Blades shall run parallel to the long dimension of the grille. The mounting frame shall be designed to accept a standard one-inch filter media.
    a. The border shall be mounted to the filter frame with 1/4 turn quick-release fasteners. Filter shall be accessible from the face to allow easy cleaning or replacement. Filter efficiency shall be MERV-(4)(8)(13) and the filter type shall be (pleated)(panel).
4. Bottom registers in gymnasium shall be heavy duty steel to withstand abuse. Fixed horizontal vanes shall be minimum 14 gauge spaced on maximum 1/2" centers, and set at 38°. Vanes shall be set in heavy steel support bars at maximum 8 inch centers. Provide 1-1/4 inch margin steel frame and countersunk or concealed screw holes. Damper shall be opposed blade face operated type with removable key.
5. Supply Registers:
    a. Sidewall supply registers shall be aluminum complete with removable, reversible double deflection core and fixed horizontal or longitudinal deflecting vanes at not more than 1/3 inch centers. Provide 1 or 1-1/4 inch margin frame 1/8 inch beveled frame or 3/16 to 1/4 inch curved frame with concealed screw holes. Damper shall be opposed blade face operated type with removable key. Units shall be provided with core removal tools which shall be turned over to the Owner. Front row of deflection blades shall be horizontal.
    b. Ceiling supply registers shall be one, two, three or four way deflection as indicated on plans and shall have adjustable curved blades to discharge air along ceiling, 1-1/4" inch margin frame with countersunk screw holes and opposed blade face operated damper with removable key.
6. Grilles shall be as specified for registers except without opposed blade dampers.
7. All registers and grilles installed in a wall shall be provided with front blades parallel to the floor. Those installed in the ceiling shall have front blades parallel to the long dimension.

2.05 WALL LOUVERS [S]:

A. Louvers shall be stationary, stormproof units constructed of (16 gauge galvanized steel) (0.081" extruded aluminum) complete with 1/2" mesh matching bird screen in removable frame and extended sill. Blades shall be "S" or "K" shape spaced 3 1/4" - 4" O.C. Finish shall be (prime coat for field finish coat) (baked enamel) (mill finish) (anodized), color as selected by Architect. Pressure drop shall not exceed 0.10 inch H_2O at 700 fpm and water penetration shall not exceed 0.01 oz./sq. ft. at 500 fpm when tested in accordance with AMCA Standard 511, and shall be licensed to bear the AMCA seal. (All project louvers shall be provided under this Section. See Architectural Drawings for louvers not shown on Mechanical Drawings, at gables, elevator vents, smoke vents and similar areas.)

2.06 ROOF VENTS [S]:

A. Roof vents shall be provided by same manufacturer as roof fans and have same finish for matching appearance. Roof vents shall be louvered penthouse constructed of (16 gauge galvanized steel) (18 gauge extruded aluminum) suitably braced to prevent twisting and complete with 1/2" mesh matching bird screen and curb cap flashing. Finish shall be (prime coat) (baked enamel) (mill finish) (anodized) color as selected by Architect. (Provide motor-operated dampers with actuator where indicated.) Prefabricated curbs shall be insulated minimum R-5, minimum 12" high, provided complete with mounting flange, integral cant strip and rack or flange to support dampers. Outer shell shall be mitered and welded continuously to form a rigid leakproof shell, inner shell shall be solid metal similarly constructed. Wood nailing strips shall be bolted to top of curb shell to provide means for securing flashing material to the curb. Curb shall be constructed of same material as roof vent.

2.07 VENTILATION HOODS [S] [O/M]:

A. Kitchen Hood Make-Up and Exhaust System

1. General: The kitchen hood make-up and exhaust system shall be an integrated, packaged unit and shall include a make-up air unit, exhaust fan, exhaust hood, ductwork and controls. Shop drawings for this system shall be submitted as one package.
2. Make-Up Unit:
   a. General: Make-up unit shall be horizontal roof mounted (down) (side) discharge type, complete with forward curved centrifugal fan, electric heating coil, V-type filter section, rain hood, motorized inlet dampers, fan motor and adjustable V-belt drive, disconnect switch wired to motor, and access doors.
   b. Casing of the unit shall be of heavy gauge, rust protected steel, welded, and provided with easily removable access panels located on the side of the unit. Entire unit casing shall have a minimum of 1 inch thick thermal insulation.
   c. Heating coils are specified in Section 23 80 00.
   d. Filters shall be UL listed two inch thick throwaway type complete with filter frames, holding racks and clips. Filters shall be removable from either side of unit. Filter face velocity shall not exceed 350 fpm.
   e. Fans shall be double width, double inlet, centrifugal type. Fans shall be statically and dynamically balanced, after unit assembly, at the factory. Fans shall be mounted on steel shaft, and supported in ball type bearings with lubrication facilities extended to the motor side of the unit. Fans shall be driven by a unit mounted motor and V-belt drive. Belt drives shall be designed for at least 150% of the connected motor capacity, and sheaves shall be adjustable to provide at least 20% speed variation. Sheaves shall be selected to drive the fan at such speed to produce the specified capacity when set at its approximate midpoint.
   f. Equipment supports shall be 18 gauge galvanized steel complete with wooden nailer.
3. Supply Fan shall be (down) (side) discharge type, double width, double inlet, centrifugal type with forward curved blades. Fan shall be driven by a unit mounted motor and V-belt drive. Casing shall be constructed of galvanized steel and shall include 1” thick permanent cleanable filters, motor operated dampers, and a weather tight removable top for access. Motor operated dampers shall be Class 1A with maximum leakage rate of 4 cfm/ft2 at 1.0 inch water gauge when tested in accordance with AMCA 500D.
4. Exhaust fan shall be upblast type of spun aluminum construction with backward inclined or airfoil blades, containing a built-in grease trough with grease collection pan, and having a motor compartment completely isolated from airstream. Fan shall be U.L. 705 and U.L. 762 listed for grease removal and shall have a non-sparking wheel.
5. Exhaust hood shall be UL listed with a supply fire damper and shall meet all requirements of NFPA #96, UL and applicable building codes and shall be constructed of 18 gauge stainless steel with all seams and joints having a liquid tight external weld. The stainless steel shall have a180 grit finish and all joints shall be ground smooth and polished. The hood shall have a stainless steel filter housing, complete with UL listed extractors the full length of the housing and sized for the air quantity indicated. This housing shall terminate at the bottom with a pitched drip tray full length of the hood. The tray shall be easily removable for cleaning. The area of the hood below the filter housing shall have an enclosed chase for the fire protection system. Vapor-proof lights shall be installed on three to four foot centers completely wired and ready for an external power source. The lower front edge of the hood shall be furnished with a stainless steel air supply slot with adjustable straightening vanes and opposed blade dampers suitable for shut-off duty. (Stainless steel face registers with opposed blade dampers shall be furnished on the outer side walls of the hood to permit the supply of air into the kitchen area.) Hoods shall be mounted at 80” above floor and a minimum of 2’-0” above the cooking surface, or as indicated by the terms of the hood’s UL listing. Stainless steel filler skirts matching the hood shall be provided between the hood and ceiling where ceilings are higher than top of hood. Filler skirts shall be fully welded with flanged edges, bolted to hood.

6. Controls shall be a complete factory-furnished package including fuses, interlocks, switches, safety devices and all wiring required to interlock the make-up unit, exhaust fan and canopy mounted control station. (The electric heating section shall be complete with a minimum of steps of control, flow switch, discharge thermostat and thermal cutout.) The canopy mounted controls station shall have fan (and heater) switches with pilots, and canopy light switch, (and an adjustable thermostat control capable of resetting the make-up air discharge temperature.) A heat sensor with control relay shall be provided to energize the system upon detection of heat under the hood.
7. Fire Protection System: Furnish in canopy specified above, a wet chemical system, providing complete fire protection of duct, plenum and surface equipment. Installation to be in compliance with chemical manufacturer's UL listing. All piping run in hood to be concealed in a chase. Piping extending up through chase to duct and plenum nozzles fitted with sleeves, forming grease-tight joint. Provide chase openings for extending piping to surface nozzles. Chase to be fitted with removable panel for making field joints and final connections. Exposed piping of surface protection nozzles shall be schedule 40 stainless steel pipe with chrome plate elbows. System shall be activated by fusible links connected to automan release. Fit automan release with electric micro switch and wire from switch to a reset relay mounted on side of automan release. Provide fuel supply shut off in accordance with applicable codes. Gas fuel shut off valves to cooking appliances shall be provided as part of the Fire Protection System. All electric fuel shut off devices to cooking appliances and wiring by (others) (Division 26). Furnish and install a remote manual fire pull and integrate into system. Provide microswitch with dry contacts for energizing the hood exhaust fan (and de-energizing the make-up air unit). At time of installation, an authorized dealer of the chemical system shall complete and certify the system.
8. Roof Curbs shall be provided for the make-up and exhaust duct roof penetrations. Prefabricated curbs shall be insulated type minimum R-5, minimum 12 inches high complete with mounting flange and integral cant strip. Outer shell shall be mitered and welded continuously to form a rigid leakproof shell, inner shell shall be solid metal similarly constructed. Wood nailing strips shall be bolted to top of curb shell to provide means for securing flashing material to the curb. Curb shall be constructed of (aluminum) (galvanized steel) and shall be sized to support exhaust fan discharge a minimum of 40 inches above the roof surface.
9. See PART 1 for spare parts requirements.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Duct clearance and lengths shall be established from measurements taken at the job site before any ducts are fabricated.

B. Provide openings in ductwork where required to accommodate thermometers and controllers. Provide pitot tube openings where required for testing and balancing of system. Where exhaust ducts are installed within a chase or shaft, pitot tube shall extend to the outside of the chase or shaft and be capped.

C. Locate ducts with sufficient space around equipment to allow normal passage, and operating and maintenance activity.

D. Locate all ductwork to align with the ceiling grid where connections are to be made to Diffusers, Registers and Grilles. Field verify exact grid location before installing ductwork.

E. Locate all Diffusers, Registers and Grilles as indicated on plans and in accordance with the Reflected Ceiling Plans, if provided.

F. Provide low loss factory fabricated fittings for all round take-off connections to low velocity rectangular ducts.

G. All Flex duct shall be properly supported to prevent any short radius bends or kinks. Connections to diffusers shall be made using long radius bends or elbows with turning vanes to ensure that airflow is distributed evenly across the neck of the diffuser. Conditions that create higher airflows in one quadrant of diffuser throw are not acceptable. Maximum flex duct runout length shall be 5 feet. Flex duct shall not penetrate wall construction of any type.
   1. Flex duct clamps shall be Thermaflex Snaplock Clamp or equal using minimum ½" wide stainless-steel band with cadmium plated hex bolt to tighten band with worm-gear action.

H. Install duct accessory items in accordance with manufacturers printed instructions.

I. Install volume, smoke and fire dampers where shown on plans.

J. Manual volume dampers shall be installed at all branch connections, divided flow branches, and end-of-run diffuser/register connections for low pressure supply, return, and exhaust duct systems. Manual volume dampers shall be installed within 3 feet of the main duct.

K. Provide access doors at all automatic dampers, fire/smoke dampers, duct heaters, duct mounted coils, thermostats and at all other points requiring inspection or servicing. Duct access doors for fire and smoke dampers shall be permanently labeled with minimum 1/2 inch high letters reading FIRE DAMPER or SMOKE DAMPER. Labeling shall be as specified for equipment nameplates under Section 23 05 53.

L. Fire dampers shall be UL listed for the type assembly in which they are installed.

M. All grease exhaust ductwork shall be sloped downward to the hood or an approved receptacle at not less than 1/4 inch per foot.

N. Where clothes dryer exhaust duct is installed concealed within the building construction, a label shall be provided indicating the equivalent length of the exhaust duct. The label shall be located within six feet of the duct connection. Where dryer exhaust duct is concealed within walls or behind hard ceilings, shield plates shall be installed between the duct and the finished face of the framing members to prevent damage from nails or screws. Coordinate dryer wall box with baseboard molding and masonry coursing as applicable.

O. All watertight ductwork shall be sloped downward to the air inlet or to a waterstop with drain tube. Slope shall be not less than 1/4 inch per foot.

P. Connection of horizontal ducts to rooftop exhaust fans shall be made using radiused elbows or mitered elbows with turning vanes. Duct transitions shall be as hereinbefore specified.

Q. Ductwork installed or stored on site shall be protected such that open ends are covered to prevent construction dust and debris and other foreign matter from being introduced into the duct systems. If at any time during construction, dust or debris is discovered within the duct systems or ducts openings are observed to be unprotected, the Contractor will be responsible for properly cleaning all duct systems in accordance with NADCA procedures for the respective type of ductwork.

R. Grille, Register and Diffuser Installation:
   1. Boots to diffusers shall fit airtight to diffuser necks and diffusers shall be securely fastened thereto.
   2. Where grilles are installed at walls or ceilings, the duct shall be fastened securely to the masonry or panel at each side of the opening and the grille shall be securely fastened snug against the masonry or panel.
   3. If flanged grille frames are used on exposed ducts, runout shall be same size as outside dimension of flange and full depth of register assembly.
   4. Unless otherwise indicated in the Contract Documents, sidewall grilles and registers to be installed high shall be installed within 6 inches of the ceiling or nearest overhead projection. Unless otherwise indicated in the Contract Documents, sidewall registers and or grilles to be installed low shall be installed within 6 inches of the floor, but shall be coordinated with cove or base molding. Sidewall registers shall also be coordinated with the block coursing where applicable.

5. Air saddles shall be installed on the light fixtures at the time the light fixture is installed. Air passage knockouts in air handling light fixtures, shall be punched out as required. Cooperation with electrical trade is required.
6. Ceiling diffusers shall be installed in and coordinated with the ceiling tile or other ceiling units. Diffusers, Registers and Grilles shall be centered in each ceiling unit, unless shown otherwise. Mounting frames shall be installed as required to support diffusers, registers and grilles. Grilles, registers and diffusers shall not be supported from the ceiling system, conduit, piping or unrelated ductwork.

S. (Patching: Where existing control, monitoring or other penetrating devices are removed from ductwork, the opening shall be patched to match thickness, type and finish of existing ductwork, and sealed airtight.)

3.02 DUCT CLEANING:

A. Clean (new)(existing-to-remain) (supply)(return)(exhaust) duct systems before testing, adjusting, and balancing.

B. Use service openings for entry and inspection.
1. Create new openings and install access panels appropriate for duct static-pressure class if required for cleaning access. Provide insulated panels for insulated or lined duct. Patch duct as recommended by duct manufacturer. Comply with paragraph "Air Duct Accessories" in this Section for access panels and doors.
2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.
3. Remove and reinstall ceiling to gain access during the cleaning process.

C. Particulate Collection and Odor Control:
1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron-size (or larger) particles.
2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.

D. Clean the following components by removing surface contaminants and deposits:
1. Air outlets and inlets (registers, grilles, and diffusers).
2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
4. Coils and related components.
5. Return-air ducts, dampers, actuators, and turning vanes except in ceiling plenums and mechanical equipment rooms.
6. Supply-air ducts, dampers, actuators, and turning vanes.
7. Dedicated exhaust and ventilation components and makeup air systems.

E. Mechanical Cleaning Methodology:
1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of ducts or duct accessories.
4. Clean fibrous-glass duct with HEPA vacuuming equipment; do not permit duct to get wet. Replace fibrous-glass duct that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.

5. Clean coils and coil drain pans according to NADCA 1992. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
6. Provide drainage and cleanup for wash-down procedures.
7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents according to manufacturer's written instructions after removal of surface deposits and debris.

F. Source-Removal Cleaning Methods: The HVAC system shall be cleaned using source-removal mechanical cleaning methods designed to extract contaminants from within the HVAC system and to safely remove these contaminants from the facility. No cleaning method, or combination of methods, shall be used that could potentially damage components of the HVAC system or negatively alter the integrity of the system.
   1. Use continuously operating vacuum-collection devices to keep each section being cleaned under negative pressure.
   2. Cleaning methods that require mechanical agitation devices to dislodge debris that is adhered to interior surfaces of HVAC system components shall be equipped to safely remove these devices. Cleaning methods shall not damage the integrity of HVAC system components or damage porous surface materials such as duct and plenum liners.

G. Cleaning Mineral-Fiber Insulation Components:
   1. Fibrous-glass thermal or acoustical insulation elements present in equipment or ductwork shall be thoroughly cleaned with HEPA vacuuming equipment while the HVAC system is under constant negative pressure and shall not be permitted to get wet according to NADCA ACR 2006.
   2. Cleaning methods used shall not cause damage to fibrous-glass components and will render the system capable of passing the HVAC System Cleanliness Tests (see NADCA ACR 2006).
   3. Fibrous materials that become wet shall be discarded and replaced.

H. Duct System Cleanliness Tests:
   1. Visually inspect duct system to ensure that no visible contaminants are present.
   2. Test sections of metal duct system, chosen randomly by Owner, for cleanliness according to "Vacuum Test" in NADCA ACR, "Assessment, Cleaning and Restoration of HVAC Systems."
   3. Acceptable Cleanliness Level: Net weight of debris collected on the filter media shall not exceed 0.75 mg/100 sq. cm.
   4. Duct system will be considered defective if it does not pass tests and inspections.
   5. Prepare and submit test and inspection reports.

3.03 DUCT SCHEDULE:

A. All ductwork shall be fabricated, installed, sealed, and tested in accordance with the schedule below. All testing shall be in accordance with the latest edition of the SMACNA HVAC Air Duct Leakage Test Manual.
   1. Testing shall be conducted and the results approved by the Architect/Engineer prior to the application of insulation.
   2. The Architect/Engineer shall be notified one week prior to conducting the test. Unless specifically waived, the Engineer and Owner reserve the right to witness the test. Final, signed and dated test results shall be documented as outlined in SMACNA HVAC Air Duct Leakage Test Manual and submitted to the Architect/Engineer.

B. Supply Ductwork
   1. Medium pressure (to include all ductwork upstream of VAV boxes):
      a. Pressure Class: Positive 6” w.g.
      b. Seal Class: A
      c. Leakage Class for Round Duct: 3
      d. Leakage Class for Rectangular Duct: 6

e. Testing Requirement: 100%

2. Low pressure duct downstream of VAV boxes:
   a. Pressure Class: Positive 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 12
   d. Leakage Class for Rectangular Duct: 12
   e. Testing Requirement: 25%
3. Low pressure duct connected to air handling units, energy recovery units, and rooftop air conditioning units/heat pumps in excess of 5 tons:
   a. Pressure Class: Positive 3” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 6
   d. Leakage Class for Rectangular Duct: 6
   e. Testing Requirement: 25%
4. Low pressure duct connected to cabinet unit heaters, fan coil units, and heat pumps - 5 tons or less:
   a. Pressure Class: Positive 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 12
   d. Leakage Class for Rectangular Duct: 12
   e. Testing Requirement: N/A
5. Ductwork located outdoors:
   a. Pressure Class: Positive 6” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 3
   d. Leakage Class for Rectangular Duct: 6
   e. Testing Requirement: 100%
6. Ductwork connected to equipment not listed above:
   a. Pressure Class: Positive 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 12
   d. Leakage Class for Rectangular Duct: 12
   e. Testing Requirement: N/A

C. Return Ductwork:

1. Ductwork located outdoors:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 6
   d. Leakage Class for Rectangular Duct: 6
   e. Testing Requirement: 100%
2. Ductwork located in unconditioned spaces or fully ducted systems located above ceiling:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 12
   d. Leakage Class for Rectangular Duct: 12
   e. Testing Requirement: 10%
3. Ductwork exposed in conditioned spaces or installed in ceiling return plenums:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 24
   d. Leakage Class for Rectangular Duct: 24
   e. Testing Requirement: N/A
4. Ductwork connected to cabinet unit heaters, fan coil units, or heat pumps – 5 tons or less:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: A

c. Leakage Class for Round Duct: 12
d. Leakage Class for Rectangular Duct: 12
e. Testing Requirement: N/A

5. Ductwork connected to equipment not listed above:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 12
   d. Leakage Class for Rectangular Duct: 12
   e. Testing Requirement: N/A

D. Exhaust Ductwork:

1. Ductwork located outdoors:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 6
   d. Leakage Class for Rectangular Duct: 6
   e. Testing Requirement: 100%
2. Negative pressure general exhaust:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 12
   d. Leakage Class for Rectangular Duct: 12
   e. Testing Requirement: N/A
3. Positive pressure general exhaust:
   a. Pressure Class: Positive 2” w.g.
   b. Seal Class: A
   c. Leakage Class for Round Duct: 12
   d. Leakage Class for Rectangular Duct: 12
   e. Testing Requirement: 10%
4. Fume exhaust:
   a. Pressure Class: Negative 6” w.g.
   b. Seal Class: Welded
   c. Leakage Class for Round Duct: 3
   d. Leakage Class for Rectangular Duct: 3
   e. Testing Requirement: 100%
5. Watertight and dishwasher hood exhaust:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: Welded
   c. Leakage Class for Round Duct: 3
   d. Leakage Class for Rectangular Duct: 3
   e. Testing Requirement: N/A
6. Grease Duct:
   a. Pressure Class: Negative 2” w.g.
   b. Seal Class: Welded
   c. Leakage Class for Round Duct: 3
   d. Leakage Class for Rectangular Duct: 3
   e. Testing Requirement: 100% Light test (or other test approved by the Code Official in accordance with local and state codes).

3.04 FANS:

A. Coordinate roof opening and locations with structural system.

END OF SECTION

SECTION 23 8000

DECENTRALIZED HVAC EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY:

A. Related Documents: Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Work Included:

1. Split System Heat Pump Units
2. Ductless Split System Air Conditioners
3. Heating and Cooling Coils
4. Gas Detection System
5. Miscellaneous Appurtenances

C. Related Sections:

1. Division 01 -- Commissioning
2. Section 23 00 10 – HVAC General Requirements
3. Section 23 05 00 – Common Work Results for HVAC
4. Section 23 05 53 – Identification for HVAC Piping and Equipment
5. Section 23 05 93 – Testing, Adjusting, and Balancing for HVAC
6. Section 23 09 00 – Instrumentation and Control for HVAC
7. Section 23 20 00 – HVAC Piping and Pumps
8. Section 23 30 00 – HVAC Air Distribution

1.02 REFERENCES:

A. General: The following standards or codes form a part of this specification to the extent indicated by the reference thereto.

B. Air Moving and Conditioning Association, Inc. (AMCA):

Bulletin 210	Standard Test Code for Air Moving Devices

C. Air Conditioning and Refrigeration Institute (ARI):

Standard 210	Standard for Unitary Air Conditioning Equipment
Standard 240	Standard for Unitary Heat Pump
Standard 310	Standard for Packaged Terminal Air Conditioners
Standard 410	Standard for Forced Circulation Air Cooling and Heating Coils
Standard 440	Standard for Room Fan Coil Air Conditioners

Duct Construction Standards (Latest Edition)

I. Underwriters Laboratories, Inc. (UL)

1.03 EQUIPMENT LABEL:

A. All mechanical equipment and appliances shall be listed and labeled by a nationally recognized testing and inspection agency approved by the authority having jurisdiction. All equipment and appliances shall be installed in accordance with the conditions of the listing. Manufacturer's installation instructions shall be available at the job site at the time of inspection.

1.04 COMMISSIONING OF HVAC SYSTEMS:

A. The Contractor shall provide contact information to the Commissioning Agent indicated in Division 1 for all major items of Equipment.

B. Provide additional submittal copy of major equipment for Commissioning Agent specified in Division 1.

1.05 SUBMITTALS:

A. Submit shop drawings, product data and samples in accordance with Division 1 and Section 23 00 10.

B. Shop drawings, diagrams, catalog data and such other data necessary to fully describe and substantiate compliance with these specifications shall be submitted for all equipment and materials marked with notation set forth in Section 23 00 10.

C. Operation and maintenance data shall be submitted in accordance with Division1, for all items of equipment and materials marked with notation set forth in Section 23 01 00.

1.06 SPARE PARTS:

A. Each cooling or heating unit shall be provided with 3 sets of filters. At end of construction each unit shall be provided with a clean filter and one set shall be turned over to the Owner as spares.

B. Each belt driven piece of equipment shall be provided with one spare set of belts to be turned over to the Owner at the end of construction.

PART 2 - PRODUCTS

2.01 SPLIT SYSTEM HEAT PUMP UNITS [S] [O/M]

A. General: Heat Pump Air Conditioners shall be commercial style Trane split type as shown complete with refrigeration section, condenser and evaporator coils, fans, controls and piping. Each unit shall conform with the applicable ARI Standard.

B. Split type units:

1. Indoor unit shall be variable speed, multi-position type complete with cooling coils, electric heating coils, fans, ECM fan motor and drive, filters, drain pan, controls and refrigerant piping enclosed in a double wall insulated casing (R-4.2). Cabinet shall have leakage rate of less than or equal to 2%. Cooling coils shall be non-ferrous direct expansion type. Heating coils shall be slide-in, electric type as shown. Fan motor drive shall be fully guarded. Filters shall be one inch thick pleated media. Provide thermal expansion valve and sight glass for each cooling coil circuit and liquid solenoid as required for compressor capacity control. Provide integral circuit breaker for single point power connection. Auxiliary heaters shall be mounted in discharge plenum section furnished as part of the unit. Outdoor thermostat shall de-energize auxiliary heaters when air temperature rises above 35°F.

2. (Indoor unit shall be variable speed, multi-position type complete with electric emergency heating coil, fans, ECM fan motor and drive, filters, drain pan, and controls enclosed in a double wall insulated casing (R-4.2). Cabinet shall have leakage rate of less than or equal to 2%. Filters shall be one inch thick pleated media, efficiency as indicated on the Drawings.
   a. Heat pump coil shall be a cased coil, complete with drain pan, controls, and refrigerant piping enclosed in an insulated casing. Coils shall be non-ferrous direct expansion type. Provide thermal expansion valve and sight glass for each cooling coil circuit and liquid solenoid as required for compressor capacity control.)
3. Outdoor unit shall be complete with compressor-motor unit, condenser coil, reversing valve, stamped sheet metal condenser coil guards, condenser fans, motor starters, controls and piping enclosed in a sheet steel enclosure recommended for outside installation. Condenser fans shall be vertical or horizontal discharge as shown. Intake and discharge openings shall be provided with welded-wire or stamped sheet metal coil guards. Condensing unit controls shall provide automatic capacity modulation and condenser and evaporator pressure control for operation down to 0°F outside air temperature. Provide high refrigerant pressure switch. Crankcase heater shall be provided in compressor body. Units shall come factory pre-charged with refrigerant. Condensers shall be equipped with field installed 7” snow legs as provided by the equipment manufacturer. Each single-phase outdoor unit for air conditioning or heat pump unit shall be provided with a soft starter module factory wired or field wired into the system. Soft starter module shall be Emerson SecureStart, Hyper Engineering SureStart, or approved equal. Soft starter modules shall provide for loss of power detection, low voltage sags, and intermittent power dropouts lasting 0.1 to 3 seconds. Modules shall protect against compressor motor reversal by preventing restarts in event of intermittent lapse in power supply. Modules shall provide detection of motor reversal and stop the motor for 3 minutes. Modules shall provide for reduction of inrush current during startup and protection of motors during low-voltage conditions.

C. Refrigerant piping and specialties are specified in Section 23 20 00. Systems shall be suitable for refrigerant piping configuration and lengths indicated.

D. Controls for safe automatic controlled operation of each system shall be provided. (Operation shall be as specified in Section 23 09 93.) Provide thermostat to limit cooling coil discharge air to 45°F or above by cycling the compressor(s). (See Programmable Thermostats as specified hereinafter for requirements.) Fan motors shall have soft start control and fan mode delays.

E. Refrigerant: Each system shall be cleaned, purged and completely charged with refrigerant and oil, and guaranteed to be free of leakage for one year.

F. Performance Test: Each system shall be tested and checked out for safe controlled operation. One week before final inspection, a letter in three copies from the certified representative shall be submitted to the Engineer certifying that each system is performing safely and satisfactorily.

G. Warranty: Motor-compressor shall be guaranteed for five (5) years. Indoor unit shall have 10-year registered warranty.

H. Set rooftop condensing unit on roof mounted equipment supports. Supports shall be factory fabricated equipment mounting pedestals sized for the weight of the equipment indicated. Pedestals shall be minimum 12 inches high, complete with equipment rail, slide channel “U” shaped mounting brackets, 18 gauge threaded galvanized rods, lateral spacer bracket and galvanized slide assembly.

I. See PART 1 for spare parts requirements.

2.02 DUCTLESS SPLIT SYSTEM AIR CONDITIONERS [S] [O/M]:

A. General: Equipment specified under this heading shall be manufactured by Mitsubishi, Daikin, Sanyo, or equal. Each system shall consist of condensing unit, air unit, refrigerant piping and system controls. Each system shall conform with the applicable ARI standards.

B. Condensing (outdoor) unit shall be complete with compressor-motor unit, condenser coil, welded-wire or stamped sheet metal condenser coil guards, condenser fans, motor starters, controls and piping enclosed in a sheet steel enclosure recommended for outside installation. Condenser fans shall be vertical or horizontal discharge. Intake and discharge opening shall be safely guarded. Condensing unit controls and accessories shall provide automatic capacity modulation and condenser and evaporator pressure control for operation down to 0°F outside air temperature. Unit shall be supported in accordance with manufacturer's installation instruction.

C. Fan coil unit (indoor) shall be a wall mounted configuration complete with cooling coil. Fan motor and drive, filters, controls, refrigerant piping, insulated enclosure and guide vanes on air discharge. Cooling Coils shall be non-ferrous direct expansion type. Filters shall be manufacturer provided, permanent, washable filter which is user accessible. Provide capillary tube and sight glass for each cooling coil circuit.

D. Condensate pump shall be, in addition to manufacturer supplied unit, Sauermann Model # Si-3200. Pump shall be rated for minimum 3.3 GPH; 3.3 feet suction head; and 10 feet discharge head. Unit shall be provided with condensate drain pan safety switch to de-energize the unit upon accumulation of water in the drain pan.

E. Refrigerant piping and specialties shall be as specified in Section 23 20 00.

F. Controls for safe automatic controlled operation of the system (including low ambient controller, winter start control, evaporator freeze thermostat, crankcase heater, cycle protector, thermostatic expansion valve kit) shall be from wall mounted controller. All accessory controls shall be installed in accordance with manufacturer's recommendation.

G. Refrigerant: The piping system shall be completely charged with refrigerant and oil, and guaranteed to be free of leakages for one year.

H. Performance Test: The system shall be tested with a thoroughly cleaned filter and checked out for safe controlled operation. One week before final inspection, a letter in three copies from the certified representative shall be submitted to the Engineer certifying that the system is performing safely and satisfactorily.

I. Warranty: Motor-compressor shall be guaranteed for five (5) years.

J. See PART 1 for spare parts requirements.

K. Set rooftop condensing unit on roof mounted equipment supports. Supports shall be factory fabricated equipment mounting pedestals sized for the weight of the equipment indicated. Pedestals shall be minimum 12 inches high, complete with equipment rail, slide channel "U" shaped mounting brackets, 18 gauge threaded galvanized rods, lateral spacer bracket and galvanized slide assembly. Supports shall be located to adequately support duct with no more than 4 feet of pipe unsupported.

L. Indoor unit shall be mounted maximum 6" below the ceiling.

2.03 HEATING AND COOLING COILS [S]:

A. General: This specification applies to all coils whether remote mounted, mounted in factory fabricated air handling units or mounted in site-built units and shall be used as a guideline to establish the minimum requirements unless definitely specified otherwise for the particular case involved.

B. Direct expansion (DX) refrigerant evaporator coils shall be full tube face, fin and tube type constructed of seamless copper tubes and aluminum fins mechanically bonded to tubes. Coil support frame shall be heavy gauge galvanized steel with heavy gauge flanges and support plates. Tubes shall be 1/2 inch or 5/8 inch diameter. Tube wall shall be minimum 0.020 inch thickness. Fins shall be minimum .0075 inch thickness. Tubes shall be staggered and circuited with equalizing distributing tubes to match the number of compressor refrigerant circuits provided. Coil circuiting shall be full face interlaced type where required for optimum capacity

reduction. Units shall be provided with brass liquid distributors for each circuit. Coils shall be factory proof tested at 450 psig and leak tested at 300 psig, cleaned, dehydrated and sealed with dry nitrogen charge. Coils shall be coordinated with the manufacturer of the condensing unit for capacities indicated. Cooling coil ratings shall be certified in accordance with ARI Standard #410. Maximum cooling coil face velocity shall not exceed 550 feet per minute.

C. Electric coils shall be UL approved and shall be 80% nickel – 20% chromium bare wire heating elements, unless indicated otherwise, mounted in a frame and wired at the factory to an identified terminal strip enclosed in a metal box on one end of the coil. Heater frame shall be constructed for slip-in or flanged frame installation as applicable. Thermal cutout shall be provided to prevent the coil from overheating. (Magnetic contactor and fuse shall be provided for each step of control.) (Solid state silicone controlled rectifiers (SCR) shall be provided for fully modulating control.) Control voltage shall be suitable for control system indicated. Contactors and fuse block shall be UL approved and mounted and wired inside a steel cabinet for remote mounting with all wiring terminated at an identified terminal strip inside the cabinet. Provide air motion switch to prevent heater from operating unless there is proper air flow. Provide additional interlock connections as indicated in Section 23 09 00. An interlocking safety disconnect switch shall be provided in the terminal box door of each coil.

D. Heating and cooling coils in the same unit shall be provided as separate coils with independent fin sheets to allow preheat, dehumidification, and individual removal of each coil.

2.04 Gas Detection System [S] [O/M]:

A. Honeywell E3Point wall-mounted standalone gas detector for monitoring toxic, oxygen, and combustible gases.
   1. Response time: <50 seconds.
   2. Gas Detection: CO, NO2, C3H8, O2, H2, H2S.
   3. Nominal Accuracy: +3% of full scale
   4. Visual and audible alarm for three levels of gas detection.
   5. Resolution:
      a. CO: 1 ppm
      b. NO2: 0.1 ppm
      c. C3H8: 0.5% LEL
      d. O2: 0.1% vol.
      e. H2: 0.5% LEL
      f. H2S: 0.1 ppm
   6. Range:
      a. CO: 0-250 ppm
      b. NO2: 0-10 ppm
      c. C3H8: 0-100% LEL
      d. O2: 0-25% vol.
      e. H2: 0-100% LEL
      f. H2S: 0-50 ppm
   7. System shall have automatic and manual activation of exhaust fans.
   8. System shall native BACnet communications and be integrated with head end system specified in Section 230900.

2.05 MISCELLANEOUS APPURTENANCES [S] [O/M]:

A. Gravity Dampers [S] shall be Ruskin counter balanced back draft damper constructed of felt edged aluminum blades. Set to open at .10" H_2O.

B. Manometers [S] shall be provided for all filter stations of 2000 cfm capacity or more and shall be Dwyer 260-AF Series inclined type, solid acrylic air filter gauge complete with mounting hardware, static pressure tips, two 5' lengths of 1/4" diameter aluminum tubing, two 3-way vent valves, over-pressure safety trap to prevent loss of oil and any other accessories necessary for effective operation of the gauge. The operating range shall be 0-1.5 inches water column.

C. Miscellaneous electric appurtenances such as transformers, solenoid valves, electric relays, selector switches, on-off switches, pilot lights and other similar items required by the electric sequence control diagrams and not shown to be provided by the Electrical Contractor shall be provided as part of the Mechanical Contract.
   1. Solenoid valves shall be Asco or Alco of coil rating and size to accomplish the indicated requirement.
   2. On-Off switches shall be toggle type, 20 amp. contract rating complete with engraved cover plate where required.
   3. Selector switches shall be manual selector type with the indicated poles and contacts and engraved cover plate. Contact rating shall be a minimum of 20 amps.
   4. Relays shall be G.E., Square D, or Cutler-Hammer 20 amp rating with sufficient contacts for the sequence indicated.

D. Time clock [S] [O/M] shall be Paragon Model 7218 or Tork Model W220, seven-day model with 10 hour minimum reserve time feature. Reserve time spring shall rewind itself after power source is restored.

E. Thermostats [S] [O/M] shall be provided as indicated below. The use of thermostats containing mercury is not allowed.
   1. Programmable Thermostats (s):
      a. Programmable thermostats shall be Honeywell T7300A thermostat and a Q7300 subbase, or approved equal for (conventional heating/cooling) (heat pump) operation. The thermostat shall contain a keyboard for entering the times and temperatures along with a liquid crystal display for reading information. The thermostat shall contain a microprocessor that performs the calculations to control the system.
      b. The T7300A thermostat shall contain a three hour override button, enabling programmed temperatures to be overridden from unoccupied mode to occupied mode.
      c. The T7300A thermostat with Q7300 subbase shall provide a system that will control with system or fan switching and seven-day flexible programming with two occupied and two unoccupied periods per day for each of the seven days of the week. The system shall have individual setpoints for occupied heat and cool, and unoccupied heat and cool. System shall have auxiliary relay output for occupied/unoccupied control of auxiliary fans and dampers. System shall have capability to provide contact closures for two stages of output for heating and two stages of output for cooling.
   2. (Night low limit thermostats) (Unit heater thermostats) for space mounting shall be Johnson Controls T26, line voltage type with SP-ST switching action rated 6 amp. full load and 36 amp. locked rotor at 120 volts.
   3. Exhaust fan thermostats shall be Johnson Controls T22 with auto-off fan switch. The thermostat shall be rated for 6 amps. at 120 volts.
   4. Heavy duty heating thermostats shall be Johnson Controls T22 rated for 16 amps. at 120 volts.
   5. Electric cooling thermostats shall be Johnson Controls T26J rated for 6 amps. at 120 volts.
   6. Outdoor thermostats shall be Johnson Controls A19 Series.
   7. Firestats shall be UL approved, Johnson Controls A25 manual reset type with an adjustable temperature setting. Set at 125°F.
   8. Thermostat guards shall be rectangular (wire, plastic, cast aluminum) with baseplate (except wire type) and all required accessories for wall mounting. Guards shall have ample openings to allow fast sensing of room air conditions. Guards and baseplate shall be selected and sized to suit type of thermostat and mounting where installed.

F. (Equipment rails for rooftop condensing units shall be Roof Products and Systems (RPS), Model ER-4 or equal. Equipment rails shall be fabricated of 18 gauge galvanized steel with built-in cant, monolithic construction with integral base plate and continuous mitered and welded corner seams, with factory installed wood 2x4 nailer. Each equipment rail shall include a matching 18 gauge galvanized steel counterflashing cap with integral drip edge, all corners

mitered and welded, and screws for attachment. Equipment Rails over 3 feet long shall incorporate 14 gauge internal gusset reinforcing. Rail height shall be 9”-16”.)

G. Dampers and Damper Motors:
   1. Automatic control dampers shall be opposed blade construction for modulating service and parallel blade construction for two-position service. Dampers shall be of the multi-louver construction with brass bearings, channel iron frame and maximum width of 10”. Damper blades shall be interlocking felt edged and air tight.
   2. Damper motors shall be provided for all automatic dampers and shall be sufficient capacity to operate the connected damper. Damper motor shall be electric type.

PART 3 - EXECUTION

3.01 GENERAL:

A. All equipment and materials, specified herein or shown on the drawings shall be installed complete, coordinated with all other work, tested and made tight and put into safe controlled operation to perform its intended function as a part of this project.

B. All rooftop equipment shall be secured to the roof framing structure.

3.02 ROOFTOP AIR CONDITIONING (HEAT PUMP) UNITS:

A. Coordinate all openings and location with structural systems.

B. Contractor’s attention is directed to Section 23 05 48 for requirements.

C. Install and connect unit in accordance with manufacturer’s recommendations and contract drawing details. Should conflicts in the two occur notify the Architect/Engineer.

D. Coordinate all control items with Section 23 09 00.

3.03 ROOFTOP CONDENSING UNITS:

A. Rooftop condensing units shall be installed on factory fabricated equipment rails as hereinbefore specified.

END OF SECTION

SECTION 26 0500

COMMON WORK RESULTS FOR ELECTRICAL

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Every item of labor, material, devices and appurtenances for installing a complete Electrical System and other related systems included in Division 26 of the Specifications.

B. Section 26 05 00 – Common Work Results For Electrical

C. Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables

D. Section 26 05 23 – Control Voltage Electrical Power Cables

E. Section 26 05 26 – Grounding And Bonding For Electrical Systems

F. Section 26 05 33 – Raceway And Boxes For Electrical Systems

G. Section 26 05 36 – Cable Management For Electrical Systems

H. Section 26 05 43 – Underground Ducts And Raceways For Electrical Systems

I. Section 26 05 53 – Identification For Electrical Systems

J. Section 26 05 73 – Overcurrent Protective Device Coordination Study

K. Section 26 09 23 – Lighting Control Devices

L. Section 26 09 36 – Lighting Control System

M. Section 26 20 00 – Low-Voltage Electrical Distribution

N. Section 26 22 00 – Low-Voltage Transformers

O. Section 26 24 16 – Panelboards

P. Section 26 27 26 – Receptacles

Q. Section 26 28 13 – Fuses

R. Section 26 28 16 – Enclosed Switches And Circuit Breakers

S. Section 26 29 00 – Low-Voltage Controllers

T. Section 26 36 00 - Transfer Switches

U. Section 26 43 00 - Transient Voltage Suppression (TVSS)

V. Section 26 50 00 – Lighting

1.03 RELATED WORK:

A. General: See all other portions of these Contract Documents and apply to those portions of work, relating to Electrical Work, the same as if repeated herein in its entirety. The Division 26 Electrical Trade shall allow for wiring and controlling all equipment requiring electrical connections as described therein even though not shown on the electrical drawings. The Division 26 Electrical Trade shall provide and install all conduits, standard boxes and grounding for Divisions 27 and 28 Trades. Divisions 27 and 28 Trades shall provide all special boxes, cabinets and enclosures to Division 26 Electrical Contractor for installation. The Division 26 Electrical Contractor shall coordinate with Divisions 27 and 28 Trades for sizes and locations of

conduits, boxes, cabinets and enclosures required by Divisions 27 and 28 Trades. The Division 26 Electrical Trade shall provide and install all conduits, standard boxes, cable trays, and grounding for Division 27 & 28 Trades.

B. Section 07 80 00 - Firestopping

C. Section 09 90 00 - Painting

D. Division 11 - Equipment

E. Division 14 - Conveying Systems

F. Division 23 – Mechanical

G. Division 21 – Fire Suppression

H. Division 22 – Plumbing

I. Division 27 – Communications

J. Division 28 – Electronic Safety and Security

K. Division 31 - Site Work

1.04 WORK NOT INCLUDED:

A. Certain electrical equipment will be provided in-place as specified under other Divisions of these Contract Documents and other pieces of equipment such as operating controls, etc., will be provided f.o.b. (freight on board) premises, which shall be mounted and connected to electrically under Division 26.

1.05 DRAWINGS:

A. Where conduit, equipment, devices and other electrical appurtenances are shown on the drawings, the general arrangement of such items on the electrical drawings shall be followed as closely as actual building construction and the work of other trades will permit. Because of the small scale of the electrical drawings, it is not feasible to indicate all offsets, fittings and accessories which may be required. The Contractor shall investigate the construction conditions affecting the work and provide fittings and accessories as required to meet actual conditions.

1.06 QUALITY ASSURANCE:

A. Equipment and material used in the project shall be new and undamaged. The electrical installation shall fit into the space allotted and shall allow adequate, acceptable, clearances for entry, servicing, safety, and maintenance. The Contractor shall coordinate the work to ensure that the equipment may be moved into place without altering building components or other installations. All Electrical work shall be performed by a licensed Texas Electrical Contractor whose technicians, mechanics, or tradesmen shall be skilled in the trade involved. All electrical work shall be performed under the direct supervision of an electrician with a locally recognized and accepted master license.

B. Equipment and material in existing installations may be reused where specifically indicated on the drawings.

1.07 REFERENCES:

A. The complete installation and all materials and equipment under Division 26 shall conform to the International Uniform Statewide Building Code, current issue, including all applicable portions of the National Electrical Code (NEC) and all other governing codes and regulations.

B. All equipment used shall bear the Underwriters Laboratory (U.L.) label for the intended application, or other organizations label if acceptable to the Authority having jurisdiction and concern with product evaluation.

C. In addition, the following codes, standards, and regulations shall apply to the complete installation and all materials and equipment. These are referred to by their accompanying abbreviations.

D. National Electrical Code (NFPA No. 70) 2023 NEC

E. National Electrical Manufacturers Association NEMA

F. Underwriters Laboratories, Inc. UL

G. Telecommunications Building Wiring Standards TIA/EIA

H. All Systems' Installation Certification Compliance Documents for Installing Trades

I. National Fire Protection Association NFPA

J. Uniform Federal Accessibility Standards UFAS

K. Americans with Disabilities Act Accessibility Guideline ADAAG

L. The above standards are intended as a minimum and shall be exceeded if required by the Contract Documents. In the event information contained in the Contract Documents conflicts with one of the above mentioned codes, the codes shall take precedence.

1.08 PERMITS, LICENSES, TAXES AND INSPECTION CERTIFICATES:

A. All permits, bonds, licenses, electrical connection fees, inspection fees and taxes required for the execution of the work shall be obtained and paid for by the Contractor. Under each phase of the Electrical work the Contractor shall furnish three copies of certificates of final acceptance to the Engineer from any inspection authority having jurisdiction.

B. At the completion of the job, provide the Engineer with three (3) copies of an electrical inspection certificate from the local Electrical Inspector, if such inspection is provided and/or required by the locality.

C. All bonds, licenses, and electrical connection fees, inspection fees, and taxes required for the execution of the work shall be obtained and paid for by the Contractor. The contractor is advised that since this project is on State property, Building Codes and Zoning Ordinances of local political sub-divisions do not legally apply. Building permits required by the locality consistent with the Governors memorandum of September 11, 1973, will be obtained and paid for by the Owner.

1.09 REGULATIONS AND STANDARDS:

A. The completed installation and all materials and equipment shall conform to local ordinances and codes, other regulations and standards listed herein or in related sections. These are intended as a minimum and shall be exceeded if required by the specifications or Drawings. In the event of a conflict between the codes, standards, or regulations, and information contained in the Contract Documents, the applicable code, standard, or regulation shall take precedence.

1.10 SUBMITTALS:

A. Submit shop drawings, product data and samples in accordance with Division 1 for all items as specified in related sections of these specifications. One (1) electronic (PDF) copy of the submittal shall be submitted. One (1) electronic (PDF) copy of the submittal will be returned to the Contractor. If additional copies are required they will be the responsibility of the Contractor. Where drawings are submitted, the Contractor shall submit a minimum of two (2) sets of full scale prints. One (1) copy will be marked and returned to the Contractor, and the Contractor shall be responsible for all additional copies required for his use. All submittal data shall be correctly identified to show project name, and the exact model, style or size of item being submitted. Improperly identified submittals will not be reviewed by the Engineer. Each item submitted for review shall bear the Subcontractor's stamp which states that they have reviewed the submission, that it is complete, and that in their opinion it meets the contract requirements.

Contractor's stamp shall identify the paragraph and page number for which the submittal is being made. Any submission which has not been reviewed and stamped by the Electrical Trade will not be reviewed by the Engineer. No reviews prior to award of Contract will be considered or accepted.

B. Shop drawings, samples, diagrams, catalog data and such other data necessary to fully describe and substantiate compliance with these contract documents shall be submitted as follows:

C. All the equipment and materials where submissions are specifically required by other Divisions of these Contract Documents.

D. All the equipment and materials that are indicated with an [S] behind the product title. This shall include submission of the specified products equipment and materials.

E. All the equipment and materials that are acceptable equal substitution.

F. If submission is NOT required for the SPECIFIED products "shop drawings and product data" under 1. and 2. above, the Contractor shall NOT submit a shop drawing for the SPECIFIED products.

G. Samples, in good working order, shall be submitted in accordance with Division 1, complete with all installation and service drawings and instructions. All samples will be returned at the submitter’s expense unless otherwise indicated. Samples may be subject to destructive testing by the Architect/Engineer.

H. Operation and Maintenance manual(s) shall be submitted in accordance with Division 1 and shall include a complete product index, a copy of all accepted shop drawings, installation and maintenance data, sequence of controls, parts lists, and the name, address and telephone number of supplier or nearest representative. All electrical devices, equipment and systems marked [O/M] in these specifications shall be included and all other such electrical items which will require servicing before the duration of its useful life has been reached. The manual(s) shall be presented to the Engineer for review and transmitted to the Owner before the final payment is recommended.

I. Equivalents: Manufacturers, trade names and model numbers indicated herein and on drawings shall be interpreted as establishing a standard of quality and shall not be construed as limiting competition. Unless definitely stated otherwise and upon complying with Division 1, the Contractor may use any article of equal appearance which, in his judgment is equal to that specified and is accepted by the Engineer. Where three or more manufacturers are named in the specifications for any item, the Contractor should use one of the manufacturers. No others shall be reviewed or accepted. Manufacturers listed first in these specifications and on drawings were used as a basis of design. It will be the responsibility of the Contractor to verify all connections, physical sizes and capacities of all other manufacturer's items, both items named herein, or items proposed. If the equipment necessitates changes in power distribution, conduit, wiring, lighting, ductwork, piping, or any other building systems from that indicated on the drawings, the Contractor shall be responsible for all additional costs included and notify other trades of the changes. Where such changes are required, detail drawings indicating all required changes shall be submitted for review at the same time the manufacturers drawings are submitted for approval. See Division 1 for substitutions.

J. The ten day prior approval requirements of The Instructions to Bidders, AIA 701, are waived for this Division of the Specifications, and unless stated otherwise the Contractor may use items that he deems as equivalent in quality and performance to the specified item subject to final acceptance of substituted items by the Engineer upon his review of shop drawings. (This paragraph cannot be used with BCOM jobs!)

K. Guarantee: Electrical equipment, materials and labor required by these specifications and accompanying drawings shall be guaranteed to be free from defective materials or workmanship, including lamps, for a period of one year after final acceptance of the project except extended warranties as specified elsewhere in these documents on specific items of

equipment will be furnished by the Trade providing the equipment. Defects in material or workmanship occurring during this period shall be corrected with new material and equipment or additional labor at no cost to the Owner. Manufacturer's certificates of warranty shall be transmitted to the Owner before final payment is recommended.

1.11 WARRANTIES:

A. The Contractor shall warrant for a period of one year all work provided under the Contract to include, but not necessarily limited to, all systems, equipment, materials, and workmanship. This shall not be construed to limit any extended warranty periods of longer than one year for specific items or systems specified elsewhere in the Contract Documents.

B. The warranty period shall commence on the date of acceptance by the Owner and shall cover all parts and labor as required to fulfill the warranty at no cost to the Owner.

C. Refer to Division 1 for additional warranty requirements.

D. Information on all warranties shall be included in the O&M Manuals specified herein to be provided to the Owner.

1.12 EXCAVATION AND BACKFILLING:

A. General: Excavation and backfilling shall be as specified in Division 31. Backfilling shall not commence until all tests have been performed and all utility systems conform to the contract documents.

B. Protection of Existing Utilities: Existing utility lines to be retained, whether known or unknown and uncovered during excavation operations, shall be protected from damage during excavation and backfilling, and if damaged, shall be restored to original condition.

C. General: The Electrical Trade shall perform all excavations of every description and of whatever substances encountered, to the depths required for installation of his work. (No extras will be allowed for rock.) All excavated materials not required or suitable for backfill shall be removed and wasted as indicated on the drawings or as directed by the Engineer. OSHA approved shoring methods shall be provided as necessary to protect existing facilities, new work and the safety of personnel. Excavation shall be open cut except that short sections of a trench may be tunneled if the conduit can be properly installed. Backfilling shall not commence until all tests have been performed and all utility systems conform to the contract documents. Refer to Section 26 05 43 for detailed specifications.

D. Protection of Existing Utilities: Existing utility lines to be retained, whether known or unknown and uncovered during excavation operations, shall be protected from damage during excavations and backfilling, and if damaged, shall be restored to original condition.

1.13 COORDINATION OF WORK:

A. General: The contract documents indicate the extent and general arrangement of the electrical systems. The Contractor shall be responsible for the coordination and proper relation of the electrical work to the building structure and to the work of other trades. No additional compensation or extension of completion time will be granted for extra work caused by the lack of coordination.

B. Miscellaneous loads, such as control panel power, are not always shown on the Drawings. Where additional circuits are needed for such loads, extend wiring to the load from the nearest electrical panel serving receptacle loads and connect to a spare circuit breaker. Where an emergency generator is present and the device to be served is for a controls system or component, the circuit shall be derived from a panelboard fed by the emergency generation optional/standby (NEC 702) system.

C. Cooperation: The Contractor shall provide dimensions and locations of all openings, shafts and similar items to the proper trades and install work as required so as not to interfere with, or delay, the building construction.

D. Locations of lines and equipment shall be determined from actual field measurements. The outlines of the building shown on the electrical drawings are intended only as a guide to indicate relative locations of the electrical work. Refer to architectural and structural drawings for building construction details. If conflicts prevent installation of electrical work at the locations indicated, minor deviations shall be made subject to acceptance by the Engineer, and without additional compensation.

E. Cutting and Patching: Unless stated otherwise, the Electrical Trade shall do all cutting necessary for the installation of his work. All work should be installed sufficiently in advance of new construction in order to permit installation of supports, sleeves, and similar items without cutting. Cutting which will in any way affect the building structure shall not be performed without permission of the Architect-Engineer. The Electrical Trade is responsible for patching where he does cutting. Patching shall be done to the satisfaction of the Architect-Engineer.

F. Roughing-In: Receptacles, switches, and other similar items shall align vertically or horizontally with each other, hose bibbs, thermostats, the building structure and features thereof when it appears obvious and logical that they should. All mounting heights shall be within the limits of the 2024 International Building Code and ADAAG.

G. Damage to Other Work: The Electrical Trade is responsible for damage to other work caused by his work or workmen. Repairing of damaged work shall be done by the Trade who installed the work, and as directed by the Architect-Engineer; the cost of which shall be paid for by the Electrical Trade.

1.14 ASBESTOS:

A. Asbestos Free Materials: The intention of these drawings and specifications is that there be no asbestos containing materials installed on this project. To the best of the Architects' and Engineers' knowledge, none of the material or equipment specified herein or shown on the drawings contains asbestos. The Contractor shall make every effort to prevent any asbestos materials from being installed in or used on the construction of the project. At the completion of the project, the Contractor shall certify by letter that to the best of his knowledge, no asbestos containing materials were used for or in the construction of this project.

B. Existing Materials:

C. Discovery: If during the construction of this project, work involving friable asbestos is suspected, or encountered, all work in this area shall be discontinued and the Owner or the Owner’s representative, shall be notified immediately and the Owner with his own forces or by separate contract shall be responsible for complete investigation, removal, and disposition of the friable asbestos hazard in accordance with applicable laws and regulations. If the Contractor claims that delay or additional cost is involved because of such action by the Owner, he shall make such claim as provided elsewhere in the contract documents.

D. Removal: All work involving the removal of friable asbestos will be done under a separate contract.

1.15 GRAPHICS DATABASE:

A. This project’s Computer Aided Design & Drafting (CADD) drawing files may be purchased directly from the Engineer for use in preparing computer graphics specific to this project. See Appendix A at the end of this Section for Letter of Indemnification and ordering instructions.

1.16 OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY ALLOWANCES:

A. Contractor shall provide the following allowances for the respective project types to offset any modifications required by the study:
   1. Elementary School - $15,000.00
   2. Middle School - $25,000.00
   3. High School - $35,000.00

B. If the respective allowance is not used, the allow shall be retained by the Owner.

(Spec. Writer verify and coordinate the proper allowance with the Architect for use in the frontend documents under allowances.)

1.17 SEISMIC RESTRAINTS [S]:

A. This structure has been determined to be in Seismic Hazard Exposure Group and Seismic Performance Category ___ as defined by the 2024 International Building Code, with Amendments. All Division 26 systems, components and their attachments shall be designed and constructed to resist seismic forces according to the formulae listed in the VUSBC. Shop drawings shall detail each type of seismic restraint and shall include all supporting calculations signed and sealed by a professional seismic engineer currently licensed by the State of Texas. Systems exempted by the IBC need not be provided with seismic restraints. Restraints shall include, but not be limited to, snubbers, sway bracing, and anchors.

PART 2 - PRODUCTS

2.01 MANUFACTURERS AND MATERIALS:

A. General: Manufacturers and materials shall be as specified in subsequent sections of these specifications and as noted on the drawings. Similar types of equipment shall be the products of the same manufacturer unless specified otherwise.

2.02 SLEEVES AND INSERTS:

A. General: Sleeves and inserts shall be provided and correctly located in the structure, as required for the work.

B. Inserts shall be steel and of proper size for loads encountered.

2.03 ACCESS DOORS:

A. Provide for all junction boxes or any item requiring access. Doors shall be of sufficient size and so located that the concealed items may be serviced or completely removed and replaced. Doors required for work shall be furnished as a part of this Division to the General Contractor for installation. Doors in acoustic tile ceilings shall be furnished in multiples of tile sizes. Doors are not required in exposed grid type ceilings where tiles are removable. Doors shall be metal access doors with cam lock, style to match ceiling or wall construction. Doors occurring in rated construction shall be fire rated U.L. labeled access doors correlated to preserve the integrity of the rated construction. Doors shall be prime finish steel except those in toilets, shower rooms, locker rooms, kitchens and other similar areas shall be aluminum with natural anodized finish. Doors shall match the access doors in Division 23 and meet the acceptance of the Architect.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General: Materials and equipment shall be installed in accordance with manufacturer's instructions to conform to the details and application as specified in subsequent sections of these specifications and indicated on the drawings.

B. Supports: Provide necessary supports for all equipment and appurtenances as required; this includes, but is not limited to, frames or supports for items such as switchboards, panelboards, lighting fixtures, disconnect switches, junction boxes, conduit, motor starters, outlet boxes, and other similar items requiring supports. Floor mounted equipment in Equipment Rooms shall be set on 4-inch high concrete foundation pads unless shown otherwise. All concrete pads shall have 1” chamfered corners and edges. Foundation drawings, bolt setting information and foundation bolts shall be furnished by the subcontractors furnishing the equipment that is

required to have concrete foundations. Concrete for foundations shall be provided by the Electrical Trade and in accordance with Division 03 - Concrete Work, unless noted otherwise.

C. Sleeves: Provide sleeves for all conduits passing through concrete or masonry walls, partitions, concrete slabs or beams installed during construction of the wall, partition, slab or beam. Sleeves placed horizontally in walls or in any position in beams shall be standard weight ASTM A53 steel pipe of length equal to the thickness of the wall or beam. Those placed vertically in non-waterproof floors shall be 20 gauge galvanized sheet steel of length equal to the thickness of the slab, flared and nailed to the form, or fastened to reinforcing fabric and filled with sand during pouring to prevent deformation. Sleeves occurring in floors of rooms where hose bibbs or floor drains provided under Division 21 occur, and in pipe spaces, shall be standard weight steel pipe projecting 1/2" above finished floor except in Equipment Rooms they shall project four (4) inches above finished floor. Sleeves in floors with waterproof membrane shall be provided with flanges or flashing rings and shall be clamped or flashed into the membrane. All sleeves shall be of sufficient diameter to allow installation of conduit except sleeves on lines subject to movement, which shall clear the conduit at least one inch all around. Conduits through exterior walls, or floors, below grade shall have seals specified in Section 26 05 33 between the conduit and wall sleeve. Sleeve shall have anchor and water stop plate. The entire assembly shall be tightened and adjusted to make watertight. Sleeves for insulated wiring and conduit, penetrating fire (and smoke) rated partitions, walls and floors shall have seals as specified in Section 26 05 33 and shall be sealed in accordance with the terms of U.L. Listed Through-Penetration Firestop Systems (XHEZ) as published in the U.L. Fire Resistance Directory. Penetrations shall exactly conform to details of the Firestop System indicated for the type of partition, wall and floor construction encountered. All penetrations through nonfireresistance rated floor assemblies and through the ceiling membrane of nonfireresistance rated roof assemblies shall be fireblocked with tightly packed mineral-wool insulation secured in place. All penetrations through equipment room walls and other areas of noise or heat generation shall be tightly sealed with mineral fiber rope. All penetrations through draftstop partitions shall be sealed to maintain the integrity of the partition. All firestopping of sleeves for electrical work shall be provided under Division 26.

D. Temporary Requirements: Openings in equipment shall be kept capped at all times until connection is made to the system. The ends of all conduits and equipment openings shall be kept capped properly with approved devices. Approved devices are items such as specially molded plastic caps and sheet metal caps.

E. Access Doors: Provide access doors for all concealed electric equipment, pull boxes, junction boxes or any item requiring access. Doors shall be of sufficient size and so located that the concealed items may be serviced or completely removed and replaced. Doors required for Electrical work shall be furnished by the Electrical Trade, to the Contractor for installation. Doors in acoustic tile ceilings shall be furnished in multiples of tile sizes. Doors are not required in exposed grid type ceilings where tiles are removable.

F. Painting: All work under this Division shall be painted in accordance with Section 26 05 53, Identification for Electrical Systems. Division 26 shall also paint and identify all conduits and boxes for Divisions 27 & 28 as described in Section 26 05 53.

3.02 EXISTING WORK AND DEMOLITION:

A. Electrical Demolition: Remove all existing electrical conduits, wiring, junction boxes, outlets, lighting fixtures, wiring devices, unused panelboards, etc., indicated for demolition. Additional amounts of demolition may be required to accommodate desired renovations and new construction. Not all demolition may be shown on the drawings. All existing electrical equipment not indicated for demolition shall remain in place. Were an existing conduit, wire, or any other item is passing through a rated assembly is to be removed; the assemblies shall be patched in accordance with UL so as to maintain the integrity of the assembly.

B. Equipment and Fixtures Removed: The Owner will select and retain such existing electrical equipment and materials which are indicated to be removed and not reused, as he desires. All

other existing equipment and materials indicated to be removed, and not reused shall become the property of the Contractor, who shall remove them from the premises within the time frame specified under other Divisions of this Contract Document.

C. Equipment and Fixtures Relocated: All existing lighting fixtures, panelboards and other electrical equipment and materials indicated to be relocated shall be disconnected, removed, and relocated. All electrical equipment and materials shall be protected from damage during demolition. Install new phase, neutral and grounding conductors, if grounding conductor is not already present, in each feeder and branch circuit to be reworked, from the panelboard to the outlet.

D. Power Interruption: Attention is called to the fact that the existing facility shall remain in operation throughout the construction period. All necessary temporary arrangements shall be made as required to keep all electrical circuits in continuous operation during this period except for scheduled outages for circuit change-overs. The outage shall be kept to the minimum and carefully scheduled to suit the Owner.

E. Mechanical Equipment: All existing mechanical equipment being removed or relocated under this contract shall be disconnected electrically, both power and control wise, so that the Mechanical Trade can remove or relocate same.

F. Miscellaneous: In all altered portions of the buildings, the Electrical Trade shall remove or alter as necessary all existing electrical work that does not fit with the new construction. All existing work or areas that are not altered shall be reconnected as required. Where indicated changes to non-electrical facilities require minor electrical changes, these changes shall be accomplished even if not specifically indicated. Only a small portion of the existing work is shown on the drawings. Contractors submitting proposals shall visit the site to determine the scope of work under this heading as no additional compensation will be granted because of existing conditions even though the existing conditions may not be indicated on the drawings. Contractor shall thoroughly inspect the electrical systems in reworked areas and bring to the attention of the Engineer all defective or unserviceable material not scheduled for removal or replacement. Demolition shall not begin until the work schedule is approved by the Owner. The work shall be scheduled to prevent any disruption to the normal operations of the building. Refer to other Divisions for work phasing.

3.03 FIELD QUALITY CONTROL:

A. System Readings: Certain system voltage and current readings shall be taken, the values recorded and submitted in triplicate to the Engineer. Two complete sets of readings are required, one under no load and one under maximum available load. The current and voltage shall be recorded on each phase (plus voltage between all phases) at main panelboard and at each branch circuit panelboard. Additional spot readings shall be made if required. Resistance of grounding system shall be tested and recorded. Forms for submitting this report may be obtained from the Engineer's office. A sample form is bound herewith.

B. Equipment Readings: Voltage and amperage readings on each phase of each motor circuit and each resistance heater circuit installed under this contract shall be measured, the values recorded, and submitted in triplicate to the Engineer. Also record motor nameplate data, actual motor heater protective device ratings and all other data necessary for selection of heater device.

C. Verification [V]: Upon completion of the project, the Contractor shall submit a separate letter of certification (or compliance) to the Owner/Architect/ Engineer that each of the following systems or equipment functions properly, conforms to all requirements of these specifications and all requirements of the manufacturer of the systems.

D. Section 26 50 00, Lighting.

E. Section 26 20 00, Low Voltage Electrical Distribution

F. Section 26 32 13, Engine Generators

G. Section 26 36 00, Transfer Switches

3.04 MANUFACTURER'S ASSISTANCE:

A. Qualified technical representatives of manufacturers shall be available to visit the project and provide required assistance for any problems or trouble areas of any systems, material or equipment used in the project. Manufacturer's engineering assistance shall also be available for above problems or trouble areas. The Contractor shall purchase all materials, equipment or systems with these services included in the purchase price or otherwise be prepared to have the above service provided when needed or requested by the Engineer without additional compensation. Where one manufacturer's equipment constitutes the majority of the components or devices to make a system, the manufacturer's technically qualified representative shall inspect and accept the completed installation whether or not especially requested by the Engineer.

3.05 INSTRUCTION OF OWNER'S REPRESENTATIVE:

A. The Electrical Trade shall instruct the representative of the Owner in the proper operation and maintenance of all elements of the Electrical systems. Competent representatives of the Contractor shall spend such time as necessary to fully prepare the Owner to operate and maintain the Electrical systems.

3.06 CONSTRUCTION STATUS REPORT:

A. Each item of discrepancies noted on Construction Status Report prepared by the Engineer shall be answered in detail in writing by the Contractor before payment can be recommended.

3.07 RECORD OF UNDERGROUND LINES:

A. On completion of the project, the Contractor shall prepare and submit to the Architect-Engineer a drawing on tracing paper and one full-size print to show the location of any underground lines installed in locations different from those on the Architect-Engineer's drawings. The location and the distance from the building to outside lines and manholes shall be dimensioned.

3.08 DESCRIPTION OF ALTERNATES:

A. Refer to the other Divisions of this Contract Specification (Manual) for description of alternates. (On BCOM projects, use the words “additive bid items”.)

3.09 SCHEDULE OF ABBREVIATIONS:

Electrical Abbreviations:

APPENDIX A
LETTER OF INDEMNIFICATION

Project Name:

Project Location:

At the Contractors request, Stratus will provide electronic files of the Revit Models for their convenience and use, subject to the following terms and conditions:

Stratus electronic files are compatible with Autodesk Revit Product version for which they were designed. Autocad files will be provided in the Autocad 2018 DWG format. Stratus makes no representation as to the compatibility of these files with your hardware or your software.

Data contained on these electronic files is part of Stratus's instruments of service and shall not be used by you or anyone else receiving this data through or from you for any purpose other than as a convenience in the preparation of project layout for the referenced project. Any other use or reuse by you or by others will be at your sole risk and without liability or legal exposure to Stratus. You agree to make no claim and hereby waive, to the fullest extent permitted by law, any claim or cause of action of any nature against Stratus, its officers, directors, employees, agents, or subconsultants which may arise out of or in connection with your use of the electronic files.

Furthermore, you shall, to the fullest extent permitted by law, indemnify and hold harmless Stratus from all claims, damages, losses, and expenses, including attorney's fees arising out of or resulting from your use of these electronic files.

These electronic files are not Contract Documents. Significant differences may exist between these electronic files and corresponding hard copy Contract Documents due to Addenda, Change Orders, or other revisions. Stratus makes no representation regarding the accuracy or completeness of the electronic files you receive. In the event that a conflict arises between the signed documents prepared by Stratus and the electronic files, the signed Contract Documents shall govern. You are responsible for determining if any conflict exists. By your use of these electronic files, you are not relieved of your duty to fully comply with the Contract Documents, including and without limitation, the need to check, confirm, and coordinate all dimensions and details, take field measurements, verify field conditions and coordinate your work with that of other contractors for the project.

The use of the Revit Model files prepared by the Engineer shall not in any way negate the Contractor's responsibility for coordination with other trades or for the proper checking and coordination of dimensions, details, member sizes and gage, and quantities of materials as required to facilitate complete and accurate fabrication and erection.

All information added to the drawings by the Contractor shall be in a distinctively heavier pen weight and different font, such that all Contractor information can be clearly distinguished from the original files.

Any information added by the Contractor, which represents a proposed change to the original design, shall be clearly identified by flagging or other distinctive presentation. Because of the potential that the information presented on the electronic files can be modified, unintentionally or otherwise, Stratus reserves the right to remove all indicia of its ownership and/or involvement for each electronic display.

Under no circumstances shall delivery of the electronic files for use by you deemed a sale by Stratus, and Stratus makes no warranties, either expressed or implied, of merchantability and fitness for any particular purpose. In no event shall Stratus be liable for any loss of profit or any consequential damages.

The Engineer believes that no licensing or copyright fees are due to others on account of the transfer of the Revit Model files, but to the extent any are, the Contractor will pay the appropriate fees and hold the Engineer harmless from such claims as may arise.

Any purchase order number provided by the Contractor is for the Contractor's accounting purposes only. The Contractor's purchase order terms and conditions are void and are not a part of this agreement.

The Recipient further agrees that the drawing files will only be used in graphics preparation for the above-referenced project.

SECTION 26 0519

LOW VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Wires and Cables, Under 600 Volts.

B. Connectors and Lugs, Under 600 Volts

1.03 RELATED WORK:

A. Division 23 – Mechanical

B. Section 26 05 00 – Common Work Results For Electrical

C. Section 26 05 26 – Grounding And Bonding For Electrical Systems

D. Section 26 05 33 – Raceway And Boxes For Electrical Systems

E. Section 26 05 36 – Cable Management For Electrical Systems

F. Section 26 05 53 – Identification For Electrical Systems

G. Section 26 20 00 – Low-Voltage Electrical Distribution

H. Division 27 – Communications

I. Division 28 – Electronic Safety and Security

1.04 REFERENCES:

A. All wire, cables, connectors and lugs shall be U.L. listed for the application intended, and meet NEMA applicable standards.

B. All wiring methods shall meet with NFPA applicable codes.

1.05 CONDUCTOR CODING: (208Y/120-Volt)

A. Color Code Conductors of 208Y/120-volt system power and lighting conductors as follows:

Neutral	White
Ground	Green
Phase A	Black
Phase B	Red
Phase C	Blue

B. No. 12 and No. 10 conductors shall have continuous insulation color. Color code conductors larger than No. 10 which do not have continuous insulation color by application of at least two laps of colored tape on each conductor at all points of access. Tape shall be “Scotch,” “Highland,” or “Timflex,” vinyl plastic electrical tape No. 35, or accepted equal. Wrap-around "Brady" markers or shrinkable PVC sleeving with hot-stamped lettering may be used and shall state the appropriate conductor identification.

C. Number code all control and instrumentation wiring at all points of access.

1.06 CONDUCTOR CODING (208Y/120 and 480Y/277 Volt)

A. Color Code Conductors of 208Y/120-volt system power and lighting conductors as follows:

Neutral	White
Ground	Green
Phase A	Black
Phase B	Red
Phase C	Blue

B. Color Code Conductors of 480Y/277-volt system* power and lighting conductors as follows:

Neutral	Grey
Ground	Green
Phase A	Brown
Phase B	Orange
Phase C	Yellow

* Owner's NEC compliant color code may be substituted for the above 480Y/277 code.

C. No. 12 and No. 10 conductors shall have continuous insulation color(s). Color code conductors larger than No. 10 which do not have continuous insulation color by application of at least two laps of colored tape on each conductor at all points of access. Tape shall be "Scotch," "Highland," or "Timflex" vinyl plastic electrical tape No. 35, or accepted equal. The 480Y/277 volt conductors shall be marked with an appropriately wide tape of the above base color and an adjacent narrow tape of yellow. Wrap-around "Brady" markers or shrinkable PVC sleeving with hot-stamped lettering may be used and shall state the appropriate conductor identification. Label "480Y/277-Volt" on all phase conductors of the 480Y/277-volt system.

D. Number code all control and instrumentation wiring at all points of access.

1.07 CONDUCTOR SIZES:

A. All conductor sizes (AWG) are based on copper.

1.08 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Section 26 05 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. All wires and cables shall be as manufactured by General Cable, Capital Wire & Cable, Carol Cable, American Insulated Wire, Southwire, Senator, Rome, Cerro Wire and Cable, Circle Wire & Cable.

B. All connectors and lugs shall be as manufactured by T & B, Buchanan, 3M, Burndy, or accepted equal.

2.02 MATERIALS AND TYPE:

A. Wiring, Power and Control:
   1. General:
      a. Conductors shall be **soft annealed copper** unless otherwise indicated.
      b. All conductors #8 AWG or larger shall be stranded (except in surface raceway SR, all conductors shall be stranded).
      c. All power wiring shall be #12 AWG minimum unless otherwise indicated.
      d. All control wiring shall be #14 AWG minimum for NEC Class I and #16 AWG minimum for NEC Class II, **extra fine stranding.**
      e. All insulation shall be rated for 600 volts unless otherwise indicated.
   2. Building Wiring: Conductors shall be type "THWN" or "THHN" unless otherwise indicated. "THHN" shall not be used in damp or wet locations.
   3. Underground Wiring (Refer to Part-3 for limitations):

a. #12 AWG through #6 AWG: Conductors shall be type UF copper cable with heat and moisture-resistant insulation, suitable for branch-circuit wiring. The cable shall have an insulated equipment grounding conductor. The overall covering shall be flame-retardant; moisture, fungus, and corrosion resistant; and shall be limited to use within the pole standard.
b. #12 AWG through 500 kcmil (MCM) AWG: Conductors shall be type RHH/USE/RHW stranded copper with Durasheath cross-linked polyethylene, thermosetting XLPE that is heat, fungus and moisture resistant.
c. #12 AWG through 500 kcmil (MCM) AWG: Conductors shall be type XHHW-2 stranded copper cable with cross-linked polyethylene, thermosetting XLPE that is chemical and oil resistant, and suitable for wet or dry locations.

4. Flexible Metal Conduit (Liquidtight) Connections and Motor Starter Enclosures: Power and line voltage control wiring Type MTW stranded copper unless otherwise indicated for all motor connections, HVAC equipment, transformers, all other equipment subject to movement and vibration, and motor starter enclosures.
5. Flexible Cable:
   a. Shall be hard service cord, type "SO" with equipment ground conductor in addition to normal current carrying conductors, and "safety-yellow" jacket.
   b. Connectors shall be Crouse-Hinds series CG, Appleton, Kellems, O.Z./Gedney, Raco, or T & B, complete with locknut, sealing gasket, gland nut and tapered neoprene bushing.
   c. In hazardous areas, connectors shall be Crouse-Hinds CGBS.

B. Motor Connections:
1. Connection lugs shall be Thomas and Betts, Series 54200.
2. Insulation shall be motor stub splice insulators, Thomas and Betts, Series MSC, or Raychem MCK.

C. Connectors and Lugs, 600 Volts and Under:
1. Material: Copper, or suitable copper alloy, for all current carrying parts and all parts coming in contact with conductors.
2. Connectors and Lugs, No. 8 and Larger Conductors: Compression type T & B "Color-Keyed", or accepted equal by Burndy or Kearney. Mechanical compression lugs furnished with equipment are acceptable. Provide insulating covers or heat shrinkable insulators where required.
3. Connectors, No. 10 and Smaller Conductors: Permanently indented self-insulated pressure connectors T & B, Buchanan, or accepted equal. Snap-on insulating caps are acceptable insulation. "Scotch-loks" by the 3M Company, "Wing-Nut" by Ideal, "Legrands" by Pass & Seymour (P&S) are acceptable wing type wire connectors.
4. Lugs, No. 10 and Smaller Conductors: Permanently indented or compression type by Buchanan, Burndy, T & B, or accepted equal. Washer head screw terminals without lugs are acceptable on neutral bars, circuit breakers, wiring devices and other equipment, unless otherwise indicated. Mechanical compression lugs furnished with equipment are acceptable.
5. Exterior Splices: Compression type T & B "Color-Keyed", complete with T & B Shrink-Kon series HS heat shrinkable insulators or accepted equal by Burndy or Kearney.
6. Connectors and Lugs, Aluminum: All connectors, lugs and fittings shall be UL listed for use with aluminum alloys, and aluminum to copper alloys where encountered.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Clean out raceway system before pulling wire.

B. Thoroughly inspect all existing raceway systems for burrs, deformation, rust, water, and other hazards. Inform Architect/Engineer in writing of any raceway conditions that would be detrimental to wiring, or not in compliance with Codes or practices. All existing raceways shall meet the requirements of Section 26 05 33.

C. Utilize an approved compound as required to facilitate pulling wires and cables, unless otherwise indicated.

D. 600 Volts and Under Wiring Methods:

1. Conductor Ties:
   a. Inside each enclosure, other than outlet and junction boxes, conductors shall be bundled and trained utilizing T & B "Ty-Rap", 3M Brand Cable Ties, Tyton Cable Ties, or accepted equal, ties. All Switchboards, Panelboards, Motor Starters, Disconnects, etc. require at least one (1) conductor tie for each circuit entering and each circuit leaving the Switchboard, Panelboard, Motor Starter and Disconnect.
2. Conductor Sizes:
   a. Line Voltage Power Wiring: No. 12 AWG minimum. Circuits and feeders larger than 20 amp. to have conductors sized for equal or greater ampacity than their protective device ratings unless otherwise indicated. All wires for 20 amp. circuits shall be #10 on runs 100 feet to 250 feet, #8 on runs 251 feet to 500 feet and #6 on runs 501 feet and above.
   b. Control Wiring:
      1) 120 Volt: If not carrying motor current, No. 14 AWG unless otherwise indicated, or required by load or distance encountered.
3. Terminal Strips: Where equipment does not have terminal strips, provide terminal strips to terminate and splice control, power limited and communication cables. Indicate wire numbers on strip with indelible pen.
4. Conductor Identification:
   a. Wire Markers:
      1) Identify lighting and receptacle branch circuit wiring by panelboard name and circuit number at all accesses.
      2) Identify motor branch circuit wiring by circuit number and phase at all accesses.
      3) Identify feeders by name of equipment from which they originate, circuit number, and phase.
      4) Identify all control wiring with a unique number for each wire.
   b. Color Code: Color code conductors to designate neutral conductor, ground conductor and phase conductors as described in Part 1 of this Section.
5. Splices:
   a. Feeders: Feeder conductors installed between electrical distribution equipment (i.e., switchboards, transformers, and panelboards) shall be free from splices, no exceptions. Any feeder conductor splices proposed by the Contractor shall be approved in advance by the Engineer; otherwise, they are not permitted.
   b. No splices shall be made in any conductor beyond the exterior walls of the Building, except in exterior pull boxes, and where approved by the Engineer.
6. Motor Connections: Shall use connection lugs with motor stub splice insulators.
7. Flexible Cable, Type SO: Flexible cable shall be used to connect portable equipment in kitchens, laboratories, shops, etc., as indicated and limited by the Codes.
8. Each applicable system shall have a separate conduit system unless the applicable system's manufacturer, Codes and Regulations permit other systems conductors to be installed in the same conduit.
9. Type RHH/USE/RHW conductors shall be used for exterior underground lighting branch circuits in schedule 40 PVC conduit. Refer to Section 26 05 43 for the exceptions to the specified complete concrete encasement. Direct burial of the RHH/USE/RHW wire is not permitted. The type UF conductors shall be used within the exterior lighting fixture pole or standard.
10. Type XHHW-2 conductors shall be used for the secondary underground service entrance cables unless otherwise indicated.
11. Test all feeders for IR to NETA ATS standard current revision.

END OF SECTION

SECTION 26 0523

CONTROL VOLTAGE ELECTRICAL POWER CABLES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Power Limited Shielded Cable

1.03 RELATED WORK:

A. Division 23 - Mechanical

B. Section 26 05 26 – Grounding And Bonding For Electrical Systems

C. Section 26 05 33 – Raceway And Boxes For Electrical Systems

D. Section 26 05 36 – Cable Management For Electrical Systems

E. Section 26 05 53 – Identification For Electrical Systems

F. Section 26 20 00 – Low-Voltage Electrical Distribution

G. Division 27 – Communications

H. Division 28 – Electronic Safety and Security

1.04 REFERENCES:

A. All wire, cables, connectors and lugs shall be U.L. listed for the application intended, and meet NEMA applicable standards.

B. All wiring methods shall meet with NFPA applicable codes.

1.05 CONDUCTOR SIZES:

A. All conductor sizes (AWG) are based on **copper**.

B. Number code all control and instrumentation wiring at all points of access.

1.06 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Section 26 05 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. All connectors and lugs shall be as manufactured by T & B, Buchanan, 3M, Burndy, or accepted equal.

B. All **power limited shielded twisted pair** shall be as manufactured by Manhattan, Belden, Alpha, West Penn, Anixter [S].

2.02 MATERIALS AND TYPE:

A. Wiring, Power and Control:

1. General:

a. All control wiring shall be #14 AWG minimum for NEC Class I and #16 AWG minimum for NEC Class II, **extra fine stranding.**
b. All insulation shall be rated for 600 volts unless otherwise indicated.

2. Plenum rated power limited twisted pair cable.
   a. For Remote Control, Signaling and Power-Limited Circuits as per NEC-725 for Class 2 and 3 circuits.
      1) General: Cable shall be UL classified, Subject 13, non-conduit application in ceiling air plenum in accordance with NEC 725 and as specified below.
      2) Control and Instrumentation (24 volt) (Heating, Ventilating and Air Conditioning): Control and instrumentation (24 volt) shall be the minimum of two (2) #16 twisted pair configuration, type CL2P and CL3P insulated stranded tinned copper conductors with 1-1/2 minimum lay, flame retardant, low smoke insulation as required by Class, insulated jacket, color coded, 100% aluminum polyester tape shield, #18 AWG tinned copper drain wire or as indicated otherwise herein.
      3) Control and Instrumentation (Heating, Ventilating and Air Conditioning): Thermocouple extension wire shall be compatible with the specific thermocouple material and shall have the same features as "(2)", except the wire shall meet ANSI standard MC96.1 (Temperature Measurement Thermocouples) and have proper amount of pairs for the application.
      4) Direct Digital Control System: Wiring between pilot relays, sensors, DDC's and control processing unit shall have proper amount of pairs and be the type as required by Digital Control System installed by temperature control system trade, and shall have similar features of "(2)".
      5) Other Systems: Wiring on the applicable systems load side shall be gauge, pairs and shield as required by the applicable system's manufacturer and shall have similar features as to "(2)". Provide shield if required by applicable system's manufacturer or Codes.
   b. For Telephone, Outside Wiring for Fire Alarm and Burglar Alarm, Telephone-like Systems Circuits per NEC 800:
      1) Cable shall be UL Classified, Subject 13, non-conduit application in ceiling air plenum in accordance with NEC 800.
      2) Cable features shall be twisted pair configuration, type CMP, color coded, solid tinned copper conductor, flame retardant, low smoke insulation, 100% aluminum polyester tape shield complete with tinned copper drain wire. The quantity of pairs, gauge and shielding requirements shall be determined by the applicable system's manufacturer. Provide shield if required by applicable system's manufacturer or Codes.
   c. For Fire Protective Signaling System Circuits per NEC-760:
      1) The cable shall be UL Classified, Subject 13, non-conduit application in ceiling air plenum in accordance with NEC 760 and as specified below.
      2) Cable features shall be twisted pair configuration, type FPLP, color coded, solid tinned copper conductor, flame retardant, low smoke insulation, 100% aluminum polyester tape shield complete with tinned copper drain wire. The quantity of pairs, gauge and shielding requirements shall be determined by the fire alarm system manufacturer. Provide shield if required by the fire alarm system's manufacturer or codes.

3. Power limited twisted pair cable (Not for air plenums):
   a. For Remote Control, Signaling and Power-Limited Circuits as per NEC-725 for Class 2 and 3 circuits.
      1) General: Cable shall be UL classified for non-conduit application in ceiling void (non-air plenum) in accordance with NEC 725 and for application in multi system common raceway in accordance with NEC 725 and as specified below.
      2) Control and Instrumentation (24 volt) (Heating, Ventilating and Air Conditioning): Control and instrumentation (24 volt) shall be the minimum of two (2) #16 twisted pair configuration, insulated stranded tinned copper conductors with 1-1/2 minimum lay, types CL2 or CL3, or riser type cables CL2R or CL3R, as required by Class,

insulated, jacket, color coded, 100% aluminum polyester tape shield, #18 AWG tinned copper drain wire or as indicated otherwise herein.

3) Control and Instrumentation (Heating, Ventilating and Air Conditioning): Thermocouple extension wire shall be compatible with the specific thermocouple material and shall have the same features as "(2)", except the wire shall meet ANSI standard MC96.1 (Temperature Measurement Thermocouples) and have proper amount of pairs for the application.

4) Direct Digital Control System: Wiring between pilot relays, sensors, DDC's and control processing unit shall have proper amount of pairs and be the type as required by Digital Control System installed by temperature control system trade, and shall have similar features of "(2)".

5) Other Systems: Wiring on the applicable systems load side shall be gauge, pairs and shield as required by the applicable system's manufacturer and shall have similar features as to "(2)". Provide shield if required by applicable system's manufacturer or Codes.

b. For Telephone, Outside Wiring for Fire Alarm and Burglar Alarm, Telephone-like Systems Circuits per NEC 800:

1) Cables shall be UL Classified for non-conduit application in ceiling void in accordance with NEC-800 and for application in multi-system common raceway application in accordance with NEC 800.

2) Cable features shall be twisted pair configuration, type CM or CMR, color coded, insulated solid tinned copper conductor, insulated jacket, 100% aluminum polyester tape shield complete with tinned copper drain wire. The quantity of pairs, gauge and shielding requirements shall be determined by the applicable system's manufacturer. Provide shield if required by applicable system's manufacturer or Codes.

c. For Fire Protective Signaling System Circuits per NEC-760:

1) The cable shall be UL Classified for non-conduit application in ceiling void in accordance with NEC 760 and as specified below.

2) Cable features shall be twisted pair configuration, type FPL or riser type FPLR as required, color coded, insulated solid tinned copper conductor, insulated jacket, 100% aluminum polyester tape shield complete with tinned copper drain wire. The quantity of pairs, gauge and shielding requirements shall be determined by the fire alarm system manufacturer. Provide shield if required by the fire alarm system's manufacturer.

4. Terminal Strips shall be 600 volt barrier type with marking strip suitable for marking with indelible pens.
5. Pulling compound shall be U.L. listed.
6. Wire markers shall be wrap-around tags made of shrinkable PVC sleeving with hot-stamped blocks or slip-on beads.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Clean out raceway system before pulling wire.

B. Thoroughly inspect all existing raceway systems for burrs, deformation, rust, water, and other hazards. Inform Architect/Engineer in writing of any raceway conditions that would be detrimental to wiring, or not in compliance with Codes or practices. All existing raceways shall meet requirements of Section 26 05 33.

C. Utilize an approved compound as required to facilitate pulling wires and cables, unless otherwise indicated.

D. 600 Volts and Under Wiring Methods:
   1. Conductor Ties:
      a. All power limited cable shall be bundled and trained for each system in the ceiling voids. Each bundle shall be supported from the structure with proper metallic (Caddy) clamp or hanger at the required distances. Proper type of T & B Halar™ cable ties are permitted for use in air plenums.
   2. Conductor Sizes:
      a. Control Wiring:
         1) 120 Volt: If not carrying motor current, No. 14 AWG unless otherwise indicated, or required by load or distance encountered.
         2) 30 Volts or Under: No. 16 AWG unless otherwise indicated, or required by load or distance encountered.
   3. Control and instrumentation wiring specified in Divisions 21 and 22 shall be furnished and installed by Division 26.
   4. Control and instrumentation wiring specified in Division 23 shall be furnished and installed as follows:
      a. All line voltage control wiring, 101 volts, 60 Hertz or higher voltage shall be provided under Division 26.
      b. All low voltage control raceways and wiring, 100 volts and lower voltages and thermocouple extension wiring, shall be provided under Division 23, according to Section 26 05 33 and Section 26 05 23 product and material requirements, and installation methods.
   5. Direct Digital Control System wiring specified in Division 23 shall be furnished and installed as follows:
      a. All line voltage control wiring, 101 volts, 60 Hertz or higher voltage, wired through the Digital Control System; and 120 volts, 60 Hertz power source wiring to the Direct Digital Control System shall be provided under Division 26.
      b. All low voltage control wiring (100 volts and lower voltages) for the Direct Digital Control System shall be provided under Division 23, in the manner as noted above for control and instrumentation wiring.
   6. Plenum Rated (and Non-Plenum) Power Limited Shielded Twisted Pair Cable:
      a. All plenum rated (and non-plenum) shielded power limited cable shall be installed in accordance with NEC Article 725, 760 or 800 on the "load" side of the applicable system.
      b. Provide proper number, shielding and size of wires as required for operation of the applicable system in accordance with the manufacturer's instructions and applicable NFPA codes.
      c. Raceway Requirements:
         1) Where an accessible ceiling system or demountable partitions are installed; hollow spaces in casework are available; or similar accessible void is available; a conduit system will not be required. If a conduit system is not utilized cables shall be installed using the specified “Open Wire Management” system.
         2) Where cable is in inaccessible ceiling voids, in inaccessible wall void, penetrates a floor or wall, or exposed on wall or at ceiling, the cable shall be in conduit.
         3) Where partial, detached or “floating” ceilings are provided or no finished ceiling is provided, the cable shall be in conduit, terminating in an accessible corridor ceiling void.
         4) The above conduits shall terminate in an accessible void and shall be bushed to prevent damage to cable. All conduits shall also be grounded to the BGES.
      d. Wiring splices are to be avoided to the extent possible, and if needed, they must be made only in accessible junction boxes and shall be crimp connected.
      e. Transposing or changing color coding of wires shall not be permitted.
      f. Wire nut-type connections are not acceptable. All connections shall be made on terminal strips (in boxes or cabinets).
      g. All conductors shall be labeled on each end with "E-Z markers" or equivalent.
      h. Conductors in cabinets shall be carefully formed and harnessed so that each drops off directly opposite to its terminal.

i. Cabinet terminals shall be numbered and coded. All controls, function switches, etc., shall be clearly labeled on all equipment panels.
j. All connections to components and equipment shall be made with crimp type terminal connections, or method approved by applicable systems manufacturer.
k. All wiring shall be checked and tested to ensure that there are no grounds, opens or shorts.
l. Ground all shields only at termination point (originating).
m. If shield is not to be grounded, pull shield back over cable jacket and insulate with heat shrink tubing to prevent accidental grounding.
n. Install cable connectors on all power limited cables entering enclosures except where cable is in protective conduit.
o. All cables installed in ceiling voids shall be attached to or supported from a vertical surface, a structural member or electrical conduit with a Caddy flexible cable support, bridle ring or cable clamp; or specified conductor tie (plenum rated where required). Absolutely **do not** support from ceiling system or fixture support wires **except** where accessing a ceiling mounted device. The cable(s) shall **not** block lay-in lighting fixtures, ceiling mounted HVAC equipment or ceiling tiles in order to allow **full** access to the ceiling void.

7. Terminal Strips: Where equipment does not have terminal strips, provide terminal strips to terminate and splice control, power limited and communication cables. Indicate wire numbers on strip with indelible pen.
8. Conductor Identification:
   a. Wire Markers:
      1) Identify all control wiring with a unique number for each wire.
   b. Splices:
      1) No splices shall be made in any conductor beyond the exterior walls of the Building except in exterior pullboxes, and where approved by the Engineer.
      2) Shielded power limited cable for Digital Control System wiring shall be splice free between sensors, DDC's and central processing unit.
9. Each applicable system shall have a separate conduit system unless the applicable system's manufacturer, Codes and Regulations permit other systems conductors to be installed in the same conduit.

END OF SECTION

SECTION 26 0526

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Service Entrance Electrode Grounding System

B. Separately Derived System's Electrode Grounding System

C. Equipment Grounding Conductor (EGC)

1.03 RELATED WORK:

A. Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 05 23 – Control Voltage Electrical Power Cables

C. Section 26 05 33 – Raceway and Boxes for Electrical Systems

D. Section 26 05 36 – Cable Management for Electrical Systems

1.04 REFERENCES:

A. NFPA 70 (NEC), Article 250

1.05 DESCRIPTION:

A. The service entrance grounding electrode system shall be in accordance with NEC 250.64 and 250.66, and other applicable NEC Articles. The minimum grounding electrode system shall be a connection to the cold water main valve inside the building or structure plus the minimum of three (3) ground rods in a triangular pattern outside the building and the metal frame of the building or structure, where effectively grounded.

B. The separately derived system grounding electrode system shall be in accordance with NEC 250.30 and other applicable NEC Articles.

C. An insulated equipment grounding conductor, color coded per section 26 05 19, and the NEC, shall be provided for each alternating current circuit without exception.

1.06 TESTS:

A. The grounding electrode system shall have a resistance of 25 ohms or less as per N.E.C. 250.56. Resistance of the grounding electrode system shall be measured separately, with this system disconnected from the building, using the three-point "fall-of-potential" method. Measurements shall be made with appropriate ground resistance meters as manufactured by James G. Biddle; Associated Research, Inc.; or accepted equal.

B. The equipment grounding conductor shall be tested for continuity and proper bonding to metallic equipment enclosures, outlet boxes, wiring devices and similar items.

C. Equipment bonding shall be provided to all equipment on service side of conductors for all boxes, raceways and enclosures in accordance with N.E.C. 250.96 and respective N.E.C. 250.102 all sections.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Ground Rods: 3/4" X 10' copper-clad steel ground rods as manufactured by Copperweld, "Permaground" stainless steel clad ground rods as manufactured by Teledyne Metal Forming, or accepted equal. The copper shall have a minimum thickness of .013 inch at any point on the rod. If necessary to install ground rods deeper than 10'-0", then sectional ground rods shall be installed.

B. Ground Clamps: Thomas & Betts “GUV,” O. Z. Gedney “CG” series or Blackburn “GUV” series, as required by water pipe size and/or grounding electrode conductor size.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. The service, which includes the service entrance conductors and raceways, and service equipment shall be grounded where required and in accordance with requirements of the National Electric Code.

B. Multiple-Rod Grounding Electrode System: The ground rods and ground grid system shall be of adequate design sufficient to allow for seasonal changes in soil characteristics and possible corrosion of the ground system by the soil, and shall be installed in virgin, undisturbed soil. Multiple-rod grids should be arranged in either a triangular arrangement or in a "hollow square" if of more than 3 rods, with spacing between adjacent rods not less than the average depth of the rods in the system. If the soil has been disturbed, either by the present construction or previous occupancies, then the ground rods shall be deep-driven, so that there shall be a minimum length of 10 feet in undisturbed soil.

   1. Where a portion(s) of the building is separated electrically from another portion of the building, the contractor shall electrically bond the two separate structures together with a #3/0 Bond wire. The bond wire shall be connected to the steel or UFER system on each structure with lugs and connectors. One bond connection shall cover at most 100 horizontal linear feet of structure.

C. Ground conductors shall be connected to the ground rod(s) by exothermic welding as manufactured by:

   1. "Cadweld" process by Erico Products, Inc., or
   2. The “ThermOweld” process by Continental Industries Inc.

D. Equipment Grounding Conductor (EGC):

   1. Provide a separate insulated grounding conductor, color-coded as per Section 26 05 19, enclosed in the same raceway with the phase conductors for all alternating current circuits, even though not necessarily shown on the drawings.
   2. The equipment grounding conductor shall be secured to the equipment enclosure at the source of power and at the apparatus being served by the alternating current supply.
   3. The minimum size for the grounding conductor shall be as specified in Table 250.122 of N.E.C.
   4. Existing alternating current circuits: If an equipment grounding conductor is not present in the existing feeder or branch circuit to be reworked, Division 26 shall provide new phase, neutral and grounding conductors from the related switchboard or panelboard to the indicated outlet.

END OF SECTION

SECTION 26 0533

RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Rigid Conduit (Heavy Wall, Intermediate Metal Conduit, Electrical Metallic Tubing and Rigid Non-Metallic Conduit)

B. Flexible Conduit (Liquidtight and "Greenfield")

C. Surface Raceway (SR) and Wireway

D. Fittings for Conduits, Flexible Metal Conduit, Surface Raceway (SR), Wireway.

E. Pull Boxes

F. Junction Boxes

G. Outlet Boxes

H. Exterior Pullboxes

I. Plugging Boxes

J. Floor Boxes

K. Multi-Service Recessed Floor Boxes

1.03 RELATED WORK:

A. Section 26 05 36 - Cable Management for Electrical Systems

B. Section 26 05 53 – Identification For Electrical Systems

C. Section 26 09 23 – Lighting Control Devices

D. Section 26 20 00 – Low-Voltage Electrical Distribution

E. Section 26 27 26 – Receptacles

F. Section 26 50 00 – Lighting

G. Division 27 – Communications

H. Division 28 – Electronic Safety and Security

1.04 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Section 26 05 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Rigid Heavy Wall Conduit (GRS): Essex, Allied Tubing, Republic, Steelduct, Triangle, L.T.V., Wheatland, or accepted equal.

B. Intermediate Metal Conduit (I.M.C.): L.T.V., Berger Industries, Inc., Allied Tubing, or accepted equal.

C. Electrical Metallic Tubing (E.M.T.): L.T.V., Wheatland, Republic, Steelduct, Berger Industries, Inc., or accepted equal.

D. Rigid Non-Metallic Conduit: Carlon "PLUS" Schedule 40, 90ºC, U.L. listed, Queen City Plastics, Sedco, Can-Tex Industries, or accepted equal.

E. Liquidtight Flexible Metal Conduit: Anaconda "Sealtite", O.Z./Gedney "Flex-Guard", Electri-Flex Co. "Liquid-Tight", or accepted equal.

F. Galvanized Single Strip Steel Flexible Conduit: American Flexible Conduit, Anaconda, Electri-Flex Co., or accepted equal.

G. Fittings (All fittings to be same materials as specified for conduit):
   1. Rigid Heavy Wall and Intermediate Metal Conduit Fittings: O.Z., T & B, Efcor, Berger Industries, or accepted equal.
   2. Electrical Metallic Tubing Fittings: T & B, Raco, Steel City, O.Z./Gedney, Berger Industries, Inc. or accepted equal.
   3. Flexible Metal Conduit Fittings: T & B, O.Z./Gedney, Midwest, Steel City, or accepted equal.
   4. Conduit "L's": Crouse Hinds, Killark, O.Z./Gedney, Shamrock Conduit Products, or accepted equal.
   5. Cable Supports: O.Z. type M, or accepted equal.
   6. **Underground Raceway Seals:** O.Z., Spring City Electrical MFG., or accepted equal [S].
   7. Fire Wall and Smoke Partition Seals:
      a. O.Z. type CFS fire seals or T & B "Flame Safe" Fire Stop System or 3M Brand Fire Barrier Penetration Sealing System #7904, 3M Brand Fire Barrier Caulk CP-25 and Putty 303, Nelson "Flameseal" fire stop putty, or accepted equal for each conduit or cable as required [S].
      b. Wiremold FlameStopper™ FS series Thru-Wall Fitting, STI EZ-Path, or other accepted equal for installation of power limited cabling through fire wall [S].
   8. Rigid Non-Metallic Conduit Fittings: Carlon, Queen City Plastics, Sedco, Can-Tex Industries, or accepted equal.
   9. Insulated Throat Metallic Bushings: O.Z./Gedney Type B or BLG, T & B nylon insulated metallic, or acceptable equal by Efcor. Provide grounding lug type where required.
   10. Service Heads: Appleton type F, or accepted equal by O.Z./Gedney, Steel City, or Crouse-Hinds.

H. Wireway: Square D or equal by Walker, or Hoffman.

I. **Surface Raceway:** Surface metal raceway and fittings shall be by the Wiremold Co. or acceptable equal by Walker and Mono-Systems [S].

J. Pull and Junction Boxes: General Metals, Electromate Mfg. Corp., Hoffman, or accepted equal.

K. Outlet Boxes: Appleton, Raco, Steel City, or accepted equal.

L. Outlet Box Brackets: E-Z Mount Bracket Co., Inc., Montvale, Virginia 24122 (540-947-5500), or accepted equal by Caddy, Raco.

M. **Floor Boxes:** Hubbell, Steel City, T & B, C.W. Cole, or Walker [S].

N. **Plugging Boxes:** C.W. Cole & Co., Inc. or accepted equal [S].

O. **Multi-Service Floor Boxes:** Walker, Inc., or accepted equal [S].

P. **Exterior Pullboxes:** Quazite Corporation, Blackburn-Weaver, Bell, Perfect-Line, O.Z./Gedney, Carlon, or accepted equal [S].

2.02 MATERIALS AND USE:

A. Rigid Heavy Wall Conduits (GRS): Of mild steel tube, electro or hot-dipped galvanized and U.L. labeled.

B. Intermediate Metal Conduit (I.M.C.): Of mild steel tube in sizes 3/4" to 4", hot-dipped galvanized or electro-galvanized and U.L. labeled. Refer to limitations under Part 3 - EXECUTION.

C. Electrical Metallic Tubing (EMT): Of mild steel tube in sizes 3/4" to 4" hot-dipped galvanized or electro-galvanized and U.L. labeled. Refer to exceptions under Part-3.

D. Flexible Metal Conduit:
   1. Liquidtight flexible metal conduit: Flexible galvanized steel tubing covered with extruded liquid-tight jacket of PVC and a continuous copper bonding conductor wound spirally between the convolutions. Refer to limitations in Part 3 - EXECUTION.
   2. Galvanized single strip steel flexible conduit (Commercial Greenfield): UL 1 listed. Refer to limitations in Part 3 - EXECUTION.

E. Rigid Non-Metallic Conduit: Schedule 40 PVC (polyvinyl chloride) conduit that meets and exceeds UL 651, NEMA TC2-1978 for above ground, direct burial, concrete and exposed applications. Refer to limitations in Part 3 - EXECUTION.

F. Fittings:
   1. For Rigid and Intermediate Conduit: Couplings to be galvanized or sherardized steel. Double galvanized steel locknuts shall be used where required by code. Single locknut and bushing may be used elsewhere. Insulated throat metallic bushings to be installed on all rigid conduit terminations where such bushings are required by NEC to protect the wires from abrasion. Use ground lug type where required.
   2. For E.M.T.: Steel set screw connectors, permanently indented or gland compression type. **Do not use cast metal type.**
   3. For Flexible Metal Conduit: Standard liquidtight fittings for liquidtight conduit. Standard steel flexible metal conduit fittings for standard flexible metal conduit.
   4. Conduit "L's": Galvanized steel, threaded, "LB" or "LBD".
   5. Cable Supports: To be installed for the support of all conductors and cables as per NEC Article 300-19.
   6. Underground Raceway Seals: Provided on each underground electrical raceway entering building. Provide type "FSK" "thruwall" seals on each conduit passing through the outside wall or floor. Provide type CSBG conduit sealing bushing on each underground conduit at the first pullbox, panel or other location as noted on drawings.
   7. Fire Resistance Rated Wall and Smoke Partition Seals:
      a. Provide fire-seals for each conduit or cable passing through fire rated walls and floors where the floor, wall or smoke partition has a rating up to three (3) hours in accordance with Manufacturer's application data. All penetration systems shall have been tested per ASTM B14-88 fire test and UL listed for "Through-Penetration Fire Stop System".
      b. Provide UL approved thru-wall fittings for passage of power-limited cabling where cable tray, path of cable hooks, or other major cable pulling route intersects fire wall. The system shall expand rapidly where exposed to fire or high temperature to provide the required firestopping. The fittings shall be complete with built-in firestopping material and through-wall penetration. Each penetration shall be equivalent size of a 4” conduit sleeve or greater and shall remain fully accessible to add or remove cables without disturbing the firestopping material. The fittings shall have been UL-tested and meet the requirements of ASTM E814 UL1479 and shall be rated for 4 hours. Fittings shall be UL approved for use in air plenums.
   8. For Rigid Non-Metallic Conduit: PVC fittings, elbows and cement shall be provided by the same manufacturer who provides the rigid non-metallic conduit.
   9. Conduit Expansion Joints: O.Z. mechanical type, or accepted equal, on each conduit run crossing building expansion joint.
   10. Service Heads: As required by conduit size.

G. Surface Raceway:
   1. The raceway shall consist of a base and cover section factory assembled and designed to accommodate pulling conductors through the raceway. Raceway shall be U.L. labeled.

2. The base section shall have a nominal material thickness of .040" and be manufactured of zinc plated or galvanized steel. 6000 base shall be .060" thickness.
3. The cover section shall have a nominal material thickness, as listed below, and be painted with a baked enamel finish which is capable of being over-painted in the field if required.

Mark	Series	Cover Thickness
SR2	Wiremold 200	.025”
SR5, SR7	Wiremold 500, 700	.040”
SR22	Plugmold	.040”
SR3	Wiremold 3000	.040
SR4	Wiremold 4000 (w/divider)	.040"
SR6	Wiremold 6000 (w/divider)	.040"

4. Raceway dimensions shall be as follows:

Mark	Series	Dimensions
SR2	Wiremold 200	½” W x 11/32” H
SR5	Wiremold 500	¾” W x 17/32” H
SR7	Wiremold 700	¾” W x 21/32” H
SR22	Plugmold 2200	2-3/8” W x 3/4” H
SR3	Wiremold 3000	2-3/4” W x 1-17/32” H
SR4	Wiremold 4000 (w/divider)	4-3/4" W x 1-3/4" H
SR6	Wiremold 6000 (w/divider)	4-3/4" W x 3-9/16" H

5. Fittings:
   a. General: A full complement of fittings must be available including, but not limited to, bushings to prevent wire abrasion, single and multiple gang boxes to accommodate device installation, adapters from conduit to raceway, transitions to both larger and smaller surface metal raceways, receptacle covers, wiring device brackets, take-off connectors, pre-wired receptacle harnesses, 90 degrees elbows, tees, fixture boxes and flexible sections to allow uninterrupted continuation of raceway along semi-circular or curved surfaces.
   b. SR4 (4000) Wiring Device Plates: Each receptacle location shall have a Wiremold #4048B device cover plate and specified duplex receptacle. Each Data/Comm. Location shall have a Wiremold #V4007C-1 Device cover plate and a blank faceplate per section 26 27 26 selection with color to match raceway.
6. Refer to limitations under PART 3 - EXECUTION.

H. Wireway:
1. Wireways shall be listed to meet UL 870.
2. Wireway covers and troughs shall be constructed from a minimum of 14 gauge steel before finishes are applied. The end flanges shall be constructed from ten gauge steel. All lengths and fittings shall have smooth, rounded edges to prevent damage to wire and cable insulation. Wireway shall be furnished without knockouts.
3. Wireway covers shall have oil-resistant closed cell gasketing for sealing purposes. A solid oil-resistant neoprene joint gasket shall be used between flanges for rigidity when sections and fittings are bolted together.
4. A gasketed captive hinged connector which interlocks with the covers shall be used at each joint. The connector shall be such that the covers cannot be closed and latched without closing the sealing connector.
5. Wireway shall be provided with quick-release cover latches which hold the cover securely in place when closed. Latches shall have provision for a sealing wire to be used when covers and latch are in the closed position.
6. Wireway covers shall be secured to the troughs with leaf type hinges which all allow full opening access to the wireway interior.
7. Provide NEMA-1, NEMA-3R, NEMA-4X, NEMA-12 or other NEMA enclosure where required by NEC or environmental conditions.

I. All boxes to be sherardized or galvanized (after fabrication) sheet steel (except floor boxes) code gauge boxes.

J. The minimum size of all boxes shall conform to the requirements of the National Electrical Code, unless noted to be larger on the drawings, and shall have adequate braces and supports.

K. Pull and Junction Boxes: All boxes shall have screw-on or hinged covers. All flush mounted boxes shall have 3/4" overlapping covers with flush-head cover retaining screws and covers in finished areas shall be prime coated with paint.

L. Outlet Boxes:

1. All boxes shall have ears turned in. Multiple gang boxes must be one piece type (not built-up). Provide 3/8" (or larger if required) fixture stud in all fixture boxes. Provide appropriate covers as required, including 3/4" deep plaster ring covers where plaster may be encountered. Provide vapor proof outlet boxes for vapor proof fixtures. Provide size and type of boxes as required by location and N.E.C., except where exposed masonry occurs, use one piece "tile boxes". All boxes shall be 4" square boxes with "tile rings" unless noted otherwise or where larger sizes are required. All outlet boxes requiring hangers shall be hung with metal hangers.
2. **All exposed boxes below ceiling level shall be cast type FS or FD.**

M. Stud Wall Outlet Box Brackets: Provide #E-Z 1-4, #E-Z 4-1116 or #E-Z 23-1 outlet box brackets with extension brackets or acceptable equal.

N. Outlet Box Bar Hangers: Provide adjustable or solid bar metal hangers by Appleton Electric Manufacturing or accepted equal.

O. Floor Boxes: Unless noted otherwise, provide Hubbell #B-2537-SA3725, or accepted equal, (or terrazzo type where needed) cast iron watertight floor box, aluminum cover and flange, with devices as specified under Wiring Devices. Each box shall have two Hubbell #S-3061 protective rings. For floors thicker than 3" provide Hubbell Series B-2536-SA-3725, or accepted equal. Telephone boxes, Hubbell #B-2537-SA-2525 with Hubbell #SA-3061 fitting. Other floor boxes are as specified elsewhere or called for on the drawings. Provide carpet flanges where carpet is encountered.

P. Recessed Floor Boxes: Unless otherwise indicated, provide "shallow" adjustable cast iron water-tight recessed floor boxes complete with aluminum cover and flange, carpet flange (if required), brass protective rings for cord connectors, low-profile bushed aluminum service heads (above floor) for telephone/data cable, and terrazzo type construction where required. All over height shall be 2-13/16" with a minimum of 30 cubic inch capacity.

Q. Through floor wiring for power and communications shall be Walker RC4 Series Multiple Service fire-rated poke-through fittings, UL classified, meeting NEC Article 300-21. Fire-rating of fitting shall match the fire-rating of the floor. Fitting shall be self-supporting without the attachment of an above-floor fitting, and consist of two (2) factory pre-wired NEMA 5-20R duplex receptacles to the integral junction box and two (2) blank plates for future installation of any of the following: Category 6, Category UTP, fiber optic, coax, audio and video connections. Each poke-thru fitting shall have two (2) runs of ½" conduit extending from its base to the location indicated on the drawings. Above floor fittings shall be flush, and provided with carpet flange in color to match Owner's carpet where applicable. Box assembly shall meet UL 514 scrub water exclusion requirements in areas where hard floors are encountered, and in areas where scrub water is anticipated.

R. Exterior Pullboxes: Provide reinforced polymer concrete service box, extension, and cover with proper logo with a minimum of 7.4 cubic feet of interior space unless otherwise indicated and meets ASTM D-756, D-543, D-570, D-790 and D-365 test requirements.

S. Plugging Boxes: C.W. Cole & Co., Inc. recessed stage floor pockets and wall boxes, with outlets as indicated on the drawings. Housing to be 16 gauge steel. Floor boxes to have cast-iron cover, nonskid tread design, self-closing door, cord clearance slots, baked black enamel finish, and suitable for mounting in wood or concrete floors. Wall boxes to have cast aluminum cover with self-closing door, lock plus two keys (all units keyed alike), baked aluminum enamel over corro-sion-resistant primer, suitable for mounting in stud wall.

T. Multi-Service Recessed Floor Boxes (FB): Walker Inc., #RFB4-CI-1, cast iron recessed four (4) compartment combination box complete with combination wire tunnel/mounting bracket, two (2)

internal duplex receptacle brackets as required, internal blank brackets as required, telephone/data brackets as required (Contractor to match telephone and data jacks' specification), flush access hatch with floorport flanged activation kit consisting of die-cast aluminum trim ring in finish color selected by Architect and insert areas for carpet or tile cutouts to match surrounding finish, or doors with 1" conduit openings for furniture feeds, as required. Box assembly shall meet UL 514 scrub water exclusion requirements in areas where hard floors are encountered, and in areas where scrub water is anticipated.

U. Wood Floor Boxes: Unless otherwise noted, provide Walker #880 Series steel floor box (one, two, or three gang with removable barriers for multi-service applications as required) with flush mount brass combination flange and multiple #828 brass duplex cover plates having flip lids and locking screws (3828GFITC plate for GFI receptacle applications and low voltage connectivity requirements). Provide all inserts, modules and jack to match Owner's requirements and as indicated on the drawings.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Provide raceway systems to achieve required distribution, switching and circuit control. All wires for all systems shall be installed in rigid metal raceways and terminated in boxes or cabinets, unless otherwise specified herein as partial conduit or non-conduit installation. Allow for making connections to all outlets, motors, etc., indicated and check plans to insure that all outlets, etc., have a designated circuit. Notify the Engineer of any discrepancies found.

B. Conduit runs are not shown on the drawings, unless specifically noted or indicated otherwise.

C. Conceal all (new) raceways (in existing and new construction) except where specifically noted on drawings or permitted as exposed. Runs in mechanical room areas may be exposed. Exposed conduit must be run parallel with the building walls and supported in a neat substantial manner. Refer to surface raceways under PART 3 - EXECUTION.

D. **Cap** raceway systems during course of construction and thoroughly clean inside before installation of conductors.

E. Provide a completely separate raceway system for all emergency lighting and exit sign circuits as required by N.E.C.

F. No rigid raceway for line voltage wiring shall be smaller than 3/4", except for flexible conduit, unless specifically indicated otherwise. The Electrical Trade shall size all other raceways based on the N.E.C. and verify the sizes shown on the drawings, increasing same if required by local authorities and/or codes.

G. All conduit feeding from one building area to another shall remain within the confines of the building, unless shown or noted otherwise on the drawings.

H. Field made conduit bends shall be made with an acceptable bending machine or conduit bender.

I. Flexible Metal Conduit:
   1. Liquidtight flexible metal conduit cannot be used in any return air plenum. Standard galvanized single strip steel flexible conduit shall be used in all return air plenum spaces.
   2. Liquidtight flexible metal conduit for **all** flexible connections, **plus** all short (less than 6' long) motor connections, transformers and all equipment subject to movement or vibration and where permitted by the Engineer. For flexible connections in return air plenums, flexible metal conduit shall be substituted for liquidtight flexible metal conduit.
   3. Galvanized single strip steel flexible conduit (6' maximum length) limited to use as the flexible connection to recessed lighting fixture assemblies *(only)* (and in existing wall voids).

J. Rigid Metal Heavywall Conduit (GRS):
   1. All joints shall be properly threaded and made tight in standard conduit couplings.
   2. All thread conduits or nipples are not acceptable.

3. All conduit cuts shall be square, made with a hacksaw or approved cutting machine, and reamed after threading and before installation to remove burrs.
4. All threads, both field-cut and factory-cut, not otherwise protected, shall be painted after installation with two coats of asphaltum paint if concealed and two coats of primer base paint if installed in an exposed location.
5. GRS shall be used in service entrance raceways where exposed.
6. Clamps to be malleable two (2) hole galvanized iron and hangers to be rod type steel.

K. Where conduits are exposed to occupants, up to 8'-0" feet above the floor, the conduits shall be snug to the wall and secured with two (2) hole clamps (utilizing specified detention type fasteners).

L. Intermediate Metal Conduit (IMC):
1. Applicable specifications for installation of rigid metal conduit applies to IMC.
2. IMC can be substituted for GRS per the NEC.

M. Electrical Metallic Tubing (EMT):
1. Applicable specifications for installation of rigid metal conduit applies to E.M.T.
2. E.M.T. shall **not** be used underground, cast in concrete, exposed on exterior of buildings, and exposed interior locations below 8'-0" (above finished floor).
3. E.M.T. may be routed down exposed interior walls to top of panelboards, motor starters, disconnect switches, light switches, etc.
4. E.M.T. is permitted in electrical and mechanical equipment rooms, per detail on drawings.

N. Rigid Non-Metallic Conduit (PVC):
1. All elbows and nipples to be same material as specified for conduit.
2. All joints to be solvent welded in accordance with conduit manufacturer's instructions.
3. Hanger clamps to be PVC coated malleable iron and hangers to be PVC coated rod type steel.
4. Conduit clamps to be PVC coated, two hole clamps complete with nylon hardware.
5. PVC conduit shall be limited to the following applications:
   a. Underground secondary service entrance concrete encased conduits outside the perimeter of the building and routed under the concrete floor slab on grade to the service entrance equipment.
   b. Underground branch circuit and feeders (under 600 volts), telephone, fire alarm, sound system, control conduits in specified concrete encasement outside the perimeter of the building and in or under the concrete floor slab on grade. The PVC conduit can be routed from the concrete floor slab on grade directly into the masonry unit wall cavities, metal wall stud cavities up to the first wall box only, maximum 4’ aff. PVC shall not be exposed within the building except if within a floor mounted enclosure or panelboard to floor conduit enclosure. The PVC conduits under a concrete floor slab on grade will not require concrete encasement if the slab is more than 2-1/2" thick. Exposed PVC conduit stubs above the concrete slab shall not be permitted. Only exposed rigid metal conduit stubs are permitted.
   c. Underground branch circuit and feeders (under 600 volts) for outdoor lighting only.
   d. Provide specified concrete encasement per Section 16115.
6. PVC shall not be acceptable in areas where subject to ambient temperatures exceeding those for which PVC conduit is approved, for the support of fixtures or other equipment and other areas not permitted by Codes.

O. Supports: Provide metallic supports as required for the proper installation of the raceway or conduit systems and all other equipment installed under this contract. **Wire shall not be used to support or tie down any conduit system.**

P. Empty Conduits: Pull #12 stranded gauge galvanized fishing wires or stranded nylon line through all empty conduits for all systems. These wires or lines to remain in the conduits.

Q. Exposed Masonry: Where wall finish is exposed masonry, raceways shall be so placed in wall that the masonry unit can be neatly set around it with minimum cutting and without injury to the exposed masonry face.

R. Wireways:

1. Furnish and install a complete lay-in wireway system where required. Wiring capacity shall be determined by NEC unless larger dimensions are indicated.
2. Wireway lengths and fittings shall be securely bolted together with same size slotted paint cutting hex-headed shoulder bolts and hex nuts with captive external tooth lock washers which maintain electrical ground continuity across the joint. Each joint shall be gasketed between end flanges. The sealing cover connector shall be installed so as to be held captive and maintain the lay-in ability of the wireway.
3. Wireway shall be installed in accordance with the National Electrical Code requirements.
4. Wireways shall be supported at intervals not exceeding five feet unless specially approved for supports at greater intervals. The ten-foot straight sections of wireway shall be Underwriters Laboratories, Inc. listed for support at ten-foot intervals.

S. Surface Raceway:
1. Install surface raceway in accordance with manufacturer's recommendations and instructions. Raceway capacity shall be determined by NEC unless larger capacity is indicated.
2. Refer to drawings and elevations for routing of all surface raceways and multi-outlet systems.
3. Surface raceway systems shall be limited to the applications and locations indicated on drawings.
   a. Existing solid masonry or concrete walls without furred out drywall, plaster lathe, paneling or other wall covering or if the furred out space is less than the dimension of a conduit or metal clad cable, surface raceway shall be permitted.
   b. Existing hollow core masonry walls where indicated. All other hollow core masonry walls shall have recessed outlets unless cores are blocked with mortar or structural member.
   c. Unless otherwise indicated, route all surface one-piece raceways vertically to floor or ceiling with no horizontal runs except under whiteboards, tackboards, windows, or casework. Short horizontal runs shall be permitted with two (2) surface raceway outlets less than 48" apart.
4. Multi-system divided raceways, SR4 and SR6, are intended for power on one side and power limited cabling in the remaining side. Fire alarm system wiring shall be type MC cable if installed in the multi-systems raceways per NEC. Provide divided (or multiple) junction boxes at the termination of multi-system raceways to allow the "homerun" conduits to be routed to the various power sources and power limited cabled systems. Separation of the various wiring systems shall be governed by the NFPA codes. Provide snap-in wire retainers to keep wiring in raceway during installation before cover is installed, and to facilitate future work.

T. All underground conduits including in grade and under floor slabs shall be watertight over the entire length, to prevent entry of water at connections. Provide compatible sealants for material encountered.

U. All conduits installed under the concrete slab shall be completely underneath the concrete slab. Care shall be taken to ensure that no part of the conduit is within the concrete slab.

V. Pull and Junction Boxes: Provide all necessary pull and junction boxes where indicated or required by National Electrical Code. Certain pull and junction boxes may be shown on the drawings for specific design reasons but is not to preclude the fact that additional boxes will be required to conform to codes and good practice.

W. Outlet Boxes:
1. General: All outlet boxes shall be set flush or set to meet the N.E.C. requirements; otherwise box extensions shall be installed. Mounting heights of all outlets shall be as indicated on the drawings, specified herein, or as permitted on the job. Support all boxes to maintain alignment and rigidity. Clean boxes of all foreign matter prior to installation of wiring and/or devices. Adjacent outlet boxes shall be aligned horizontally at the same height, or vertically in the same line, as required.
2. Wall Outlets:
   a. Where the outlet boxes are shown back-to-back in the walls of 6" or less in thickness, the boxes shall be offset horizontally. Through-the-wall outlet boxes shall not be permitted.

Outlet boxes, indicated to be installed side-by-side in the same wall, shall be located 6" apart. All boxes shall be rigidly secured in the wall.

b. Steel Outlet boxes in fire walls and fire separation assemblies shall be installed in accordance with International Building Code 704 and 714 respectively. Therefore outlet box openings cannot exceed 16 square inches per outlet with 100 square inches limit per 100 square feet of wall area. Where outlet boxes are shown in opposite sides of the wall or assembly, the boxes shall be separated by a horizontal distance of not less than 24 inches.

3. Exposed Masonry: The outlet boxes shall be placed in the wall to allow the masonry unit to be neatly set around the box, with the minimum of cutting and without injury to the exposed masonry face. The dimensioned heights of the outlets in the exposed masonry walls are intended to mean to the nearest masonry joint.
4. Stud Walls: The outlet boxes shall utilize the wall brackets and extensions as required. The Electrical Trade shall coordinate with the dry wall or plaster lathe installation trade for fastening the outboard part of bracket to prevent any movement of the outlet box within the wall cavity.
5. Floor Outlets: Outlets that are indicated to be installed side by side in the floor shall be located 3" apart.
6. Ceiling Outlets: All flush mounted ceiling outlet boxes shall be supported by adjustable or solid bar metal hangers or directly supported by threaded steel rods or stud type fasteners.
7. Local Switch Outlets: Prior to the installation of the local switch outlet boxes, the Contractor shall verify the door swings to insure the proper location of the box. This outlet shall be installed with a minimum of 4" of separation from door jamb trim. Refer to typical elevation for mounting outlet boxes at doors.

X. Conduit Termination: All rigid heavy wall metal conduits (G.R.S, I.M.C. and E.M.T.) and rigid non-metallic conduits (P.V.C.) shall terminate with locknut and bushing in all boxes, cabinets, panels, etc. Where a grounding means is not provided in the box, cabinet, panel, etc. provide a locknut and grounding bushing.

Y. Exterior Pullboxes: Install flush with finished grade on a minimum of tamped 6" gravel base.

Z. Plugging Boxes: Install flush with finished floor or wall. Refer to drawings for proper support and installation method.

AA. Multi-Service Recessed Floor Boxes: Install flush with finished covering or floor. Provide receptacles, telephone/data jacks and other outlet configurations as indicated. Install telephone, data and other systems jacks as specified hereinafter. Where the box penetrates to floor depth, coordinate with related trades for additional support.

BB. Wood Floor Boxes: Install flush with finished floor. Where box is to be installed in raised wood floor (i.e., stage applications, etc.), provide additional support underneath box to adequately withstand potential loads as determined by the use of the space. Provide receptacles, telephone/data jack and other outlets as indicated. Install telephone, data and other systems jacks as specified hereinafter.

END OF SECTION

SECTION 26 0536
CABLE MANAGEMENT FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Wall Brackets

B. Cable Tray

1.03 SUBMITTALS:

A. Submit shop drawings and product data on all equipment specified in this section in accordance with Section 26 05 00. Provide installation shop drawings in accordance with 3.01.B.3 below.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Open Wire Management Hardware:

1. Brackets, Wall Metallic “C” shaped hanger by Mono-Systems, Inc. (The Hook).
2. Cable Trays: Mono-Systems, Inc., Mono-Tray/50 lb./ft. Series Tray or equals by Atlas Cable Tray and B-Line or other acceptable equal meeting all requirements specified herein.

2.02 MATERIALS AND USE:

A. Wall Brackets / Center Supported: Brackets shall be multi-use "C" or “J” shaped hanger with 9/32 (7mm) diameter holes on four (4) sides. The center space shall provide the required cross section area for the cable being supported. The bracket shall be 6063-T6 aluminum, steel or galvanized metal with box beam design (19mm x 12mm x 2mm thick walls), one (1) inch radii turns, smooth and free from sharp edges, two (2) 7mm holes in long side, one (1) 7mm hole in both short sides, and mounted with 6mm (1/4") hardware or supported with rod and clamps from structure. This is the basis of design. Other manufacturers are acceptable. Product shall have a same form, fit and function and be suitable for support data cabling.

B. Cable Tray:

1. General: Cable trays shall be of ventilated construction with widths and depths as indicated. The cable tray shall be center supported or wall mounted as required. The cable tray shall be constructed of 6063-T6 aluminum alloy and shall utilize a center spine being 1.5 in. wide x 2.75 in. high and square/triangular cross section rungs a minimum of .50 inches thick. Rungs shall be staked in place, not screwed or welded. All fittings and accessories are also 6063-T6 aluminum.
2. Ceiling Center Supported Cable Tray (CT1) shall be constructed of a center rectangular aluminum tube which forms a spine to which square/triangular cross rungs are attached on 6 inch centers. The cross rungs shall be bent up at their ends to a height of 3.5 inches to form a center supported, open sided, ladder like assembly. The tray shall not have side rails. Rungs shall emanate at right angles from the top of the spine. Tray width shall be 12".
3. Wall Mounted Cable Tray - Single Tier (CT2) shall be constructed of a rectangular tube which forms a spine to which cross rungs are attached on 6 inch centers. These cross rungs shall be attached to emanate from one side of the spine and shall be bent up at their ends to a height of 3.5 inches to form an open sided ladder like assembly. The tray shall not have side rails. Rungs shall emanate at right angles from the top of the spine/bottom of the spine. Tray shall

be mounted by fastening the spine directly to the wall in accordance with the manufacturer's specifications. Tray width shall be 9".

4. Wall Mounted Cable Tray - Double Tier (CT3) shall be the same specifications as wall mounted single tier cable tray above except it shall have two sets of vertically stacked cross rungs.
5. Ceiling Supported Ladder Tray (LT) shall consist of two longitudinal “I” shaped members (side rails) with transverse members (rungs) welded to the side rails. The ladder tray shall be constructed of extruded 6063-T6 aluminum alloy and shall have rounded edges and smooth surfaces. Rungs shall be spaced 6” inches on center. Rung spacing in radiused fittings shall be approximately 9” at center of fitting. No portion of the rungs shall protrude below the bottom plane of the side rails. Ladder tray depth shall be 3 inches per NEMA VE-1. Tray width shall be 12".
6. Fittings:
    a. Splice Connectors: Sections of tray and all other fittings shall be joined by using a two bolt, 4" long rectangular splice connector which telescopes into the spine of the tray. Splice connectors shall allow for thermal expansion/contraction of the tray system. The splice connectors shall be provided with a vertical hole to accept 1/2 inch threaded rod which is used to support the tray in an overhead application.
    b. Right Angle Couplings: Horizontal and vertical, quick connect items shall be used for all 90 degree elbows, tees and crosses by clamping to the spine without the need for drilling or cutting.
    c. Angle Connectors: Horizontal and vertical shall be used for angles of 90 degrees to 30 degrees and fasten into the spine in the same manner as the above splice connectors.
    d. Dropouts, Conduit Bushing Dropouts, End Caps, as well as all other accessories shall effect a complete rigid mechanical tray installation of compatible material and design.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Wall Brackets: The metallic "C" shaped wall (or ceiling) brackets shall be wall mounted or suspended on a minimum of 24" centers for the support of Data, telephone, fire alarm, CCTV, telephone communication and direct digital controls system (Division 23) wiring and cabling. Wall brackets shall be installed in continuous and even rows, above each corridor ceiling, spaced as indicated above. Coordinate installation of wall brackets with piping, ductwork, conduits, etc. All wall brackets shall be readily accessible for installation of low voltage wiring systems. Wall brackets are required in all corridors where cable tray is not installed and in additional locations as indicated on the drawings.

B. Cable Trays (CT):
    1. Wall Mounted Cable Tray - Single and Double Tier shall be installed as follows (based on Mono-Systems):
        a. Wall rack cable tray shall be supported with 3/8" diameter anchors.
        b. Three anchors should be fastened approximately as indicated in detail on drawings.
        c. Maximum load capacity of tray is 50 lbs/ft.
        d. When supporting tray on a concrete wall, expansion anchors shall be used to give a safety factor of 4.
        e. When supporting wall rack tray on a sheet rock hollow wall a 3/8" diameter threaded rod should be mounted thru the wall with a sufficiently large fish-plate mounted on the far side. The fish-plate should be of sufficient area and thickness so that the pressure on the far wall exerted by the load in the tray is light enough so that it does not crush the wall.
        f. When tray is mounted on a steel wall or columns, powder actuated heavy duty fasteners (drive pins) may be used provided pull or shear loads will give a safety factor of 4.
        g. Splice connectors with or without vertical holes may be used when hanging wall rack.
        h. Provide additional extra hangers whenever in doubt or for any unusual situation.

i. Wall rack shall be installed with 3 spacers per 12 ft. section. Spacers provided with tray. Anchor bolts shall go through spacers. Refer to detail on drawing.
j. Cable tray shall be installed with complete access to allow cable to be laid directly into the tray without pulling.
k. Lay heavy cables as far into the tray as possible.
l. During and after installation of cable tray, care shall be taken by all the tradesmen not to hang from the tray rungs or walk on the tray.
m. All nuts, bolts and washers are supplied with all fittings.
n. When pulling cable into tray, sufficient rollers and sheaves shall be used so that tray is not damaged.

2. Ceiling Center Supported Cable Tray and Ladder Tray shall be installed as follows (based on Mono-Systems):
   a. Cable tray shall be supported with 1/2" diameter thread rod. For ladder tray, provide two (2) rods on each side every six (6') feet.
   b. Maximum span is 12 feet.
   c. Maximum load capacity is 50 lbs/ft on a 12'-0" span.
   d. At support points, threaded rod shall be hung from concrete inserts, clamps or devices that are securely fastened into the slab, wall or beam sufficiently to carry the load of the tray and its contents with a safety factor of 3.
   e. Eccentric loading on each side of tray should not exceed 1 60% vs 40% load differential.
   f. Install stiffener bars, Mono-Systems #0100-0569, along the length of the tray run when length of threaded hanger rod (underside of slab to tray) exceeds 3 feet (refer to drawings). Stiffener bars are manufactured with a preload angle and should be mounted opposite the side of the tray having the heavier load.
   g. Provide additional hangers whenever in doubt or for any unusual situation.
   h. When connecting 12 foot sections at other than hanging points, use splice connectors with no vertical holes. When hanger rod is mounted at other than splice connector points along tray, drill a 5/8" hole vertically through the spine and insert hanger rod with nuts and washers. Do not drill holes in spine unless a hanger rod is used.
   i. Cable tray shall be installed with complete access from either side to allow cable to be laid directly into the tray in lieu of pulling.
   j. Lay heavy cables in center of tray.
   k. During and after installation of cable tray, care shall be taken by all the tradesmen not to hang from the tray rungs or wall on the tray.
   l. All nuts, bolts and washers shall be supplied with all fittings.
   m. When pulling cable into tray, sufficient rollers and sheaves shall be used so that tray is not damaged.
   n. Notched splice connectors which are supplied with bottom rung tray should be used to splice field cut joints only. Use standard splice connectors to tie 12 foot sections together.
3. Cable and Ladder Trays: All cable trays shall be installed with manufacturer’s drawings and written instructions for the type of construction encountered. The methods specified hereinbefore are typical for Mono-Systems Cable Tray and are intended for general installation methods. Contractor shall have cable tray manufacturer prepare installation shop drawings for the Architect/Engineers specified review process. Although the drawings indicate various sections of ceiling and wall mounted cable tray, the Contractor may use either version to suit the job site conditions for coordination with the mechanical and structural systems.
4. Division 27 & 28 systems including Fire Detection and Alarm System, Intrusion Detection System, Access Control System, Telephone (Owner's) System, Communication/Data Network, Building InterCommunication System and CATV System conduits that enter the cable tray, shall have grounding type bushings with a #10 green insulated or bare ground wire bonding the conduit to the tray spine with self-tapping 10-32 cadmium pan-head screw of sufficient length or cable tray conduit bushing "dropout". The drilling and bonding method shall be acceptable to the tray manufacturer. All cable trays shall be continuously bonded together and grounded to the building grounding electrode system (BGES) at each communication closet/room.

5. **No** conduit or unlisted (E1A-T1A) wiring system shall be permitted to utilize the cable tray system in any form. No conduit shall parallel the tray system within 2" or pass over or above the cable tray system within 2" per EIA/TIA standards. No unshielded wire system can parallel the tray system within 5" or pass over or above the cable tray system within 5" per EIA/TIA standards.

END OF SECTION

SECTION 26 0543

UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Underground Power, Telephone, Fire Alarm, CATV and Communication Raceways (Ducts)

B. Prefabricated Manhole(s)

1.03 RELATED WORK:

A. Section 26 05 00 - Common Work Results for Electrical

B. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables

C. Section 26 05 23 - Control Voltage Electrical Power Cables

D. Section 26 05 26 - Grounding and Bonding for Electrical Systems

E. Section 26 05 53 - Raceway and Boxes for Electrical Systems

F. Division 27 - Communications

G. Division 28 - Electronic Safety and Security

1.04 REQUIREMENTS:

A. Standards:
   1. National Electric Safety Code (NESC)
   2. Applicable AASHTO specification and testing for precast manholes.
   3. National Electrical Manufacturers Association (NEMA)
   4. American National Standards Institute (ANSI)
   5. Local Electric Utility Company Regulations
   6. NFPA-70

1.05 SUBMITTALS

A. Submit shop drawings and product data in accordance with Section 26 05 00.
   1. Shop drawings for the pre-cast concrete manholes shall include:
      a. Dimension layout and weight
      b. Material and Structural Specifications
      c. Manufacturing Procedures
      d. Quality Control
      e. Manhole lid and frame
   2. Product Data: Submit application, technical and installation data.

PART 2 - PRODUCTS [S]

2.01 MANUFACTURERS:

A. Pre-cast Concrete Manhole: Smith Midland Company, (Midland, VA/540 439-3266) or local area pre-cast concrete manufacturer.

B. Manhole Lid and Frame: Construction Casting Co., Atlanta, Georgia; Neenah Foundry Company, Neenah, WI; Dewey Bros., Inc., Goldsboro, NC.

C. Underground Marker Tapes: Seton Metallic Detection Tapes, Panduit Underground Hazard Tape, Thomas & Betts, Ideal.

2.02 MATERIALS:

A. Precast concrete manholes (unless otherwise indicated):
   1. Type A: Smith Midland Company model #880MH two (2) section utility vault complete with one or more 12" ring riser(s) (#4112), pulling irons, pulling eyes (and inserts), bolting inserts (for cable racks, etc.), center mount utility vault ladder, required insulated cable racks and hardware for complete installation.
   2. Type B: Smith Midland Company model #660MH two (2) section utility vault complete with one or more 12" ring riser (#4112), pulling irons, pulling eyes (and inserts) bolting inserts (for cable racks, etc.), center mount utility vault ladder, required insulated cable racks and hardware for complete installation.
   3. Type C: Smith Midland Company model #444 junction box complete with standard concrete lid, one or more 12" riser rings (#412), pulling eyes (and inserts) and hardware for complete installation.

B. Manhole Lid and Frame: Construction Casting Co. #B-1640 series complete with logo "ELECTRIC" or "TELEPHONE". Dewey Bros., Inc. "MH-RCR" series and Neenah #R-1640 series with similar logo are acceptable equals.

C. Underground Marker Tapes (unless otherwise indicated):
   1. Electric: Seton #37223 6" x 1000' metallic underground detection tape or similar by Panduit "HTU" series or Thomas & Betts #0700 series with proper logo and red background.
   2. Telephone and CATV: Seton #45385 6" x 1000' metallic underground detection tape or similar by Panduit "HTU" series or Thomas & Betts #0700 series with proper logo and orange background.

PART 3 - EXECUTION

3.01 **EXCAVATION, BACKFILLING, BEDDING AND RESEEDING**:

A. See Division 31 for other excavation, backfilling, bedding and reseeding requirements.

3.02 EXCAVATION:

A. Perform all excavation of every description and of whatever substance encountered to the depths required for installation of the work as indicated on the drawings or specified herein. The amount of trench opened at one time shall not exceed 200 feet including the backfilled portion of any trench which is not in condition for traffic. All excavated materials not required, or which are not suitable for backfill, shall be removed by the Contractor. Shoring shall be provided as necessary to protect existing facilities, new work, and the safety of personnel. Sheathing for duct banks (and manholes) trenches shall be left in place at the Contractor's expense. Provide cofferdams or other structures required for construction at no additional cost.

B. Trenches shall be necessary width for the proper laying of the duct bank with the banks as nearly vertical as practicable. Trench width at the top of the duct bank shall not exceed 8 inches on either side of duct bank. In rock excavation, the rocks shall be removed to a minimum of 6 inches from the sides of the duct bank. Trenches shall be excavated to a depth of 4" below the normal duct bank depth except where rock, shale or other hard material is encountered. Where rock, shale or other hard material is encountered, the trench shall be excavated to a depth of 4" below normal conduit depth. Care shall be taken not to excavate below the depths indicated. Unauthorized over depths shall be backfilled with No. 10 (Texas size) aggregate stone to levels previously specified. Whenever wet or otherwise unsuitable soil that is incapable of properly supporting the duct bank is encountered in the bottom of the trench, such soil shall be removed to the depth required as determined by the Engineer and the trench backfilled to the proper grade with material as specified above for over depth.

C. Trenches shall be of a depth that will provide a minimum 24" cover from top of conduit to finished grade, as hereinbefore stated, unless otherwise indicated.

D. Excavation for Appurtenances: Excavation for manholes, handholes, and similar appurtenances shall be sufficient to leave at least 12 inches in the clear between their outer surfaces and the embankment or shoring. Final earth supporting elevations shall be of bearing capacity for loads encountered. Rock and over depth shall be treated same as described for trench excavation. Manhole lid and frame shall be flush with finished grade.

3.03 INSTALLATION:

A. Installation of Underground Non-Metallic Raceways: PVC type 40 conduit, laid to true alignment and uniform grades, encased in 4" minimum monolithic poured concrete and steel reinforcement unless otherwise indicated in the Contract Documents. All bends to have exactly the right curvature and have regular tapered joints. Where connecting to manhole or pull boxes, use a bell end. Loose dirt in the bottom of the trench shall be well tamped previous to placing of conduit. Use pre-cast concrete or composition separators spaced not more than 5 ft. apart and secured to the conduits by hemp twine. Joints shall be staggered at least 6 inches and the tapered ends shall be given an application of solvent cement for PVC conduit to insure a good joint between the conduit and sleeve coupling. Conduit shall be thoroughly cleaned before installation. During construction and after the duct line is completed, the ends of the conduits shall be plugged. Care shall be taken to keep conduits clean of concrete, dirt, and any other substance. The concrete envelope shall be 3000 pound concrete. While the concrete is being placed, it shall be tamped between and around the conduits to insure a solid mass of concrete without voids. After underground raceway installation is completed, a flexible mandrel not less than 12 inches long, having a diameter approximately 1/4 inch less than the inside diameter of the conduit, shall be pulled through each conduit, after which a brush with stiff bristles shall be pulled through each conduit. The trenches shall not be filled until 72 hours after the concrete is poured. Ready-mix 3000 pound concrete is permitted (air entrained).

B. Installation of Pre-Cast Manholes: Manholes shall be installed in accordance with the excavation and backfilling specified herein. Manhole lid and frame shall project no more than 1/2 inch above finished grade.

3.04 BEDDING AND BACKFILLING:

A. Duct bank trenches shall be accurately graded to the duct bank level and thoroughly compacted as specified hereinafter. Trenches shall be backfilled, thoroughly haunched and tamped. Settling the backfill with water will not be permitted. The surface shall be graded to reasonable uniformity and mounded over trenches.

B. The precast manhole shall be accurately graded and bedded with No. 10 crushed stone to the base level and thoroughly compacted as specified hereinafter. The manhole shall rest firmly on the bedding. The excavation shall be backfilled, thoroughly haunched and tamped. Settling the backfill with water will not be permitted. The surface shall be graded to reasonable uniformity and mounded over excavation.

C. Compacted Backfill: All backfill material used in trenches under paved or future paved areas shall be classified as "compacted backfill". Backfill materials shall be approved excavated material, or other select material, as approved by the Engineer, free from large clods of earth, cinders, ashes, refuse, vegetable or organic matter, and rocks or stones over 1" dimension. Backfill from this duct bank to the top of the trench shall be placed in 6 inch layers and compacted to prevent future settlement. Methods and materials used in backfilling shall be provided to obtain 95 percent of maximum density at optimum moisture as determined by AASHO Standard T99, and as sufficient to prevent settlement of the pavement or surface.

D. Normal Backfill: For all backfill <u>not</u> under paved or future paved areas, backfill material shall be free from cinders, ashes, refuse, vegetable or organic matter, boulders, rocks or stones over 3" dimension. Backfill shall be placed and compacted in 6 inch layers to one foot above the top of the duct bank. The remainder of the backfill shall be placed in one foot layers and tamped.

E. The Contractor shall supply the backfill material as specified herein without additional cost to the Owner.

3.05 EXISTING UNDERGROUND UTILITIES:

A. The location of the existing underground utilities indicated on the drawings shall be considered approximate, and any locations may not be indicated or shown. The Contractor shall be responsible to have a thorough underground utility survey made in the path of the proposed underground utility work to locate and protect the known and unknown utilities, and to prevent disrupting the affected utility. The Contractor shall be responsible for repairing damage to any utility caused by their work.

B. Where any existing utilities are damaged, they shall be repaired as directed by the Engineer, with materials approved by the local utility company or the Owner, at no additional cost to the Owner.

3.06 SEPARATION OF UNDERGROUND RACEWAYS FROM OTHER UNDERGROUND UTILITIES

A. Where underground utilities are encountered, separation shall be provided as follows:
   1. Parallel Installation:
      a. Normal conditions: Duct banks shall be laid at least ten feet horizontally from a utility line or related manhole whenever possible, the distance shall be measured edge-to-edge.
      b. Unusual conditions: When local conditions prevent horizontal separation of ten feet, the duct bank may be laid closer to a utility line or related manhole provided that: The bottom of the duct bank shall be at least twelve inches above the top or below the bottom of the other utilities.
   2. Crossing:
      a. Normal conditions: Duct banks crossing other utilities shall be laid to provide a separation of at least 12 inches between the duct bank and the other utility whenever possible.

3.07 DISPOSITION OF DEBRIS:

A. The Contractor shall be responsible for removal from the property and disposal of all debris of whatever nature.

3.08 PROPERTY PROTECTION:

A. The Contractor shall be responsible for protecting all property and if damaged, repair to existing condition.

3.09 EROSION AND SEDIMENT CONTROL:

A. Precautions shall be taken throughout the duration of the project to prevent sediment throughout the excavated area, as required by the Texas Pollutant Discharge Elimination System (TPDES) Construction General Permit and the Texas Commission on Environmental Quality (TCEQ), and as shown on the drawings.

B. Erosion control measures shall be provided until the seeded areas are sufficiently prepared and accepted by the Owner.

3.10 CONNECTIONS TO EXISTING UTILITY SYSTEMS, ETC.:

A. All connections to existing utility systems, etc., shall be made as required or deemed necessary to insure the maintenance of continued operation of the above and provide the very minimum of interruption. This Contractor shall make such temporary connections as may be required to facilitate this work and to protect the existing systems from damage. Any work which will in any way affect the continued operation of any existing facility shall be coordinated with the proper authorities as well as the Engineer, and permission received, before any service is interrupted.

3.11 CUTTING AND PATCHING OF EXISTING WALKS, CURBS AND PAVEMENT:

A. All walks, curbs and pavement over trenches shall be restored to original condition and the Contractor will be responsible for any sinking in the walks, curbs, pavement or backfill which may occur within one year from acceptance by the Owner. All walks, curbs and pavement removed for trenching shall be saw cut before removal. Refer to other divisions for concrete paving specifications.

3.12 LAYING OUT THE WORK:

A. The Contractor shall lay out the work in accordance with the drawings, establish and maintain locations, lines, levels required for the work, and shall be responsible for its correctness. He shall report any discrepancies between the drawings and actual measurements to the Engineer for proper interpretation before proceeding with work affected by such discrepancies.

B. Prior to any excavation, the Contractor shall stake out the routes of the proposed underground electric and telephone/comm/data services for review by the Owner and Engineer. Minor deviations in the routing may be required.

3.13 VERIFYING MEASUREMENTS AND CONDITIONS:

A. The exactness of grades, elevations, dimensions, or locations given on the drawings, is not guaranteed by the Engineer. The Contractor shall, therefore, satisfy himself as to the accuracy of all grades, elevations, dimensions and locations. In all cases of interconnection of his work with existing or other work, he shall verify at the site all dimensions relating to such existing or other work. Any errors due to the Contractor's failure to so verify all such grades, elevations, locations, or dimensions shall be promptly rectified by him without cost to the Owner.

3.14 MISCELLANEOUS:

A. Grounding: Provide ground electrode(s) in each new manhole in accordance with N.E.C. and as covered by Section 26 05 26.

B. All manholes shall have pulling irons, cable racks, insulators and ladders. Refer to drawings for interior dimensions.

C. Exception: Underground CATV, telephone, and exterior branch circuit conduits do not require complete specified concrete encasement except where conduits intersect or parallel (within 10 feet) other underground utilities, cannot maintain the Code minimum burial depth below the finished grade or pavement, or are indicated to be encased. The specified concrete shall be required, where conduits change direction or at riser poles, for anchoring purposes during wire pulling procedures. Local utility's regulations or the Authority having jurisdiction's code for concrete encasement may nullify these exceptions.

D. Underground conduit dimensions (unless otherwise indicated): All primary and power conduit shall be a minimum 4" diameter. All communication conduit shall be a minimum 4" diameter.

E. Metallic detection tapes shall be installed at the 50% backfill depth (12" maximum).

F. Coordination is required with all existing and new underground utilities. Review all profiles indicated.

END OF SECTION

SECTION 26 0553

IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL:

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Prepare and paint Division 26 equipment supports and miscellaneous materials located in Equipment Rooms, Mechanical Rooms, and other utility areas housing mechanical and/or electrical equipment.

B. Identification of conduits, junction boxes, pull boxes, cabinets, panelboards, switchgear, motor starters, disconnect switches, motor protective switches, and Division 26 system enclosures.

1.03 WORK NOT INCLUDED:

A. Painting of factory finished Division 26 Equipment such as Switchboards, Panelboards, Emergency Generator Sets, etc.

1.04 RELATED WORK:

A. Division 23 – Mechanical

B. Section 26 05 00 – Common Work Results For Electrical

C. Section 26 05 33 – Raceway And Boxes For Electrical Systems

D. Section 26 05 36 – Cable Management For Electrical Systems

E. Section 26 22 00 – Low-Voltage Transformers

F. Section 26 24 16 – Panelboards

G. Section 26 28 16 – Enclosed Switches And Circuit Breakers

H. Section 26 29 00 – Low-Voltage Controllers

I. Section 26 36 00 - Transfer Switches

J. Division 27 – Communications

K. Division 28 – Electronic Safety and Security

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Except as otherwise specified, materials shall be the products of the following manufacturers:

1. Sherwin-Williams
2. Pratt and Lambert
3. Devoe
4. Benjamin Moore

2.02 MATERIALS:

A. Deliver all paints and materials to the project site in their original containers with all labels intact and legible at the time of use.

B. Sherwin-Williams Industrial Maintenance Coatings System 4000 products are listed below to establish color and a standard of quality.

1. All Hangers and Supports: One coat Series 54 Gloss Black Alkyd Enamel.
2. Uninsulated diesel engine exhaust and other similar hot surfaces shall be painted with two coats of No. B59S8 Heat Resistant Aluminum.
3. Exterior of belt guards and other protective guards shall be finished with two coats of Series 54 Alkyd Gloss Enamel No. SW4084 safety yellow color. Interior of and all items covered by belt guards and other protective guards shall be finished with two coats of No. SW4083 safety orange color.
4. Factory Finished Equipment finishes shall be cleaned and properly touched up with equipment manufacturers touch-up paint unless finish is severely damaged or of unacceptable quality. In the latter case, the entire finish shall be restored in accordance with painted procedures herein specified.

PART 3 - EXECUTION

3.01 WORKMANSHIP:

A. The work shall be accomplished by qualified mechanics skilled in the painting trade. Painting of equipment and other materials shall not commence until all testing is complete and systems are ready for operation. Materials shall be evenly spread, and smoothly flowed on without runs or sags. Each coat shall be thoroughly dry before application of succeeding coats.

3.02 PROTECTION OF WORK:

A. The painters shall protect all adjacent surfaces with drop covers during the process of painting. Upon completion, paint spots, if any, shall be removed from all surfaces not intended to be painted.

3.03 PREPARATION OF SURFACE:

A. Surfaces to be painted shall be completely dry before applying paint. Metal surfaces shall be cleaned with mineral spirits before applying materials. Rust and scale shall be removed by wire brushing or sanding. Galvanized surfaces shall be chemically treated with crystalline zinc phosphate in strict accordance with the manufacturer=s recommendations. Surfaces shall not be painted when the temperature is, or is likely to be, near the freezing point, nor when they are exposed to hot sun.

3.04 IDENTIFICATION OF PIPES AND EQUIPMENT:

A. After **all** painting is completed, operating and control parts of the equipment and systems such as switchgear, panelboards, telephone cabinets, system cabinets, disconnect switches, motor starters and control cabinets shall be properly identified with laminated engraved plastic nameplates fastened with sheet metal screws, bolts or permanent adhesive. Pressure sensitive tape is **not** acceptable. Identification symbols or designations shall be the same as shown on the contract documents.

B. Boxes; Concealed and Surface Mounted: Each junction box, pullbox or similar enclosure shall be **neatly** identified by stencil marking which shall indicate service contained, and circuit numbers. Stencil letters shall be upper case (Capital) not less than one-half inch high and painted with Series 54 black gloss enamel.

C. Conduit:

1. Color bands shall be painted on each conduit where exposed or accessible. Bands shall be six inches wide and shall be placed along the conduit run immediately preceding the passage of the conduit through walls, ceiling or floor, and at each equipment connection or junction box. Where sub-bands are specified, they shall be two inches wide and centered in the color band. Adjacent to each color band, the abbreviation of the name of the service contained in the conduit shall be **neatly** stenciled. Stencil letters shall be one-half inch high upper case, applied with Series 54 black gloss enamel. Color bands shall be Series 54 Alkyd Gloss Enamel of colors listed below.

2. In lieu of painted color bands, the Contractor may use pressure sensitive tape a minimum of 2" wide. Each color band will require wraps as necessary to provide the full 6" wide band with or without the 2" sub-band.
3. In lieu of stenciled names of the pipe service, the Contractor may use vinyl "snap around" markers as manufactured by Seton, Bunting, Brady and Thomas & Betts (T&B).
4. Color Banding:

System	Abbrev./Color	Color Band	Color Sub-Bands
120/208 Volts (Normal)	208V/Black	Black	Yellow
120/208 Volts (Emergency)	208V/Red	Black	Yellow
277/480 Volts (Normal)	480V/Black	Black	Orange
277/480 Volts (Emergency)	480V/Red	Black	Orange
Fire Alarm	FA/Red	Red	Black
Security Access	SA/Black	Black	Brown
Surveillance CCTV	CC/Black	Black	Brown
Telephone System	TE/Black	Black	Blue
Data Network	DN/Black	Black	Blue
Direct Digital Control	DDC/Black*	Black	Blue
Building Intercommunications	IN/Black	Black	Green
Sound Systems	PA/Black	Black	Green
CATV	TV/Black	Black	Green
Audio/Video	AV/Black	Black	Green

D. The main panelboard, generator control panel, and other similar systems shall have an engraved informational laminated nameplate with the installing trade's name, telephone number and address for the Owner to obtain preventive maintenance, service or parts. The nameplate shall include the job order number, shop number or other identification which will identify the related equipment.

If the above address and telephone number is a branch office, the main office or manufacturers address and telephone number shall be included.

SECTION 26 0573

OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED

A. Short-Circuit analysis evaluation study

B. Protective Device Time-Current Coordination study

C. Field Adjustments To Equipment based on Study findings

1.03 RELATED WORK

A. Section 26 05 19 – Low Voltage Electrical Power Conductors and Cables

B. Section 26 20 00 – Low-Voltage Electrical Distribution

C. Section 26 24 16 – Panelboards

D. Section 26 28 13 – Fuses

E. Section 26 28 16 – Enclosed Switches and Circuit breakers

1.04 REFERENCES

1.05 SUBMITTALS

A. Submit shop drawings in accordance with Section 26 05 00.

1. The studies shall be submitted to the design engineer prior to receiving final approval of the distribution equipment shop drawings and/or prior to release of equipment drawings for manufacturing. If formal completion of the study may cause delays in equipment shipments, approval from the Engineer may be obtained for a preliminary submittal of data to ensure that

the selection of device ratings and characteristics will be satisfactory to properly select the distribution equipment. The formal study will be provided to verify preliminary findings.

2. The results of the short-circuit, protective device coordination study shall be summarized in a final report. A minimum of five (5) bound copies of the complete final report shall be submitted.

B. The report shall include the following sections:

1. Executive Summary including Introduction, Scope of Work and Results/Recommendations.
2. Short-Circuit Methodology Analysis Results and Recommendations
3. Short-Circuit Device Evaluation Table
4. Protective Device Coordination Methodology Analysis Results and Recommendations
5. Protective Device Settings Table
6. Time-Current Coordination Graphs and Recommendations
7. One-line system diagram that shall be computer generated and will clearly identify individual equipment buses, bus numbers used in the short-circuit analysis, cable and bus connections between the equipment, calculated maximum short-circuit current at each bus location, device numbers used in the time-current coordination analysis, and other information pertinent to the computer analysis.

C. Submit Operation and Maintenance Manuals in accordance with Section 26 05 00.

1.06 QUALIFICATIONS

A. The short-circuit, protective device coordination and arc flash hazard analysis studies shall be conducted under the responsible charge and approval of a Registered Professional Electrical Engineer skilled in performing and interpreting the power system studies.

B. The Registered Professional Electrical Engineer shall be an employee of the equipment manufacturer or an approved engineering firm.

C. The Registered Professional Electrical Engineer shall have a minimum of five (5) years of experience in performing power system studies.

D. The engineering firm shall have a minimum of twenty-five (25) years experience in performing power system studies.

1.07 COMPUTER ANALYSIS SOFTWARE

A. The studies shall be performed using one of the following software manufacturer programs:

1. CYME International, Inc.
2. EDSA Micro Corporation.
3. Electrical Systems Analysis, Inc.
4. SKM Systems Analysis, Inc.

1.08 OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY ALLOWANCES:

A. Contractor shall provide the following allowances for the respective project types to offset any modifications required by the Overcurrent Protective Device Coordination Study:

1. Elementary School - $20,000.00
2. Middle School - $25,000.00
3. High School - $35,000.00

B. If the respective allowance is not used, the allow shall be retained by the Owner.

PART 2 - PRODUCTS

2.01 STUDIES

A. The contractor shall furnish a short-circuit and a protective device coordination studies. All studies to be prepared by equipment manufacturer.

2.02 DATA

A. Contractor shall furnish all data as required for the power system studies. The Engineer performing the short-circuit, protective device coordination and arc flash hazard analysis studies shall furnish the Contractor with a listing of required data immediately after award of the contract. The Contractor shall expedite collection of the data to assure completion of the studies as required for final approval of the distribution equipment shop drawings and/or prior to the release of the equipment for manufacturing.

B. Source combination may include present and future motors and generators.

C. Load data utilized shall include existing and proposed loads obtained from Contract Documents.

D. If applicable, include fault contribution of existing motors in the study. The Contractor shall obtain required existing equipment data, if necessary, to satisfy the study requirements.

2.03 SHORT-CIRCUIT ANALYSIS

A. Transformer design impedances shall be used when test impedances are not available.

B. Provide the following:

1. Calculation methods and assumptions
2. Selected base per unit quantities
3. One-line diagram of the system being evaluated that clearly identifies individual equipment buses, bus numbers used in the short-circuit analysis, cable and bus connections between the equipment, calculated maximum short-circuit current at each bus location and other information pertinent to the computer analysis.
4. The study shall include input circuit data including electric utility system characteristics, source impedance data, conductor lengths, number of conductors per phase, conductor impedance values, insulation types, transformer impedances and X/R ratios, motor contributions, and other circuit information as related to the short-circuit calculations.
5. Tabulations of calculated quantities including short-circuit currents, X/R ratios, equipment short-circuit interrupting or withstand current ratings and notes regarding adequacy or inadequacy of the equipment rating.
6. Results, conclusions, and recommendations. A comprehensive discussion section evaluating the adequacy or inadequacy of the equipment must be provided and include recommendations as appropriate for improvements to the system.

C. For solidly-grounded systems, provide a bolted line-to-ground fault current study for applicable buses as determined by the engineer performing the study.

D. Protective Device Evaluation:

1. Evaluate equipment and protective devices and compare to short circuit ratings.
2. Adequacy of switchgear, motor control centers, and panelboard bus bars to withstand short-circuit stresses.
3. Manufacturer shall notify Engineer in writing, of any circuit protective devices improperly rated for the calculated available fault current.

2.04 PROTECTIVE DEVICE TIME-CURRENT COORDINATION ANALYSIS

A. Protective device coordination time-current curves (TCC) shall be displayed on log-log scale graphs.

B. Include on each TCC graph, a complete title with descriptive device names.

C. Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which the device is exposed.

D. Identify the device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.

E. Plot the following characteristics on the TCC graphs, where applicable:

F. Electric utility's overcurrent protective device
   1. Medium voltage equipment overcurrent relays
   2. Medium and low voltage fuses including manufacturer's minimum melt, total clearing, tolerance, and damage bands
   3. Low voltage equipment circuit breaker trip devices, including manufacturer's tolerance bands
   4. Transformer full-load current, magnetizing inrush current, and ANSI through-fault protection curves
   5. Medium voltage conductor damage curves
   6. Ground fault protective devices, as applicable
   7. Pertinent motor starting characteristics and motor damage points, where applicable
   8. Pertinent generator short-circuit decrement curve and generator damage point
   9. The largest feeder circuit breaker in each motor control center and applicable panelboard.

G. Provide adequate time margins between device characteristics such that selective operation is provided, while providing proper protection.

H. Provide the following:
   1. A One-line diagram shall be provided which clearly identifies individual equipment buses, bus numbers, device identification numbers and the maximum available short-circuit current at each bus when known.
   2. A sufficient number of log-log plots shall be provided to indicate the degree of system protection and coordination by displaying the time-current characteristics of series connected overcurrent devices and other pertinent system parameters.
   3. Computer printouts shall accompany the log-log plots and will contain descriptions for each of the devices shown, settings of the adjustable devices, and device identification numbers to aid in locating the devices on the log-log plots and the system one-line diagram.
   4. The study shall include a separate, tabular printout containing the recommended settings of all adjustable overcurrent protective devices, the equipment designation where the device is located, and the device number corresponding to the device on the system one-line diagram.
   5. A discussion section which evaluates the degree of system protection and service continuity with overcurrent devices, along with recommendations as required for addressing system protection or device coordination deficiencies.
   6. Manufacturer shall notify Engineer in writing of any significant deficiencies in protection and/or coordination. Provide recommendations for improvements.

PART 3 - EXECUTION

3.01 FIELD ADJUSTMENT

A. Field adjustments to be completed by Manufacturer as part of this contract and prepare a report of all final settings.[V][O&M]

B. Contractor shall be responsible for making all modifications stated within these studies to the entire electrical system at no additional cost to the Owner. Contactor shall notify Engineer prior to making any modifications.

C. Provide allowances for changes to electrical gear per paragraph 1.8 listed above.

END OF SECTION

SECTION 26 0923

LIGHTING CONTROL DEVICES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Switches

B. Dimmers

C. Low Voltage Lighting Controls
   1. Wallpods
   2. Daylighting Sensors
   3. Occupancy Sensors

D. Low Voltage Lighting Control Equipment

E. Plates

F. Automatic Lighting Controls

G. Lighting Contactors

1.03 RELATED WORK:

A. Section 26 05 23 – Control Voltage Electrical Power Cables

B. Section 26 05 33 – Raceway And Boxes For Electrical Systems

C. Section 26 50 00 – Lighting

1.04 SUBMITTALS:

A. Submit shop drawings, product data and wiring device samples in accordance with Sections 26 05 00.

B. Submit Operation and Maintenance Manuals in accordance with Section 26 05 00.

C. Low Voltage Lighting Control Systems: Furnish the following for each system:
   1. Building floor plans (1/8” = 1’- 0” scale) showing:
      a. All lighting fixtures and low voltage control devices in their correct locations and configurations.
      b. Separate plans showing control zones and orientations for all daylighting sensors.
      c. Separate plans showing control zones and orientations for all occupancy and vacancy sensors.
   2. System riser diagrams showing connections to all lighting fixtures and low voltage control devices.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Switches [S] shall be as manufactured by:
   1. Bryant,
   2. Hubbell,
   3. Cooper-Crouse Hind

4. Pass and Seymour (P&S)

All switches shall be by the same manufacturer.

B. Dimmers shall be as manufactured by:
   1. Hubbell,
   2. Leviton,
   3. Lutron

C. Low Voltage Lighting Controls and Equipment [S] shall be as manufactured by:
   1. Sensorswitch,
   2. Hubbell,
   3. Lutron

D. Wiring Device Plates [S] and Blank Plates [S] shall be as manufactured by:
   1. Bryant,
   2. Hubbell,
   3. Cooper Crouse-Hinds,
   4. Pass & Seymour (P&S)

E. Lighting Contactors [S] shall be as manufactured by:
   1. Square D
   2. ABB
   3. ASCO

F. Automatic Lighting Controls shall be as manufactured by:
   1. Sensorswitch,
   2. Hubbell,
   3. Lutron

2.02 MATERIALS AND TYPE:

A. All switches, dimmers, and other wiring devices shall be as indicated on drawings and specified hereinafter.

B. Unless otherwise indicated on the drawings all switches shall be:
   1. Bryant "Tech-Spec" series,
   2. Hubbell HBL series (Industrial, Heavy-duty specification grade)
   3. Cooper Industrial Specification grade AC Quiet series
   4. Pass & Seymour (P&S) specification grade “PS” series

C. The switches shall be complete with green (brass) hexhead grounding screw, back and side wired high impact polycarbonate, LexanTM, high impact thermoplastic or nylon toggle. Switch shall be rated for the voltage, poles, amperage and circuit configuration required.

D. Plates: For all systems unless indicated otherwise.
   1. For Concealed Work: Stamped stainless steel type 302 with satin finish.
   2. OR
   3. High impact nylon, high impact thermoplastic or polycarbonate (Lexan) with smooth finish unless otherwise indicated. Color of plates shall be _____.
   4. For Wet Locations:
      a. While in Use (WL) (LP): Weatherproof NEMA-3R enclosure constructed of flame retardant U.V. stabilized polycarbonate, reinforced thermoplastic, die-cast metal or combinations of the above materials complete with sealing gaskets and stainless steel mounting screws; and meets OSHA and NEC requirements "WHILE IN USE". The cover shall be clear. Housing size shall depend on the wiring device being protected. Housing for receptacles shall allow both angled and straight cord connectors. As manufactured by Tay-Mac® Corp., P&S, Hubbell, Cooper Crouse-Hinds or acceptable equal.
      b. While cover is Closed (WP): Weatherproof NEMA-3R enclosure constructed of die-cast metal complete with sealing gaskets and stainless steel mounting screws; and meets

OSHA and NEC requirements while cover is "Closed". As manufactured by P&S, Bryant, Hubbell, Cooper Crouse-Hinds or acceptable equal.

5. For F.S. or F.D. Boxes (Interior Only): Die cast covers with gaskets, as manufactured by Crouse-Hinds, Appleton, Red Dot or acceptable equal.
6. Screws: Heads to match plate material and finish.
7. Provide blank plates for all unused outlets.

E. Wiring Device and Plate Colors: Architect will review and accept color of wiring devices and plates. Contractor shall allow for selection from "standard" colors (grey, white, ivory, brown) of wiring devices in his bid proposal.

F. All pilot lights shall be neon or L.E.D. type with Red color glass, unless otherwise noted. Lamp to be sized to adequately illuminate under daylight conditions. Incandescent pilot lights are not acceptable. LED conversion lamps are acceptable in incandescent lampholders.

G. Fluorescent Dimmers:

1. Dimmers shall be line voltage slider type (minimum 8A @ 120 volts, 6A @ 277 volts) with preset button and 3-way capability, unless indicated otherwise. Dimmer shall be compatible with the type of dimming ballast provided. Dimmers shall be Lutron #NF-103P series or acceptable equal to coordinate with the specified dimming ballast.

H. Low Voltage Lighting Controls:

1. Low Voltage Lighting Controls shall all have the following features:
   a. Fully addressable and compatible with Sensorswitch nLight control CAT-5e network.
   b. Complete with power supply and 2 RJ-45 ports.
   c. Shall be configured and engraved as specified here-in and as indicated on the drawings.
   d. 5 year product warranty.
2. Wallpods, Low Voltage [O&M] [S]:
   a. Graphic Wallpods:
      1) 3.5” Full-color touch screen.
      2) 16 On/Off/Dim controls and 16 scene controls with full user customization of all settings.
      3) Password protection for controls and set-up screens.
      4) Customizable screen saver image (.jpeg format) and onboard help screens.
      5) Operating temperature 14°F to 160°F.
      6) Sensorswitch nLight nPOD GFX or accepted equal by Hubbell or Lutron.
   b. Low Voltage Dimming and On/Off control Wallpods:
      1) 1, 2 or 4 channel raise/lower with 0-10V dimming control.
      2) 1, 2 or 4 channel on/off.
      3) Operating temperature 14°F to 160°F.
      4) Sensorswitch nLight nPODM DX or accepted equal by Hubbell or Lutron.
   c. Low Voltage Scene control Wallpods:
      1) Runs locally stored scenes.
      2) Runs remotely stored profiles from a gateway device. Remotely configurable and upgradeable.
      3) 1, 2 or 4 scene control.
      4) On/Off and Raise lower with 4 scene control.
      5) Operating temperature 14°F to 160°F.
      6) Sensorswitch nLight nPODM 1S/2S/4S or accepted equal by Hubbell or Lutron.
3. DayLighting Sensors, Low Voltage [O&M] [S]:
   a. Remotely configurable and upgradeable.
   b. Automatic Set-Point Calibration.
   c. Blink-back Set-Point (in footcandles).
   d. Set-Point (0-200 fc)
   e. Sunlight Discount Factor (1-8)
   f. Occupied Bright Level (0-100%)
   g. Unoccupied Dim Level (0-100%)
   h. Photocell On/Off Transition Time (45 sec. – 25 min.)

i. Adaptive cloud delay to prevent cycling on cloudy days.
j. Push-Button Programmable.
k. Full On/Off switching control.
l. Recessed Ceiling Applications: Sensorswitch nLight nRM ADCX series or accepted equal by Hubbell or Lutron.
m. Surface Ceiling Applications: Sensorswitch nLight nCM ADC series or accepted equal by Hubbell or Lutron.

4. Occupancy Sensors, Low Voltage [O&M] [S]:
   a. Recessed Ceiling Mounted:
      1) Dual technology; passive infrared and ultrasonic.
      2) Full 360° operation.
      3) Assorted lens choices for desired motion coverage.
      4) Minimum 24’ diameter small motion coverage at 9’ ceiling height.
      5) Minimum 48’ diameter large motion coverage at 9’ ceiling height.
      6) Sensorswitch nLight nRM PDT 9 (small motion) or nRM PDT 10 (large motion) or acceptable equals by Hubbell/Unenco, or Lutron.
   b. Surface Ceiling Mounted:
      1) Dual technology; passive infrared and ultrasonic.
      2) Full 360° operation.
      3) Assorted lens choices for desired motion coverage.
      4) Minimum 24’ diameter small motion coverage at 9’ ceiling height.
      5) Minimum 48’ diameter large motion coverage at 9’ ceiling height.
      6) Sensorswitch nLight nCM PDT 9 (small motion) or nCM PDT 10 (large motion) or acceptable equals by Hubbell/Unenco, or Lutron.
   c. Wall Mounted:
      1) Dual technology; passive infrared and ultrasonic.
      2) Full 120° operation.
      3) Small motion detection up to 40’.
      4) Large motion detection up to 70’.
      5) Beveled rear enclosure piece to facilitate corner mounting.
      6) Ceiling mounting bracket for mounting heights over 10’.
      7) Sensorswitch nLight nWV PDT 16 or acceptable equals by Hubbell/Unenco, or Lutron.
   d. Corridor Wall Mounted:
      1) Passive infrared technology.
      2) Long narrow motion.
      3) Linear coverage up to 130’ at 10’ mounting height.
      4) Ceiling mounting bracket for mounting heights over 10’.
      5) Sensorswitch nLight nHW 13 or acceptable equals by Hubbell/Unenco, or Lutron.
   e. High Bay Surface Mounted:
      1) Passive infrared technology.
      2) Full 360° operation.
      3) High bay and low bay lenses
      4) Minimum 30’ diameter detection at 15’ mounting height.
      5) Large motion detection at 35’ mounting height.
      6) Extra large motion detection at 45’ mounting height.
      7) Sensorswitch nLight nCM 6 or acceptable equals by Hubbell/Unenco, or Lutron.
   f. Wall Switch:
      1) Dual technology; passive infrared and ultrasonic.
      2) Full 180° operation.
      3) Minimum 40’ diameter small motion detection.
      4) Switching and dimming control.
      5) Sensorswitch nLight nWSX PDT LV series or acceptable equals by Hubbell/Unenco, or Lutron. Include raise/lower dimming control option (DX) where required.

I. Low Voltage Lighting Control Equipment:

1. Low Voltage Lighting Equipment Components shall all have the following features:
    a. Fully addressable and compatible with Sensorswitch nLight control CAT-5e network.
    b. Complete with power supply and 2 RJ-45 ports.
    c. Shall be configured and labeled as specified here-in and as indicated on the drawings.
    d. 5 year product warranty.
2. Power/Relay Packs for Low Voltage Lighting Control [O&M] [S]:
    a. Select the proper Power/Relay from the selection below.
    b. Linear Power/Relay Packs with dimming:
        1) For lighting fixtures capable of 0-10V dimming control that are not nLight capable from the factory.
        2) Maximum load 16A.
        3) Sensorswitch nLight nPP16 D Series Power Packs or acceptable equals by Hubbell/Unenco, or Lutron.
    c. Secondary Relay Pack with phase control dimming:
        1) For lighting fixtures requiring low voltage dimming control that are not 0-10V compatible.
        2) For 2 wire ballast or 3 wire dimmable ballast.
        3) Dimming ranges: High (0-100%), Low (0-100%).
        4) Dimming offset: (-200% to 200%).
        5) Requires CAT-5e power.
        6) Sensorswitch nLight nSP5 PCD series lighting control relay or acceptable equals by Hubbell/Unenco, or Lutron.
    d. For Switching of LED and T5 Fluorescent Lighting Loads:
        1) Maximum Load 16A.
        2) Combination unit includes power supply for up to 80ma. of bus load.
        3) Sensorswitch nLight nPP16 series or acceptable equals by Hubbell/Unenco, or Lutron.
    e. For switching of line voltage non nLight lighting loads:
        1) Maximum Load 16A.
        2) Sensorswitch nLight nSP16 series slave relay pack or acceptable equals by Hubbell/Unenco, or Lutron.
    f. For switching of low voltage non nLight lighting loads:
        1) Maximum Load 1A @ 40 VAC/VDC.
        2) Sensorswitch nLight nAR 40 series auxiliary low voltage relay or acceptable equals by Hubbell/Unenco, or Lutron.
3. Power Supplies [O&M] [S]:
    a. Power Supplies shall all have the following features:
        1) Power supplies shall operate on 120V and 277V power.
        2) Plenum Rated.
        3) Complete with elongated chase nipples for direct connection through a ½" knock-out to a standard junction box.
    b. For Bus and System Power over CAT-5e (80ma): Sensorswitch nLight nPS 80 series or acceptable equals by Hubbell/Unenco, or Lutron.
    c. For Power to nLight Bridges: Sensorswitch nLight PS 150 series or acceptable equals by Hubbell/Unenco, or Lutron.
    d. For Power to nLight Gateway Control Units and Gateway Touch Screens: Sensorswitch nLight PS 250 series or acceptable equals by Hubbell/Unenco, or Lutron.
4. Backbone Devices [O&M] [S]:
    a. Gateway:
        1) Automatically discovers nLight devices.
        2) 400 and 1500 device models available. Select the appropriate model based on the total amount of system lighting fixtures and devices.
        3) Provides system time clock.
        4) Provides an Ethernet interface for the required Sensorswitch SensorView software.
        5) Requires power supply as listed above.

6) Include one (1) Sensorswitch nLight nGWY2 GFX Gateway Touch Screen with each Gateway.
7) Sensorswitch nLight nGWY2 KIT or acceptable equals by Hubbell/Unenco, or Lutron.

b. Bridge:
1) Increases the number of lighting control zones in an nLight lighting control system.
2) Complete with 8 RJ-45 ports.
3) Connects zones of daisy-chained nLight enabled devices.
4) Acts as hubs to aggregate traffic from the connected downstream zones and as routers by forwarding information to the downstream zones.
5) Requires power supply as listed above.
6) Furnish required number of bridges necessary to completely connect all network devices to the gateway(s).
7) Sensorswitch nLight nBRG 8 series or acceptable equals by Hubbell/Unenco, or Lutron.

c. Wireless Communication:
1) Allows wireless communication to the nLight network using the required Sensorswitch SensorView software.
2) Furnish devices as necessary for full wireless communication with the nLight network.
3) Sensorswitch nLight nPP 16 WIFI or acceptable equals by Hubbell/Unenco, or Lutron.

J. Software Graphics [O&M] [S]: Furnish one master copy of Sensorswitch SensorView software, or accepted equal for the entire project which contains the following factory programming (Software shall be compatible with the latest version of Microsoft Windows® and Apple iOS®).:

1. A master graphic of the entire building, by floor, showing each and every nLight device installed in the project to include but not be limited to the following:
a. nLight capable lighting fixtures.
b. Lighting fixtures that are not nLight enabled, but are controlled by an nLight device.
c. Light Sensors.
d. Occupancy Sensors.
e. Wallpods.
f. Scene Controllers.
g. Power Supplies and Relays.
h. Bridges
i. Gateways
j. nPanels.
2. Allow for pan and zoom commands so smaller areas can be displayed on a larger scale simply by panning and zooming each floor's master graphic.
3. A mouse click on any nLight device shall display the following information (as applicable):
a. The device name.
b. The device catalog number.
c. The device configuration.
d. Replacement part numbers (Lighting fixtures):
1) LED Driver Part Number.
2) LED Card(s) Part Number(s).
4. Manufacturer shall also provide a mobile application with all features listed above compatible with Apple iOS® and Google Android®.

K. Lighting Contactors:

1. Lighting contactors shall be the mechanically held type, minimum 30A rated poles of number and amperage required, with factory wired controls:
a. Square D: Class 8903
b. ABB: A-Line
c. ASCO: 918 Series
d. Refer to detail on drawings.

L. Automatic Lighting Controls:
   1. Photocells by Precision Multiple Controls:
      a. Standard 120 Volts: #P2275 (1800VA - 120V)
      b. Standard 277 Volts: #P68275 (1800VA - 208 to 277V)
      c. FAA Type 120 Volts: #102FAA (1800VA - 120V only)
      d. Refer to detail on drawings.
   2. Timeclocks by Intermatic or acceptable equal as indicated below [O/M]:
      a. Intermatic ET2845C 365/7 day astronomic electronic control with independent 7 day and to the minute programming Astronomic programming, automatic daylight savings adjustment, 50 holiday blocks with schedules, manual operation. Non-volatile EEPROM memory. Includes four (4) independent output circuits. Controller shall operate from 120VAC-277VAC with auto voltage detection. 100 hour super capacitor eliminates battery dependency. Select proper enclosure for environmental condition encountered.
   3. Occupancy Sensors, Line Voltage [O&M] [S]:
      a. Ceiling or Wall-mounted: Provide dual technology (infrared and ultrasonic) occupancy sensors, complete with 120 or 277volt power packs for fluorescent lighting in indicated spaces. Sensors shall be ceiling or wall mounted as indicated as indicated on drawings. The local room switches shall be wired after the relay's contact. Provide a satellite relay for additional circuits under the sensor's control. Occupancy sensor shall be Watt-Stopper type DT-300 for 360 degree operation or DT-200 for 180 degree operation, or acceptable equals by Hubbell/Unenco, Sensorswitch, or Lutron.
      b. Corridor: Provide ultrasonic sensors, complete with 120 or 277 volt power packs for fluorescent lighting in corridors and elsewhere as shown on the drawings. Sensors shall be listed for coverage up to a minimum 90 foot linear distance. Sensor shall be Watt-Stopper Type WT-2255 or acceptable equal by Hubbell/Unenco, Sensorswitch, or Lutron.
      c. High Bay: Provide passive infrared sensors, complete with 120 or 277 volt power pack for fluorescent lighting in high bay areas where shown on the drawings. Include proper choice of lens for the application. Sensors shall be listed for minimum 24' diameter coverage when mounted at 20' height or 68' diameter when mounted at 40' height with proper application of lens. Sensor shall be Watt-Stopper HB series with L3 or L4 lens or acceptable equal by Hubbell/Unenco, Sensorswitch, or Lutron.
      d. Wall Switch: Provide single pole (2 wire) dual technology infrared (motion) and ultrasonic occupancy sensing wall switch where shown on the drawings, 800 watts @ 120 volts, 1200 watts @ 277 volts, 170 degree field of view. Switch shall be Watt-Stopper #DW-100 for single switches, #DW-200 for bi-level control, #DW-103 or #DW-203 for three-way switching or acceptable equals by Hubbell/Unenco, Sensorswitch, or Lutron.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. All wiring devices shall be mounted at elevations indicated.

B. Local switches shall be coordinated with the door swings to insure the proper location of the switch. Local switches shall be a minimum of 4" from door jamb trim. Refer to elevation for mounting outlet boxes at doors.

C. Install plates on all outlets and wiring devices, with all four edges in continuous contact with finished wall surfaces without the use of mats or similar devices. Plaster fillings will not be permitted. Plates shall be installed with an alignment tolerance of 1/16 inch. The use of sectional device plates will not be permitted.

D. Where the wall opening for a wall or casework outlet box is larger than a standard plate cover, repair the outlet opening to accept a standard size plate. "Jumbo" or "Junior Jumbo" device plates are not acceptable.

E. Low Voltage Dimming and ON/OFF Control System: Provide all components and wiring necessary for a complete and functioning Low Voltage Dimming and ON/OFF control system as indicated.

Furnish and Install all wallpods, occupancy sensors, lighting sensors, power supplies and dimming controls, cat 5e cable and miscellaneous appurtenances necessary for each complete and operating system. Drawing symbols indicate which lighting zones and spaces are to have low voltage (0-10V) Dimming and ON/OFF controls.

F. Daylighting Sensors and Controls: Daylighting sensors are shown in spaces with LED and fluorescent lighting fixtures. Daylighting sensors and controls shall sense and dim these lighting fixtures via nLight CAT 5e network control of the fixtures. Dimming shall begin with fixtures located closest to exterior fenestration, and work inward in the space a minimum of 15' as appropriate for even total illumination of the space (A combination of daylighting and controlled lighting). In all cases daylighting control strategies must comply with the IECC, 2012 Paragraph C405.2.

G. Occupancy Sensing and Control: The low voltage lighting control system shall be programmed as follows:
   1. When an occupant first enters a space with lighting enabled (fixtures off), the space shall illuminate to the 50% lighting power level. This requirement is based on ASHRAE 90.1, 2010 and applies to all spaces except those listed in Paragraph 9.4.1.a through d.
   2. At all times, the occupant's manual control of the space (via wallpods or network control) will override automatic controls.

H. Vacancy Sensing and Control: In spaces containing occupancy sensors with a 'vs' designation, occupancy sensors shall be programmed as vacancy sensors (wallpod 'on,' occupancy sensor 'off').

I. All solid state line voltage dimmers shall have dedicated neutral wiring from the panelboard to the fixture. Light track systems that have a shared neutral shall be wired in accordance with the dimmer and light track systems manufacturers' drawings and instructions.

J. Photocells shall be installed with view window oriented to the North and away from direct or reflected artificial or natural light sources. Mount photocell(s) 1'-6" above roof on condulet fitting and connected to circuits indicated.

K. Lighting contactors shall be installed in a NEMA enclosure rated for the environment encountered.

SECTION 26 2000

LOW-VOLTAGE ELECTRICAL DISTRIBUTION

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Connections For:
   1. Kitchen Equipment
   2. Washers
   3. Dryers, Residential
   4. Ranges, Residential
   5. Motorized Shutters

B. Contactors and Relays

C. Special Voltages

D. Kitchen Hood Fire Suppression System Interfaces

E. Electric Door Strike

F. Connections for Fire Suppression Systems (Sprinklers Wet and Dry)

G. Smoke Shutter Release

H. Surge and Transient (ILCP) Protection

I. Emergency Panic Stop Station

J. Emergency Glass Break Switch

1.03 RELATED WORK:

A. Division 08 – Openings - Overhead Coiling Doors

B. Division 08 – Openings - Finish Hardware

C. Division 11 – Equipment - Projection Screens

D. Division 11 – Equipment - Laundry Equipment

E. Division 11 – Equipment - Food Service Equipment

F. Division 11 – Equipment – Scoreboard

G. Division 11 - Equipment - Laboratory Equipment

H. Division 12 – Furnishings

I. Division 14 - Conveying Systems

J. Division 21 – Fire Protection

K. Division 22 – Plumbing

L. Division 23 – Mechanical

M. Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables

N. Section 26 05 23 – Control Voltage Electrical Power Cables

O. Section 26 05 33 – Raceway And Boxes For Electrical Systems

P. Section 26 05 36 – Cable Management For Electrical Systems

Q. Section 26 05 53 – Identification For Electrical Systems

R. Section 26 09 23 – Lighting Control Devices

S. Section 26 27 26 – Receptacles

T. Section 26 28 16 – Enclosed Switches And Circuit Breakers

U. Division 27 – Communications

V. Division 28 – Electronic Security and Safety

1.04 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Section 26 05 00.
   1. Shop Drawings for contactors, relays shall include:
      a. Scale drawing of enclosure and internal components.
      b. Internal wiring schematic.
      c. Roughing-in requirements.
   2. Product Data: Submit application, technical, and installation data.

B. Submit Operation and Maintenance Manuals in accordance with Section 26 05 00 for contactors, relays, buck/boost transformers.

PART 2 - PRODUCTS

2.01 PRODUCTS:

A. Contactors and Relays:
   1. Shall be provided as required for proper circuit control. Each contactor shall have a hand-off-automatic switch and L.E.D. indicator [S] [O/M].
   2. Square D Class 8903, Type L lighting contactor in NEMA-1 enclosures. Select correct coil voltage, normally open and normally closed contacts, quantity of paired contacts. The installation shall include an **undervoltage relay** if required, to drop out contactor at 85% of normal voltage [S] [O/M].

B. Buck/Boost Transformers: Square D, Cutler-Hammer, G.E., Siemens, Hevi-Duty or acceptacle equal [S].

C. Emergency Panic Stop Stations (EPO): Emergency power off push button. Pushing the button shall turn off the associated power, and turning it on shall reset the button. The push button shall be red with a yellow housing and a flush, clear, weather-proof cover. Cover and housing shall state 'emergency power off'. product shall be STI SS2239ZA-EN or acceptable equal [S].

D. Isolated Loop Circuit Protector (ILCP) [S]:
   1. The ILCP furnished is to have a line to line response time of less than one (1) nanosecond capable of accepting greater than 2000 amps (35 joules each line) to earth. Shield to earth current is to be 5000 amps maximum.
   2. The ILCP is to be protected by a high dielectric insulating material and of small enough size to mount in a standard 4" square 2-1/8" deep electrical box.
   3. Spark gap devices or devices incorporated in or installed within various systems' control panels in lieu of the specified ILCP are not acceptable.
   4. All Isolated Loop Circuit Protectors must comply with UL #497B requirements.

E. Emergency Glass Break Switch (EGB): Asco #124 breakglass station with proper logo or acceptable equal [S].

F. Cord Reel: Industrial heavy-duty style cord reel with 45' long cord. cord reel shall have two (2) NEMA 5-20R outlets, adjustable stop, and a GFCI module. cord reel shall be by Hubbell or an acceptable equal [S].

G. Light Reel: Industrial style light reel with 45' long cord. Light reel shall have LED hand lamp with end light and adjustable stop. Light reel shall be by Hubbell or acceptable equal [S].

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General: Division 26 shall provide the installation methods specified hereinafter for the following equipment:

1. Kitchen Equipment
2. Washers
3. Dryers, Residential
4. Ranges, Residential
5. Motorized Shutters

All electrical work for receptacles or connections to the above equipment shall be made by the Electrical Trade. Do no roughing-in or other electrical work in these areas until roughing-in drawings reviewed by the Architect-Engineer are received. The presumed location of all presently envisioned equipment having electrical connections is shown on the drawings and specified herein, but this is for estimating purposes only and the Contractor shall prepare his bid to allow for any possible rearrangement of the equipment listed, or as indicated. Provide permanent liquid-tight flexible metal conduit connections to the equipment from the outlet boxes or conduit stubbed up above the floor or conduit stubbed down from the ceiling for all equipment indicated, except where receptacles are indicated. These connections shall include but not be limited to; disconnect switches, service switches, combination motor starters, motor protective switches and other wiring devices as required per the manufacturer’s drawings, the NEC and the Contract Documents.

B. Installation Methods:

1. Kitchen Equipment: Division 26 shall include in their bid the cost for providing wiring between components of the dishwasher and related accessories, the garbage disposal and solenoid, the fryer "battery's" fryers, filter and warmer, the walk-in refrigerator's condenser, evaporator, lights, door heat tape and timers, the walk-in freezer's condenser, evaporator, defroster, drain heat tape, door heat tape, pressure relief port heat tape, lights and timers, and other noted items. This electrical work is in addition to work specified in Paragraph 3.01 A.
2. Washers: Connect washer(s) on dedicated 120 volt circuit(s) indicated.
3. Residential Type Dryers: The bonding jumper between the unit's frame and neutral shall be deleted per NEC 250-140.
4. Residential Type Ranges: The bonding jumper between the unit's frame and neutral shall be deleted per NEC 250-140.
5. Motorized Shutters: The shutters shall be provided in-place by other Divisions. The control unit will be furnished by the shutter installing trade to Division 26 for installation. Division 26 shall provide all power and control wiring, and make all connections to the unit and controller in accordance with equipment manufacturer's drawings and instructions, and shutter installing trade's written instructions.
6. Equipment Wiring: Shall be in accordance with equipment manufacturer's drawings and instructions, and the equipment installing Trades' written instructions

C. Contactors and Relays: Install all contactors and relays in accordance with NEC as required.

D. Special Voltages: Some outlets and equipment are connected to the 277/480 volt system, 120/208 volt system and some low voltage systems. The Electrical shall be responsible for coordinating all related equipment and wiring to ensure that they are related for the voltage encountered. Low voltage wiring shall not be installed in the same conduits or boxes with the building service voltage wiring unless permitted by NEC.

E. Kitchen Hood Fire Suppression System:

1. Provide power connection to system as indicated.
2. Connect alarm and trouble contacts to building's fire alarm system.

3. Circuit breakers supplying kitchen cooking equipment under kitchen hood shall be supplied with shunt trips for connection by the Electrical Trade to the Kitchen Hood Fire Suppression System. All such circuit breakers shall trip in event of any actuation of the Kitchen Hood Fire Suppression System. Whether the hood supply and/or the exhaust fans shall be tripped off or remain fully or partially functional during fire suppression conditions shall be governed by the listings and instructions for both the hood and fire suppression systems.
4. All wiring shall be in accordance with Manufacturer's drawings and instructions and applicable codes.

F. Electric Door Strike:
1. All electric door strike mechanisms shall be furnished in-place by Division 8 on indicated doors.
2. Coordinate operation of the electric strike with all controls including Section 28 10 10 Electronic Access Control system. Division 26 shall provide all necessary controls, wiring, conduit, relays, connections not specifically specified as being provided under other Divisions.
3. If required, Division 26 shall provide a 120 VAC circuitry, protected transformer and/or power supply above the ceiling to coordinate proper voltage with the electric strike or provide the necessary power. Include any necessary control relays.
4. The electric strike shall be connected to the fire alarms 24 VDC door release circuit if door is part of the path of egress and manual unlatching (such as a panic bar) is not provided. Provide proper wiring and conduit as recommended by fire alarm system and electric strike manufacturer. Refer to Section 28 31 00.

G. Emergency Panic Stop Stations: Install stations to operate shunt trip (main) circuit breakers in panelboards as indicated. Provide engraved label with 1" high white letters on red background to read "POWER CUTOFF" with each station.

H. Electrical connections are required for the following items in Division 21 & 22:
1. Sprinkler Flow, Pressure and Tamper Switches, Post Indicator Valve Switch(es)
2. Pressure and Vacuum Switches for medical gases located on pipes, compressors, and vacuum pumps.

Refer to Plumbing and/or Fire Protection drawings for the exact location for MGO's, MGA's, pressure switches, flow switches, tamper switches (electrically supervised valves), vacuum switches, air compressors, vacuum pumps, electric heating cable (heat trace cable) and post indicator valves (also see Division 2).

I. Smoke Shutter Release:
1. Smoke shutters shall be furnished by other Divisions. Division 26 shall provide a release mechanism, and connect to the general alarm output **or** local smoke detectors auxiliary relays for release in accordance with NFPA.

J. Surge and Transient (ILCP) Protection: All power and control equipment, between the building and site facility shall have surge and/or transient protection devices to comply with UL and NEC requirements. The protection shall be on both sides.
1. Provide ILCP devices for the Fire Alarm System and other systems as required.
2. Provide ILCP devices in accordance with NEC Article 800.

K. Emergency Glass Break Switch:
1. Provide one (1) ASCO 124 break-glass switch to stop all gas-fired boilers and water heaters. Connect to boiler and gas water heater main control panel per manufacturer's drawings.

END OF SECTION

SECTION 26 2200

LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Three phase indoor dry type transformers.

B. Three phase indoor dry type transformers for non-linear loads.

1.03 RELATED WORK:

A. Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 05 23 – Control Voltage Electrical Power Cables

C. Section 26 05 26 – Grounding And Bonding For Electrical Systems

D. Section 26 05 33 – Raceway And Boxes For Electrical Systems

E. Section 26 05 53 – Identification For Electrical Systems

1.04 GENERAL DESCRIPTION:

A. Size, voltage ratings and features of transformers as indicated on drawings.

1.05 QUALITY ASSURANCE:

A. Source Quality Control: Dry type transformers shall be UL listed for application intended and specified temperature rise.

1.06 REFERENCES:

A. The transformer shall be designed and manufactured to meet the latest applicable NEMA publications such as ST-1, ST-20 and TR-27; UL Standards and NFPA-70. Specifically, all transformers shall comply fully with **(DOE 2016 Transformer Efficiency)** - regarding energy efficiency.

1.07 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Section 26 05 00.

1. Shop Drawings shall include:
   a. Dimensioned layout.
   b. All characteristics including KVA, phase, Hertz, primary volts and amps, secondary volts and amps, type class, weight, impedance, temperature rise, no-load loss in watts, sound level.
   c. Connection diagram.
2. Product Data: Submit application, technical and installation data.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Acceptable ventilated general purpose and high harmonic load **transformer** manufacturers are Square D, G.E., Cutler-Hammer, Siemens, ACME and Hevi-Duty.[S][O/M]

2.02 MATERIALS AND TYPE:

A. General Purpose Transformer(s):

1. Three phase units shall be 480 volts delta primary and 208Y/120V secondary with two 2-1/2% taps, FCBN and two 2-1/2% taps FCAN.
2. Units above 15KVA sizes shall be in ventilated sheet metal enclosures with louvers of such a design that they are "sight-tight" so that a wire or other similar object cannot be inserted through the ventilation louvers and touch interior parts having a voltage potential above ground.
3. All ratings called for shall be continuous full-load ratings. Transformers shall be designed for maximum of 80 degree Centigrade rise with minimum of 220 degree Centigrade class H insulation system and capable of 30% overload continuously at 40 degree Centigrade ambient. Units under 15 KVA shall be designed for maximum of 115 degree Centigrade rise with minimum of 220 degree Centigrade class H insulation system and capability of 15% overload continuously at 40 degree Centigrade ambient.
4. Enclosure or case temperature shall not be greater than 32°C above ambient. Terminal temperature shall not be greater than 5°C rise above ambient.
5. Sound level: Transformers shall be of the low noise design and sound levels shall be warranted by the manufacturer not to exceed the following (which may be less than the values prescribed in NEMA ST20):

Up to	50 KVA	39 dB
51 to	150 KVA	44 dB
151 to	300 KVA	49 dB
301 to	500 KVA	54 dB

6. The nameplate on each transformer shall list the following: KVA, Phase, Hertz, Primary Volts and Amps., Secondary Volts and Amps., Type, Class, Weight, Impedance, Temperature Rise, Catalogue Number, Serial Number, Transformer No-Load Loss in Watts, UL labeled.
7. Electrostatic shield bonded to enclosure.
8. Square D Type EX **(and EXN)** Series (**80°C** temperature rise) with copper windings is basis of design.

B. High Harmonic Load Transformer(s) For Non-Linear Loads:

1. Three phase units shall be 480 volts delta primary and 208Y/120V secondary with two 2-1/2% taps, FCBN and two 2-1/2% taps FCAN.
2. Units above 15KVA sizes shall be in ventilated sheet metal enclosures with louvers of such a design that they are "sight-tight" so that a wire or other similar object cannot be inserted through the ventilation louvers and touch interior parts having a voltage potential above ground.
3. All ratings called for shall be continuous full-load ratings designed for maximum of 115 degree Centigrade rise with minimum of 220 degree Centigrade class H insulation system.
4. Enclosure or case temperature shall not be greater than 32°C above ambient. Terminal temperature shall not be greater than 5°C rise above ambient.
5. Sound level shall not exceed the following dB at any sound level.

Up to	50 Kva	45 dB
51 to	150 Kva	50 dB
151 to	300 Kva	55 dB

6. The nameplate on each transformer shall list the following: KVA, Phase, Hertz, Primary Volts and Amps., Secondary Volts and Amps., Type, Class, Weight, Impedance, Temperature Rise, Catalogue Number, Serial Number, Transformer No-Load Loss in Watts, UL labeled.
7. Electrostatic shield bonded to enclosure.
8. 115 degree Centigrade maximum temperature rise with **non-linear** loads at 40 degree Centigrade ambient.
9. Reduced core flux to compensate for harmonic voltage distortion.
10. Double-size neutral terminal for non-linear neutral.
11. Additional winding capacity to compensate for higher stray loss due to non-linear loading.
12. A minimum K-factor of 4 or factor indicated on drawings.
13. Square D Type NL Series (**115°C** temperature rise) with copper windings is basis of design.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Mounting:
   1. Transformers shall be mounted so that vibrations and noise are not transmitted to the building structure.
   2. Wall mounted transformers shall be supported by manufacturer's standard wall brackets, with additional Kindorf channel as necessary.

B. Conduit connections shall be liquid-tight flexible conduit with stranded conductors to reduce any vibration/noise. Allow from 1/2 to a full loop of flexible conduit for vibration dampening.

END OF SECTION

SECTION 26 2416

PANELBOARDS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Branch Circuit and Distribution Panelboards

B. Main Panelboard

1.03 RELATED WORK:

A. Section 26 05 53 – Identification for Electrical Systems

B. Section 26 28 16 – Enclosed Switches and Circuit Breakers

1.04 QUALITY ASSURANCE:

A. Integrated Circuit Breaker Panelboard Rating: Each panelboard, as a complete unit, shall have a rating equal to or greater than the integrated equipment rating shown on the panelboard schedule on the plans. Such rating shall be established by test with the circuit breakers mounted on the panelboard. The short-circuit tests on the circuit breaker and on the panelboard structure shall be made simultaneously by connecting the fault to each panelboard breaker with the panelboard connected to its rated voltage source. Method of testing shall be per proposed UL standards pertaining to listing of molded case circuit breakers for high-interrupting capacity ratings. The source shall be capable of supplying the specified panelboard short- circuit current or greater. Test data showing the completion of such tests upon the entire range of distribution and power panelboards to be furnished shall be submitted to the Engineer, if requested by him, with or before the submittal of approval drawings. Testing of panelboard circuit breakers for short-circuit rating only with the breaker individually mounted is not acceptable. Also, testing of the bus structure by applying a fixed fault to the bus structure alone is not acceptable.

1.05 REFERENCES:

A. All enclosed circuit breakers and panelboards shall meet and comply with applicable sections of UL, NEC and NEMA.

1.06 SUBMITTALS:

A. Submit shop drawings in accordance with Section 26 05 00.

1. Shop drawings for each panelboard shall include:
    a. Dimensioned layout.
    b. **EXACT** Arrangement of circuit breakers or fusible switches as indicated in the schedules. (Automatic "Rejection" of shop drawings if not followed.)
    c. Bus ampacity, interrupting capacity and composition.
    d. Main lug capacity and location.
    e. Future provision.

B. Submit Operation and Maintenance Manuals in accordance with Section 26 05 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. All panelboards shall be as manufactured by Square D or acceptable equal by Cutler-Hammer, G.E., or Siemens.

B. All replacement circuit breakers as indicated.

2.02 MATERIALS AND TYPE:

A. General:

1. Panels shall be dead front automatic circuit breaker as indicated and designed for type of service encountered.

B. **Panelboards** [S] [O/M]:

1. Breakers: Square D frame sizes are called for on the drawings to designate type of breaker to be installed. All breakers shall have a minimum interrupting capability of 18,000 amperes rms symmetrical or higher for 480 volt panels and 10,000 amperes rms symmetrical or higher for 120 volt panels as noted on drawings, and shall be U.L. listed. The breaker's line terminal connection shall bolt directly to the panelboard's bus connecting strap or shall be a bus bar clamp type connection with bolt on device. Multi-pole breakers shall be in one molded case, common trip, with one operating handle. Where space only is indicated, provide mounting straps for future breaker.
2. Cabinets and Trim: Cabinets shall be of all code gauge galvanized steel, 6" minimum outside depth, with studs for mounting interiors. Minimum of 4" side gutters; top and bottom gutters as required; special gutter sizes as indicated on the drawings. Raceway openings to be 2" clear from front of cabinet. Steel front shall be grey lacquered Code gauge (#12 gauge) minimum for 225 amp bus panelboards and smaller amperage types, and (#10 gauge minimum) for 250 amp bus panelboards and higher amperage types, complete with metal framed index card holder, door with flush latch, concealed hinges, lock (two keys for each panel with all panels keyed alike) concealed adjustable trim clamps or screws and **hinged** trim.
3. Interior:
   a. All bus structure shall be copper with silver, cadmium or tin plating and insulated. Provide individual full solid plated copper neutral bus and solid plated copper ground bus. The bus structure and main lugs, including any feed-through lugs, sub-feed (double) lugs and main circuit breaker where required, shall have the current ratings as indicated.
   b. Panelboards that are indicated to be “Non-Linear” shall have 200% plated copper neutrals.
   c. Provide mechanical screw type U.L. Listed lugs to accept solid and/or stranded copper and aluminum conductors for 90° C rated wire to accommodate the conductors indicated including derated conductors and oversized neutrals, as required.
4. Miscellaneous: Panelboards; that are indicated to be service equipment shall be rated and labeled for "Suitable for Service Entrance" by U. L.

C. Molded Case Circuit Breakers (MCCB) [S] [O/M] shall be as specified in section 26 28 16.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Set all cabinets of all branch circuit and distribution panelboards, with top 6'-0" above finished floor, unless noted otherwise, or unless panel is taller than 4'-6".

B. Index cards to be properly labeled with typewritten letters indicating loads controlled by each circuit complete with room designation matching the Owner’s final labeling.

C. Engraved laminated plates on breakers of main panels shall be filled in with the load designation.

D. Interior trims of all panels shall be pulled up flush with front covers.

E. Coordinate voltage of shunt trips with connected systems.

F. Branch circuit breakers serving the following items shall have lock-on devices.
   1. Exit signs
   2. Walk-through and/or exit (egress) lighting
   3. Fire alarm system(s)
   4. Security systems(s)
   5. Timeclocks
   6. Clock and Program Time Control System(s)
   7. Building Intercommunication Systems
   8. Telephone power disconnect switches and receptacles
   9. Sump pumps
   10. HVAC controls
   11. Refrigerators and Freezers.
   12. Control circuits for shunt trips and "panic" switches.
   13. Hand Dryers

G. Panelboards shall not be activated ("hot") without **all** protective covers and enclosures installed.

H. Electric Heating Cable Circuits:
   1. Provide 30 milliamp equipment protection circuit breakers for each electric heating (heat trace) cable circuit complete with dedicated neutral.
   2. Do not connect any heat trace cable without written verification of testing and acceptance of the installed heat trace cable by the cable manufacturer's authorized technician.
   3. Provide the minimum ampacity circuit breaker as indicated in Divisions 21, 22 & 23.

3.02 FIELD QUALITY CONTROL:

A. Technical Assistance: The panelboard manufacturer’s representative shall generally provide installation supervision of this equipment if requested by the contractor.

B. Calibration and Testing: The panelboard manufacturer’s representative shall provide a factory trained technician for initial calibration of circuit breaker trip and time delay settings to indicated values including ground fault protection system performance testing (NEC 230.95). All calibration and testing shall be in accordance with the manufacturer’s written instructions, NETA and all applicable codes and industry standards. Written records of the calibration and test procedures shall be submitted to the Owner, Architect/Engineer and Local Authority Having Jurisdiction (if required). These test procedures shall also include an insulation test, torquing of all connections, electrical interlocking verification, etc. The Architect/Engineer and/or Owner’s representative shall have the option of witnessing the testing procedures. The contractor shall coordinate the testing with all parties concerned.

SECTION 26 2726

RECEPTACLES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Receptacles

B. Tamper Proof Receptacles

C. Plates

1.03 RELATED WORK:

A. Section 26 05 33 – Raceway And Boxes For Electrical Systems

1.04 REQUIREMENTS:

A. NEC 406 (Receptacles)

1.05 SUBMITTALS:

A. Submit shop drawings, product data and wiring device samples in accordance with Sections 26 05 00.

B. Submit Operation and Maintenance Manuals in accordance with Section 26 05 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. **All Receptacles [S]** shall be as manufactured by:
   1. Cooper Industries
   2. Hubbell
   3. Pass and Seymour (P&S)

   All receptacles shall be by the same manufacturer.

B. Wiring Device Plates [S] and Blank Plates [S] shall be as manufactured by:
   1. Hubbell,
   2. Cooper Industries,
   3. Pass & Seymour (P&S)

   All plates shall be by the same manufacturer. "Wet Location" (WL) (LP) plate and covers by:
   1. Hubbell-Bell
   2. Hubbell-TayMac
   3. Legrand

2.02 MATERIALS AND TYPE:

A. All receptacles and other wiring devices shall be as indicated on drawings and specified hereinafter.
   1. Unless otherwise indicated on the drawings all standard duplex receptacles shall be:
      a. Hubbell heavy duty specification grade “HBL 5362” series,
      b. Cooper Industrial Specification grade “5362” series,
      c. Pass & Seymour heavy duty specification grade “5362” series.

The receptacles shall be complete with one-piece plated grounding system, self-grounding, back side wired, and high impact polycarbonate, Lexan™, or nylon faces. Receptacle shall be rated for the voltage, poles, amperage and NEMA configuration required. Provide the proper nylon or polycarbonate bodied plug where indicated for equipment connection.

2. Selected NEMA 5-20 receptacles shall be corrosion resistant type as manufactured by:
   a. Cooper Industries “CR” series or
   b. Hubbell "CM and M" series unless otherwise indicated on the drawings.
3. Selected NEMA 5-20 receptacles shall be ground-fault circuit-interrupter type as indicated. Ground fault circuit interrupting receptacles, unless otherwise indicated on the drawings, shall be equal to the same receptacles series specified in paragraph A.2. Provide corrosion resistant type where indicated.
4. Selected NEMA 5-20 receptacles shall be “Hospital Grade” as indicated, and shall be the same receptacle series specified in paragraph A.2.
5. All other NEMA configurations (amperage and type) shall be equal to the same receptacle series specified in paragraph A.2. Provide matching nylon or polycarbonate bodies plug to match receptacle for all connected equipment where the equipment is not furnished with plug.

B. All Tamper Resistant Receptacles shall be as indicated on the drawings and specified hereinafter.
   1. Unless otherwise indicated on the drawings all tamper resistant receptacles shall be:
      a. Cooper Industries TR8300 series.
      b. Hubbell 8300 series.
      c. Leviton 8300-SGT series
      d. P&S TR63H series.

      The tamper resistant receptacles shall be complete with a one-piece grounding system, self grounding, back side wired, and high impact polycarbonate, Lexan™, nylon or thermoplastic faces. Tamper resistant receptacles shall be hospital grade, tamper resistant with dual mechanical shutters and shall be rated for the voltage, poles, amperage and NEMA configuration required.

C. The weather resistant receptacles shall be complete with a one-piece grounding system, self grounding, back side wired, and high impact polycarbonate, Lexan™, nylon or thermoplastic faces. Receptacle shall be rated for the voltage, poles, amperage and NEMA configuration required. Provide the proper nylon or polycarbonate bodied plug where indicated for equipment connection.

D. Plates: **For all systems** unless indicated otherwise.
   1. For Concealed Work: Stamped stainless steel type 302 with satin finish.

      OR

      High impact nylon, high impact thermoplastic or polycarbonate (Lexan) with smooth finish unless otherwise indicated. Color of plates shall be _____.
   2. For Wet Locations, While in Use (WL) and Low Profile (LP): Weatherproof “Extra Duty” NEMA-3R enclosure constructed of die-cast aluminum complete with sealing gaskets and stainless steel mounting screws; and meets OSHA and NEC requirements **"WHILE IN USE"**. Housing size shall depend on the wiring device being protected. Housing for receptacles shall allow both angled and straight cord connectors, and shall incorporate a “cord catch” or “cord flap” gaskets.
      a. Hubbell-Bell “RaynGuard” 5800 series
      b. Hubbell-Taymac “CodeGuard” 5800 series.
      c. Legrand WIUCAST1 series.
   3. Screws: Heads to match plate material and finish.
   4. Provide blank plates for all unused outlets.

E. Wiring Device and Plate Colors: Architect will review and accept color of wiring devices. Contractor shall allow for selection from "standard" colors (grey, white, ivory, brown) of wiring devices in his bid proposal.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. All wiring devices shall be mounted at elevations indicated.

B. All duplex receptacles shall be mounted vertical with ground slots towards floor, unless otherwise indicated by the Owner or Authority having jurisdiction.

C. Install plates on all outlets and wiring devices, with all four edges in continuous contact with finished wall surfaces without the use of mats or similar devices. Plaster fillings will not be permitted. Plates shall be installed with an alignment tolerance of 1/16 inch. The use of sectional device plates will not be permitted.

D. Where the wall opening for a wall or casework outlet box is larger than a standard plate cover, repair the outlet opening to accept a standard size plate. “Jumbo” or “Junior Jumbo” device plates are not acceptable.

E. Provide ground-fault interrupter type (GFCI or GFI) NEMA 5-20 receptacles where NEMA 5-20 receptacles are indicated in or at the following locations unless ground fault interrupter branch circuit breakers are indicated:

1. Bathrooms, showers, toilets, elevator pit(s), elevator machine room.
2. Within 6'-0" radius of all lavatories and sinks, and at **all** elevations.
3. All countertops in galleys and service pantries.
4. Receptacles that power refrigeration compressors, evaporators, etc., shall not be GFI protected due to inherent ground fault currents which will cause nuisance tripping, unless the receptacle device is located in a kitchen in which case it must be GFCI.
5. All other current IBC, NEC and OSHA GFCI required locations.

F. Low Profile (LP) Locations: Wiring device outlet boxes within 12” of the finished grade and located in laundry rooms, shower rooms, boiler rooms, HVAC equipment rooms, lavatories, and similar areas subject to wash-down, spray, or rinsing procedures shall be required to have wet location wiring device enclosures (WL) for “while-in-use” service. The NEC shall govern the requirement of a GFCI receptacle or similar device.

G. All exterior wiring device outlet boxes shall utilize weather resistant ground fault interrupter receptacles and wet location (WL) **"While in Use"** enclosures.

H. Each rooftop and grade mounted exterior Division 23 (HVAC) equipment shall be provided with a NEMA 5-20 weather resistant ground fault interrupter work receptacle in a FS/FD box and gasketed **“While in Use” (WL)** weatherproof enclosure in compliance with the NEC. Connect on nearest available circuit unless a circuit is indicated.

I. Division 26 shall furnish the polycarbonate or nylon angular plugs for the indicated equipment as required. Division 26 shall install the plugs on the equipment including proper specified flexible cable (cord).

END OF SECTION

SECTION 26 2813

FUSES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Fuses [S]

1.03 RELATED WORK:

A. Section 26 28 16 – Enclosed Switches And Circuit Breakers

B. Section 26 29 00 – Low-Voltage Controllers

1.04 SUBMITTALS:

A. Submit product data in accordance with Section 26 05 00.

1. Product Data: Submit application, technical, and installation data.

PART 2 - PRODUCTS [O/M]

2.01 MANUFACTURERS:

A. All Fuses shall be as manufactured by Cooper Industries, GEC Alsthon, Littlefuse, Gould-Shawmut (Nippon Mining). [S] [O/M]

B. **Fuse Cabinet** shall be as manufactured by the above fuse manufacturer, Hoffman, Austin or acceptable equal. [S]

2.02 MATERIALS AND TYPE:

A. Motor and Panelboard Fuses: Rejection type **C** class RK-1, dual element, time-delay, current limiting, cartridge type, by 300™ Low-Peak Yellow™ by Bussman, LoIp© by CEFCo, Power-Pro® by Littlefuse, "AMP-TRAP 2000" by Gould-Shawmut (Nippon Mining), with a minimum interrupting rating of 200,000 amperes rms symmetrical.

B. For applications 601 amps and higher, utilize time-delay, current limiting, silver linked **UL** class **"L"** fuses by 300™ Low-Peak™ Bussman, Short Check® by CEFCo, Power-Pro© by Littlefuse, A4BQ "AMP-TRAP 2000" by Gould-Shawmut (Nippon Mining) with a minimum interrupting rating of 200,000 amperes rms symmetrical.

C. Cabinet: Wall mounted enclosure complete with shelves for storage of spare fuses and instruction manual. Door shall be lockable with same key as panelboards.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Fuses for motor circuits shall be sized in accordance with the fuse manufacturer's sizing chart for **"motor running overload protection"**, unless otherwise required for a specific motor. All other fuses for other than motor circuits shall be of size and type as required by the connected equipment manufacturer's written instructions unless otherwise indicated. Labels indicating size and type of replacement fuses shall be glued to inside of door on all fusible switches, fusible motor starters and panels.

3.02 SPARE FUSES:

A. 600 Amp Fuses and Smaller: Furnish spare fuses not to exceed 10% of each rating with a minimum of three (3) per rating.

B. 601 Amp Fuses and Larger: Furnish three (3) spare fuses of each rating.

C. Contractor shall deliver the spare fuses with invoice to the Owner's Maintenance Operations Center.

END OF SECTION

SECTION 26 2816

ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Disconnect Switches

B. Circuit Breakers

1.03 RELATED WORK:

A. Section 26 05 53 – Identification For Electrical Systems

B. Section 26 20 00 – Low-Voltage Electrical Distribution

C. Section 26 24 16 - Panelboards

D. Section 26 28 13 – Fuses

E. Section 26 29 00 – Low-Voltage Controllers

1.04 REFERENCES:

A. All disconnect switches and circuit breakers shall meet and comply with applicable sections of U.L., N.E.C. and NEMA.

1.05 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Section 26 05 00.
   1. Shop Drawings for Disconnect Switches shall include:
      a. Scale drawing of enclosure and internal components.
      b. Roughing-in requirements.
   2. Circuit Breaker shop drawings shall include:
      a. Frame type and ampere rating.
      b. Trip amperage.
      c. Interrupting rating in RMS symmetrical amps.
      d. Accessories.
   3. Product Data: Submit application, technical, and installation data.

B. Submit Operation and Maintenance Manuals in accordance with Section 26 05 00.

PART 2 - PRODUCTS [O/M]

2.01 MANUFACTURERS:

A. All disconnect switches shall be Square D (Group Schneider) Class 3110 Heavy Duty Visible-Blades® safety switches, General Electric Spec-Setter© Heavy Duty Type TH (to 600A), and Type TC (800A & 1200) safety switches [S][O/M], Cutler-Hammer/Eaton Heavy Duty Type DH series safety switches, and Siemens Vacu-Break VBII™ Heavy Duty safety switches.

B. All circuit breakers shall be as manufactured by Square D or acceptable equal by Cutler-Hammer/Eaton, General Electric (GE) or Siemens.

2.02 MATERIALS AND TYPE:

A. Disconnect Switches [S] [O/M]: Rated for voltage encountered, poles and amperage as required. Heavy Duty, NEMA enclosures, fusible for rejection type class R fuses only, solid neutral assembly, equipment grounding kit, unless otherwise indicated. Refer to NEMA type under PART 3 - EXECUTION.

B. Molded Case Circuit Breakers (MCCB) [S] [O/M]:
   1. Ratings and special features shall be as scheduled.
   2. Trips shall be thermal magnetic with inverse time delay and instantaneous time-current characteristics.
   3. 225 ampere frame and larger MCCB shall have permanent non-interchangeable trips, factory-calibrated at 40 degrees C, and adjustable magnetic feature set by a single adjustment. Interchangeable trips will be considered as an alternative.
   4. Industrial grade MCCB shall be provided except that commercial grade MCCB (quick-lag "Q-Line") may be used for MCCB 100 amperes and below where other indicated criteria are met.
   5. Ambient compensating MCCB shall be provided for outdoor applications or where indicated on drawings.
   6. MCCB shall not be used for switching lights unless they are specifically rated for switching duty.
   7. U.L. listed HACR type circuit breakers shall be provided for use with air conditioning, heating and refrigeration equipment having motor group combinations and marked for use with HACR type circuit breakers.
   8. Electronic Trip Circuit Breakers: Square D “Micrologic” trip system or accepted equal to include the following features (unless otherwise indicated in schedules):
      a. 100% Rated
      b. True RMS Sensing
      c. Interchangeable Trip Units
      d. LI, LIG, LS(I)G (Instantaneous OFF) Configurations (as scheduled)
      e. Short-time Delay = I^2t IN & 1^2t OUT
      f. Ground-fault Delay = I^2t IN & 1^2t OUT
      g. Short-time Withstand Rating
      h. Integral Ground-fault Testing
      i. LED Long-time Pickup Indication
      j. Zone Selective Interlocking (Short-time & Ground-fault) with main protective device and downstream protective devices
      k. Thermal & Magnetic Backup Protection
      l. Long-time & Ground-Fault Memory
      m. Local Trip Indicators - Overload, Short-circuit, Ground-fault
      n. Local Ammeter/Trip Indicator
      o. Trip unit seal kit
      p. Externally accessible test port
      q. High level selective over-ride
      r. Neutral Current Transformer
      s. One (1) universal test set, for the entire project, to be used for required test procedures prior to project completion.
   9. Circuit breakers shall have removable lugs. Lugs shall be UL listed for copper and aluminum conductors. Breakers shall be UL listed for installation of mechanical screw-type lugs and compression type lugs.
   10. Current limiting circuit breakers shall meet UL 489 requirements, NEMA Standard AB3-2013 and Federal Specifications W-C-375B/GEN.
   11. Combinations for series connected interrupting ratings shall be recognized by Underwriters Laboratories and shall appear in the Recognized Component Directory under the "Circuit Breakers - Series Connected" product category DKSY2. Current limiting circuit breakers shall allow the use of branch circuit breakers with lower interrupting capacities on systems capable

of delivering fault currents up to 200,000 rms symmetrical amperes at 480V ac and 100,000 rms symmetrical amperes at 600V ac.

12. Add-on ground fault modules (GFM) shall be a U.L. Listed circuit breaker accessory complete with adjustable time and levels, ground fault sensing device and relay, push-to-test button, indicator, neutral transformer, zone-interlock restraint interface module, and 120 volt control power for integral test. Provide a factory installed ground-fault shunt trip in related circuit breaker.

C. Fuses: Provide specified fuses, sizes as required.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Provide disconnect switches for all motors and appliances for the project where required by the National Electrical Code; and rated for the voltage encountered complete with required poles, amperage rating and all accessories. Not all disconnect switches required by NFPA-70 are necessarily indicated on the drawings.

B. All roof mounted fans shall have a disconnect switch (device) mounted under the hood by the Mechanical Trade. This switch (device) shall be wired in series with the firestats on the fans.

C. Provide rain-tight NEMA-3R, NEMA-4, NEMA-4X, explosion-proof or other NEMA enclosures for switches where required by NEC and environmental conditions.

D. Certain fusible disconnect switches shall be fully U.L. Service Equipment rated and labeled as indicated by the electrical distribution system.

E. Coordinate voltage of shunt trips with connected systems.

3.02 FIELD QUALITY CONTROL:

A. Technical Assistance: The electrical gear manufacturer's representative shall generally provide installation supervision of this equipment if requested by the contractor.

B. Calibration and Testing: The electrical gear manufacturer's representative shall provide a factory trained technician for initial calibration of circuit breaker trip and time delay settings to indicated values. All calibration and testing shall be in accordance with the manufacturer's written instructions, and all applicable codes and industry standards. Written records of the calibration and test procedures shall be submitted to the Owner, Engineer and Authority Having Jurisdiction (if required). These test procedures shall also include an insulation test, torquing of all connections, electrical interlocking verification, etc. The Engineer and/or Owner's representative shall have the option of witnessing the testing procedures. The contractor shall coordinate the testing with all parties concerned.

END OF SECTION

SECTION 26 2900

LOW-VOLTAGE CONTROLLERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Motor Protective Switches

B. Magnetic Starters, including across-the-line starters and reduced-voltage starters.

C. Variable Frequency Drives (VFD's), Installation of Division 23 VFD's

D. Control Accessories

1.03 RELATED WORK:

A. General: The Contractor shall consult all other sections of these Contract Documents specifications containing any type of equipment requiring electrical connections and allow for wiring and controlling all equipment as described therein even though not shown on the electrical drawings. See mechanical drawings for exact locations and names of Mechanical Equipment and Controls. (Division 23)

B. Division 23 - Mechanical

C. Section 26 28 13 - Fuses

1.04 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Section 26 05 00.
   1. Shop Drawings shall include:
      a. Scale drawing enclosure and internal components.
      b. Internal wiring schematic.
      c. Roughing-in requirements.
   2. Product Data: Submit application, technical, and installation data.

B. Submit Operation and Maintenance Manuals in accordance with Section 26 05 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. All motor starters shall be as manufactured by Square D, Furnas, Cutler-Hammer/Eaton, G.E., Siemens, or Allen Bradley. All controllers and accessories to be by the same manufacturer.

B. Phase Protection Relays shall be by Diversified Electronics, Inc. (Available from Wesco, Johnson Control and others) or acceptable equal.

C. Interposing (Interface) Relays: Square-D or Potter-Brumfield.

2.02 MATERIALS AND TYPE:

A. Motor Protective Switches [S] [O/M]: Marked 'MP' on drawings. Manual type with overload relay for each phase, with poles as required and separately wired neon or L.E.D. pilot light. M.P. switch and pilot shall be mounted on one (1) multi-gang plate.

1. Magnetic Starters [S] [O/M]: Where M.S. is marked on the drawings, provide an across-the-line combination starter complete with the following:
2. Disconnect Switch: Fusible disconnect switch for rejection type Class RK-1 fuses only, unless non-fusible is indicated.

   OR

3. Motor Circuit Protector: Instantaneous trip magnetic-only circuit breaker with a single magnetic adjustment that sets all poles to the same trip current. Adjustment shall be continuous throughout the adjustable trip range.
4. Overload Relays [S] [O/M]:
   a. NEMA Size 00 to 4 Contactor: Factory calibrated, directly heated, **NEMA-10**, block design, three (3) pole, bi-metallic overload relay, and ambient temperature compensation.
   b. Current sensing solid state overload relays are not acceptable due to the non-automatic reset for unbalanced phase currents.
5. Indicating Lights: L.E.D. indicating lights for "power available" (green) and "run" (red). **Incandescent indicating light modules are not acceptable**, except with LED conversion lamps.
6. Control Voltage: Control circuits and holding coils shall be 120 volts. Provide individual transformers of required size where higher voltages are encountered. Protect control circuit in accordance with N.E.C.
7. **Reduced-Voltage (Part Winding) Combination Starters** [S] [O/M]: Unless indicated otherwise, all 480 volt, 3 phase, 20 horsepower and larger motors; or all 208 volt, 3 phase, 10 horsepower and larger motors shall be provided with part-winding combination motor starters complete with all specified accessories including oversized enclosures. Other types of reduced-voltage combination motor starters shall be as indicated. Coordinate all motor starters with Division 23 motors to ensure motors are setup to work with reduced-voltage starters.

B. **Heaters** [S] [O/M]: Install thermal overload heater elements in all switches and starters on the job whether or not the switches and starters are furnished by this subcontractor. Assume responsibility for proper application of motor running protection for all motors in accordance with the manufacturer's recommendations and the nameplate rating of the motors actually installed. All phases to have overload protection. (Not required on solid state overload relay.)

C. **Control Stations** [S]: Standard duty with maintained contact, start-stop buttons and red neon or L.E.D. indicating light, unless otherwise indicated. All start-stop buttons, hand-off-automatic switches, pilots, etc., mounted in covers of motor starters as required, unless noted otherwise.

D. **Enclosures** [S]: All motor starters and VFD=s shall have NEMA-1 **oversized** enclosures except motor starters in damp, wet or exterior (outdoors) locations shall have NEMA-3R oversized enclosures. Motor starters in kitchens and food preparation areas shall have NEMA-4X oversized enclosures.

E. **Phase Protection Relay (PLP)** [S] [O/M]: Provide Diversified Electronics, Inc., or accepted equal phase sequence and unbalance monitor, SLD Series, to monitor phase unbalance, under-voltage, phase sequence and regeneration. Monitor shall have adjustable phase unbalance, under-voltage and time delay (to break).

F. **Interposing (Interface) Relays** [S]: Square D #8501 RS 14 V20 (120 volt) relay(s) with #8501 NR45 socket, 5 amp contacts, control coil burden is 3.5 VA in rush and 1.2 VA sealed mounted in the **oversized** motor starter enclosure (bucket).

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Motors: All motors and motor-driven equipment will be provided in place by another Trade, ready for connection by the Electrical Trade with control equipment provided by the Trade who provides

the equipment unless specifically indicated otherwise. Motor branch circuits, etc., are designed for motor sizes as shown on the drawings. The motors and motor-driven equipment actually installed may vary from these sizes. The Electrical Trade shall verify actual sizes and notify the Engineer of any required changes.

B. Provide all required motor starters and motor protective switches, rated for the voltage encountered, complete with required poles, amperage rating and all accessories, unless indicated otherwise. Required motor starters may not be indicated on the electrical drawings. Refer to mechanical (and other divisions) equipment drawings and specifications for additional starter requirements, and provide starters as required. Provide all H.O.A. switches, L.E.D. pilots, auxiliary contacts, etc. in starters and M.P. Switches as required by Electric Sequence Control Diagrams. Provide all other control devices as called for by drawings and specifications. Provide "power available" and "run" L.E.D. indicating lights for all motor starters. The "power available" L.E.D. indicating lights are not necessarily indicated in the Electric Sequence Control Diagrams.

C. Variable Frequency Drives (VFD=s) (Furnished by Division 23):
   1. The qualified manufacturer's technical representative shall supervise the contractor's installation, testing, and start-up of all the drives furnished under Division 23. A maximum total of one (1) supervision day (8 hours) shall be provided by the manufacturer's representative.
   2. Division 26 shall provide assistance to Division 23 for system start-up. The VFD system start-up shall include a checkout of vibration at various frequencies through field observation and manufacturer's data on the driven equipment. Frequency deadbands shall be set-up for each point of equipment vibration.

D. Responsibility: The Mechanical Trade is responsible for the proper operation of the mechanical systems. The Electrical Trade is responsible for all electrical work in connection therewith.

E. Provide a motor protective switch in the cabinet of wall mounted unit heaters or fan coil units; and on one side of ceiling mounted units unless indicated otherwise. Position the switch to prevent the radiation from affecting the overload protection.

F. Motor Operated Dampers (MOD's): Division 26 shall interconnect all line voltage MOD's with Division 23 air-handling units and fans with proper voltage and ampacity wiring for sequence of operation as required by the Mechanical Drawings. Provide a 120 volt – 20 amp circuit from the next available spare breaker in the closest mechanical or receptacle circuit panel where a circuit is not specifically indicated on the drawings. MOD's may be connected as part of the motor control circuit, verify with the Division 23 Electric Sequence Control Diagrams.

G. Phase Loss Protection Relays shall be provided for the following three (3) phase equipment:
   a. All three (3) phase equipment as indicated to have "PLP" contacts on the Division 23 Electric Sequence Control Drawings. Select the monitor (relay) for the line voltage encountered.
   b. All three (3) phase (walk-in) refrigerators and (walk-in) freezers as instructed by Kitchen Equipment Installing Trade.
   c. All three (3) phase motors 10hp and larger.
   d. All Division 23 Variable Speed Drives.

   Phase loss protection relays shall be installed in the Division 26 motor starter **oversized** enclosures.

H. All motor starters shall be provided with sound isolation mounting when mounted adjacent to an occupied space such as corridor, office, classroom, auditorium, gym or similar space.

I. Install all motor protective switches adjacent to the panelboard serving the switch unless indicated otherwise on the drawing or Division 23 Electric Sequence Controls. Each switch shall be installed in an individual outlet box, arranged in vertical or horizontal rows. Provide recessed outlet boxes if the adjacent panel is recessed. Provide **cast type** single gang boxes if the adjacent panel is surface mounted.

J. Certain multi-speed fractional horsepower motors are indicated on the Division 23 Electric Sequence Drawings to have built-in overload protection in the motor in lieu of motor protective switches.

K. Provide interposing (interface) relays for the Division 23 microprocessor based building control system module relay output (and Section 28 31 00 Fire Detection and Alarm) if the system's output relay contact is overburdened.

L. All wiring within the motor starter (control) enclosure and to the motor shall be Type MTW stranded copper per Section 26 05 19 and Section 26 05 23.

M. Division 23 will furnish power factor correction capacitors with their motors over five (5) horsepower unless otherwise indicated. Division 26 shall install and connect these capacitors to cycle with the motors. The capacitors shall be connected on the motor side of the overcurrent protective device at the motor starter. The overcurrent device shall be adjusted to reflect the reduced line current. Size capacitor conductors per NEC Article 460.

SECTION 26 3600

TRANSFER SWITCHES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Automatic Transfer Switches

1.03 RELATED WORK:

A. Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 05 23 – Control Voltage Electrical Power Cables

C. Section 26 05 26 – Grounding And Bonding For Electrical Systems

D. Section 26 05 33 – Raceway And Boxes For Electrical Systems

E. Section 26 05 53 – Identification For Electrical Systems

1.04 DESCRIPTION; OPERATION

A. Description:

1. Each automatic switch shall consist of a power transfer module and a control module, interconnected to provide a complete system in a single NEMA-1 enclosure.
    a. Power Transfer Module:
        1) All main contacts shall be of silver composition. They shall be protected by arcing contacts in sizes 600 amperes and over. They shall be of the blow-on configuration and of segmented construction in ratings 600 amperes and over. The operating transfer time in either direction shall not exceed one-sixth (1/6) of a second.
        2) Inspection of all contacts (movable and stationary) shall be possible from the front of the switch without disassembly of operating linkages and without disconnection of power conductors. A manual operating handle shall be provided for maintenance purposes. The handle shall permit the operator to stop the contacts at any point throughout the entire travel to properly inspect and service the contacts when required.
        3) Automatic transfer switches utilizing components of molded-case circuit breakers, contactors, or parts thereof which have not been intended for continuous duty or repetitive load transfer switching are not acceptable. Automatic transfer switches shall be listed for emergency service as a complete factory assembled and tested apparatus, in accordance with requirements of NFPA-110.
        4) The automatic transfer switch shall be rated to withstand the rms symmetrical short circuit current available at the automatic transfer switch terminals with the type of over-current protection, voltage and X/R ratio as shown on the plans.
    b. Control Module: The control module shall be supplied with a protective cover and be mounted separately from the transfer switch for ease of maintenance. The interconnecting wiring harness shall include a disconnect plug to disconnect all wires including both sources of control power for routine maintenance. Sensing and control logic shall be solid-state and mounted on plug-in printed circuit boards. Printed circuit boards shall be keyed to prevent incorrect installation. Interfacing relays shall be industrial control grade plug-in type with dust covers.

B. Operation:

1. Four pole switches shall be used for three phase separately derived A.C. service with switched neutral. Neutral conductor terminal lugs shall be provided as required for the power system unless switch is on a 480 volt system which requires an overlapping switched neutral.
2. The automatic transfer switch control panel for three phase shall utilize solid-state sensing on normal and emergency for automatic, positive operation. The following shall be provided:
    a. For three phase switches all phases of the normal shall be monitored line-to-line. Close differential voltage sensing shall be provided on all phases. The pickup voltage shall be adjustable from 85% to 100% of nominal and the dropout voltage shall be adjustable from 75% to 98% of the pickup value. The transfer to emergency will be initiated upon reduction of normal source to 85% of nominal voltage and retransfer to normal shall occur when normal source restores to 90% of nominal.
    b. A time delay to override momentary normal source outages to delay all transfer switch and engine starting signals. The time delay shall be field adjustable from 0.5 to 6 seconds and factory set at 1 second.
    c. A time delay option that allows the user to adjust the time of transition from normal to emergency power and emergency to normal power.
    d. A time delay on retransfer to normal source. The time delay shall be automatically bypassed if the emergency source fails and normal source is available. The time delay shall be field adjustable from 0 to 30 minutes and factory set at 30 minutes.
    e. An unloaded running time delay for emergency generator cool-down. The time delay shall be field adjustable from 0 to 5 minutes and factory set at 5 minutes.
    f. A time delay on transfer to emergency. Initially set at zero but field adjustable up to 1 minute for controlled timing of load transfer to emergency, where indicated.
    g. Independent single phase voltage and frequency sensing of the emergency source. The pickup voltage shall be adjustable from 85% to 100% of nominal. Pickup frequency shall be adjustable from 90% to 100% of nominal. Transfer to emergency upon normal source failure when emergency source voltage is 90% or more of nominal and frequency is 95% or more of nominal.
    h. A contact that closes when normal source fails for initiating engine starting, rated 10 amps, 32 VDC. Contacts to be gold plated for low voltage service.
    i. A contact that opens when normal source fails for initiating engine starting, rated 10 amps, 32 VDC. Contacts to be gold plated for low voltage service.
    j. Green signal light to indicate when the automatic transfer switch is connected to the normal source. A red signal light to indicate when the automatic transfer switch is connected to the emergency source.
    k. One auxiliary contact that is closed when automatic transfer switch is connected to normal and one auxiliary contact that is closed when automatic transfer switch is connected to emergency. Rated 10 amps, 480 volts, 60 Hz AC.
    l. A test switch to momentarily stimulate normal source failure.
    m. Engine Generator exercising timer to select load or no-load operation with a reserve power for carryover.

1.05 REQUIREMENTS:

A. Standards:

1. The automatic transfer switch shall conform to the requirements of NEMA Standard ICS 2-447 and Underwriters' Laboratories UL 1008 and shall be UL listed as follows:
    a. For use in emergency and standby systems in accordance with Articles 517, 700, 701 and 702 of the National Electrical Code (NFPA-70) and NFPA-110.
    b. Rated in amperes for total system transfer including control of motors, electric-discharge lamps, electric-heating and tungsten-filament lamp loads as referred to in Paragraph 30.9 of UL 1008.
2. The automatic transfer switch shall provide complete automatic operation to start the engine generator upon normal power failure to the transfer switch, and transfer the load automatically to the generator bus in ten (10) seconds or less, all in accordance with the latest editions of NFPA 70, 99 and 110.

B. Testing:
   1. Certified laboratory test data on a switch of the same design and rating shall be provided to confirm the following switching abilities:
      a. Overload and endurance at 480 volts AC per Tables 21.2, 23.1 and 23.2 of UL 1008 when enclosed according to Paragraph 1.6.
      b. Temperature rise tests after the overload and endurance tests to confirm the ability of the transfer switches to carry their rated current within the allowable temperature limits of the insulation in contact with current-carrying parts.
      c. No welding of contacts. Transfer switch must be operable to alternate source after the withstand current tests.
      d. Dielectric tests at 1960 volts, rms, minimum after the withstand current test.
   2. All production units should be subjected to the following factory tests:
      a. The complete automatic transfer switch shall be tested as to ensure proper operation of the individual components and correct overall sequence of operation and to ensure that the operating transfer time, voltage, frequency and time delay settings are in compliance with the specification requirements.
      b. The switch shall be subjected to a dielectric strength test per NEMA Standard ICS 1-109.21.
      c. The control panel shall meet or exceed the voltage surge withstand capability in accordance with IEEE Standard 472-1974 (ANSI C37.90a-1974) and the impulse withstand voltage test in accordance with the proposed NEMA Standard ICS-109.

1.06 SUBMITTALS:

A. Refer to Section 26 05 00 for submittal procedures.

B. Shop Drawings:
   1. Shop drawings shall include:
      a. Scale drawing of enclosure and internal components.
      b. Internal wiring schematic.
      c. Roughing-in requirements.

C. Product Data: Submit application, technical, and installation data.

D. Refer to Section 26 05 00 for submittal procedures for Operation and Maintenance Manuals.

E. Warranty, Service:
   1. The transfer switch manufacturer shall warrant the transfer switch for a minimum of two (2) years from date of acceptance by Owner against defective parts and/or workmanship and shall provide parts and labor to fulfill this warranty at no cost to Owner.
   2. Refer to Section 26 05 00 for submission of warranty.
   3. Major service and renewal parts service shall be readily available through authorized manufacturer's dealer located within 200 miles of this installation.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. The automatic or manual/automatic transfer switch shall be as manufactured by Automatic Switch Company (ASCo) whose number are used herein or accepted equal microprocessor type by Zenith Controls, or Russel Electric. Size and ratings are as indicated on the Drawings.

2.02 TRANSFER SWITCHES [S] [O/M]:

A. Automatic type: ASCo series 300 ADTS complete with:
   1. ASCo standard accessories #1, 2B, 2E, 3A, 4B, 5, 7, 9, 9A, 9B, 14A, 14B.
   2. ASCo standard accessories as required for NFPA-99 (110).
   3. ASCo accessories in addition to the other listed accessories:
      a. One (1) accessory #14A and two (2) accessory #14B for load control and limiting.

b. Accessory #27, in-phase solid-state monitor for transfer and retransfer of motor loads.
c. Accessory #28, overlapping neutral transfer contacts for proper ground fault sensing. The neutrals of the normal and emergency power sources shall be connected together only during the transfer and retransfer operation and remain connected together until power source contacts close on the source to which transfer or retransfer is being made. The overlapping neutral transfer contacts shall not overlap for a time duration greater than 100 milliseconds. A non-over-lapping neutral transfer (fourth) pole will be given consideration.
d. Accessory #33, equipment ground lug, solderless screw type.
e. Accessory #9C and 9D, signal lights to indicate if normal and emergency sources are powered up.
f. Accessory #63 double lugs on emergency terminals to drive non-transferred loads.
g. Accessory #11C exercising timer for engine generator, complete with toggle switch for no-load or load testing.

B. Enclosure shall be NEMA-1 containing the power transfer module, control module and all accessories.

C. The transfer switch KAIC rating shall be greater than the load side equipment (panelboard, disconnect switch, breaker) that the transfer switch is connected to KAIC rating. Refer to Riser Diagram and panelboard schedules for cabling and panelboard information.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install all of this equipment strictly in accordance with the manufacturer's instructions and roughing-in drawings.

3.02 TECHNICAL ASSISTANCE:

A. The transfer switch manufacturer's representative shall provide qualified electrical assistance to the Contractor in initial checkout of the unit on the job after completion of installation. The manufacturer's representative shall be responsible for making any adjustments that may be required on the transfer switch for proper performance. The manufacturer's representative shall also instruct the Owner's representative in the proper operation and care of this equipment.

3.03 MODIFICATIONS:

A. Contractor shall refer to drawings to determine special lug requirements.

SECTION 26 4300

TRANSIENT VOLTAGE SURGE SUPPRESSION (TVSS)

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Transient Voltage Surge Suppressors (TVSS)
   1. Service Entrance, TVSS-#1
   2. Separately Derived Services, TVSS-#2
   3. Panelboard, TVSS-#3

1.03 RELATED WORK:

A. Section 26 05 53 – Identification For Electrical Systems

B. Section 26 24 16 – Panelboards

1.04 DESCRIPTION:

A. General. The TVSS shall be a hybrid high-energy power conditioning filter incorporating transient voltage surge suppression and high-frequency electrical line noise filtering. The specified unit shall provide effective high-energy transient voltage suppression, surge current diversion, high-frequency attenuation, and line control in ANSI/IEEE C62.41-1991 environments connected on the load side of the facility's electrical distribution system as indicated. The unit shall be connected in parallel with the facility's wiring system.

B. Parameters: The TVSS shall meet or exceed the following electrical parameters.
   1. Unit Operating Voltage. The nominal unit operating voltage and configuration shall be as determined from the parameters of the circuit to which the TVSS is connected on the drawings.
   2. Maximum Continuous Operating Voltage (MCOV). The maximum continuous operating voltage of all suppression components utilized in the unit shall not be less than 125% of the facility's nominal operating voltage for 120 volt nominal systems and not less than 115% of the facility's nominal operating voltage for 480 volt nominal systems.
   3. Operating Frequency. The operating frequency range of the unit shall be 47 to 63 Hertz.
   4. Protection Modes. The unit's primary mode of protection shall be line-to-line and line-to-neutral. The secondary modes of protection shall be line-to-ground and neutral-to-ground. This results in 10 modes of protection.
   5. The Rated Single Pulse Surge Current Capacity. Based on ANSI/IEEE C62.41-1991's standard 8 x 20 microsecond current waveform, the rated single pulse surge current capacity, in amps, of the designated unit shall be no less than as follows:

TVSS-#1:		
200,000A	=	L-N
200,000A	=	L-G
200,000A	=	N-G
200,000A	=	L-L
400,000A	=	Per Phase

TVSS-#2:		
150,000A	=	L-N
150,000A	=	L-G
150,000A	=	N-G

150,000A = L-L
300,000A = Per Phase

TVSS-#3:
80,000A = L-N
80,000A = L-G
80,000A = N-G
80,000A = L-L
160,000A = Per Phase

In compliance with NEMA LS-1-1992, paragraphs 2.2.9 and 3.9, the system shall be single pulse surge current tested in all modes at rated surge currents by an industry-recognized independent test laboratory. Single pulse surge current capabilities of 200,000 amps or less are established by single-unit testing of all components within each mode. Due to present industry test equipment limitations, single pulse surge current capacities over 200,000 amps are established via testing of individual components or sub-assemblies within a mode. The test shall include a UL1449 Second Edition surge defined as a 1.2 x 50 Φsec, 6000V open circuit voltage waveform and an 8 x 20 Φsec, 500A short circuit current waveform to benchmark the unit's suppression voltage followed by a single pulse surge of maximum rated surge current (for units rated over 200,000A per mode, components or sub-assemblies are tested) magnitude with an approximated 8 x 20 Φsec waveform. To complete the test, another UL1449 surge shall be applied to verify the unit's survival. Survival is achieved if the suppression voltage measured from the two UL1449 surges does not vary by more than 10%.

6. Minimum Repetitive Surge Current Capacity. Per ANSI/IEEE C62.41-1991 and ANSI/IEEE C62.45-1992, the TVSS system shall be repetitive surge current capacity tested in every mode utilizing a 1.2 x 50 Φsec, 20 KV open circuit voltage, 8 x 20 Φsec, 10 KA short circuit current Category C3 bi-wave at one minute intervals without suffering either performance degradation or more than 10% deviation of clamping voltage at the specified surge current. The specified TVSS system shall be capable of withstanding the following category "C.3" impulses (per mode) without failure.

Repetitive Surge Current Capacity-Number of Impulses

TVSS Mark	# of Impulses
TVSS-1	>6,500
TVSS-2	>5,000
TVSS-3	>4,000

7. NEMA LS-1-1992 Clamping Voltage Data. All TVSS system clamping voltages shall be in compliance with test and evaluation procedures outlined in NEMA LS-1-1992, paragraphs 2.2.10 and 3.10. The maximum clamping voltages for the specified system shall be no higher than 700 volts @ category C.3 volts, for 480Y/277V unit and 330 volts @ category C.3 for 208Y/120V type unit. The clamping voltage numbers include the integral disconnect.
8. Unit UL1449 Second Edition Suppression Voltage Ratings. The UL1449 Second Edition listed suppression voltage ratings shall be published, as assigned by Underwriters Laboratories utilizing the test procedure described in UL1449 Second Edition Suppression Voltage Performance Testing.
9. High Frequency Extended Range Power Filter. The TVSS system's EMI-RFI noise rejection or attenuation values shall be in compliance with test and evaluation procedures outlined in NEMA LS-1-1992, paragraphs 2.2.11 and 3.11.

Atten. Freq.	**50KHz**	**100KHz**	**500KHz**	**1MHz**	**5MHz**	**10MHz**	**50MHz**	**100MHz**
	53dB	41dB	32dB	31dB	32dB	35dB	47dB	53dB

NOTE: Standardized insertion loss data obtained utilizing MIL-STD-220A 50 ohm insertion loss methodology. Noise source path = 100' to model maximum average circuit distance, filter connection distance = 6".

The TVSS system shall function in conjunction with other suppression filter devices of the same manufacturer via coordinated filters within the facility-wide suppression filter system that provide minimum noise attenuation as follows:

Atten. Freq.	50KHz	100KHz	500KHz	1MHz	5MHz	10MHz	50MHz	100MHz
	85dB	83dB	68dB	68dB	68dB	67dB	78dB	84dB

NOTE: Standardized insertion loss data obtained utilizing MIL-STD-220A 50 ohm insertion loss methodology, based on a minimum of 100 ft. of #4 AWG conductor between the two devices. Noise source = 100' to model maximum average circuit distance, filter connection distance = 6".

C. Overcurrent Protection
   1. Each suppression element shall be individually fused such that the failure of a single component or the operation of a single fuse element remains isolated and does not render the entire mode, or product, deficient by more than the 10%.
   2. Every electrical current carrying conductor shall be fused such that every fault is isolated at the point of the fault or at the device level.
   3. Fusing shall be present in all modes, including Neutral-to-Ground.
   4. All overcurrent/fault current protection shall be UL248-1 recognized as a stand-alone fuse.
   5. All fusing must be UL248-1 recognized and tested at 200kAIC. Testing shall be inclusive of all available product voltages.
   6. In accordance with UL248-1, all fuses and overcurrent/fault current devices must be tested with a 0.2 power factor.
   7. All fuses and overcurrent/fault current protection devices shall consist of self-arch-quenching, sand-encapsulated UL248-1 recognized fuse arrays. Each fuse shall be individually sealed in a manner that eliminates cross arching.
   8. The device shall be capable of withstanding the full single pulse surge current capacity for every mode without the operation or failure of overcurrent/fault current protection or fuses.

D. Transient Conduction Path: All full magnitude transient currents shall be conducted on low-impedance solid copper bussing. If printed circuit boards are utilized in surge current paths, no single trace shall be allowed to conduct more than the proportional current share of the connected TVSS component.

E. Environmental Requirements:
   1. Storage Temperature. Storage temperature range shall be -40º to +85ºC (-40º to +185ºF).
   2. Operating Temperature. Operating temperature range shall be -40º to +60ºC (-40º to +140ºF).
   3. Relative Humidity. Operation shall be reliable in an environment with 5% to 95% non-condensing relative humidity.
   4. Operating Altitude: The unit shall be capable of operation in altitudes up to 13,000 feet above sea level.
   5. Audible Noise: The unit shall not generate any audible noise.
   6. Magnetic Fields: No appreciable magnetic fields shall be generated. Unit shall be capable of use directly in Computer Rooms in any location without danger to data storage systems or devices.

1.05 QUALITY ASSURANCE:

A. Source Quality Control: Materials and equipment shall be new, unused and UL listed for use as a TVSS.

B. The TVSS shall be supplied by a USA manufacturer of established reputation and experience who shall have produced similar apparatus for a period of at least five (5) years and who shall be able to refer to similar installations rendering satisfactory service.

C. The Electrical Trade shall furnish the services of the TVSS manufacturer's authorized technical representative who is qualified in the installation and operation of the TVSS being provided, and who shall be qualified and experienced in the inspection, testing, and maintenance of TVSS units. This authorized technical representative shall be factory trained and certified by manufacturer of the TVSS being installed.

D. The above TVSS manufacturer's authorized technical representative shall be hereinafter known as the "TVSS Technician". The TVSS Technician and his employer shall be capable of providing testing and maintenance in accordance with UL's requirements. The TVSS Technician shall supervise the hook-up, final testing and adjustment of the TVSS, and provide instruction to the Owner's representative. The TVSS installation shall include wiring, components, connections, adjustment, testing and certification. The Electrical Trade shall provide conduit, wire, circuit breaker, and boxes as indicated, and required by the manufacturer's drawings or instructions. The TVSS manufacturer shall furnish any special back boxes, cabinets, enclosures and similar items to the Electrical Trade for installation by the Electrical Trade in accordance with the manufacturer's drawings and instructions, and as indicated.

E. Certification shall be submitted verifying that the TVSS installation is by the manufacturer's authorized representative.

1.06 REFERENCES:

A. Standards:

1. The TVSS shall be designed, manufactured, tested and installed in compliance with the following:
   a. Underwriters Laboratories (UL 1449 Second Edition and 1283)
   b. National Fire Protection Association (NFPA-70, 75 and 78).
   c. American National Standards Institute (ANSI).
   d. Institute of Electrical and Electronics Engineers (ANSI/IEEE C62.41-1991, Categories A, Band C3 and C62.45-1987).
   e. National Electrical Manufacturers Association (NEMA).
   f. ANSI/IEEE Std. 1100-1999 Section 8.6.1 (Emerald Book).
   g. ANSI C84.1, American National Standard for Electric Power Systems and Equipment – Voltage Ratings (60Hz).
2. The unit shall be UL 1449 listed as a Transient Voltage Surge Suppressor.

B. Testing:

1. Single Pulse Surge Current Capacity Testing: In compliance with NEMA LS-1-1992, paragraphs 2.2.9 and 3.9, each design configuration shall have the maximum single pulse surge current capacity per mode verified through testing. The test shall include a UL1449 Second Edition surge defined as a 1.2 x 50 Φsec 6,000V open circuit voltage waveform and an 8 x 20 Φsec 500A short circuit current waveform to benchmark the unit's suppression voltage, followed by a single pulse surge of maximum rated surge current magnitude with an approximated 8 x 20 Φsec waveform. To complete the test, another UL1449 surge shall be applied to verify the unit's survival. Survival is achieved if the suppression voltage found from the two UL1449 surges does not vary by more than 10%.
2. Minimum Repetitive Surge Current Capacity Testing. Each design configuration shall have a repetitive surge current capacity rating which shall be verified through testing. The test shall include a UL1449 Second Edition surge defined as a 1.2 x 50 Φsec 6,000V open circuit voltage waveform and an 8 x 20 Φsec 500A short circuit current waveform to benchmark the unit's suppression voltage, followed by a repetitive number of ANSI/IEEE C62.41-1991 Category C3 surges defined as a 1.2 x 50 Φsec 20,000V open circuit voltage waveform and an 8 x 20 Φsec 10,000A short circuit current waveform. To complete the test, another UL1449 surge shall be applied to verify survival. Survival is achieved if the suppression voltage resulting from the two UL1449 surges do not vary by more than 10%. Proof of such testing shall be the test log generated by the surge generator.

3. UL 1449 Second Edition Suppression Voltage Performance Testing. Each design configuration shall have a UL 1449 Second Edition Suppression Voltage Rating that has been tested and assigned by Underwriters Laboratories utilizing the following waveforms and procedures. The test shall be initiated with a surge of 6,000V / 500A, using waveshapes defined within ANSI/IEEE C62.41-1991 as a 1.2 x 50 Φsec open circuit voltage waveform and an 8 x 20 Φsec short circuit current waveform, to benchmark the unit's suppression voltage. The unit shall then be subjected to 10 positive polarity and 10 negative polarity 1.2 x 50 Φsec 6,000V open circuit voltage waveforms and an 8 x 20 Φsec 3,000A short circuit current waveform. For comparison with the initial benchmark voltage reading, another ANSI/IEEE surge defined as 1.2 x 50 Φsec 6,000V open circuit voltage waveform and an 8 x 20 Φsec 500A short circuit current waveform shall be applied. Deviation from initial to final clamping voltage may not exceed +/ - 10%. Upon successful completion, an appropriate UL1449 Second Edition Suppression Voltage Rating is assigned by Underwriters Laboratories.
4. Short Circuit Fuse Testing: Each design configuration shall be short circuit tested in accordance with the type of fusing utilized in the suppression path. Testing shall include application of a sustained overvoltage that causes the unit to enter a bolted fault condition. This bolted fault condition shall occur with the full rated A/C current of the fuse available. The fuse shall fail in a safe manner with no physical or structural damage to the unit and any failure shall be self-contained within the unit.
5. Surge Current Fuse Testing: Each design configuration shall be surge tested with fusing in series to verify that a transient of maximum surge current capacity magnitude is fully suppressed without fuse failure, operation, or degradation.
6. MCOV (Maximum Continuous Operating Voltage) Testing: Each unit shall be factory tested at the applicable MCOV to assure proper field operation.
7. Quality Assurance Testing. Each unit shall be thoroughly factory tested before shipment. Testing of each unit shall include, but shall not be limited to, UL manufacturing and production-line tests, quality assurance checks, MCOV and clamping voltage verification tests.
8. Start-Up Testing. Upon completion of installation, a factory-certified local service technician shall provide testing services. The following tests shall be performed: (a) voltage measurements from Line-to-Ground, Line-to-Neutral, Line-to-Line, and Neutral-to-Ground at the time of the testing procedure, (b) impulse injection to verify the system suppression voltage tolerances for all suppression paths. Impulse testing shall be completed while the unit is off-line to isolate the unit from the distribution system. Test results shall be recorded and compared to factory benchmark test parameters supplied with each individual unit. A copy of the start-up test results and the factory benchmark testing results shall be supplied to the engineer and the owner for confirmation of proper suppression filter system function. In addition, the integrity of the neutral-ground bond should be verified through testing and visual inspection. A Ten Year Limited Warranty shall initiate after the owner has accepted the testing results and taken possession of the equipment.

1.07 SUBMITTALS:

A. Refer to Section 26 05 00 for submittal procedures.

B. Shop drawings shall include:
   1. Scale drawing of enclosure and internal components.
   2. Internal wiring schematic.
   3. Roughing-in requirements.

C. Product Data: Submit application, technical, and installation data.

D. Refer to Section 26 05 00 for submittal procedures for Operation and Maintenance Manuals.

E. Warranty, Service:
   1. The manufacturer shall provide a Ten Year Limited Warranty from the date of shipment against failure when installed in compliance with applicable national/local electrical codes and the manufacturer's installation, operation, and maintenance instructions. The warranty shall cover overexposures. The warranty shall cover all parts, labor, and material to return the unit

to serviceable condition. A factory trained local representative located within 250 miles of the jobsite shall provide on-site labor and system testing, if required, during the warranty period. The local representative shall own and operate test equipment capable of determining the clamping voltages of the systems provided on the project.

2. Refer to Section 26 05 00 for submission of warranty.
3. Major service and renewal parts service shall be readily available through authorized manufacturer's dealer located within 200 miles of this installation.

PART 2 - PRODUCTS [S] [O/M]

2.01 MANUFACTURERS:

A. Surelogic (Square D), or acceptable equal by APT, Liebert, EFI Electronics, Surge Suppression Inc. or General Electric (G.E.) only. No other TVSS manufacturers will be considered or approved.

2.02 MATERIAL:

A. Suppression System. The TVSS system shall include an engineered solid-state suppression system utilizing arrays of non-linear voltage dependent metal oxide varistors with similar operating characteristics. To maximize current density the device shall contain sufficient thermal mass allowing the device the ability to dissipate large amounts of average power that may be caused from sustained over-voltage events and voltage swells as well as repetitive transient impulses. The suppression system components shall optimally share surge currents in a seamless, low-stress manner assuring maximum performance and proven reliability. The suppression system shall not utilize silicon avalanche diodes (SADs) or other components which might short or crowbar the line, thus leading to interruption of normal power flow to or system upset of connected loads.

B. High Frequency Extended Range Power Filter. The TVSS system shall include a high frequency extended range power filter and shall be UL1283 listed as an Electromagnetic Interference Filter. The filter shall reduce fast rise-time, high frequency, error-producing transients, and electrical line noise to harmless levels, thus eliminating disturbances which may lead to electronic system upset. The filter shall provide minimum noise attenuation as specified in section 2.10 of this specification.

C. Internal Connections. All full magnitude transient currents shall be conducted utilizing low-impedance copper bus bars. No plug-in component modules or quick-disconnect terminals shall be used in surge current-carrying paths.

D. Internal and External Mounting: TVSS devices may be externally mounted or internally mounted inside switchboards or panelboards. TVSS shall meet all other requirements herein regardless of mounting. Internally mounted TVSS shall be factory installed and certified by the switchgear manufacturer and shall in no way affect the U.L. listing of the switchgear. The Contractor shall be responsible for insuring where switchgear size increases to support internally mounted TVSS, that the switchgear will fit in the allotted space shown on the drawings.

E. Field Connections. The TVSS system shall include mechanical or compression lugs for each phase, neutral and ground, if applicable. The system shall be capable of connection up to a #2 AWG copper wire size.

F. Field Installation. The unit shall be installed as close as practical to the facility's wiring system in accordance with applicable national/local electrical codes and the manufacturer's recommended installation instructions.

G. Enclosure. Standard unit shall be supplied in a NEMA 4 metallic enclosure. Enclosure sizes and weights shall not exceed 28@H x 16@ W x 9.5 AD. The weight shall not exceed 91 pounds.

H. The TVSS shall be provided with an integral monitoring option as specified below:

1. Dual Form "C" Dry Contacts: The TVSS system shall be provided with 2 sets of form "C" dry contacts (normally open and normally closed) to facilitate connection to a building management system or other remote monitoring system. The contacts shall be normally open or normally closed and shall change state upon failure of the suppression system or power

loss in any of the phases. The contacts shall be optically isolated to insure transient energy does not "jump" over to the monitoring circuit.

2. Display Event Counter**:** The TVSS system shall be provided with a display event counter that makes available the cumulative number of transients the device has been subjected to. The detection circuitry must be current sensing to eliminate erroneous counts that may be produced from stray voltages and noise signals, both conducted and radiated. The event counter shall have a ten year lithium battery to provide back-up in the event of a power outage or when the unit is disconnected for service.
3. Battery Powered Audible Alarm and LED Indicators: The TVSS system shall be provided with a battery powered audible alarm that detects and provides notification of single or multiple phase failure of the suppression filter system. The alarm shall have a silence switch as well as a test switch for ensuring positive function and an alarm LED that illuminates when the alarm is disabled. The monitoring unit shall have an easily replaceable, commonly available battery for backup to ensure audible alarm function in the event of a total power failure. The unit shall have a battery backed-up monitor LED which shall illuminate when battery requires replacement.

I. INTEGRAL DISCONNECT SWITCH:

1. The device shall have a NEMA designed and certified safety interlocked integral disconnect switch located within the unit with an externally mounted metal manual operator. The disconnect shall be fused and rated for a minimum of 200 amps.
2. The switch shall disconnect all ungrounded circuit conductors from the distribution system to enable testing and maintenance without interruption to the facility's distribution system.
3. The switch shall be rated for 600VAC.
4. The TVSS device shall be UL1449 Second Edition listed with the integral disconnect switch and the UL1449 Second Edition Suppression Voltage Ratings shall be provided.
5. The integral disconnect switch shall be capable of withstanding the published maximum surge current magnitude without failure or damage to the switch.
6. The integral disconnect switch is required, unless a supply breaker is located in the adjacent panelboard or switchboard to provide an individual overcurrent protection and disconnecting means. For existing installations, the Engineer must approve the use of an existing supply breaker in advance of the product submittal before waiving the requirement of an integral disconnect switch.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. The TVSS system along with the remote status alarm contacts shall be installed including all connections, at the location and as indicated on the drawings and wiring diagrams as specified herein, and in accordance with the accepted shop drawings, the manufacturer's instructions, and the manufacturer's standard specification and dimension sheets.

B. The auxiliary monitor contacts shall be connected to the local DDC as an alarm point. Division 23 shall provide the wiring with Division 26 supervising the connection at the TVSS. Division 26 shall provide a non-metallic conduit within the TVSS enclosure for isolation.

3.02 FIELD QUALITY CONTROL:

A. Technical Assistance: The TVSS manufacturer's representative shall generally supervise installation of this equipment with the Contractors concerned providing up to four hours of job supervision during the job.

B. Initial Start-Up and Checkout: The TVSS manufacturer's representative shall provide a qualified technical representative to assist the Contractor in initial checkout of the system or the job after completion of installation. The manufacturer's representative shall be responsible for field testing making any adjustments that may be required for proper performance. The manufacturer's

representative shall also instruct the Owner's representative in the proper operation and care of this equipment.

C. Field Testing: Upon completion of initial start-up and system checkout, the technical representative of the TVSS shall perform a field test, with the Engineer notified in advance.

END OF SECTION

SECTION 26 5000

LIGHTING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Lighting Fixtures

B. Wires and Cables, Under 600 Volts.

C. Connectors and Lugs, Under 600 Volts

D. Lamps

E. Drivers

1.03 RELATED WORK:

A. Division 9 – Finishes

B. Section 26 05 00 – Common Work Results For Electrical

C. Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables

D. Section 26 05 23 – Control Voltage Electrical Power Cables

E. Section 26 05 26 – Grounding And Bonding For Electrical Systems

F. Section 26 05 33 – Raceway And Boxes For Electrical Systems

1.04 REFERENCES:

A. The complete fixture and installation method including the lamps, fixture construction, ballast, sockets, wiring, raceway, suspension system, fixture environment shall be in accordance with:
   1. 2024 International Building Code.
   2. N.E.C.
   3. Fixture and application use listed by U.L. Inc.
   4. Where applicable, all lamps shall meet the National Energy Policy Act (EPCA) of 1992.
   5. Where applicable, all fluorescent ballasts shall meet the minimum efficiency standards of Public Law No. 100-357, National Appliance Energy Conservation Amendments of 1988 (NAECA).
   6. All above references shall be current issue in effect at time of bid.

1.05 SUBMITTALS:

A. Submit shop drawings and product data in accordance with Section 26 05 00.
   1. Shop Drawings shall include:
      a. Photometrics.
      b. Dimensions.
      c. Roughing-in requirements.
      d. Point by point footcandle study for exterior post lighting.
   2. Product Data: Submit application, technical, and installation data.

B. Submit Operation and Maintenance Manuals in accordance with Section 26 05 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. **Lighting Fixtures:** Lighting fixture manufacturer's names and catalog numbers are noted on drawings and are used to designate the type, general design, size, quality, etc., of fixtures desired [S][O/M][V].

B. **Lamps [S]:**

1. Fluorescent:
   a. Rapid Start Fluorescent Lamps (T8 bulb, color temperature = 4100ºK, CRI = 85):
      1) 24" length, 17 watts, 1325 lumens. Philips F17T8/TL841.
      2) 48" length, 32 watts, 2950 lumens. Philips F32T8/TL841.
      3) U-bent, 6" spacing; 22-7/16" length, 33 watts, 2800 lumens. Philips FB32T8/TL841.
   b. T8 High Output (HO) Fluorescent Lamps (Color temperature = 4100ºK, CRI = 85): 96 inch length, 86 watts, 8200 lumens. Philips F96T8/TL841.
   c. T5 and T5HO Programmed Start Fluorescent Lamps (color temperature = 4100°K, CRI = 85):
      1) 46” T5 (4’ nominal) length, 28 watts, 2900 lumens. Philips F28T5/841/ALTO. (T5HO = 54 watts, 5000 lumens - Philips F54T5/841/HO/ALTO).
      2) 22” T5 (2’ nominal) length, 14 watts, 1350 lumens. Philips F14T5/841/ALTO. (T5HO = 24 watts, 2000 lumens - Philips F24T5/841/HO/ALTO).
   d. Compact Fluorescents (PL-C bulb, color temperature = 4100ºK, CRI = 82):
      1) 6" length, 18 watts, 1250 lumens. Philips PL-C 18W/841/ALTO.
      2) 6-13/16" length, 26 watts, 1800 lumens. Philips PL-C 26W/841/ALTO.
      3) 5-5/8” length, 32 watts, 2400 lumens. Philips PL-T 32W/841/4P/ALTO.
      4) 6-3/8” length, 42 watts, 3200 lumens. Philips PL-T 42W/841/4P/ALTO.
      5) Refer to lighting fixture schedule for remaining bulb sizes and wattages.
   e. All other fluorescent lamps shall have a minimum CRI = 85 and color temperature of 4100ºK. Refer to lighting fixture schedule for remaining types and wattages.
2. Incandescent: G.E., Philips, Osram Sylvania, or accepted equal, general lighting line, inside frosted, 2500 hour average life, 130 volts unless noted otherwise.
3. LED: Lamps, with electronic drivers, as scheduled on the drawings.
4. H.I.D.: Lamps shall not exceed corrected color temperature of 4200E Kelvin. Metal halide lamps shall be provided with self-extinguishing devices to prevent operation of lamps when outer globe is broken, or operate in an approved enclosed fixture.
   a. Metal Halide: Philips, G.E., Osram Sylvania or Venture
   b. High Pressure Sodium: Philips (CRI = 65), G.E., Osram Sylvania

C. Ballasts [S] [O/M]:

1. Fluorescent:
   a. Ballasts for the following rapid-start lamps such as 36", 48" and 96" long T8 bulb, 96" long high output T8 bulb, the U-bent T8 bulb, and the 4-pin compact fluorescent lamps shall be an integrated circuit (IC) all electronic type and shall have the following specification:
      1) Shall **NOT** incorporate laminate core and coil components.
      2) U.L. listed, ETL certified, Class P and CSA certified.
      3) Sound levels shall not exceed Class A ambient noise levels. Limit to 2dB above a 16dB ambient (typical).
      4) Maintain constant light output with input variations of +/- 10%.
      5) Less than 10% Total Harmonic Distortion and 6% Third Harmonic Distortion on the nput current.
      6) Crest factor of 1.6 or less.
      7) Case temperature shall not exceed 25ºC rise over 40ºC ambient.
      8) Withstand input line transients as defined by ANSI/IEEE C62.41, Category A3.
      9) Internally fused for internal component failure.
      10) High power factor of .98 or greater.

11) High frequency operation of 25 Khz or greater with less than 2% visible lamp flicker.
12) Meet the requirements of the FCC Rules and Regulations, Part 18, Subpart C for RFI and EMI interference feedback into power systems.
13) Instant start ballast design is not acceptable for rapid start lamp applications except for low temperature (0º or less) ambient application. Rapid start ballast shall provide normal rated lamp life as stated by lamp manufacturers.
14) Ballast shall be as manufactured by Advance or Osram Sylvania.
15) A five (5) year warranty in-fixture replacement or labor reimbursement.
16) Other compact fluorescent ballasts shall be the all electronic type as manufactured by Advance or Osram Sylvania.

b. Unless otherwise noted in the fixture schedule on the drawings, ballasts for all T5 long fluorescent lamps shall be based on the Osram Sylvania PROStart T5 programmed rapid start series, or equal by Advance, having the following specifications:
1) (1) U.L. listed class P.
2) (2) Sound levels shall not exceed Class A ambient noise level.
3) Dynamic end-of-lamp life sensing.
4) High power factor (>98%).
5) Ballast factor of 1.0 or greater.
6) Starting temperature 0°F.
7) Lamp crest factor less than 1.6.
8) <10% THD.

c. Ballasts for all other fluorescent lamps including pre-heat trigger start lamps, compact fluorescent lamps and other lamps shall have the following specification unless otherwise indicated:
1) U.L. listed Class P.
2) Sound levels shall not exceed Class A ambient noise level.
3) CBM and ETL labeled.
4) High power factor or power factor corrected.
5) Encapsulated construction.

2. H.I.D. ballast shall be Advance, Universal Lighting Technologies, Osram Sylvania, Lithonia, or accepted equal, High Power Factor - 20ºF.
3. Emergency Ballasts:
a. Fluorescent emergency ballast shall be as manufactured by Bodine, catalog number B50ST or acceptable equal. The emergency ballast shall be capable of operating one (1) 17 watt to 215 watt (2' to 8') T8, T10, or T12 fluorescent lamp, one (1) 24 watt to 40 watt long compact fluorescent lamp, or two (2) (2' x 4') T8, T10, or T12 lamps for a minimum of 90 minutes in emergency mode. The ballast shall produce 1100 to 1200 lumens initial light output for standard lamps or 700 to 1000 lumens with a long compact fluorescent lamp. The ballast shall be self-testing by utilizing a 30 second test and diagnostic routine at least once every 30 days and indicate failures by a status indicator.

b. Fluorescent emergency ballast for 4' T5 and T5HO lamps shall be as manufactured by Bodine, catalog number B30ST or acceptable equal. The emergency ballast shall be capable of operating one (1) 28 watt T5 fluorescent lamp or one (1) 54 watt T5HO fluorescent lamp, for a minimum of 90 minutes in emergency mode. The ballast shall produce approximately 1850 lumens initial light output for 28 watt T5 lamps or approximately 2650 lumens with a 54 watt T5HO lamp. The ballast shall be self-testing by utilizing a 30 second test and diagnostic routine at least once every 30 days and indicate failures by a status indicator.

c. Fluorescent emergency ballast for 2' T5 and T5HO lamps shall be as manufactured by Bodine, catalog number LP600STU or acceptable equal. The emergency ballast shall be capable of operating one (1) 14 watt T5 fluorescent lamp or one (1) 24 watt T5HO fluorescent lamp, for a minimum of 90 minutes in emergency mode. The ballast shall produce approximately 750 lumens initial light output for 14 watt T5 lamps or approximately 725 lumens with a 24 watt T5HO lamp. The ballast shall be self-testing by utilizing a 30 second test and diagnostic routine at least once every 30 days and indicate failures by a status indicator.

d. Fluorescent emergency ballasts for 8' High Output (HO) or Very High Output (VHO) lamps shall be the same as specified above except to produce a minimum initial lumen value of 2900 for 8' type HO lamps and 3300 for 8' type VHO lamps. Ballast shall be Bodine, catalog number B30ST or acceptable equal.
e. Compact fluorescent emergency ballast shall be Bodine #413 for 5 thru 9 watt twin tube (2-pin) or #B84CG for 13 thru 42 watt twin, quad, or triple tube (4-pin) lamps.
f. The emergency ballast shall be U.L. listed for mounting inside or on top of the fixture and exceed NEC emergency standards [S][O/M].

4. Generator Lighting Transfer Device (G): Provide a generator (lighting) transfer device to work in conjunction with the emergency power generation system to power the selected (normal power) fluorescent lighting fixtures for egress lighting regardless of fixture wall switch position. The device shall consist of relay switching circuitry and fusing in a compact galvanized case. One (1) generator lighting device per fixture ballast to bypass the local wall switch (or time switch or contactor) allowing the building's emergency power to bring on normally powered switchable fixtures. The transfer device shall be suitable for damp locations. Bodine GTD Series or acceptable equal.
5. HID Backup Ballast (A): Provide an HID Backup Ballast to work in conjunction with the fixture's normal ballast and the emergency power generation system to hold the arc of the lamp from extinguishing during a power outage until the building generator comes on-line and emergency power is provided to the fixture. The ballast shall detect voltage sag, power interruption or failure and respond within two milliseconds. The ballast shall be capable of supplying power to the lamps for two minutes. It shall relinquish control only after AC power has been restored and deemed stable. The ballast shall use field-replaceable nickel-cadmium batteries which will fully recharge within 24 hours and shall be mounted remote. The ballast shall have a 5-minute delay on cold start to allow for natural warm up of the lamp. The ballast shall work with normal switching arrangements to operate only on a true loss of circuit or building power and not based on switch position. Bodine ArcKeeper Series or acceptable equal.

2.02 MATERIALS AND TYPE:

A. Exterior Post Lights [S] [O/M]:
1. The pole shall be complete with matching base cover, four (4) or more galvanized 50,000 PSI steel anchor bolts, two (2) galvanized 50,000 PSI nuts per bolt, two (2) galvanized washers per bolt.
2. The entire exterior post light assembly including the foundation shall be capable of withstanding 100 MPH winds with a 1.3 gust factor and an overall safety factor of 1.65.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Provide lighting fixtures complete with all required lamps, plates, rings, hangers, trim and all accessories necessary for a complete and secure installation. The number of lamps and lamp wattage is indicated as a prefix to the fixture type number. Contractor shall verify that the lighting fixtures' and ballasts' voltage conforms with the installation, the designated circuit voltage and the lighting fixture schedule.

B. All fixtures shall be adequately supported by fixture studs, conduit stems, steel rods or bar hangers. Fixtures shall not be mounted to or suspended from any mechanical system unless otherwise indicated.

C. Recessed fixtures in plaster ceiling areas shall be installed in rolled metal plaster frames provided by the Electrical Trade.

D. Before fixture order is placed, the Contractor will be responsible for checking type of ceiling in all spaces to determine if fixture type indicated is correct to fit ceiling encountered and if exposed fixture finish indicated is correct.

E. All recessed fluorescent light fixtures mounted in lay-in ceilings shall be fastened to the adjacent T-bars by Caddy #515 fasteners, or accepted equal. Support outlet boxes and fixtures from building structure independent of associated ceiling suspension system. Where a recessed 1' x 4', 2' x 2' or 2' x 4' lay-in fluorescent fixture is indicated, the Electrical Trade shall provide a minimum of two (2) auxiliary support wires at the diagonal corners of the recessed fixture. These auxiliary support wires shall be equal to or greater than the support wires for the ceiling system and capable of supporting the fixture if the ceiling system support wires were compromised. The auxiliary support wires shall attach **directly** to the fixture, at the fixture manufacturer's indicated locations. These wires shall be attached and supported from the structure in the same manner as the ceiling system support wires. Where support wires are attached to the structural steel above the ceiling system, utilize CADDY catalog number 4H24 flange clamps or equal at the point of attachment to the structural steel.

F. The installation of all air-handling troffers shall be coordinated with the Mechanical Trade who will install the duct portion. Troffers not utilized for air supply, shall have air supply slots function as return air openings directly to the plenum unless otherwise noted. Air slot closure strips shall be installed by the Mechanical Subcontractor where required.

OR

All recessed fluorescent troffers shall have air supply slots in the side trim and heat removal through the lamp cavity, complete with air slot closure strips and heat transfer dampers, to function as return air openings directly to the plenum, unless indicated otherwise. The air slot closure strips and heat removal dampers shall be installed by the Mechanical Trade where required. The above air functions shall require all the recessed fluorescent troffers, including the non-air function (static) recessed fluorescent troffers, to have a “floating door” appearance.

G. Lighting fixtures are shown in mechanical rooms for quantity and approximate location only. Coordinate exact location of all fixtures with Mechanical Trade. Some lighting fixtures will have to be mounted below ducts and pipes or on walls. Where possible, fixture to be approximately 8'-6" above floor to bottom.

H. The combined fixture body and enclosure for classroom use (library, labs, etc.) shall meet the V.C.P. (Visual Comfort Probability) Criteria of Texas’s Department of Education. Complete E.T.L., E.R.L., B.A.L.L., or I.T.L. photometric test data shall be submitted with the fixture shop drawing.

I. Where an emergency ballast is indicated, the charging circuit (unswitched lighting circuit) shall be connected on the local (circuit indicated on the drawings) unswitched lighting circuit controlling that fixture or fixture group. The emergency ballast output circuit shall be connected on the local switched circuit. The emergency ballast shall power a minimum of two (2) lamps in the same fixture to meet the Codes unless otherwise indicated.

J. All exterior post lighting fixtures shall be mounted on reinforced concrete foundation bases adequate for the site soil and weather conditions encountered. A detail generally illustrating the type and shape of the desired foundation is shown on the drawings and is issued for bidding purposes only. The Electrical Trade shall submit a similar detail of the foundation for their proposed lighting fixture and pole and shall obtain approval of the Architect's Structural Engineer. The post light foundation design factors shall include, but are not limited to, the following considerations:

1. Structural adequacy of concrete, with steel reinforcing as necessary.
2. Depth adequate to prevent frost heave.
3. Size large enough to encase anchor bolts with adequate thickness, preferably not less than 3 inches between the bolts and the soil.
4. Top surface of foundation shall be wide enough for the baseplate of the pole. Round foundations shall have the top surface diameter not less than 1-1/2 times the width of the pole base.
5. Larger foundations shall be used where adjacent trenching or other disturbances of the surrounding soil has occurred, where the soil quality is of poor strength characteristics, or if above-average winds are to be expected at the site.

6. Where required or indicated, provide "breakaway devices" that meet the Texas's Department of Transportation requirements, meet the latest AASHTO "Breakaway Criteria", are approved by FHWA and meets the standards and regulations of the Local Authority Having Jurisdiction.

K. Where a three- or four-lamp fixture is shown cross-hatched, the emergency circuit shall power the outside two (2) lamps without any local switch and the normal circuit shall control the inside remaining lamp(s) with the indicated local switch control (NEC 700-9).

L. All exit signs shall have the required individual or group flashing interface devices for connection to Section 28 31 00 Fire Detection and Alarm general alarm output for visual indicating appliances (per UFAS 4.28.3).

M. Low temperature (0ºF or less) solid state instant start ballast shall be used for all exterior and non-heated interior locations unless otherwise indicated.

END OF SECTION

SECTION 27 0000
GENERAL TECHNOLOGY REQUIREMENTS

PART 1 GENERAL

1.01 PROJECT SUMMARY

A. Scope: Successful bidder shall provide, install, configure, and provide warranty service for technology systems described herein.

1.02 RELATED DOCUMENTS

A. Documents: Provisions of General Conditions, Supplementary Conditions, and the sections included under Procurement & Contract Requirements are included as part of this section as though bound herein.

1.03 RELATED WORK

A. Section 27 0500 – Communications General Requirements
B. Section 27 0523 – Pathways for Technology Systems
C. Section 27 0526 – Grounding and Bonding for Technology Systems
D. Section 27 1100 – Communications Equipment Rooms
E. Section 27 1300 – Communications Backbone Cabling
F. Section 27 1500 – Communications Horizontal Cabling
G. Section 27 1600 – Communications Connecting Cords
H. Section 27 1800 – Communications Labeling and Identification
I. Section 27 3000 – Voice Communications
J. Section 27 4000 – AV/Multimedia General Requirements
K. Section 27 5100 – Distributed Communications Systems
L. Section 27 6000 – Physical Security General Requirements
M. Section 27 6200 – Electronic Access Control System
N. Section 27 6400 – Video Surveillance System
O. Section 27 6600 – Intrusion Detection System

1.04 DEFINITIONS

A. Approved or Approval: Where approval is called for, only persons with the authorized authority may grant approval. Owner reserves all rights to govern over and grant approval and will appoint authority of agents acting on their behalf.
B. As Required: Contractor shall provide the quantity of said item that is necessary. Owner and Consultant reserve the right to make the final determination of necessary quantities to provide for a complete system.
C. Basis of Design: The documentation of the concepts, calculations, decisions, and product selections used to meet the Owner's project requirements. These Consultant produced documents are not shop drawings. Product selections depict minimum functionality and overall quality and are open to substitution requests.
D. Consultant: True North Consulting Group.
E. Copyright: ©1984-2022 True North Consulting Group.
F. Contractor: The qualified party is responsible to provide all items and perform services as described within these documents. The Contractor referred to within a specific specification section shall be the successful qualified party contracted to perform and complete that work.
G. Documents: The complete package of Bid and Contract Requirements, General Technology Requirements, related Division 27 sections, drawings, schedules, and addenda that make up this Request for Bid.
H. End-User: Individual(s) who will ultimately operate the completed system.
I. ETR: Existing to Remain. Item is to remain in current location and maintain current functionality.

J. Furnish: To supply and deliver to project site, ready for installation.
K. Install: To place in a position of service or use.
L. NIC: Not in Contract. Item will be the responsibility of others.
M. Notice to Proceed: Formal communication from Owner to Contractor stating the date the Contractor can begin work subject to the conditions of the contract. The performance time of the contract starts from the Notice to Proceed date.
N. OFCI: Owner Furnished Contractor Installed. Item will be provided by Owner and shall be installed by Contractor.
O. OFE: Owner Furnished Equipment. Item will be provided and integrated by Owner.
P. OFOI: Owner Furnished Owner Installed. Item will be provided and installed by Owner.
Q. Owner: The party named in the Procurement and Contract Requirements as the advertising party.
R. Provide: To furnish and install, complete and ready for intended use.
S. Substantial Completion: The stage in the progress of installation when the systems described herein are sufficiently complete, in accordance with the Contract Documents, so that the Owner can utilize such systems for their complete intended use.
T. Turnkey: Of or involving the provision of a complete product or service that is ready for immediate use.
U. Work: The provision of products and/or services to meet the requirements specified in these documents.

1.05 REFERENCE STANDARDS AND CODES

A. Standards and other procedures referenced by this bid package are as follows:
1. ADA – Americans with Disabilities Act of 2010
www.ada.gov/2010ADAstandards_index.htm
2. AIA – American Institute of Architects
www.aia.org
3. ANSI – American National Standards Institute
www.ansi.org
4. ASTM – American Society of Testing and Materials
www.astm.org
5. BICSI – Building Industry Consulting Service International, Inc.
(RCDD Standards)
www.bicsi.org
6. CFR – Code of Federal Regulations
www.gpo.gov/fdsys/browse/collectionCfr.action?collectionCode=CFR
(Available from the Government Printing Office)
(Material is usually first published in the Federal Register)
7. U.S. Copyright Law, December 2011
www.copyright.gov/title17
8. ECIA – Electronic Components Industry Association
ESC – EIA Standards Council
www.eciaonline.org
9. IACS – International Annealed Copper Standard
www.ndt-ed.org/GeneralResources/IACS/IACS.htm
10. IEC – International Electrotechnical Commission

17. OSHA – Occupational Safety and Health Administration
    (U.S. Department of Labor, OSHA)
    www.osha.gov
18. TIA – Telecommunications Industry Association
    www.tiaonline.org/standards
19. UL – Underwriters' Laboratories
    www.ul.com

B. Standards: Referenced standards and/or procedures shall be binding on the Contractor and work shall be judged against such standards and procedures unless otherwise stated in writing.
C. Local/State Codes: Contractor shall comply with all local and state code requirements as determined by the authority having jurisdiction (AHJ).
D. Owner Standards: Contractor shall obtain and abide by all published Owner standards as they pertain to the work described herein.
E. Contractor shall use the latest versions of all standards and codes unless otherwise directed by the authority having jurisdiction (AHJ) or expressly noted herein.

1.06 QUALIFICATIONS

A. Refer to related sections for specific requirements.

1.07 PERMITS AND INSPECTIONS

A. Responsibility: Obtain permits and inspections required for the work. Contractor is responsible for all permit and inspection costs.
B. Performance: Perform tests required herein, or as may be reasonably required to demonstrate conformance with the specifications or with the requirements of any legal authority having jurisdiction.
C. Review: Obtain approval from authorities responsible for enforcement of applicable codes and regulations to establish that the work is in compliance with all requirements of reference codes indicated herein and required by the appropriate jurisdiction. Make corrections, changes or additions as required and deliver certificates of acceptance, operation, and/or compliance with the Operation and Maintenance Manuals described herein.

1.08 DRAWINGS AND BASIS OF DESIGN

A. General: Work, equipment, or material delineated on any drawing in this package is expected to be provided by Contractor unless noted otherwise.
B. Interpretation: Work shall be installed in accordance with the basis of design diagrammatically expressed on the drawings and described in the written specifications and equipment schedule(s). Contractor shall not make limiting interpretation that provides for incomplete work or a non-functioning system.

1.09 PRODUCT SUBSTITUTION PROCEDURES

A. Requests for Substitutions: Should the Contractor request a change in the material that is to be supplied, from that which was specified in the contract, the Contractor shall provide the Owner and the Consultant with a written request for said change.
B. Substitutions for Non-specified Products: Where no product specification is provided, Contractor may use manufacturer's specification for the identified product as a guide for suggesting appropriate substitutions.
C. Requirements: The Request for Substitution shall include:
    1. Reason for substitution.
    2. Material data sheets for both the proposed item(s) and the item(s) to be replaced.
    3. Any cost impact to the Owner.

D. Changes: Proposed changes to Contract Documents shall be clearly identified in the pre-construction submittals.
E. Approval: The Owner may approve or deny any Requests for Substitution. The Owner reserves the right to govern over and proclaim whether proposed products are equal to the specifications. The Contractor shall not procure any substitute materials until the Owner has approved and signed the Request for Substitution and passed copies to the Contractor and the Consultant. Any procurement or work performed prior to this approval is at the Contractor's own risk.
F. Deviation: Products provided or installed that deviate from the products specified in make, model, color, or other significant characteristic (i.e., non-approved substitutions) shall be removed and replaced with specified products at no additional expense to Owner.

1.10 SOFTWARE

A. Versions: Consultant used the following software versions for this project:
   1. Autodesk Revit 2019 (floor plans)
   2. Autodesk AutoCAD 2018 (detail sheets)

1.11 SUBMITTAL CONDITIONS

A. The Contractor shall not consider the Consultant or Owner's review of submittals to be exhaustive or complete in every detail. Approval of shop drawings or submittals including substitutions, indicates only the acceptance of the Contractor's apparent intent to comply with general design or method of construction and quality as specified. The finished product shall meet functional requirements, operations, arrangements, and quantities and comply with the contract documents unless specifically approved otherwise.
B. The Contractor shall be held responsible for delivery of systems as specified. Any errors or omissions in the submittals shall not relieve Contractor of responsibility to deliver complete systems as specified.

1.12 PRE-CONSTRUCTION PROCEDURES

A. Pre-Construction Submittal Meeting: Contractor shall schedule web conference (WebEx or similar) with Consultant to review basis of design and submittal expectations.
B. Prior to Work: Pre-construction submittals shall be provided to Consultant with appropriate promptness as to cause no delay to the work.
C. Project Timeline: Project timeline will not be altered due to lateness of submittals. Contractor is bound to deliver a timely, complete, and finished project as stipulated in their contract and specified herein.
D. Format and Distribution: Contractor shall provide one (1) electronic copy in PDF format to Consultant of all pre-construction submittals. The Contractor shall provide hard copies sets as required up to five (5) sets.
E. Provision: Contractor shall submit pre-construction submittals including any corrections or additions to Consultant prior to the procurement of equipment or commencement of work.
F. Review: Pre-construction submittals shall be received and formally approved by Consultant prior to the procurement of material or the commencement of work. Any procurement or work performed prior to this approval is at Contractor's own risk.
G. Failure to Provide: The failure of Contractor to provide pre-construction submittals as required herein may result in the withholding of payment for work and/or the cancellation of the contract.

1.13 PRE-CONSTRUCTION SUBMITTALS

A. Pre-construction submittals are intended to document the details of installation. Exact copies of original drawings and specifications are not acceptable as pre-construction submittal drawings. Consultant schematic diagrams describe the basis of design as defined herein.

B. Contractor shall provide to Consultant the following pre-construction submittals for approval in addition to specific requirements identified in subsequent sections.
    1. Qualifications: Shall include documentation of all required qualifications.
    2. Shop Drawings:
        a. Title: Each drawing shall have a descriptive title, and all subparts of each drawing shall have unique identifiers.
        b. Floor Plans: Shall include device locations, Contractor provided furniture and installation notes.
        c. System Drawings: Shall include functional diagrams for each system detailing system flow including all equipment, routing, inputs/outputs, wiring signal type, cable identification detail, connectors, adapters, intra/inter-rack power distribution, installation notes and any other information required to convey the complete turnkey system design.
        d. Equipment Rack and Cabinet Elevations: Shall include placement of all mounted equipment.
        e. Structurally Mounted Elements: Shall include both plan view of placement as well as a detail of structural mounting techniques to be used.
        f. Furniture: Shall include all Contractor provided furniture showing dimensional drawings, cable management and finishes with samples for Owner approval.
    3. Product Data:
        a. Equipment Schedules: Shall include manufacturers, part numbers, quantities and unit pricing.
        b. Product Cut Sheets: Shall identify (highlight, arrow, etc.) actual part numbers to be utilized including but not limited to equipment, mounting hardware, cabling, connectors, software and power distribution equipment.
    4. Manufacturers' Recommendations:
        a. Where installation procedures or any part thereof are required to be in accordance with the recommendations of the manufacturer of the material being installed, copies of these recommendations shall be provided prior to installation. Installation of the items will not be allowed to proceed until the recommendations are received and approved.

1.14 PRE-INSTALLATION PROCEDURES

A. Refer to individual sections for additional information.

1.15 CONSTRUCTION PROGRESS PROCEDURES

A. Meeting Attendance: Contractor is required to attend job progress meetings in accordance with requirements set by Owner or Consultant.
B. Additional Coordination: Contractor shall request additional job construction coordination meetings it deems to be necessary to ensure coordination of their responsibilities with other parties.
C. Progress Inspection: Consultant may perform periodic progress inspections. At Consultant's request, Contractor shall make Project Manager and/or Lead Technician available.
D. Test Plan: Ten (10) business days prior to the proposed Contractor test date, Contractor shall provide a test plan defining the tests required.
    1. The test plan shall be approved by Consultant prior to any testing.

1.16 CONSTRUCTION PROGRESS SUBMITTALS

A. Completion: Contractor shall complete and submit via email all construction progress documentation in PDF format as requested by Owner and Consultant.
B. Contractor shall provide to Consultant the following construction progress submittals in addition to specific requirements identified in subsequent sections.
    1. Weekly Report: Weekly written report to be submitted to Consultant through appropriate project channels in PDF format outlining progress from previous week,

plans for progress in the current week, and any coordination issues that may require Consultant or Owner attention.

2. Test Plan: Shall ensure the system meets Owner operational and performance specifications and include the following:
   a. Identification of the capabilities and functions to be tested.
   b. Detailed instructions for the setup and execution of each test.
   c. Procedures for evaluation and documentation of the results.

C. Failure to Complete: Failure to complete requested construction progress documentation may result in the withholding of payment by Owner.

1.17 CLOSEOUT PROCEDURES

A. Notification: Contractor shall provide written notification to Consultant and Owner when Contractor is satisfied that the work has reached Substantial Completion and is ready for inspection.

B. Pre-Inspection Submittals: Contractor shall submit an electronic copy of all closeout submittals to Consultant in accordance with the requirements found in these documents no less than ten (10) business days prior to the scheduled Final Inspection.

1. Test Results
2. As-built drawings (full-size sheets)
3. Operation and Maintenance Manuals
4. End User Software
5. Photos that demonstrate complete system installation.

C. Punch List: Work or materials found to be incomplete, of unsatisfactory quality, failing to meet the specifications in these documents, and/or unacceptable to Consultant or Owner shall be documented by Consultant and provided to Contractor to rectify at no additional cost. Contractor shall provide written notification to Consultant and Owner when all punch list items have been completed.

D. Final Inspection: At Consultant's request, Contractor shall make Project Manager and/or Lead Technician available.

E. Re-Inspection: If more than one (1) re-inspection is necessary, the costs of the additional travel, time, and expenses of Owner and Consultant may be deducted by Owner from the contract amount due to the Contractor.

F. Punch List Approval: Once all punch list items are complete, the Contractor shall return an initialed punch list to the Consultant and Owner for verification. Punch list shall be considered complete only after having been signed by Owner and Consultant.

G. Closeout Submittals: Upon approval of closeout submittals and prior to final acceptance, Contractor shall provide three (3) electronic copies to Owner and Consultant in format(s) noted below.

1. Record Drawings – AutoCAD 2018 editable .dwg format AND PDF.
2. Operation and Maintenance Manuals – Digital format
3. End User Software – digital format.
4. Documentation of testing and system certification.

H. Closeout Submittal Format and Distribution: Upon approval of closeout submittals and prior to final acceptance, Contractor shall provide a total of three (3) bound hard copies and one (1) digital copy with labeled dividers of all record drawings (full-size sheets) and operation and maintenance manuals, three (3) copies to Owner and one (1) digital copy to Consultant. Title on front and spine of binder shall be "Operation and Maintenance Manual – [Project Name]". The following additional items shall be identified on the binder cover:

1. Client Name
2. Contractor Name and Contact Information
3. Consultant Name and Contact Information
4. Date

I. All documentation prepared by the Contractor, including hard copy and electronic forms, shall become the property of the Owner.
J. Payment Authorization: Final payment will be authorized only after all closeout procedures and requirements have been followed and fulfilled by Contractor and approved in writing by Owner and Consultant, including punch list(s) and/or re-inspection(s) and delivery of closeout deliverables.

1.18 CLOSEOUT SUBMITTALS

A. Closeout submittals are intended to document the details of the final installation that substantially conforms to the construction documents and functions as intended to meet the Owner's needs.
B. Contractor shall provide to Consultant the following closeout submittals for approval in addition to specific requirements identified in subsequent sections.
    1. As-built drawings: As-built drawings are prepared by the Contractor. They show, in red ink, on-site changes to the Consultant-approved pre-construction submittal documents. As-built drawings shall be submitted to Consultant for approval prior to submitting record drawings and include:
        a. Changes made by Addenda, Change Orders, Requests for Information (RFIs), Architect's Supplemental Instruction (ASIs), or Requests for Proposal (RFPs) in addition to any other changes to the original documents.
        b. Actual device locations, conduit routing, wiring and relationships as they were constructed.
        c. Nomenclature showing as-built wire designations and colors.
        d. Room numbers coinciding with Owner space planning numbering.
    2. Record drawings: Record drawings are the final drawings prepared by the Contractor and incorporate all as-built drawing changes previously approved by Consultant. Record drawings should be electronically produced without any handwritten, red ink, or clouded changes.
    3. Operation and Maintenance Manuals: Notwithstanding requirements specified elsewhere, submit one (1) copy of each of the following per binder:
        a. A final Bill of Materials for each system.
        b. A Microsoft Excel (.xlsx format) spreadsheet for each device that resides on the network, provide the following:
            1) IP Address
            2) MAC Address
            3) Serial Number
            4) Manufacturer
            5) Model Number
            6) Device Username
            7) Device Password
            8) Telecom Closet or Rack Location
            9) Patch Panel Port Number
            10) Switch Port Number
            11) Any other relevant information as requested by Owner
        c. Manufacturers Instruction Manuals: Specification sheets, operation manuals and service sheets published by the manufacturers of the components, devices and equipment provided.
        d. Information for testing, repair, troubleshooting, assembly, disassembly, and recommended maintenance intervals.
        e. Replacement parts list with current prices. Include list of recommended spare parts, tools, and instruments for testing and maintenance purposes.
        f. Performance, Test, and Adjustment Data: Comprehensive documentation of performance verification according to parameters specified herein.
        g. Warranties: Provide an executed copy of the Warranty Agreement and copies of all manufacturers' Warranty Registration papers as described herein.

h. Sufficient information, (detailed schematics of subsystems, assemblies, and subassemblies to component level) clearly presented, shall be included to determine compliance with drawings and specifications.
i. Any other items defined herein.

4. Local Reference Diagrams: Within each equipment rack, enclosure, or cabinet, the Contractor shall place a functional diagram of the system(s) in a clear plastic sleeve secured to the equipment rack, cabinet, or enclosure.
5. Intellectual Property: Provide all required items and written release as described herein.
6. Training Program: Proposed training materials and program outline.
7. Spare Parts and Remote Controls: Contractor shall submit record of Owner sign-off of turnover of spare parts and remote controls.

1.19 PROJECT MANAGEMENT

A. Project Manager: Contractor shall appoint a Project Manager who will be the main point of contact for Owner and Consultant regarding the project.
B. Responsibility: Project Manager is responsible for the following:
   1. Successfully completing the contract in a timely manner.
   2. Overseeing work and performance of all employees and Subcontractors who have been hired by Contractor and ensuring compliance with specification.
   3. Completing and submitting required documentation.
   4. Attending project coordination meetings as required by Owner, Consultant, and Contractor. Contractor is responsible for taking minutes of these meetings and distributing copies to all participants in a timely manner.
   5. Coordinating with Owner, Consultant, Architect, General Contractor, and other Contractors involved in the project to ensure smooth flow of work and on-time project completion.
   6. Providing a written weekly progress update to the Owner and Consultant in a PDF format emailed to the project team.
   7. Reporting all unexpected conditions and problems that may result in delay or expense to Owner and Consultant immediately upon discovery.
C. Change of Project Manager: If Contractor seeks to change Project Manager during the course of the Project, such change is subject to prior written approval from Owner.
D. The Owner reserves the right to request a change of project manager at any time for any reason.

1.20 EXAMINATION OF EXISTING CONDITIONS

A. Examination: Contractor shall examine the facility and construction documents to the extent necessary to plan for efficient installation strategies prior to the delivery of materials to the site or the commencement of work. Other documents (Architectural Drawings, hardware schedules…) may be made available upon request. Failure to adequately complete the examination shall not result in change order requests.
B. Acceptance of Conditions: Commencement of work by Contractor shall indicate acceptance of existing conditions, unless a written notice of exceptions has been provided to Owner prior to commencement.
C. Observation: If Contractor observes—during preliminary examinations or subsequent work—existing violations of fire stopping, electrical wiring, grounding, or other safety- or code-related issues, Contractor shall report these to Owner in a timely manner.
D. Pre-Existing Damage: If Contractor observes damage to finished surfaces before they begin installation in any area, Contractor shall document by taking digital photos of the damaged area(s) and immediately notify Construction Manager and Consultant via email with attached photos.
E. Damage during Installation: Any damage caused by or reasonably believed by the Construction Manager to be caused by the Contractor shall result in back-charges for said damages. Repairs shall match preexisting color and finish of walls, floors, and

ceilings. Any Contractor damaged ceiling tiles, floor, and carpet shall be replaced to match color, size, style, and texture.

1.21 CONTRACT MODIFICATION PROCEDURES

A. Changes: Changes to the contract may be initiated by Owner, Consultant or Contractor.
B. Request for Information (RFI): If a change originates with Contractor, the Contractor shall submit an RFI for Consultant review. If it is deemed a change is necessary, the Consultant shall issue a PR to address the change.
C. Proposal Request (PR): If a change originates with Owner or Consultant, Consultant shall issue a Proposal Request to Contractor.
D. Change Proposal (CP): If a change originates with Contractor, or if Contractor receives a Proposal Request from Consultant, Contractor shall submit a Change Proposal to Consultant to review.
    1. References: A Change Proposal shall reference the work to be performed and shall include the cost change to the Project (if any) and the time change to the scheduled completion (if any).
    2. Additional Information: Consultant may request additional information to be supplied with the Change Proposal for consideration.
    3. Acceptance: Owner reserves the right to accept or reject Change Proposals.
E. Change Order: A Change Order is a modification of the contract.
    1. If a Change Proposal is approved, Owner will issue a Change Order that references PR and/or CP. Change Order is not valid until it has been signed by Owner.
    2. Work performed or equipment supplied outside of contract without a valid Change Order is done at Contractor's own risk.

1.22 PRODUCT STORAGE AND HANDLING REQUIREMENTS

A. Storage: Contractor shall provide secure material storage. If Contractor chooses to store cabling or equipment at project site, that Contractor shall receive written approval from GC or Owner to identify acceptable location. All equipment provided by the Contractor remains the responsibility of that Contractor until Owner has beneficial use of the equipment.
B. Protection: Contractor shall take all necessary precautions to protect materials from the following:
    1. Theft
    2. Vandalism/Tampering
    3. Dents
    4. Scratches
    5. Dust
    6. Temperature
    7. Weather
    8. Cutting
    9. Paint
    10. Other hazardous conditions
C. Replacement: Contractor shall replace any damaged or lost material as required by Owner or Consultant.
D. Installed Materials: Installed materials remain the responsibility of the Contractor until Acceptance. Contractor shall take necessary precautions to ensure the safety and security of installed materials.

1.23 INTERFERENCE WITH THE FACILITY

A. Transportation and storage of materials at the facility, work involving the facility, and other matters affecting the habitual use by the Owner of the Owner's buildings, shall be conducted to minimize interference, and at times and in a manner acceptable to the Owner.

1.24 ON-SITE CONDUCT

A. Conduct: Any demonstration of rudeness, use of profanity, or lack of respect by Contractor Personnel to a building tenant will be cause for immediate removal from the premises, and such Personnel will not be allowed to return. Contractor and Contractor's Personnel are to remain in project area.
B. Vandalism: Graffiti or vandalism will not be tolerated. Any Contractor/Personnel caught in the act shall be immediately removed from the premises and will not be allowed to return.
C. Hazardous Conditions: No one shall be allowed to endanger the building, its premises, or its occupants in any manner whatsoever. In the event that a situation occurs which threatens the building or its occupants in any manner, Contractor, Contractor Personnel, Subcontractor, etc. shall take immediate steps to correct the hazardous condition. In the event that Contractor's Personnel fail to correct hazardous condition, Owner reserves the right to immediately take steps to correct the situation at Contractor's expense.

1.25 SAFEGUARDS AND PROTECTION

A. Barriers: Provide and maintain suitable barriers, guards, fences and signs where necessary to accommodate the safety of others relative to and/or for the protection of this work.
B. Regulations: Comply with OSHA, Federal, State, Local, and Owner regulations and standards pursuant to this work.
C. Protection: Protect all materials and equipment to prevent the entry or adhesion of any and all foreign material. If necessary, cover equipment with temporary protective material suitable for this purpose.
D. Finishing: Check, clean and remove defects, scratches, fingerprints and smudges if necessary from all equipment and devices immediately prior to Acceptance of the Installation.
E. Damage: Replace all damaged or defective material or work at no additional cost prior to Final Acceptance.
F. Documentation: Provide written description of accidents by workers, staff, and general public of any incident occurring on the project. Report incident in writing to Owner's representative immediately and to the Project Manager for follow up.

1.26 OWNER-FURNISHED PRODUCTS

A. Delivery: Owner is responsible for delivery of Owner-furnished products to the project site, unless otherwise specified in this document.
B. Placement: Contractor is responsible for locating, inspecting, and moving Owner-furnished products to their final installation position.
C. Inspection: Contractor shall report any damage, discrepancies in quantity, type, or function to Owner and Consultant immediately upon discovery.
D. Warranty: Contractor assumes no responsibility for any material warranty for Owner-furnished products. Contractor shall be responsible for integrating, cabling, and installing Owner-furnished products under the same warranty conditions as other products furnished by Contractor.

1.27 QUALITY ASSURANCE

A. Assurance: It is the intent of these specifications to describe and provide for a complete, professional, and reliable installation.
B. Qualifications: Contractor employees who are engaged in installation shall be properly trained in the tasks they are expected to perform.
C. Acceptability: Owner shall determine the acceptability of work.
D. Regulatory Requirements: Contractor shall comply with code requirements that apply to the work being performed.

E. Certifications: Where manufacturer certifications are required for warranty or for authorized resale, installation personnel shall have received such certification prior to the start of installation of those manufacturers' materials.

1.28 QUALITY CONTROL

A. Installation: During installation period, when connections are made to the Owner's existing infrastructure, Contractor shall use care to ensure that such connections will not have a negative impact which could reduce or hamper existing systems.

1.29 OWNER'S RIGHT TO USE EQUIPMENT

A. The Owner reserves the right to use equipment, material and services provided as part of this work prior to Acceptance of the Work, without incurring additional charges and without commencement of the Warranty period.

1.30 INTELLECTUAL PROPERTY OWNERSHIP

A. All intellectual property shall remain in escrow for an unlimited period of time. All supporting documentation including but not limited to: software, firmware, programming, uncompiled source code, graphic files, diagrams, written and electronic files, including all latest versions of the documentation and software necessary to edit and adapt the system(s), shall be provided to the Owner in digital format for all spaces and all systems. The integrator and/or programmer shall also maintain a current live copy incorporating all system modifications to be provided at the Owner's request and for system restoration upon a failure.
B. A written release shall be given by the Contractor and all other required parties for all programming and configuration done by the Contractor and/or Subcontractors. This release will acknowledge the Owner's ownership and right to modify the intellectual property directly, or to have the intellectual property modified by any party of the Owner's choosing.

PART 2 PRODUCTS

2.01 BASIC EQUIPMENT AND MATERIALS REQUIREMENTS

A. Standards: Equipment and materials used to accomplish the goals of this project shall meet standards for good engineering practice as defined within this document.
B. Quality: Products specified in these documents are intended to establish a baseline or operational, functional, and performance-based standards that all proposed products shall meet or exceed by functionality and quality.

2.02 FACTORY-ASSEMBLED PRODUCTS

A. Manufacturer: Reference to specific equipment manufacturers does not imply that all products produced by that manufacturer meet the specification requirements.
B. Age of Equipment: Equipment shall be new and unused with full manufacturer's warranties. Contractor shall supplement such warranties as required by the specification. Contractor shall immediately notify Consultant of any product that will be or is expected to be discontinued by the end of the project for resolution.
C. No Modification: Where a product is available from a factory/manufacturer to meet the needs as outlined, that product shall be used without modification to ensure the full factory warranty is maintained.
D. Like Materials: Like materials used shall be of the same manufacturer, model, and quality unless otherwise specified.
E. Software/Firmware: No software or firmware is to be used unless specifically authorized by Owner or its appointed representative.

2.03 RACKS, CABINETS, HARDWARE

A. Equipment Racks and Cabinets: Provide racks and cabinets as specified herein and/or described in accompanying documents, appendices, or drawings. Verify that any

existing racks and/or cabinets provided by others are complete, bringing any discrepancies to the attention of Owner and Consultant prior to beginning the installation.

B. Shelves and Mounts: Contractor shall supply necessary mounting hardware to install rack-mounted equipment. Mounting hardware shall be a product of the manufacturer of the equipment to be mounted, or manufacturer of the rack system, or approved by either for use with their product. Provide supporting channels, shelves, rack mounts, and/or rack ears as recommended by equipment manufacturers.

C. Screws and Washers: Contractor shall provide screw head types appropriate to the level of security required for the equipment and racking. Screws shall include polyethylene or nylon washer.

1. Public Access Areas: Star post or square post security screws shall be used for hardware and equipment mounted in equipment racks and consoles in areas that are accessible to the public.
2. Restricted Access Areas: Philips head screws may be used where a secure room entrance or locked rack/console door prevents public access.

2.04 POWER DEVICES

A. Power Strips: Unless otherwise specified, power strips shall be UL listed, surface mounted, and rated for 20 amp continuous electronic loads. Outlets shall be 125 volt, 20 amp, three-wire, grounded, and NEMA 5-20R compliant. Cords shall be 12/3 SJT with molded plug.

B. Power Distribution Panels: Unless otherwise specified, power distribution panels shall be UL listed, rack mounted, rated for 20 amp continuous electronic loads, with switch and pilot light. Up to eight outlets shall be mounted to the back, each rated 125 volt, 20 amp, three-wire, grounded, and NEMA 5-20R compliant. Switch and pilot shall be mounted to the front. Cords shall be 12/3 SJT with molded plug.

C. Contractor shall provide acceptable power distribution units as required in order to provide sufficient outlet connectivity for Contractor-furnished and Owner-furnished equipment indicated on drawings and equipment schedules, plus up to 15% additional capacity for future growth. This may be in addition to any power distribution equipment indicated on equipment schedules.

2.05 CABLE AND CONNECTORS

A. Cable: Cable shall be selected and applied in a manner defined by signal type, consistent with best industry practices. Highest quality products shall be used with attention given to transmission characteristics, termination methods, resistive and complex impedance at operating frequencies, and insulating material characteristics. Where required by the NEC, substitutions of air handing plenum cable shall exactly match the normally applied product and shall meet the standards of UL Standard #900 and the NEC Articles 800 and 820.

B. Connectors: Highest quality products shall be used with attention given to transmission characteristics, termination methods, resistive and complex impedance at operating frequencies, and insulating material characteristics. Strain reliefs and cable clamps shall be sized for the connector and the cable.

C. Color: Cable and connector color shall be coordinated with Consultant to maintain consistency with cable and connector color schemes used by other trades.

2.06 CABLE MANAGEMENT

A. Plastic Cable Ties: Single use white nylon plastic cable ties, appropriate screw fittings, or mounting clips may be used for AC power cable management within racks and enclosures. Plastic/nylon cable ties shall not be used for signal and DC cables.

B. Velcro Cable Ties: Velcro straps shall be used for all signal and DC cables. Velcro straps shall be black, with no logo or decoration, except as authorized by Consultant.

2.07 ANCILLARY HARDWARE

A. General: Contractor shall provide ancillary and required accessory items necessary to provide a complete and fully functional system to Owner.
B. Interpretation: Exclusion of or limitation in the language used in the drawings or specifications shall not be interpreted as meaning that ancillary or accessory items of work or equipment necessary to complete or make the installed system fully functional can be omitted.

2.08 GROUNDING HARDWARE

A. Refer to Section 27 05 26 for specific Grounding and Bonding requirements.
B. Provide data/telecommunication grounding systems indicated in the project drawings and specifications. Products shall include, but are not limited to, cables/wires, connectors, terminals, compression lugs, grounding rods/electrodes and plate electrodes, bonding jumper braid, surge arresters, and additional accessories needed for a complete installation. Where materials or components are not indicated, provide products complying with NEC, UL, IEEE, ANSI/TIA and established industry standards for applications indicated.

2.09 FIRE STOPPING MATERIALS

A. All penetrations of walls shall be approved by the General Contractor before any penetrations are made. Should the Contractor find it necessary to penetrate any walls extending to the slab, it will be the responsibility of that Contractor to provide satisfactory sleeving and fire caulking both inside and outside of that sleeving. If existing sleeving is to be utilized, it will be the responsibility of the Contractor to fire caulk inside the sleeving.
B. The Contractor is responsible for adhering to the following standards:
    1. Conduit penetrations through fire-rated or smoke walls: Completely seal around the conduit penetration with Hilti FS 601 fire-rated sealant or equivalent by Tremco, 3M, or equal.
    2. Conduit sleeves through fire-rated or smoke wall: Completely seal around the conduit penetration with Hilti FS 601fire-rated sealant or equivalent by Tremco, 3M, or equal. Completely seal inner opening of the conduit sleeve with fire wool packing and Hilti FS 611A intumescent firestop sealant.
    3. Cable bundles through fire-rated or smoke walls (without sleeves): Completely seal openings with Hilti FS 611A intumescent firestop sealant or equivalent by Tremco, 3M, or equal.
    4. Cable tray penetrations through fire-rated or smoke walls: Completely seal openings with Hilti FS 635 (trowelable type), or equivalent by Tremco, 3M, or equal.
C. A submitted response to this specification assumes that all firestopping will be provided as specified. The firestop manufacturer’s specifications and instructions shall be submitted with the final documentation.

2.10 COMPATIBILITY OF RELATED EQUIPMENT

A. Existing Equipment: Equipment and systems specified in these documents shall be assumed to be compatible with the systems already installed at Owner site(s) and as identified in this document as related to this project.
B. Installed Equipment: Specified equipment and systems shall be compatible with all other equipment and systems as offered by Contractor, thus placing the responsibility on Contractor to ensure proper interaction.

2.11 LICENSES

A. Any and all licenses required for system functionality shall be provided.

2.12 SPARE PARTS

A. Suggested List: Contractor is requested to submit a list of suggested spare parts with an offered price, allowing Owner to select appropriate parts.

B. Means of Obtainment: Contractor shall state where spare parts can be obtained after the installation.

2.13 MAINTENANCE MANUALS

A. Contractor shall produce a maintenance manual showing interconnection of equipment and any special procedures necessary for proper operation and maintenance of the systems.

PART 3 EXECUTION

3.01 GENERAL

A. Contractor shall provide, furnish, deliver, transport, erect, install, connect and configure all of the material and equipment described herein or depicted on any bid package document or drawing, as required for a turnkey solution.

3.02 COORDINATION

A. General: Contractor shall cooperate with other Contractors for proper provisioning, anchorage, placement, and execution of all work. Interference between the work of various Contractors shall be resolved before installation. In the event of conflict on space requirements or location of devices, refer the matter to Owner and Consultant for decision.

B. Related Work: References to the following related work do not limit or release Contractor from the responsibility of coordination with other trades or from having the necessary knowledge of other non-referenced work.

1. Work by General Contractor.
2. Work by other Technology Contractors.
3. Work by Electrical Contractor, including electrical rough-ins and surface-mounted raceway.

C. Delays: Contractor shall coordinate with all other trades to avoid causing delays in the installation schedule.

D. AC Power: Contractor shall coordinate with General Contractor its requirements for proper AC power to service all equipment installed by Contractor.

E. Low Voltage Sleeving: Contractor shall provide openings through walls as necessary, with sleeving and fire-stopping materials installed in a professional manner to meet local and national codes.

F. Grounding and Bonding: Contractor shall coordinate with General Contractor its requirements for proper grounding and bonding to their equipment.

G. Surface-Mounted Raceway Coordination

1. General and Electrical Contractors: Contractor shall coordinate with General Contractor and Electrical Contractor the installation of surface-mounted-raceway where not provided but made necessary by non-penetrable wall.
2. Verification: Contractor shall field verify and coordinate the proposed use of surface-mounted raceway at any location with Consultant and Owner.

3.03 BASIC EXECUTION REQUIREMENTS

A. General: Contractor is responsible for following industry standards of good practice for telecommunications and networking equipment.

B. Aesthetic Factors: With the installation of equipment and cables, consideration shall be given not only to operational efficiency but also to overall aesthetic factors. Contractor shall redo, at no cost to Owner, any work deemed by Owner to appear sloppy, hastily done, or unprofessional. Owner shall make final decision over whether work shall be redone.

C. Manufacturers' Recommendations: Manufactured items, materials, and equipment shall be applied, installed, connected, erected, used, and adjusted as recommended by the

manufacturers or as indicated in their published literature unless otherwise noted herein.

D. Protection of Work Area: Work shall be properly protected during construction; including shielding soft or fragile materials, protecting against dust and dirt, protecting and supporting cable ends off of the floor and from other traffic, protecting floor box lids, and temporarily plugging open conduits during construction. Upon completion, installation shall be thoroughly cleaned and all tools, equipment, obstructions, or debris present as a result of work shall be removed from the premises.

E. Protection of Cable and Equipment: Contractor shall make appropriate preparations to protect all cabling and equipment from foreign material. Foreign material is defined as any substance or material that would void the manufacturer's performance warranty, impact ratings (UL, Plenum, etc.), or cover up markings needed for inspection. Foreign material includes, but is not limited to, paint overspray (intentional or not), fire-stopping material, drywall compound, or any other chemical, liquid, or compound that could come in contact with cables, cable jackets, cable termination points, or other equipment.

   1. Cleaning of cables or equipment with harsh chemicals is unacceptable. Contractor shall replace any affected cable, cable components, or equipment in its entirety at no cost to the Owner.

F. Waste Materials: Contractor shall keep work area neat, orderly, and free from accumulation of waste materials. Remove trash and debris from the building and job site as required to maintain a clean work environment at all times. Rubbish shall be moved to a common trash point or receptacle on the job site as determined and directed by General Contractor or Owner.

G. Dumpsters: No construction debris shall be placed in building's dumpsters. Contractor shall provide a dumpster for construction waste and debris at own expense. Said dumpster shall be emptied on a regular schedule. Location of dumpster shall be arranged through Building Management. Appropriate measures shall be taken to protect asphalt or other ground surfaces.

H. Ceiling Grid: Contractor shall not hang cable supports from ceiling grid wire.

I. Roof Deck: Contractor shall not shoot into the roof deck for mounting cable hangers.

J. Mounting: Equipment and enclosures shall be mounted plumb and square in relation to the structure.

K. Raised Floor: All cabling installed below the raised floor shall be placed in the provided cable trays with appropriate means to hold cable in place. If no cable tray exists, Contractor shall provide J-hooks to hold cables in place. Sleeves shall be utilized for cable egress.

L. Motorized Furniture: Care shall be taken to properly dress all cables placed within motorized furniture and provide sufficient cable length and strain relief to allow motorized elements to operate within their full range of travel.

M. Flexible Furniture: Care shall be taken to properly dress all cables placed within flexible or re-configurable furniture to provide sufficient cable length and strain relief to allow full range of travel for flexible furniture configurations.

3.04 PREPARATION

A. Existing Equipment: Prior to any installation, the Contractor shall prepare the site by removing any remaining debris, leveling equipment racks (where appropriate), and verifying information and systems stated to be in-place are ready for use.

B. Equipment for Installation: Prior to installation, Contractor shall ensure that required major equipment has been secured and is ready for installation.

3.05 CLEANING

A. Tool Clean-up: Contractor is not permitted to use restrooms for tool clean-up. A slop-sink may be provided in janitorial closet on each floor for cleaning of tools and equipment and as a source of water. Janitorial closet or maintenance area or shop shall

be kept clean at all times. Contractor or Contractor's Personnel found using restrooms for clean-up or other similar purposes shall be subject to removal from building.

B. Daily: At the end of each work period or day, Contractor shall remove excess packing, drilling remnants, and other non-equipment related parts, materials, or debris to ensure a clean, safe, and professional working environment.
C. Carpet: Contractor shall ensure that no damage to carpeting occurs as a result of their work. Contractor shall cover carpets in areas of work to prevent wire and other debris from entering the carpet.

3.06 DEMOLITION

A. General: The Contractor shall be responsible for removal, collection, transportation, and recycling of all cabling and components that become abandoned as a result of this project. This shall include the delivery of cable and components to the proper recycling centers. If material is to remain on site for more than seven days after removal, Contractor shall coordinate with Owner for an acceptable storage location.
B. Verification: Contractor shall field-verify existing conditions prior to beginning demolition work. Any discrepancies shall be reported to the Consultant prior to the start of work in order to prevent disturbance of existing installation(s). Beginning work shall indicate acceptance of existing conditions. Contractor is responsible for immediately restoring any outages caused as a result of removing or damaging adjacent cabling, systems, or services.
C. Abandoned Cable: The Contractor shall remove all abandoned cable back to the headend. Where it is not possible to remove cables without damaging other cables that are to remain, such as in a shared conduit, the Contractor shall report these conditions to the Consultant for approval. These cables shall be cut at entry and exit points, leaving a minimum of 24" of cable at each end.
D. Cover Plates: The Contractor shall provide and install blank cover plates for any outlets or junction boxes that are to be left in place and from which all cables have been removed. Cover plates shall match the Project standard color and finish.
E. Equipment: The Contractor shall remove all equipment abandoned as part of this project. The Contractor shall be responsible for the delivery of this equipment to a proper recycling facility. Any electrical service connected to the equipment shall be properly decommissioned and labeled to prevent any safety issues.
F. Right of Refusal: The Owner shall have first right of refusal to any abandoned cable or equipment. The Owner has the right to remove any components from the equipment before it is recycled.

3.07 FIRE STOPPING

A. Contractor is responsible for applying fire-stopping material in and around all openings that it creates or are created for it, whether or not specifically indicated in specifications or project drawings, where code requires the use of fire stopping material.
B. Contractor shall ensure that all fire-stopping materials meet appropriate codes and are installed in a neat and workman like manner.

3.08 WATERPROOFING

A. Contractor is responsible for creating a waterproof seal in and around any openings to the outside environment that are created by Contractor or for systems being installed.
B. Contractor shall ensure that all waterproof materials meet appropriate codes and are applied according to good engineering practice.

3.09 RACKS, CABINETS, AND HARDWARE

A. Racks and Cabinets: Contractor shall assemble and install racks and cabinets.
B. Installation Hardware: Install hardware in a secure manner. Screws shall be tightened to a torque just sufficient to secure equipment without deforming washers beyond their original diameter.
C. Considerations: Rack mount equipment shall be secured as recommended by the manufacturer with consideration to airflow, power, and in/out connections.

D. Cross Connections: Where cross connections are required between equipment, interconnections shall be installed using cable management devices to secure cables in a neat and workmanlike manner, applying best industry practices.

3.10 INSTALLATION REQUIREMENTS

A. Cable pulling shall be done in accordance with cable manufacturer's recommendations and ANSI/IEEE C2 standards. Recommended pulling tensions and pulling bending radius shall not be exceeded. Any cable bent or kinked to radius less than recommended dimension shall not be installed.
B. All cable shall be pulled by hand unless installation conditions require mechanical assistance. Where mechanical assistance is used, care shall be taken to ensure that the maximum tensile load for the cable as defined by the manufacturer is not exceeded. This may be in the form of continuous monitoring of pulling tension, use of a "break-away", or other approved method.
C. Qualified personnel utilizing state-of-the-art equipment and techniques shall complete all installation work. During pulling operation, an adequate number of workers shall be present to allow cable observation at all points of pathway entry and exit.
D. All cable shall be free of tension at both ends.
E. PLENUM rated cable shall be used in areas used for air handling or where required by code.
F. Contractor shall replace any cables that have been damaged or abraded during installation.
G. Pulling lubricant may be used to ease pulling tensions. Lubricant shall be of a type that is non-injurious to the cable jacket and other materials used and will not harden or become adhesive with age.
H. A pull cord (nylon; 1/8" minimum) shall be co-installed with all cable installed in any conduit or surface mount raceway.

3.11 CABLE

A. Cable treatment: Cable shall be stored and handled to assure that it is not stretched, kinked, crushed, or abraded in any way. Bend radiuses shall meet manufacturer specifications and/or recommendations. Cable shall not be installed in ambient temperatures or moisture conditions above or below the rating of the manufacturer.
B. Splicing
    1. Voice, data, and other twisted pair cables: No splices shall be installed in any voice, data or twisted pair cables.
    2. Technology systems: No splices shall be installed in any cable less than five hundred (500) feet in length.
    3. Digital multimedia/video cables: No splices are allowed in any digital multimedia/video cable.
    4. Overhead paging systems: Cable splices for constant voltage overhead paging system shall occur only at speaker, amplifier or volume control knob locations.
C. Lengths
    1. Variations: Where cables are to be of the same length, variations in the length shall be less than plus or minus ½ inch. Lengths of cables are based on the length of the unterminated signal conductors.
    2. Labeling: Cables, regardless of length, shall be marked with a labeling scheme approved by Consultant.
    3. Service Loops: A surplus of cable, located at or near the point of termination to facilitate potential future changes, shall be provided where appropriate. Cables shall have a minimum cable slack of 10ft (3m) at the telecommunication room(s) and 3.28ft (1m) at each telecommunications outlet in the suspended ceiling unless noted otherwise. Service loops shall be stored in an extended loop or in a figure-eight configuration, not in bundled loops.
D. Grouping

1. Cables shall be separated into like groups according to signal or power levels.
2. Power Cable Group: Power cables shall be secured to one side of the rack separate from any low-energy signal cable groups. Separation shall be a minimum of 4” in all directions.
3. Signal Cable Group: Signal cables shall be grouped according to signal type and secured to one side of the rack separate from any power cable groups. Separation shall be a minimum of 4” in all directions.

E. In Equipment Racks
1. Equipment rack wiring and cabling shall be neatly dressed.
2. Fastening: Rack cabling shall be adequately supported with Velcro wire wraps and horizontal support cable managers fastened to rack frame.

F. Support for Cables Outside of Equipment Racks
1. External wire and cables shall be supported in maximum 5 foot intervals from the structure and as required to maintain less than 12 inches of cable sag between supports without over-tensioning the cables. Contractor shall vary the precise distance between cable supports on long runs to avoid harmonics issues.
2. Hardware: Cables shall be supported by J-hooks, cable tray, or ladder rack. Hardware shall be secured to building structure using 3/8” threaded rod supports.
   a. Right Angles: Cables are to run at right angles to the structure, placed above ceiling in halls or corridors.
   b. Height: Cables shall not run above red iron joist.

G. Concealment: Contractor shall make every effort to conceal wiring and other apparatus into walls, floors, and ceilings, assuming code and good engineering practice allows and suggests. Cabling systems installed in public areas shall be installed within walls, ceiling, or floors or within surface wiring pathways, as dictated by codes and good engineering practice.

H. Velcro Straps for Horizontal Cabling: Straps shall be installed snugly without deforming cable insulation. Straps shall be spaced at uneven intervals not to exceed 4 feet.

I. Cable Ties and Velcro Straps within Equipment Racks and Cabinets: Ties and straps shall be installed snugly, without deforming cable insulation, at uneven intervals not to exceed 8 inches. Cable ties shall only be used for non-signal carrying cables. No sharp burrs shall remain where excess length of the cable tie has been cut.

J. Obstruction: Contractor shall notify Owner immediately if any obstruction or hazard is discovered in a pathway provided by others.

3.12 CONNECTORS

A. Preparation: Cables shall be carefully prepared and connectors installed as directed by the manufacturer. Proper stripping devices and crimping tools shall be used.

B. Terminations: Connectors shall be carefully fitted to mating devices on equipment to avoid damage to mating contacts, inserts, or bodies. Specialized terminations shall be made in a neat and secure manner suited to the service of the wire and as directed by the manufacturer. Contractor shall use manufacturer specified terminations when those specifications exist.

C. Soldering: A person skilled in that practice shall execute soldered terminations. Any excessive insulation displacement resulting from soldering shall be grounds to require the Contractor to re-terminate the connector.

D. Adapters: Adapters shall be used only where the identity of the necessary type of connector is unknown at the time of installation, such as for Owner-provided equipment or in anticipation of future equipment upgrades, with Consultant’s approval.

3.13 SPARE PARTS AND REMOTE CONTROLS

A. Keys: Contractor shall turnover all keys, tagged and organized by type on individual key rings, to Owner upon project completion.

B. Refer to individual sections for spare parts and remote control requirements.

3.14 EQUIPMENT INSTALLATION

A. General: Contractor shall make system properly operational and physically secure by mounting equipment and related accessories into furniture, consoles, and racks as required. Manufacturer's guidelines for installation shall be followed. Discrepancies in installation procedure or inability to complete a given task due to a shortage of materials or malfunctioning equipment shall be reported to Consultant immediately upon discovery.

B. Equipment Placement: Contractor shall locate equipment as indicated on drawings and as specified herein. Where such information is not provided, Contractor shall follow industry best practices and locate operable devices at convenient positions; heat generating devices at the top and seldom-accessed equipment below.

   1. Unless otherwise specified, end user-operable devices shall be positioned within the range of front wheelchair access per ADA standards.

C. Equipment Installation: Equipment shall be installed as directed by the manufacturer using equipment manufacturer's desktop mounting frames, equipment tubs, installation hardware, and techniques. Contractor shall be responsible for moving equipment from storage and for providing necessary personnel or devices to carry and lift equipment around obstacles and into operating position.

3.15 FIRMWARE

A. Firmware shall be latest version supported by software and/or equipment as of Date of Acceptance.

3.16 ROUGH-IN

A. Scheduling: Contractor shall make every effort to install systems per this specification in a timely manner including rough-in of cabling and other apparatus where appropriate to stay on schedule.

B. Protection of Environment: Where cabling and/or equipment is installed prior to other trades completing their work in an area, Contractor shall take necessary precautions to cover, wrap, or otherwise protect to reduce possible damage which may result from plastering, painting, cleaning, or other such work completed after installation and before substantial completion of the project.

3.17 CUTTING, DRILLING, PATCHING, AND PAINTING

A. Coordination: Contractor is responsible for coordinating with the General Contractor and other trades when any cutting or drilling is required for the installation or proper performance of the specified systems.

B. Restoration: Contractor is responsible for returning all surfaces (including walls, floors, and ceilings) to their previous condition after any cutting including painting.

C. Painting: Contractor is responsible to paint all new work including exposed pathway to match the conditions.

3.18 LABELING

A. General: Rack-mounted equipment and hardware shall be labeled as required herein. Connectors, jacks, receptacles, outlets, cables, cable terminations, terminal blocks, rack mounted equipment, active slots of card frame systems, etc. shall be clearly, logically, and permanently labeled in a manner acceptable to Consultant.

B. Approval: Proposed wording and/or numbering schemes for labeling shall be provided to Consultant for review and written approval prior to procurement or installation.

C. Labels used shall be permanent and secure. Provide labeling as follows unless otherwise noted in a specific section:

   1. Like Size: All labels, including engraved labels, shall be sized to match other labels used for same purpose.
   2. Equipment Racks: For enclosed racks containing equipment, provide labels on each equipment rack rear door or console rear panel reading "No user serviceable parts. Refer service to qualified technician."

3. Installer and Consultant Identification: Position at the front top center section of each equipment rack a label that states the names of system Installer and Consultant.
4. Custom Panels: Custom panel nomenclature shall be engraved, etched, or screened. Markings are to be designed to ensure consistency and clarity within and without of system. Verify markings and placements by submitting label sample layouts to Consultant for approval prior to procurement.
5. Documentation: Labeling information shall appear on the as-built drawings.

3.19 FIRE-STOPPING

A. If Contractor removes anything from an opening in a fire-rated wall, Contractor shall restore the fire-rating condition of the wall to the same condition as before Contractor started its work. Depending on the size of the opening, this may involve sheetrock patching, in addition to use of other appropriate fire-stopping materials

3.20 ADDITIONAL ENGINEERING SERVICES

A. General: Contractor is responsible for securing necessary engineering services where needed to meet the needs of the installation.
B. Change Orders: Only when Contractor can show that additional engineering services are needed as a result of changes to the scope of the services being requested in the contract documents will Owner entertain a Change Order Request for these services.

3.21 TESTING

A. Procedure: Contractor shall develop a rigorous testing procedure to ensure full functionality and durability of installed systems under heavy-use conditions.
B. Supplies: Contractor shall supply testing equipment needed to verify compliance with specifications found in these documents.
C. Schedule: Contractor shall complete required testing prior to the substantial completion inspection by Owner and Consultant.
D. Data: Test data shall be properly documented and recorded so that it is available for final inspection.
E. Quality Control: Testing may be repeated during the inspection process at the request of Owner or Consultant.
F. Prior to energizing or testing the system, Contractor shall ensure the following:
    1. Installation: Products are installed in a proper and safe manner per the manufacturer’s instructions.
    2. Cleanliness: Products are neat, clean, and unmarred and parts securely attached. Dust, debris, solder, splatter, etc. is removed.
    3. Cables and Connections: Cable is dressed, routed, and labeled; connections are consistent with regard to polarity.
    4. Grounding: Electronic devices are properly grounded.
    5. AC Power: Each AC power receptacle is tested with a circuit checker for proper hot, neutral, and ground connections prior to connecting equipment.

3.22 GROUNDING

A. Refer to Section 27 05 26 for specific Grounding and Bonding installation requirements.

3.23 TRAINING PROGRAM

A. Contractor shall provide training in the manner delineated below in addition to specific requirements identified in subsequent sections.
B. Contractor shall provide audio-video recording of each training session to Owner.
C. Prior to scheduling or delivering End User training, Contractor shall confirm that:
    1. Closeout submittals have been accepted by Owner and Consultant.
    2. Final closeout inspection has been completed and punch list items rectified.
    3. Training schedule dates have been coordinated with and approved by Owner and Consultant.

D. Training shall include:
    1. Approved handouts.
    2. Practical and comprehensive operation of systems.
    3. Basic system troubleshooting techniques.
    4. Basic system maintenance.

E. Training Blocks
    1. Training time is defined as those hours specifically set aside for the sole purpose of training end users. Credited time will not be given for any time spent providing instructions to the Owner's staff for a system not completed or that has not passed final acceptance by the Owner and Consultant, or training performed outside of the approved training program.
    2. This training will be divided into training session "Blocks" as coordinated with the Owner.
        a. The first training session block shall consist of training intended for the common system operators. Such training, at a minimum, shall include the day to day use of the system.
        b. The second training session block shall consist of training administrators on the day to day administration of the system. Such training, at a minimum, shall include use of the administration control functions of the systems, user setup, and filtering and pulling reports.
        c. The third training session block shall consist of training administrators on system troubleshooting, maintenance, and updates. Such training, at a minimum, shall include using the system tools to diagnose issues, diagnosing common physical equipment issues, performing simple maintenance, and performing system updates.
        d. The forth training session block shall consist of a training session structured for high-level users, for example staff trainers who will provide instruction to other users and will include advance system configuration and operational knowledge needed to maintain and manage all specified technology systems. The Contractor may elect to engage the Manufacturer(s) in certifying the high-level end users in the systems at no cost to the Owner.

F. The Contractor shall issue a certificate of training completion to the trainees upon completion of their training. Such certificates must be signed by both the trainer and trainee(s) for the Contractor to receive training credit.

3.24 WARRANTY AND MAINTENANCE PROGRAM

A. Contractor shall provide a warranty conforming to the stipulations below in addition to specific requirements identified in subsequent sections.

B. As part of the base proposal cost, the Contractor shall include a 1-year turnkey warranty period with full support costs.
    1. Pricing for warranty services to be provided in years two through five shall be itemized on the Contract's Unit Pricing Form as part of a complete response. The Owner may fund the additional warranty services separately or not at all at the Owner's discretion.

C. The Warranty period shall begin after all punch list items have been rectified. The Contractor shall receive a letter of completion from the Consultant and Owner indicating project completion and starting the warranty period.

D. The warranty and support work included in this contract shall cover the following materials, software, and services, without additional cost to the Owner:
    1. Inspections, preventative maintenance, and testing of equipment and components. The Contractor shall schedule a 10-month on-site preventative system review 10-months into each year of warranty and support including system inspections, preventive maintenance, software upgrades/patches, and testing of equipment and components.

2. Regular Service, Emergency Service, and Normal Service.
3. Labor, travel, equipment, materials, and transportation cost for all services covered by this warranty.

E. Response Time: Contractor shall respond to calls for warranty services in a timely manner as delineated below.
   1. The Owner reserves the right to make the final determination of emergency or normal service calls and the right to coordinate the best times for service of any system failure.
   2. Emergency service calls are defined as failures which prohibit the use of a typical system function(s) and pose a life safety concern, or such failures which cause a major impact to the Owner's daily operations.
      a. The Contractor shall provide remote service diagnosing the impact within two (2) hours after notification by the Owner.
      b. If remote service does not correct the reported issue, the Contractor shall provide on-site service correcting the impact within four (4) hours after notification by the Owner.
   3. Normal service calls are defined as failures which prohibit the use of typical system function(s) but which do not inhibit critical system usage, do not pose life safety concerns, and do not create a major impact to Owner's daily operations.
      a. The Contractor shall provide remote service correcting the impact within twenty-four (24) hours after notification by the Owner.
      b. If remote service does not correct the reported issue, the Contractor shall provide on-site service correcting the impact within forty-eight (48) hours after notification by the Owner.
   4. The Contractor shall supply Service Request forms and or proper contact procedure to the Owner with instructions for proper notification of the Contractor for warranty service. By following said instructions, the Owner shall constitute proper notification for any needed warranty service

F. Repair Time: Contractor shall locally stock critical parts in sufficient quantities such that emergency repair or replacement shall be guaranteed within twelve (12) hours. Temporary replacements within this time period shall be acceptable, provided temporary replacements do not compromise system functionality and provided permanent replacement is achieved within ninety-six (96) hours. Contractor may contact the Owner for use of Owner supplied spare parts where delay of system repair will have negative impact on system performance.

G. Transmittal: A copy of this Warranty shall be delivered to and signed for by the Owner's representative whose primary responsibility is the operation and care of these systems. A copy of the signed Warranty document shall be delivered for review as part of the Final Submittals.

H. Registration: Contractor shall register Warranty papers for all equipment and software in the name of the Owner and furnish reproductions of all equipment Warranty papers to the Owner with the Final Submittals.

I. Subcontracting: Warranty service work may not be subcontracted except with specific permission and approval by the Owner.
   1. Service/Warranty Procedures: Contractor shall submit a warranty service plan containing all contact information and Owner service call directions for Owner review with project close-out submittals.

J. Resolution of Conflicts:
   1. The Owner retains the right to resolve unsatisfactory warranty service performance at any time by declaring the work unsatisfactory and stating specific areas of dissatisfaction in writing.
   2. If the Contractor or his approved Subcontractor does not resolve such stated areas of dissatisfaction within ninety-six (96) hours, the Owner may appoint an alternative service agency or person to fulfill the terms of the Warranty at the expense of the

Contractor. This action may be taken repeatedly until the Owner is satisfied that Warranty service performance is satisfactory. Satisfactory resolution of a malfunction shall be considered adequate when the device, equipment, system or component which is chronically malfunctioning is brought into compliance with the standards of performance as contained herein and published by the manufacturers of the equipment installed.

END OF SECTION

SECTION 27 0500
COMMUNICATIONS GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 SCOPE

A. Refer to Section 27 00 00 for additional project scope information.
B. This section describes the products and execution requirements related to furnishing and installing Category 5e/6/6a Cabling and Termination Components and related subsystems as part of a Structured Cabling System.
C. Backbone system comprising copper and fiber optic cabling and horizontal (station) cabling is covered under this document.
D. Others will provide the network electronics for the LAN within the Telecom Rooms (TRs) and will be responsible for connecting the new cabling infrastructure to the LAN. The Contractor, however, shall supply the patch cords. The Contractor shall be available on site during the crossover to assist with any cabling issues that may occur during the connection.
E. The Electrical Contractor shall install conduits and surface raceway for new technology outlet locations unless otherwise noted.
F. The Telecommunication Contractor shall provide and install all sleeves through the wall penetrations as required whether or not specifically marked on Project Drawings, unless otherwise noted.
G. All cables and related terminations support, and grounding hardware shall be furnished, installed, wired, tested, labeled, and documented by the Contractor, as detailed in the following section(s).
H. All work and materials shall conform in every detail to the rules and requirements of the National Fire Protection Association, the Electrical Code in the state where the work is to be performed, and present manufacturing standards.
I. All materials shall be listed by UL and shall bear the UL label. If UL has no published standards for a particular item, then other national independent testing standards shall apply and such items shall bear those labels. Where UL has an applicable system listing and label, the entire system shall be so labeled.

1.05 QUALIFICATIONS

A. Refer to Section 27 00 00 for additional requirements.
B. Premises Distribution System: Written certification that the premises distribution system complies with the EIA ANSI/TIA/EIA-568-C.0,1, 2, 3, EIA ANSI/TIA/EIA-569-B, and ANSI/TIA/EIA-606-A.
C. Materials and Equipment: Where materials or equipment are specified to conform, be constructed, or be tested to meet specific requirements, Contractor shall supply, upon request by Consultant or Owner, certification that the items provided conforms to such requirements. Certification by a nationally recognized testing laboratory that a representative sample has been tested to meet the requirements, or a published catalog specification statement to the effect that the item meets the referenced standard, will be acceptable as evidence that the item conforms. Compliance with these requirements does not relieve the Contractor from compliance with other requirements of the specifications.
D. Certifications
    1. The Contractor shall have an RCDD (Registered Communication Distribution Designer) on staff assigned to manage this Project; documented proof shall accompany the proposal response.
    2. All installing personnel shall have completed and be certified in manufacturer training or BICSI (Building Industry Consulting Service International) installation training for UTP infrastructure systems, or the Contractor shall contract with manufacturer for installation of all proposed components. Company Certifications shall accompany the proposal response.
    3. The Contractor's technicians shall be certified and trained in the connectivity hardware which is being installed.
    4. The Contractor shall submit certification that installers are factory certified to install and test the provided products. No less than half of the crew to be used for the telecommunications installation shall be trained by that manufacturer for the work.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Shop Drawings in addition to requirements in Section 27 0000:
    1. Equipment rack elevation details
    2. Elevations of telecommunication room walls with planned mounted equipment
    3. Outlet faceplate details for all outlet configurations, sizes, and cable types
    4. Overhead telecommunication room enlargements, providing dimensions of room and clearance for maintenance and operation

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for requirements.
   1. Data cable test results
   2. Digital medium containing:
      a. As-built drawings (CAD format)
      b. As-built drawings (PDF format)
      c. Detailed test results in original tester format (e.g. Fluke Linkware)
      d. Detailed cable test results in PDF format
   3. Warranty certification from connectivity manufacturer

1.09 DELIVERY, STORAGE, AND HANDLING

A. Contractor shall be responsible for all materials until completion of Project.
B. Cable shall be stored according to manufacturer's recommendations at minimum. In addition, cable shall be stored in a location protected from vandalism and weather.
C. If cable is stored outside, it shall be covered with opaque plastic or canvas with provision for ventilation to prevent condensation and for protection from weather. If air temperature at cable storage location will be below 40 degrees Fahrenheit, the cable shall be moved to a heated (minimum 50 degrees Fahrenheit) location. If necessary, cable shall be stored off site at the Contractor's expense.
D. If the Contractor wishes to have a trailer on site for storage of materials, arrangements shall be made with the Owner.
E. Commercial off-the-shelf manuals shall be furnished for operation, installation, configuration, and maintenance for all products provided as a part of the premises distribution system. Specification sheets for all cable, connectors, and other equipment shall be provided.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 00 00.

2.02 FIRE STOPPING MATERIALS

A. Refer to Section 27 0000 for additional requirements.

PART 3 EXECUTION

3.01 TESTING

A. Refer to Section 27 0000 for additional requirements.

3.02 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.03 WARRANTY

A. Refer to Section 27 0000 for additional requirements.
B. The Contractor shall provide to the Owner a manufacturer's 15-year minimum warranty certificate for all materials, equipment, etc. Upon successful completion of the installation and subsequent inspection, the Owner shall receive the numbered certificate from the manufacturing connectivity hardware (patch panels, jacks, parch cords 110 blocks, etc.) company registering the installation. This warranty shall include all labor, materials, and travel time.

C. The warranty shall ensure against product defects and guarantee that all approved cabling components exceed the specifications of TIA/EIA-568-C and ISO/IEC IS 11801 for cabling links/channels, and that the installation will exceed the loss and bandwidth requirements of TIA/EIA 568-C ISO/IEC IS 11801 for fiber links/channels for a fifteen (15) year period. The warranty shall apply to all passive structured cabling system components.
D. The warranty shall cover the failure of the wiring system to support the application that it was designed to support, as well as additional application(s) introduced in the future by recognized standards or user forums that use the TIA/EIA 568-C or ISO/IEC IS 11801 component and link/channel specifications for cabling. Such warranty shall apply for a minimum of a fifteen (15) year period.
E. The warranty shall cover the replacement or repair of defective product(s) and labor for the replacement or repair of such defective products(s), labeling of the new components, and testing of the circuit(s) at no cost to the Owner.

3.04 EXAMINATION

A. Verification of Conditions: Contractor shall examine areas and conditions under which work is to be performed and identify conditions detrimental to proper and timely completion.
B. Contractor shall verify that cable lengths comply with published standards.
C. Contractor shall notify Owner of any proposed installation which is expected to exceed maximum lengths prior to installation of cable.
D. Contactor shall consult with Owner regarding alternative routing or location of cable.
E. Contractor shall not proceed until unsatisfactory conditions have been corrected.

3.05 SPARE PARTS

A. Suggested List: Contractor is requested to submit a list of suggested spare parts with an offered price, allowing Owner to select appropriate parts.
B. Means of Obtainment: Contractor shall state where spare parts can be obtained after the installation.

3.06 INSTALLATION REQUIREMENTS

A. Refer to Section 27 0000 for additional requirements.

3.07 COOPERATION

A. The Contractor shall cooperate with other trades and General Contractor’s personnel in locating work in a proper manner.
B. Should it be necessary to raise, lower, or move longitudinally any part of the work to better fit the general installation, such work shall be done at no extra cost to the Owner, provided such decision is reached prior to actual installation. The Contractor shall check location of electrical outlets with respect to other installations before installing.

3.08 TESTING AND ACCEPTANCE

A. The Contractor shall perform acceptance tests as indicated below for each subsystem (backbone, station, etc.) as it is completed.
B. The Contractor shall supply all equipment and personnel necessary to conduct the acceptance tests. Prior to testing, the Contractor shall provide a summary of the proposed test plan for each cable type, including equipment to use, setup, test frequencies or wavelengths, results format, etc. The Consultant will approve the method of testing.
C. The Contractor shall visually inspect all cabling and termination points to ensure that they are complete and conform to the wiring pattern defined herein. The Contractor shall provide the Consultant with a written certification that this inspection has been made.
D. The Contractor shall conduct acceptance testing according to a schedule coordinated with the Consultant. Representatives of the Owner may be in attendance to witness the test procedures. The Contractor shall provide a minimum of one (1) week advance

notice to the Consultant and Owner to allow for such participation. The notification shall include a written description of the proposed conduct of the tests, including copies of blank test result sheets to be used.

E. Tests related to connected equipment of others shall be done only with the permission and presence of Contractor involved. The Contractor shall ascertain that testing only as required to prove the wiring connections are correct.

F. The Contractor shall provide Consultant with test results and descriptions of the testing methodology, including the date of the tests, the equipment used, and the procedures followed. At the request of the Consultant, the Contractor shall provide copies of the original test results.

G. All cabling shall be 100% fault free unless noted otherwise. If any cable is found to be outside the specification defined herein, that cable and the associated termination(s) shall be replaced at the Contractor's expense. The applicable tests shall then be repeated.

H. Backbone voice cables shall be free of shorts within the pairs and be verified for continuity, pair validity and polarity, and conductor position on the termination blocks (e.g., 110). Any mispositioned pairs shall be identified and corrected. The percentage of "bad" pairs shall not exceed 1% in any backbone (riser or tie) cable based on total pair count. All bad pairs shall be identified and documented.

I. The Consultant or Owner may request that a 10% random field re-test be conducted on the cable system to verify documented findings.

   1. If requested, the Contractor shall test up to 10% of cable links at no cost to the Owner.
   2. Tests shall be a repeat of those defined above and under Testing and Acceptance. If findings contradict the documentation submitted by the Contractor, additional testing shall be performed to the extent determined necessary by the Consultant, including a 100% re-test. This re-test shall be at no additional cost to the Owner.

3.09 FIRE STOPPING

A. Contractor shall seal any openings created for cable pass-through between floors or through fire rated walls. Sealing material and application of this material shall be accomplished in such a manner that is acceptable to the local fire and building authorities having jurisdiction over this work.

B. Creation of such openings as are necessary for cable passage between locations as shown on the Drawings shall be the responsibility of the Contractor. Any openings created by or for the Contractor and left unused shall also be sealed as part of this work.

END OF SECTION

SECTION 27 0523
PATHWAYS FOR TECHNOLOGY SYSTEMS

PART 1 GENERAL

1.01 SCOPE

A. Refer to Section 27 00 00 for additional project scope information.

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0526 – Grounding and Bonding for Technology Systems
D. Section 27 1100 – Communications Equipment Rooms
E. Section 27 1300 – Communications Backbone Cabling
F. Section 27 1500 – Communications Horizontal Cabling
G. Section 27 1600 – Communications Connecting Cords
H. Section 27 1800 – Communications Labeling and Identification
I. Section 27 3000 – Voice Communications
J. Section 27 4000 – AV/Multimedia General Requirements
K. Section 27 4100 – Audio Visual Systems
L. Section 27 5100 – Distributed Communications Systems
M. Section 27 6000 – Physical Security General Requirements
N. Section 27 6200 – Electronic Access Control System
O. Section 27 6400 – Video Surveillance System
P. Section 27 6600 – Intrusion Detection System

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 0000.

2.02 WIRE BASKET TRAY RUNWAY

A. As shown on the Project Drawings, the Contractor shall provide and install sufficient wire basket tray runway systems to support horizontal cable bundles.

B. The Contractor shall provide all necessary labor, supervision, materials, equipment, tests, and services to install complete wire basket tray runway systems.
C. Wire basket runway systems shall include, but are not limited to, straight sections of continuous wire mesh, field formed horizontal and vertical bends, tees, drop outs, supports, and accessories.
D. Specifications and Drawings are for assistance and guidance, but exact routing, locations, distances, and levels will be governed by actual field conditions.
E. Contractor shall ensure that all straight section longitudinal wires are installed with no bends, kinks, or twisting.
F. Wire basket runway shall be made of high strength steel wires and formed into a standard 2-inch by 4-inch wire mesh pattern with intersecting wires welded together. All wire ends along runway sides (flanges) shall be rounded during manufacturing to prevent damage to cables and injury to installers.
G. All fittings shall be field formed as needed.
H. All splicing assemblies shall be the bolted type using serrated flange locknuts. Hardware shall be either yellow zinc dichromate in accordance with ASTM B633 SC2 or AISI Type 304 stainless steel. Splicing assemblies shall provide a continuous ground connection.
I. Wire Basket Tray shall be grounded only at the Telecommunications Room ground bus bar.
J. Cable Drop Out/Waterfall
    1. Where cables bundles transition from tray to tray or tray to conduit or sleeve of varying elevations the Contractor shall provide and install a radius control device. This device shall be a waterfall or drop out device and shall be properly sized to accommodate cable bundle plus 20% future growth.
K. T-sections of tray shall be made using T-section fittings.
L. Straight section splices shall be made using splice plates.
M. Wire basket runway supports shall be of the trapeze hanger type.
N. Trapeze hangers shall be supported by 3/8 inch diameter rods.
O. Tray shall have an electro zinc finish or a flat Black finish wherever finished installation will be visible to end users.
P. Accessories (connectors, splice plates…) shall be painted to match tray finish.
Q. Contractor shall refer to project drawings for cable tray sizing.
R. Manufacturer: Cable trays and accessories shall be of one of the following manufacturers
    1. Cooper B-Line
    2. Legrand Cablofil
    3. Pentair Hoffman
    4. Or approved equal

2.03 CABLE HOOK SYSTEMS

A. In the areas where the cables are required to be run in a “free-air” plenum, a cable hook system shall be used.
B. Cable hooks shall be capable of supporting a minimum of 30 lbs. with a safety factor of 3.
C. Spring steel cable hooks shall be capable of supporting a minimum of 100 lbs. with a safety factor of 3 where extra strength is required.
D. Cable hooks shall be Category 6a or better rated.
E. Follow manufacturer’s recommendations for allowable fill capacity for each size of cable hook.
F. Installation and configuration shall conform to the requirements of the ANSI/ EIA/TIA Standards 568A & 569, NFPA 70 (National Electrical Code), and applicable local codes.
G. Cable hooks shall:
    1. Have a flat bottom and provide a minimum of 1 5/8" cable bearing surface.
    2. Have 90-degree radiused edges to prevent damage while installing cables.

3. Be designed so the mounting hardware is recessed to prevent cable damage.
4. Have a steel cable latch retainer to provide containment of cables within the hook.
5. Have a retainer that shall be removable and reusable.
6. Be factory assembled for direct attachment to walls, hanger rods, beam flanges, purlins, strut, and floor posts, to meet job conditions.

H. Factory assembled multi-tiered cable hooks shall be used where required to provide separate cabling compartments, or where additional capacity is needed.
I. Cable hooks for non-corrosive areas shall be pre-galvanized steel, ASTM A653 G90. Where additional strength is required, cable hooks shall be spring steel with a zinc-plated finish, ASTM B633, SC3.
J. Cable hooks for corrosive areas shall be stainless steel, AISI type 304.
K. Cable hooks shall be B-Line series BCH21, BCH32 or other manufacturer that meets these specifications

2.04 SURFACE RACEWAY

A. In areas where surface raceway will be used as a cable path, no exposed cable shall be permitted.
B. With the agreement of the Consultant and Owner, where telecommunications outlets are to be located in areas where the walls cannot be fished, the station wire serving these outlets shall be covered with raceways. No exposed wire shall be permitted within offices, laboratories, conference rooms, or like facilities. Contractor shall attempt to fish hollow walls, use existing conduit, or exhaust all other options to conceal cabling prior to installing surface raceway.
C. The raceway shall originate from a surface mounted box located off the floor, be attached to the wall, and terminate above the ceiling. The outlet box height shall match existing electrical receptacle height. Raceway for wall-mounted phone locations shall originate from a surface mounted box with the top of the box located 48" off the floor.
D. Raceway finish shall match finish of project electrical raceway. All fittings including but not limited to extension boxes, elbows, tees, and fixture boxes shall match the color of the raceway.
E. Telecommunication outlet faceplates shall match electrical faceplate standards for finish.
F. The raceway and all system devices shall be UL listed, exhibit nonflammable self-extinguishing characteristics, tested to specifications of UL94V-0, and be Category Compliant as defined by TIA/EIA 568.
G. Raceway turns or bends shall conform to manufacturer specifications or recommendations and industry best-practices for UTP and fiber optic cable minimum bend radius.
H. Non-Metallic raceway systems:
    1. Non-metallic surface raceway shall have an adhesive-applied base and have a hinged snap-on cover. The raceway shall be manufactured of natural PVC compounds.
    2. The raceway system shall be made up of the following components:
        a. Raceway channel shall be Panduit LD5.
        b. Surface mount outlet boxes shall be Panduit JBX3510EI-A.
        c. Dropped ceiling connectors shall be Panduit DCF5EI-X or DCEFXEI-X.
        d. Right angle fittings shall be Panduit RAFC5EI-X.
        e. Coupler fittings shall be Panduit CFX5EI-X.
I. All raceway systems shall be installed complete as specified herein and in manufacturer recommendations.

2.05 CABLE PATHWAY SLEEVES

A. The Contractor shall only provide when re-enterable sleeves are not possible.
B. The Contractor shall provide all necessary wall penetration for cable pathways whether or not specifically shown on Project Drawings.

C. All wall penetrations shall have a metallic sleeve(s) as required to maintain a maximum 40% fill ration.
D. All sleeves shall be properly firestopped by this Contractor.
E. Contractor shall provide all core holes, pathways and sleeves (minimum 1.25" c).
F. Contractor shall install non-metallic threadless insulating bushings on end of all conduits.
G. Conduit Core Holes and Sleeves thru Floor: For all floor penetrations, Contractor shall provide IMC conduits with threaded steel couplings set flush with finish floor. Extend 6” above finish floor with IMC before any termination.

2.06 RE-ENTERABLE FIRESTOP SLEEVES

A. Manufacturer:
   1. Hilti Speedsleeve

2.07 METAL CONDUITS AND FITTINGS

A. General Requirements for Metal Conduits and Fittings:
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Comply with TIA-569-B.
   3. GRC: Comply with ANSI C80.1 and UL 6.
   4. EMT: Comply with ANSI C80.3 and UL 797.
   5. Fittings for Metal Conduit: Comply with NEMA FB 1 and UL 514B.
      a. Fittings for EMT:
         1) Material: Steel
         2) Type: Setscrew
   6. Expansion Fittings: Steel to match conduit type, complying with UL-467, rated for environmental conditions where installed, and including flexible external bonding jumper.

2.08 OUTLET BOXES

A. General Requirements for Outlet Boxes
   1. Comply with TIA-569-B.
B. Metallic outlet boxes and device covers shall be galvanized steel not less than 1/16" thick.
C. The dimensions of the metallic outlet box shall be 2"x4", 4"x4" and 6"x4" with a minimum depth of 2.5". See drawings for details.
D. Metallic outlet boxes shall be equipped with single device cover (or two-device cover where needed).
E. Where installed in plaster, gypsum board, etc., covers shall be raised to compensate the thickness of the wall.
F. Box extensions used to accommodate new building finishes shall be of same material as recessed box.
G. Where metallic outlet boxes are to be empty for future use, blank covers shall be used.
H. Gangable boxes are not allowed.

2.09 UNDERGROUND ENCLOSURES (HANDHOLES)

A. Handholes shall conform to the following dimensions unless noted otherwise (W x L x D):
   1. 24” x 36” x 48” – assists the cable placing operation
   2. 30” x 48” x 48” – for splice and cable slack storage
B. Handhole load rating shall be appropriate for the environment in which it will be installed.
C. Handholes shall be placed at strategic splice and installation assistance locations or as required by environmental and/or existing topographical conditions. Handholes shall be placed using the following guidelines:

1. A handhole shall be placed within 300-feet of the penetration point to the building.
2. A handhole shall be placed where conduit bend radius equals or exceeds 90-degrees.
3. The length of conduit sections between handholes shall not exceed 1,200-feet.
4. Handholes shall be placed with the long dimension in line with the fiber run.
5. The location of the handhole shall be away from traffic conditions and shall be easily accessible for maintenance.
6. Handhole shall be installed to allow continuing water drainage.
7. Handhole shall be placed on 4-6-inch-deep rock/gravel bottom contained by wire mesh that allows drainage from the enclosure and secures the rock/gravel in place to solidify the base of the enclosure.
8. All conduits installed within the enclosure shall be sealed to prevent moisture incursion within the ducts.

2.10 PAINTING

A. The Contractor is responsible for painting all exposed pathway, boxes, fittings, etc. The paint shall match the surrounding conditions and may change mid-run.

PART 3 EXECUTION

3.01 TESTING

A. Refer to Section 27 0000 for additional requirements.

3.02 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.03 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

3.04 WIRE BASKET TRAY RUNWAY

A. Basket tray shall be installed in accordance with recognized industry practices, to ensure that the cable tray equipment complies with requirements of NEC, applicable portions of NFPA 70B and NECA's "Standards of Installation" pertaining to general electrical installation practices.
B. Coordinate installation of wire basket runway with other electrical work as necessary to properly interface installation of wire basket runway with other work.
C. Provide sufficient space encompassing wire basket runways to permit access for installing and maintaining cables.
D. Test wire basket runways to ensure electrical continuity of bonding and grounding connections and to demonstrate compliance with specified maximum grounding resistance.

3.05 CABLE HOOK SYSTEM

A. J-hooks fabricated to contain data/voice and video cables may be used to support 25 or fewer cables in each hook. J-hooks are to be fastened to building steel with beam clamps, suspended from ceiling slab with threaded rod, or anchored to the wall. All J-hooks shall be hung straight and level. No other installation technique will be authorized unless pre-approved.
B. Three tiered double-sided J-hook configurations shall contain a maximum of 25 cables per hook or 150 cables. Smaller configurations may be used as bundles decrease in size, maintaining no more than 25 cables per hook.
C. Bundles surpassing 150 cables shall be supported by hangers, fabricated of 3/8" threaded rod and 24" Unistrut. Hangers shall also be installed where the installation of a three-tiered J-hook system is not appropriate for the ceiling space, or where blocked by other trades' work.
D. Cable bundles consisting of fewer than 10 cables may be supported by single J hooks.

E. All cable support in the main cable path shall be installed every four feet. Small cable bundles (under 25) not in the main path may be supported every five feet.
F. A sag shall be maintained between supports of 6”, to reduce cable strain. Velcro is an appropriate method of securing cables, when properly used and not over tightened.
G. Proper cable support is extremely important to the Owner, and care shall be taken by the Contractor to provide and install the appropriate supports. Supports found to be inadequate will be replaced.
H. Cable bundles including voice/data cabling shall not have plastic cable ties.
I. All cable trunks shall have radius controlled cable waterfalls where trunk drops from conduit, sleeve or tray from horizontal path to vertical path.

3.06 SURFACE RACEWAY SYSTEM

A. In areas where surface raceway will be used as a cable path, no exposed cable shall be permitted.
B. With the agreement of the Consultant and Owner, if a telecommunications outlet is required in an area where the walls cannot be fished, the station cable serving these outlets shall be covered with raceway. No exposed cable shall be permitted within offices, laboratories, and conference rooms, or like facilities. Contractor shall attempt to fish hollow walls, use existing conduit, or exhaust all other options to conceal cabling prior to installing surface raceway.
C. The raceway shall originate from a surface mounted box located off the floor and be attached to the wall and terminate above the ceiling. The outlet box height shall match existing electrical receptacle height. Raceway for a wall-mounted location shall originate from a surface mounted box with the top of the box located 48" off the floor.
D. Minimum bend radius shall be adhered to for UTP and fiber optic cable.
E. Where raceway is to be installed on painted, smooth, finished surfaces, the Contractor shall clean surface prior to installing raceway.
F. Where non-metallic raceway is to be installed on non-smooth surfaces such as wallpaper, unpainted brick, concrete, etc., the Contractor shall use screws in addition to the adhesive backing to fasten channel to surfaces.
G. Where Contractor is required to install metallic raceway, the raceway base shall be installed using screws and following all manufacturer’s recommendations.
H. Where new outlet locations are indicated on Project Drawings as having existing Wiremold™ type raceway, the Contractor shall remove existing raceway from wall and install new specified raceway to cover any damage or markings caused from removing existing raceway product.
I. All surface raceway shall be mounted level and plumb. Where the Owner considers raceway channels to be installed unsatisfactorily, the Contractor shall remove and replace necessary channels at no additional cost to the Owner.
J. Suitable insulating bushings and inserts shall be used at connections to outlets and corner fittings. Dropped ceiling end fittings shall be utilized where raceway channel connects to dropped accessible ceiling tile. In rooms with drywall ceilings, open ceilings, or non-accessible ceilings, the Contractor shall extend raceway to the nearest location, hallway, or corridor that has accessible ceiling cavity. All cables shall be concealed.

3.07 PATHWAY APPLICATIONS

A. Indoors: Apply pathway products as specified below unless otherwise indicated:
    1. Exposed, Not Subject to Physical Damage: EMT
    2. Concealed in Ceilings and Interior Walls and Partitions: EMT
B. Minimum Pathway Size for Data: 1-inch trade size. Cable fill shall not exceed a 40% fill ratio.
C. Pathway Fittings: Compatible with pathways and suitable for use and location.
    1. Rigid Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10.
    2. EMT: Use setscrew, steel fittings. Comply with NEMA FB 2.10.

3.08 INSTALLATION

A. Comply with NECA 1, NECA 101, and TIA-569-B for installation requirements except where requirements on Drawings or in this article are stricter. Comply with NFPA 70 limitations for types of pathways allowed in specific occupancies and number of floors.
B. Keep pathways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal pathway runs above water and steam piping.
C. Complete pathway installation before starting conductor installation.
D. Arrange stub-ups so curved portions of bends are not visible above finished slab.
E. Install no more than the equivalent of two 90-degree bends in any pathway run. Support within 12 inches of changes in direction. Utilize long radius ells for all optical-fiber cables.
F. Conceal conduit and EMT within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.
G. Support conduit within 12 inches of enclosures to which attached.
H. All conduit penetrations shall comply with all applicable fire codes. All conduit penetrations in fire-rated walls or floors shall be sealed and fire proofed to at least the rating of the penetration area.
I. Conduits shall be routed in the most direct route, with the fewest number of bends.
J. There shall be no continuous conduit sections longer than 100 feet. For runs that total more than 100 feet, insert junction or pull boxes (or gutters if appropriate) so that no continuous run between pull boxes is greater than 100 feet.
K. There shall be no more than two 90-degree bends (180 degrees total) between conduit pull boxes.
L. Changes in direction shall be accomplished with sweeping bends observing minimum bend radius requirements above. Do not use pull boxes for direction changes unless specifically designated otherwise in the Drawings.
M. Stub-ups to Above Recessed Ceilings:
    1. Use EMT for pathways.
    2. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.
N. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install insulated bushings on conduits terminated with locknuts.
O. Install pathways square to the enclosure and terminate at enclosures with locknuts. Install locknuts hand tight plus 1/4 turn more.
P. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to assure a continuous ground path.
Q. Cut conduit perpendicular to the length. For conduits of 2-inch trade size and larger, use roll cutter or a guide to ensure cut is straight and perpendicular to the length.
R. Install pull wires in empty pathways. Use polypropylene or monofilament plastic line with not less than 200-lb. tensile strength. Leave at least 12 inches of slack at each end of pull wire. Cap underground pathways designated as spare above grade alongside pathways in use.

3.09 OUTLET BOXES

A. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.
B. Exact locations of the outlet boxes shall be coordinated with the electrical contractor and other trades.
C. The approximate locations of the outlets are indicated on the drawings. The exact locations shall be determined at the building. The right is reserved to change without additional cost, the exact location of any outlet, a maximum of 10' before it is permanently installed.

D. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall. Prepare block surface to provide a flat surface for a rain tight connection between box and cover plate or supported equipment and box.
E. Horizontally separate boxes by a minimum of 12" mounted on opposite sides of walls so they are not in the same vertical channel.
F. Outlet boxes installed back to back in fire-rated walls shall be separated horizontally by a minimum of 24".
G. Install all outlet boxes in finished areas flush with the wall. Maintain ¼" or less space between outlet box front and finished wall surface.
H. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for the purpose.
I. Outlet boxes shall be firmly anchored in place and shall not depend on the cover plate to hold it secure to the wall.
J. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits.
K. Any surface boxes shall have rounded corners and edges. Surface boxes must be approved by Owner prior to installation.

3.10 RISER CONDUITS

A. Conduits entering equipment rooms shall be reamed or bushed and terminated not more than 4" from a wall and within 12” of room corners.
B. Conduits entering equipment rooms from below floor shall be terminated not more than 4" above finished floor.
C. Conduits shall not be less than 4" trade size and be equipped with a measured pull line at 12” increments rated at a minimum 1200 pound test.
D. Provide restorable fire stops inside and around conduits as recommended by UL1479 or ASTM E814 for all conduits penetrating fire-rated construction.
E. Provide an insulating press fit bushing on all telecommunications riser conduits. Bushings must be rated to be used in an environmental air handling space (Plenum).

3.11 SLEEVE-SEAL INSTALLATION FOR COMMUNICATIONS PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies.

3.12 FIRESTOPPING

A. Install firestopping at penetrations of fire-rated floor and wall assemblies.

END OF SECTION

SECTION 27 0526
GROUNDING AND BONDING FOR TECHNOLOGY SYSTEMS

PART 1 GENERAL

1.01 SCOPE

A. Refer to Section 27 00 00 for additional project scope information.

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0523 – Pathways for Technology Systems
D. Section 27 1100 – Communications Equipment Rooms
E. Section 27 1300 – Communications Backbone Cabling
F. Section 27 1500 – Communications Horizontal Cabling
G. Section 27 1600 – Communications Connecting Cords
H. Section 27 1800 – Communications Labeling and Identification
I. Section 27 4000 – AV/Multimedia General Requirements
J. Section 27 4100 – Audio Visual Systems
K. Section 27 5100 – Distributed Communications Systems
L. Section 27 6000 – Physical Security General Requirements
M. Section 27 6200 – Electronic Access Control System
N. Section 27 6400 – Video Surveillance System
O. Section 27 6600 – Intrusion Detection System

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. IEEE C2 - National Electrical Safely Code
B. IEEE Std. 837-2002, or latest version – Standard for Qualifying Permanent Connections Used in Substation Grounding
C. ANSI/TIA-607 - Commercial Building Grounding and Bonding Requirements for Telecommunications
D. NFPA 70E - Standard for Electrical Safely in the Workplace
E. ANSI/NECA/BICSI-607 - Telecommunications Bonding and Grounding Planning and Installation methods for Commercial Buildings
F. UL 467 - Standard for Grounding and Bonding Equipment
G. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 00 00.

2.02 GROUNDING AND BONDING CABLE

A. The grounding and bonding cable shall be stranded copper conductors.
B. The grounding and bonding cables shall have a green jacket color and riser or plenum rated as required.
C. Feeder and Branch Circuit Equipment Ground: Size as shown on drawings, specifications, or as required by NFPA 70, whichever is larger. Differentiate between normal ground and isolated ground when both are used within the same facility.

2.03 GROUNDING AND BONDING BUSBARS

A. Telecommunications Main Grounding Busbar (TMGB)
   1. Factory-drilled solid copper with holes to accommodate lugs. Field manufactured busbars are not acceptable.
   2. 0.25” thick x 4” wide
   3. Sized for current applications and future growth, no less than 18”
   4. Insulated from its support
   5. Shall be an electro-tin plated busbar
   6. Maintain a minimum of 2” of clearance from wall
   7. UL listed and BICSI certified
B. Telecommunications Grounding Busbar (TGB)
   1. Factory-drilled solid copper with holes to accommodate lugs. Field manufactured busbars are not acceptable.
   2. 0.25” thick x 4” wide
   3. Sized for current applications and future growth, no less than 12”
   4. Insulated from its support
   5. Shall be an electro-tin plated busbar
   6. Maintain a minimum of 2” of clearance from wall
   7. UL listed and BICSI certified
C. Horizontal Equipment Rack or Cabinet Busbar
   1. Mounts to standard 19” Rack or Frame
   2. Capacity: 6 Double hole lugs
   3. Shall be an electro-tin plated busbar
   4. UL listed and BICSI certified
D. Vertical Equipment Rack or Cabinet Busbar
   1. Mounts to vertical rail or inside of cabinet in 19” or 23” equipment rack or frame.
   2. Capacity: 9 Double hole lugs
   3. Shall be an electro-tin plated busbar
   4. UL listed and BICSI certified

2.04 MECHANICAL CONNECTORS

A. Mechanical connector bodies shall be manufactured from high strength, high conductivity cast copper alloy material. Bolts, nuts, washers, and lock washers shall be made of Silicon Bronze and supplied as a part of the connector body and shall be of the two bolt type.
B. Split bolt connector types are not allowed.
C. Connectors shall meet or exceed UL 467.

2.05 COMPRESSION LUGS

A. Shall be UL & CSA listed
B. Shall meet or exceed the performance requirements of IEEE 837, latest revision
C. Compression type

D. Shall be manufactured from pure wrought copper. Conductivity of this material shall be no less than 99% by IACS standards.
E. Shall be electro-tin plated
F. Lugs shall be 2-hole. Single hole lugs are not allowed
G. Long barrel that will allow a minimum of two crimps with standard industry colors
H. Each connector shall be filled with an oxide-inhibiting compound
I. Crimped with a compression, tool and die system, according to manufacturer's recommendation

2.06 TAPS

A. Connections to the Conductor shall be made with irreversible compression connectors
B. Shall be UL & CSA listed
C. Requires a minimum of (2) crimps for C Tap or H Tap, 1 crimp for I-Beam and busbar Tap
D. Crimp according to manufacturer's recommendation

PART 3 EXECUTION

3.01 GENERAL

A. Install products in accordance with manufacturer's recommendations.
B. Inspect grounding and bonding system conductors and connections for tightness and proper installation.
C. Mechanical connections shall be accessible for inspection and maintenance.
D. No insulation shall be installed over mechanical ground connections.
E. Ground connection surfaces shall be cleaned and all connections shall be made so that disconnection or removal is impossible.

3.02 RESISTANCE MEASUREMENT

A. Measure ground resistance from system neutral connection at service entrance to convenient ground reference point using suitable ground testing equipment. Resistance shall not exceed 2 ohms.

3.03 TELECOMMUNICATIONS BONDING BACKBONE (TBB)

A. The intended function of a TBB is to reduce or equalize potential differences between telecommunications systems. While the TBB will carry some current under ac power ground fault conditions, it is not intended to provide the only ground fault return path.
B. The TBB shall:
   1. Be connected to the TMGB & TGB.
   2. Be a continuous copper conductor that shall be sized no less than 6 AWG to a maximum of 3/0 AWG. The TBB shall be sized in accordance to the following table:

Linear Length – ft.	Size (AWG)
Less than 13	6
14 – 20	4
21 – 26	3
27 – 33	2
34 – 41	1
42 – 52	1/0
53 – 66	2/0
Greater than 67'	3/0

   3. The TBB conductors shall be installed and protected from physical and mechanical damage.

4. The TBB conductors should be installed without splices.
    a. Where splices are necessary, the number of splices should be kept to a minimum and they shall be accessible and located within telecommunications spaces or j-box labeled as a telecommunications bonding backbone splice.
    b. Joined segments of a TBB shall be connected using exothermic welding, irreversible compression-type connectors or equal.

C. A metallic cable shield shall not be used as a TBB.

3.04 GROUNDING EQUALIZER (GE)

A. The GE shall be a continuous copper conductor that shall be sized no less than 6 AWG to a maximum of 3/0 AWG. The GE shall match the size of the TBB.
B. The GE shall connect to the telecommunications grounding busbar(s) in the same-floor telecommunications rooms on the first, top, and every third floor in a building greater than 4 floors.
C. A metallic cable shield shall not be used as a GE.

3.05 TELECOMMUNICATIONS EQUIPMENT BONDING CONDUCTOR (TEBC)

A. Connects the TMGB/TGB to equipment racks and cabinets.
B. Shall be a continuous copper conductor that shall be sized per the length of cable.
C. Shall be separated from ferrous materials by 2” or be bonded to the ferrous metal.
D. May be routed within cable trays or suspended 2” under or off the side of the cable tray or ladder rack.
E. Shall be supported every 3ft.
F. 8” minimum bend radius.
G. May come cross other cable groups at a 90 degree angle only.
H. A metallic cable shield shall not be used as a TEBC.

3.06 RACK OR CABINET BONDING CONDUCTOR

A. A bonding conductor shall be used to connect the equipment racks and cabinets directly to the TMGB, TGB or underfloor ground mesh network.
B. All metallic enclosures, including remote mounted equipment cabinets and racks for telecommunications, security or audio/visual shall be bonded to the nearest TMGB or TGB using a minimum sized conductor of 6 AWG. Remote bonds shall be labeled on both ends stating the destination of the bond.

3.07 ELECTRICAL DISTRIBUTION PANEL (EDP)

A. The AC EDP serving the Telecommunications Room shall be bonded to the TMGB or TGB using a minimum of a 6 AWG cable.
B. A qualified electrician shall make all connections within an AC electrical distribution panel.

3.08 OPTICAL FIBER CONDUCTIVE CABLES

A. Conductive fiber-optic cables should be bonded and grounded as specified in the NEC.

3.09 CONDUIT AND SLEEVE BONDING

A. All conduits and sleeves entering a telecommunications room shall be grounded.

3.10 LADDER RACK AND/OR CABLE TRAY

A. All low voltage cable runway sections shall be bonded together and bonded back to the nearest Telecommunications Room the runway is serving as close TMGB or TGB as practical.
B. Maintain an 8” minimum bend radius on the TEBC.
C. Keep a 2” separation from other cables both power and telecommunications.
D. Remove any paint, oxidation, etc. from the runway surfaces that are being bonded.
E. Drill two holes as required to accommodate the 2-hole compression lug.
F. Apply a thin coat of antioxidant around the holes and on the surface where the lug will be in contact.

G. Attach straps to the runway using stainless steel hardware sized for the lug holes.
H. Wipe off any excess antioxidant after installation of the lug.

3.11 BUILDING STEEL

A. Each ground bus bar shall be bonded to building steel.
B. Remove any paint or fire stopping spray from the building steel.
C. Provide the appropriate bonding connector to connect to beams, trusses or other types of structure.

3.12 LABELING

A. Each grounding/bonding cable shall be labeled at the TMGB or TGB.
B. All taps to the TBB shall be within an enclosure and labeled as to its purpose.
C. Mechanical connectors shall be clearly marked with the catalog number, conductor size, and manufacturer.
D. Compression lugs shall be clearly marked with manufacturer, catalog number, conductor size, and required compression tool settings.

3.13 TESTING

A. Refer to Section 27 0000 for additional requirements.
B. Perform testing in accordance with test instrument manufacturer’s recommendations using the fall-of-potential method.

3.14 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.15 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

END OF SECTION

SECTION 27 1100
COMMUNICATIONS EQUIPMENT ROOMS

PART 1 GENERAL

1.01 SCOPE

A. Refer to Section 27 0000 for additional project scope information.
B. This section describes the products and execution requirements relating to telecommunications cabling, termination components, racks, pathways, telecommunication rooms and related subsystems. Covered systems include the following:
    1. Equipment room cable management system and equipment racks
    2. Horizontal and backbone cable terminating equipment
    3. Telecommunications grounds and related components

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0523 – Pathways for Technology Systems
D. Section 27 0526 – Grounding and Bonding for Technology Systems
E. Section 27 1300 – Communications Backbone Cabling
F. Section 27 1500 – Communications Horizontal Cabling
G. Section 27 1600 – Communications Connecting Cords
H. Section 27 1800 – Communications Labeling and Identification
I. Section 27 5100 – Distributed Communications Systems
J. Section 27 6000 – Physical Security General Requirements
K. Section 27 6200 – Electronic Access Control System
L. Section 27 6400 – Video Surveillance System
M. Section 27 6600 – Intrusion Detection System

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 0000.

2.02 CATEGORY 6 PATCH PANELS

A. Cables shall be terminated at the telecommunication closets on high-density integrated patch panels incorporating Category 6 jacks (non-keyed 8-pin), meeting the specifications for the telecommunications outlet detailed in the section above.
B. Patch panel configuration shall be 48 ports.
C. The patch panel shall exceed ANSI/TIA/EIA 568-C.2-1 Category 6 component compliance standard. All pair combinations shall be considered, with the worst-case measurement being the basis for compliance.
D. The patch panels shall be interoperable and backwards compatible to lower performing cabling systems.
E. Panels shall incorporate cable support and/or strain relief mechanisms to secure the horizontal cables at the termination block and to ensure that all manufacturers' minimum bend radius specifications are adhered to.
F. The patch panel shall have color-coded designation strips to identify cable count.
G. Manufacturers:
    1. Ortronics

2.03 CATEGORY 6A PATCH PANELS

A. Cables shall be terminated at the telecommunication closets on high-density integrated patch panels incorporating Category 6a rated jacks (non-keyed 8-pin), meeting the specifications for the telecommunications outlet detailed in the section above.
B. Patch panel configuration shall be 48 ports.
C. Wireless access points shall be installed on their own dedicated patch panel at the top of the rack.
D. The patch panel shall exceed ANSI/TIA/EIA 568-C.1 Category 6a compliance standard. All pair combinations shall be considered, with the worst-case measurement being the basis for compliance.
E. The patch panels shall be interoperable and backwards compatible to lower performing cabling systems.
F. Panels shall incorporate cable support and/or strain relief mechanisms to secure the horizontal cables at the termination block and to ensure that all manufacturers' minimum bend radius specifications are adhered to.
G. The patch panel shall have color-coded designation strips to identify cable count.
H. Manufacturers:
    1. Ortronics

2.04 VOICE BACKBONE TERMINATION FIELD

A. Wall Mounted 110 Blocks
    1. At the MDF room or the primary distribution point for voice backbone cables shall be terminated on high-density wall mounted 110 blocks.
    2. The panels shall incorporate the openings between rows to allow cables to be routed from behind the panel directly to the point of termination.
    3. The panels shall be with cable managers and covers. Termination strips on the base shall be notched and divided into 5-pair increments and accommodate C5 clips.
    4. The mechanical termination shall:
        a. Have the ability of terminating 22-26 AWG plastic insulated, solid, and stranded copper conductors.
        b. Provide a direct connection between the cable and jumper wires.
        c. Have less than 0.2-dB of attenuation from 1 - 100 MHz.
        d. Have less than 100 mw of DC resistance.
        e. Have less than 5 mw of resistance imbalance.
        f. Have minimal signal impairments at all frequencies up to 100 MHz.
    5. Blocks shall identify pair position by a color designation: blue, orange, green, brown, and slate (backbone only).

2.05 VOICE PATCH PANELS

A. At the MDF and each IDF the voice backbone cables originating from the primary distribution point shall be terminated on rack mounted voice patch panels.
B. Backbone cables 25-pair or less shall be terminated on 24-port patch panels and backbone cables greater than 25-pair shall be terminated on 48-port patch panels.
C. The voice patch panel shall utilize 25-pair Amphenol connectors on the rear and RJ-45 jacks on the front.
D. Manufacturers:
    1. Ortronics

2.06 FIBER OPTIC PATCH PANELS

A. The Contractor shall provide a fiber optic patch panel at each location where a fiber optic cable terminates.
B. All terminated fibers shall be mated to duplex LC couplings mounted on enclosed patch panels. Couplers shall be mounted on a panel that, in turn, snaps into the enclosure. The proposed enclosure shall be designed to accommodate a changing variety of connector types, including SC, ST, Fixed Shroud Duplex (e.g., “FDDI Connector”), Biconic, and FC by changing panels on which connector couplings are mounted.
C. The patch panel enclosure shall be sized to accommodate the total fiber count to be installed at each location as defined in the specifications and Drawings, including those not terminated (if applicable), PLUS 50% future growth.
D. The Contractor shall provide all required connector panels and connector couplings (sleeves, bulkheads, etc.) adequate to accommodate the number of fibers to be terminated.
E. Patch panels shall be designed for easy installation, front removal, and expansion of snap-in adapter panels.
F. Patch panels shall be enclosed assemblies affording protection to the cable subassemblies and to the terminated ends. The enclosures shall incorporate a hinged or retractable front cover designed to protect the connector couplings and fiber optic jumpers.
G. The patch panel’s enclosure shall provide for strain relief of incoming cables and shall incorporate radius control mechanisms to limit bending of the fiber to the manufacturer’s recommended minimums or 1.2”, whichever is larger.
H. Access to the inside of the patch panel enclosure during installation shall be from the front and rear. Panels that require any disassembly of the cabinet to gain entry will not be accepted.
I. All patch panels shall provide protection to both the “facilities” and “user” side of the coupling. The patch panel enclosure shall be configured to require front access only when patching. The incoming cables (backbone, riser, etc.) shall not be accessible from the patching area of the panel. The enclosure shall provide a physical barrier to access of such cables.
J. Where singlemode fibers are installed, the fibers contained in these cables may be terminated either by (1) splicing of factory-terminated cable assemblies (“pigtails”) or (2) use of a “fan-out” kit. In the latter approach, individual fibers are to be secured in a protective covering (such as an Aramid reinforced tube, for example) with connectors mated to the resulting assembly. In both instances, the proposed termination hardware shall incorporate a mechanism by which cable and subassemblies are secured to prevent damage. Splicing shall be by the “fusion” method. Individual splice loss shall not exceed 0.2 dB.
K. Fiber optic patch panels shall be Corning PCH-02 in TR/IDF and PCH-4U in MDF or Server Rooms or approved equal.
L. 50-micron LC adaptor panels shall be Corning CCH-CP12-E4 or approved equal.
M. Singlemode LC adaptor panels shall be Corning CCH-CP12-A7 or approved equal.

2.07 CABLE MANAGEMENT SYSTEM

A. The cable management system shall be used to provide a neat and efficient means for routing and protecting fiber and copper cables and patch cords on telecommunication racks and enclosures. The system shall be a complete cable management system comprising 4-post and 2-post floor mount racks, wall mount racks, equipment cabinets and vertical and horizontal cable managers to manage cables on both the front and rear of the rack. The system shall protect network investment by maintaining system performance, controlling cable bend radius, and providing cable strain relief.
    1. 4-Post Equipment Racks
        a. The Contractor shall provide and install 4-post adjustable equipment racks to house cable termination components (e.g., copper data and fiber optic) and network electronics (by others) as shown on the Drawings. Prior to installation, the Contractor shall coordinate exact placement with Consultant and Owner.
        b. Rack shall be 84" in height and shall be self-supporting.
        c. Channel uprights shall be spaced to accommodate industry standard 19" mounting.
        d. Rack shall be constructed of aluminum.
        e. Rack shall be double side drilled and tapped to accept 12-24 screws. Uprights shall also be drilled on back to accept cable brackets, clamps, power strip(s), etc. Hole pattern on rack front shall be per EIA/TIA specifications (5/8"-5/8"-1/2"). Hole pattern on the rear shall be at 3" intervals to accept cable brackets.
        f. Rack shall be supplied with at least 24 spare screws.
        g. Rack shall be supplied with a vertical ground bar and #6 AWG ground lug.
        h. Manufacturers:
            1) Pentair Hoffman
    2. 4-Post Server Racks
        a. The Contractor shall provide and install 4-post adjustable server racks to house cable termination components (e.g., copper data and fiber optic), network electronics (by others) and servers as shown on the Drawings. Prior to installation, the Contractor shall coordinate exact placement with Consultant and Owner.
        b. Rack shall be 84" in height and shall be self-supporting.
        c. Channel uprights shall be spaced to accommodate industry standard 19" mounting.
        d. Rack shall be constructed of aluminum.
        e. Rack shall be double side drilled and tapped to accept square-punched .375” equipment mounting holes. Uprights shall also be drilled on back to accept cable brackets, clamps, power strip(s), etc. Hole pattern on rack front shall be per EIA/TIA specifications (5/8"-5/8"-1/2").
        f. Rack shall be supplied with at least 24 spare screws.
        g. Rack shall be supplied with ground lugs.
        h. Provide with cable waterfall and vertical cable managers
        i. Contractor shall provide 100 cage nuts and screws with each rack.
        j. Manufacturers:
            1) Pentair Hoffman
    3. 2-Post Equipment Racks
        a. The Contractor shall provide and install 2-post adjustable equipment racks to house cable termination components (e.g., copper data and fiber optic) and network electronics (by others) as shown on the drawings. Prior to installation, the Contractor shall coordinate exact placement with Owner.
        b. Rack shall be 84" in height and shall be self-supporting.
        c. Channel uprights shall be spaced to accommodate industry standard 19" mounting and have pass-through holes with smooth edges to protect cables.
        d. Rack shall be constructed of aluminum.
        e. Able to support up to 1,500 pounds.

f. Rack shall be double side drilled and tapped to accept 12-24 screws. Uprights shall also be drilled on back to accept cable brackets, clamps, power strip(s), etc. Hole pattern on rack front shall be per EIA/TIA specifications (5/8"-5/8"-1/2"). Hole pattern on the rear shall be at 3" intervals to accept cable brackets.
g. Rack shall be supplied with at least 24 spare screws.
h. Rack shall be supplied with a vertical ground bar and #6 AWG ground lug.
i. Manufacturers:
    1) Pentair Hoffman

B. Vertical Cable Management
1. At the telecommunication rooms, vertical cable management shall be furnished and installed to adjacent racks to organize cables on front and rear of telecommunication racks.
2. Vertical cable managers shall include components that aid in routing, managing, and organizing cable to and from equipment. Panels shall protect network equipment by controlling cable bend radius and providing cable strain relief. Panels shall be a universal design mounting to EIA 19" or 23" racks.
3. Vertical cable management system shall feature the following:
    a. Open cabling section on the rear that provides easy access and routes cable bundles feeding into the back of patch panels and 1 RMU cable guide on the front designed for fanning and managing patch cords.
    b. Edge-protected pass-through ports designed for easy routing of cable from front channel to back.
    c. Vertical slots along the center separator to allow securing cable bundles neatly with management straps.
    d. Door/cover (front only) that is easily opened from the right or left and still easily removed to allow for quick moves, adds, and changes.
    e. Movable wire retainers to retain the cables during cover removal.
4. Vertical cable management at the end of rack rows shall be 6”.
5. Vertical cable management between racks shall be 10”

2.08 POWER DEVICES

A. Refer to Section 27 0000 for additional requirements.
B. Horizontal PDU, Single Circuit
1. Power strip shall provide 3,840 joules of surge protection.
2. 40-80db of EMI/RFI power conditioning
3. Contractor shall provide one (1) power strip per rack/cabinet.
4. Power strip shall be rated for 20 amps.
5. Manufacturer:
    a. Hoffman DP1N191020S

C. Vertical PDU, Dual Circuit
1. Contractor shall provide one (1) power strip per server rack/cabinet.
2. Dual NEMA L5-20R or 5-20R (with included adapter) receptacle connections.
3. Single-Phase, Dual 20A Circuits, 3.8kW
4. 16 color coded outlets per circuit
5. Dual digital meters displaying amps.
6. Provide with appropriate rack mounting hardware.
7. Manufacturer:
    a. Pentair Hoffman DP1N622420MT with adaptor cord for 5-20 plug

2.09 SHALLOW WALL MOUNT CABINET

A. Where Indicated on Project Drawings, the Contractor shall provide and install a shallow wall mount cabinet to house cable termination panels and network electronics. The Contractor shall also provide and install ¾" plywood backboard for support when mounting cabinet.

B. The Contractor shall coordinate with General Contractor to install power outlet into cabinet.
C. Cabinets housing active equipment shall be equipped with a fan and fan controller.
D. Manufacturers:
    1. Pentair Hoffman

2.10 WALL MOUNT EQUIPMENT CABINET

A. Where indicated on Project Drawings, the Contractor shall provide and install wall mount cabinet to house cable termination panels and network electronics. The Contractor shall also provide and install one (1) ¾" plywood backboard for support when mounting cabinet.
B. The Contractor shall coordinate with Electrical Contractor to install a power outlet into cabinet.
C. Cabinets shall be equipped with fans and thermostatic fan controller.
D. Manufacturers:
    1. Pentair Hoffman

2.11 HORIZONTAL CABLE MANAGEMENT

A. Horizontal cable managers shall include components that aid in routing, managing, and organizing cable to and from equipment. Panels shall protect network equipment by controlling cable bend radius and providing cable strain relief. Panels shall be a universal design mounting to EIA 19" racks and constructed of steel bases with PVC duct attached. The duct fingers shall include retaining tabs to retain the cables in place during cover removal. The covers shall be able to hinge from either side yet still be easily removed to allow for quick moves, adds, and changes.
B. The cable managers shall be provided with movable wire retainers to retain the cables during cover removal and #12-24 mounting screws. An integral strain relief bracket shall be provided on either end of the duct to allow for easy cover placement.
C. Double-Sided horizontal cable managers shall be placed above and below each patch panel.
D. The Contractor shall also supply (1) per 48-port patch panel additional managers for network electronics.
E. Manufacturers:
    1. Pentair Hoffman

2.12 TELECOMMUNICATION GROUND

A. The Telecommunication Contractor is responsible for providing an appropriate ground for all racks, trays, and telecommunications equipment installed by this Contractor. Refer to the Grounding and Bonding for Technology Systems specification section.

2.13 WIRE BASKET RUNWAY TRAY

A. Within each Telecommunications Room, the Contractor shall provide and install sufficient wire basket tray to support cable bundles from corridor to equipment racks or as shown on the Project Drawings, this Contractor shall provide and install sufficient basket tray to support cable bundles from corridor to equipment racks or cabinets.
B. The Contractor shall provide all necessary labor, supervision, materials, equipment, tests, and services to install complete wire basket runway systems in the telecommunication closet.
C. Wire basket runway systems shall include, but are not limited to, straight sections of continuous wire mesh, field formed horizontal and vertical bends, tees, drop outs, supports, and accessories.
D. Specifications and Drawings are for assistance and guidance, but exact routing, locations, distances, and levels will be governed by actual field conditions.
E. All straight section longitudinal wires shall be straight (with no bends).
F. Wire basket runway shall be made of high strength steel wires and formed into a standard 2-inch by 4-inch wire mesh pattern with intersecting wires welded together. All

wire ends along runway sides (flanges) shall be rounded during manufacturing for safety of cables and installers.

G. All fittings shall be field formed as needed.
H. All splicing assemblies shall be the bolted type using serrated flange locknuts. Hardware shall be either yellow zinc dichromate in accordance with ASTM B633 SC2 or AISI Type 304 stainless steel. Splicing assemblies shall provide a continuous ground connection.
I. Wire Basket Tray shall be grounded to a Telecommunications Room ground bus bar.
J. Cable Drop Out/Waterfall
    1. Where cables bundles transition from tray and drop to the rack, cabinets or ladder rack, the Contractor shall provide and install a radius control device. This device shall be a waterfall or drop out device and shall be properly sized to accommodate cable bundle plus 20% future growth.
K. T-sections of tray shall be made using T-section fittings.
L. Straight section splices shall be made using splice plates.
M. Wire basket runway supports shall be wall mounted brackets and trapeze hangers when spanning the room.
N. Trapeze hangers shall be supported by 3/8 inch diameter rods.
O. Provide size as indicated on the drawings.
P. Tray shall have flat Black finish.
Q. Accessories (connectors, splice plates…) shall be painted to match tray finish.
R. Manufacturer:
    1. Legrand Cablofil
    2. Or approved Dallas ISD equal

2.14 LADDER RACK

A. Within each Telecommunications Room, the Contractor shall provide and install ladder rack as shown on the Project Drawings.
B. Within each Telecommunications Room with a vertical conduit riser the Contractor shall provide and install vertical ladder rack connecting the ground conduit sleeve penetrations with the ceiling conduit sleeve penetrations.
C. The Contractor shall provide all necessary labor, supervision, materials, equipment, tests, and services to install a complete ladder rack system in the telecommunications room as shown on the Drawings.
D. Specifications and Drawings are for assistance and guidance, but exact routing, locations, distances, and levels will be governed by actual field conditions.
E. All splicing assemblies shall be the bolted type using serrated flange locknuts. Hardware shall be either yellow zinc dichromate in accordance with ASTM B633 SC2 or AISI Type 304 stainless steel.
F. Cable Drop Out/Waterfall
    1. Where cables bundles transition from tray and drop into the racks/cabinets, the Contractor shall provide and install a radius control device. This device shall be a waterfall or drop out device and shall be properly sized to accommodate cable bundle plus 20% future growth.
G. Size ladder rack as indicated on the Contract Documents.
H. Accessories (connectors, splice plates…) shall be painted to match tray finish.
I. Manufacturers:
    1. Pentair Hoffman

2.15 PLYWOOD

A. The Contractor shall provide plywood. Plywood shall be installed on all walls within a telecommunications room and other locations as noted.
B. Provide void-free, interior grade, fire rated A-C grade plywood, 3/4” by 48” by 96”, or as indicated.

C. When plywood is required to be painted, the paint shall be UL 723 rated white or gray fire retardant. The plywood's rating stamp shall be exposed (not painted over) on each sheet. Plywood shall have fire calk around all edges. Provide label including paint manufacturer, date painted, UL listing and name of Installer
D. Plywood shall be mounted vertically starting at 22" AFF to 118" AFF and anchored to all studs.

PART 3 EXECUTION

3.01 TESTING

A. Refer to Section 27 0000 for additional requirements.

3.02 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.03 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

3.04 EQUIPMENT RACK AND CABINETS

A. Prior to permanently securing racks or cabinets, the Contractor shall coordinate a walk through with the Owner to determine exact placement of racks.
B. The Contractor shall bolt the rack to the floor as recommended by the manufacturer. Multiple racks shall be joined and the ground made common on each. Rack shall also be stabilized by extending a brace extending to the wall. Alternately, overhead cable tray over which the cabling accesses the equipment rack(s) shall provide this function.
C. A space between the rack upright and the wall (~6") shall be planned to allow for cabling in that area. The rear of the rack shall be ~40" from the wall to allow for access by maintenance personnel. In all cases, a minimum of 40" workspace in front of the rack is also required. Locations where these guidelines cannot be followed shall be brought to the attention of the Consultant for resolution prior to installation.
D. All hardware and equipment is to be mounted at least 18" above floor level. This is to afford easy access and, in the case of the lower limit, prevent damage to the components. Positioning of hardware shall be reviewed and approved by the Consultant and Site Coordinator(s) prior to installation.
E. Equipment rack shall be equipped with cable management hardware to allow an orderly and secure routing of twisted pair cabling to the data patch panels. At minimum, one such horizontal jumper management panel shall be placed below each fiber optic patch panel installed by the Contractor. Additional jumper management panels may be required pending installation of other cable types on the rack. The rack shall be grounded to the telecommunications grounding backbone (TGB) using a #6 AWG (or larger) insulated stranded copper conductor (GREEN jacket).

3.05 WIRE BASKET TRAY AND LADDER RACK RUNWAY

A. Runway shall be installed in accordance with recognized industry practices, to ensure that the cable tray equipment complies with requirements of NEC, applicable portions of NFPA 70B and NECA's "Standards of Installation" pertaining to general electrical installation practices.
B. Coordinate installation of runway with other electrical work as necessary to properly interface installation of wire basket runway with other work.
C. Provide sufficient space encompassing runways to permit access for installing and maintaining cables.
D. Test runways to ensure electrical continuity of bonding and grounding connections and to demonstrate compliance with specified maximum grounding resistance.

END OF SECTION

SECTION 27 1300
COMMUNICATIONS BACKBONE CABLING

PART 1 GENERAL

1.01 SCOPE

A. Refer to Section 27 00 00 for additional project scope information.
B. This section describes the products and execution requirements relating to telecommunications voice, data and video backbone cabling and termination components.
C. Backbone Cabling is the cable and hardware interconnecting telecommunication rooms (TRs), building demarcation rooms, equipment rooms and server rooms. The backbone cabling shall consist of the following cable types:
    1. 50-micron Multimode Fiber Optic Cable
    2. Multi-Pair Copper Voice Backbone Cable

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0523 – Pathways for Technology Systems
D. Section 27 0526 – Grounding and Bonding for Technology Systems
E. Section 27 1100 – Communications Equipment Rooms
F. Section 27 1500 – Communications Horizontal Cabling
G. Section 27 1600 – Communications Connecting Cords
H. Section 27 1800 – Communications Labeling and Identification
I. Section 27 2100 – Network Electronics and UPS Systems

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 00 00 for additional requirements.

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.09 TEST DATA – FIBER OPTIC MEDIA

A. The test result information for each link shall be recorded in the memory of the field tester upon completion of the test.
B. The test result records saved by the tester shall be transferred into a Windows-based database utility that allows for the maintenance, inspection, and archiving of these test records. A guarantee shall be made that these results are transferred to the PC unaltered, i.e., “as saved in the tester” at the end of each test.
C. The database for the completed job shall be stored and delivered on a digital storage medium. This medium shall include the software tools required to view, inspect, and print any selection of test reports.

D. A paper copy of the test results shall be provided that lists all the links that have been tested with the following summary information:
    1. The identification of the link in accordance with the naming convention defined in the overall system documentation.
    2. The overall Pass/Fail evaluation of the link-under-test including the Attenuation worst-case margin (margin is defined as the difference between the measured value and the test limit value as defined in this document).
    3. The date and time the test results were saved in the memory of the tester.
E. The following general information is to be provided in the electronic database containing the test result information for each link:
    1. The identification of the customer site as specified by the end user.
    2. The overall Pass/Fail evaluation of the link-under-test.
    3. The name of the standard selected to execute the stored test results.
    4. The cable type and the value of the 'index of refraction' used for length calculations.
    5. The date and time the test results were saved in the memory of the tester.
    6. The brand name, model, and serial number of the tester.
    7. The revision of the tester software and the revision of the test standards database in the tester.
F. The detailed test results data to be provided in the electronic database for each tested optical fiber shall contain the following information:
    1. The identification of the link/fiber in accordance with the naming convention defined in the overall system documentation.
    2. The insertion loss (attenuation) measured at each wavelength, the test limit calculated for the corresponding wavelength, and the margin (difference between the measured attenuation and the test limit value).
G. The link length shall be reported for each optical fiber for which the test limit was calculated.
H. Contractor shall provide accurate as-built Construction Drawings at the site during construction.
I. The Drawings are to include cable routes and outlet locations. Outlet locations shall be identified by their sequential number as defined elsewhere in this document. Numbering, icons, and drawing conventions used shall be consistent throughout all documentation provided. The Owner will provide floor plans in paper and electronic (".dwg", AutoCAD rel. 2018 and ".dxf") formats on which as-built construction information can be added. These documents will be modified accordingly by the Contractor to denote as-built information as defined above and returned to the Owner.
J. The Contractors shall annotate the base Drawings and return to the Consultant in hard copy (same plot size as originals) and electronic (AutoCAD rel. 2018 and ".dxf") form.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 0000.

2.02 BACKBONE VOICE CABLING

A. The voice backbone cable shall link the Main Closet and Telecommunications Rooms serving the building. The cables shall be CMP rated where required.
B. Voice backbone cable shall incorporate 24 AWG solid annealed copper conductors insulated with a polyvinyl chloride skin over expanded polyethylene. Conductors shall be twisted to form pairs and fully color-coded.
C. The voice backbone cable shall be sized as detailed on the Drawings.

D. Conductors shall be identified by the insulation color of each conductor. The color code shall follow the industry standard composed of ten (10) distinctive colors to identify 25 pairs in accordance with ICEA publication S-80-576-1988. Marking of each mate of the primary conductor in a pair with the color of that primary conductor is optional.
E. The voice backbone cable shall meet or exceed the EIA/TIA Category 3 performance requirements.
F. When cables of larger than 25 pairs are required, the core shall be assembled into 25-pair subunits, each color-coded in accordance with ICEA publication S-80-576-1988. Cables with over 600 pairs shall have 25-pair binder groups combined into super units. These super units shall be wrapped with a solid color thread that follows the primary color scheme of white, red, black, yellow, and violet. Binder color code integrity shall be maintained wherever cables are spliced.
G. All cables and equipment shall be furnished, installed, wired, and tested by the Contractor.
H. Manufacturers:
    1. Superior Essex

2.03 TIGHT-BUFFERED OPTICAL FIBER CABLES FOR INDOOR DISTRIBUTION APPLICATIONS

A. General Considerations
    1. The cable shall meet the requirements of the National Electrical Code (NEC) Section 770.
    2. For plenum applications, the cable shall meet applicable flame tests: ANSI/UL 910 (NFPA 262-1994).
    3. Finished cables shall conform to the applicable performance requirements of Tables 8-6 and 8-7 of the Insulated Cable Consultants Association, Inc. (ICEA) *Standard for Fiber Optic Premises Distribution Cable* (ICEA S-83-596).
B. Cable Construction
    1. The coated fiber shall have a layer of Teflon placed between the acrylate coating of the optical fiber and the thermoplastic buffer. The diameter of the thermoplastic buffer coating shall be 900 ±50µm. The fiber coating and buffer shall be removable with commercially available stripping tools in a single pass for connectorization or splicing.
    2. Cables with 2 to 24 fibers layered aramid yarns shall serve as the tensile strength member of the cable.
    3. A ripcord shall be applied between the aramid yarns and the outer jacket to facilitate jacket removal.
    4. The outer jacket shall be extruded over the aramid yarns for physical and environmental protection. The jacket shall be continuous, free from pinholes, splits, blisters, or other imperfections. The jacket shall have a consistent, uniform thickness. The jacket shall be smooth, as is consistent with the best commercial practice.
    5. The fibers shall be stranded around a dielectric central member.
    6. For cables containing 12-24 fibers, the fibers shall be arranged in two layers.
    7. The central member shall be over coated with a thermoplastic, when required, to achieve dimensional sizing to accommodate and support the 900 µm buffered fibers.
    8. Cables with 24 to 60 fibers shall have unitized riser and plenum constructions.
    9. The buffered fibers shall be grouped in six-fiber subunits.
    10. The fibers shall be stranded around a dielectric central member in the subunit.
    11. Layered aramid yarns shall serve as the tensile strength member of the subunit.
    12. A ripcord may be applied between the aramid yarns and the subunit jacket to facilitate jacket removal.
    13. The subunit jacket shall be extruded over the aramid yarns for physical and environmental protection. The jacket shall be continuous, free from pinholes, splits,

blisters, or other imperfections. The jacket shall have a consistent, uniform thickness. The jacket shall be smooth, as is consistent with the best commercial practice.

14. The subunits shall be stranded around a dielectric central member. A ripcord shall be inserted beneath the outer jacket to facilitate jacket removal. The outer jacket shall be extruded around the subunits. The strength members shall be of a high modulus aramid yarn. The aramid yarns shall be helically stranded around the buffered fibers. Non-toxic, non-irritant talc shall be applied to the yarns to allow them to be easily separated from the fibers and the subunit jacket.

C. Outer Cable Jacket

1. The jacket shall be continuous, free from pinholes, splits, blisters, or other imperfections. The jacket shall have a consistent, uniform thickness; jackets extruded under high pressure are not acceptable. The jacket shall be smooth, as is consistent with the best commercial practice. The jacket shall provide the cable with a tough, flexible, protective coating, able to withstand stresses. The nominal thickness of the cable outer jacket shall be sufficient to provide adequate cable protection while meeting the mechanical, flammability, and environmental test requirements of this document over the life of the cable.
2. The indoor distribution cable specified herein shall have an interlocking armor made of steel or aluminum. Provide plenum rated cable as required.
3. The indoor distribution cable specified herein shall be non-conductive. Provide plenum rated cable as required.
4. The color of the jacket shall match the jacket color of the optical fiber cable located inside of the cable.

D. Fiber Identification

1. The individual fibers shall be color-coded for identification. The optical fiber color-coding shall be in accordance with ANSITIA/EIA-598-B “Optical Fiber Cable Color Coding.” The coloring material shall be stable over the temperature range of the cable, shall not be susceptible to migration, and shall not affect the transmission characteristics of the optical fibers. Color-coded buffered fibers shall not adhere to one another.
2. When buffered fibers are grouped into individual subunits, each subunit jacket shall be numbered for identification, with the exception of filler subunits where used. The number shall be repeated at regular intervals. The subunit jacket color shall be aqua for subunits containing OM3/4 multimode fibers, yellow for subunits containing singlemode fibers, and white for filler subunits.
3. The outer jacket for all dielectric cable shall be marked with the manufacturer name or UL file number, date of manufacture, fiber type, flame rating, listing symbol, and sequential length markings every two feet. The marking shall be in contrasting color to the cable jacket. The cable jacket color shall be Aqua for cables containing OM3/4 multimode fibers and yellow for cables containing singlemode fibers.
4. Cables shall be marked with the manufacturer name, date of manufacture, fiber type, flame rating, listing symbol, and sequential length markings every two feet. The marking shall be in contrasting color to the cable jacket. The cable jacket color shall match the color of the core optical fiber cable.

E. Cable Specifications

1. Temperature Range
   a. Non-Plenum Applications: The storage temperature range for the cable on the original shipping reel shall be -40 to +70ºC. The installation/operating temperature range for riser cables shall be -20 to +70 ºC. Testing shall be in accordance with FOTP-3.
   b. Plenum Applications: The storage temperature range for the cable on the original shipping reel shall be -40 to +70ºC.The installation/operating

temperature range for plenum cables shall be 0 to +70ºC.Testing shall be in accordance with FOTP-3.

2. Compressive Load Resistance
    a. When tested in accordance with FOTP-41, Compressive Loading Resistance of Fiber Optic Cables, the cable shall withstand a minimum compressive load of 89 N/cm (50 lbf/in) applied uniformly over the length of the compression plate. While under compressive load, the fiber shall not experience an attenuation change greater than 0.4 dB at 1550 nm (singlemode) or greater than 0.6 dB at 1300 nm (multimode). After the compressive load is removed, the fibers shall not experience an attenuation change greater than 0.2 dB at 1550 nm (singlemode) or greater than 0.4 dB at 1300 nm (multimode).
3. Cyclic Flexing
    a. When tested in accordance with FOTP-104, Fiber Optic Cable Cyclic Flexing Test, the cable shall withstand 25 mechanical flexing cycles at a rate of 30 ± 1 cycle per minute. The fiber shall not experience an attenuation change greater than 0.2 dB at 1550 nm (singlemode) or greater than 0.4 dB at 1300 nm (multimode).
4. High and Low Temperature Bend
    a. When tested in accordance with FOTP-37, Fiber Optic Cable Bend Test, Low and High Temperature, the cable shall withstand four full turns around a mandrel at test temperatures of 0 ºC and +50 ºC. The fibers shall not experience an attenuation change greater than 0.2 dB at 1550 nm (singlemode) or greater than 0.5 dB at 1300 nm (multimode).
5. Impact Resistance
    a. When tested in accordance with FOTP-25, Repeated Impact Testing of Fiber Optic Cables and Cable Assemblies, the cable shall withstand a minimum of 20 impact cycles for riser cables and 10 impact cycles for plenum cables. The fibers shall not experience an attenuation change greater than 0.2 dB at 1550 nm (singlemode) or greater than 0.4 dB at 1300 nm (multimode).
6. Temperature Cycling
    a. When tested in accordance with FOTP-3, Procedure to Measure Temperature Cycling Effects on Optical Fiber, Optical Cable, and Other Passive Fiber Optic Components, the change in attenuation at extreme operational temperatures (0 to +50 ºC) shall not exceed 0.3 dB/km at 1550 nm (singlemode) or 0.6 dB/km at 1300 nm (multimode). The change in attenuation is measured with respect to the baseline values measured at room temperature before temperature cycling.
7. Twist-Bend
    a. When tested in accordance with FOTP-91, Fiber Optic Cable Twist-Bend Test, a length of cable no greater than 2 meters shall withstand 10 cycles of mechanical twisting and bending around a mandrel 20 times the cable outer diameter. The fibers shall not experience an attenuation change greater than 0.2 dB at 1550 nm (singlemode) or 0.4 dB at 1300 nm (multimode).

F. Multimode OM4 (50/125 µm)
1. The multimode fiber utilized in the optical fiber cable shall meet EIA/TIA-492AAAA-A-1997, Detail Specification for 50µm Core Diameter/125µm Cladding Diameter Class Ia Graded-Index Multimode Optical Fibers, unless noted otherwise. Cable shall have the following specifications:
    a. Core Diameter: 50 ± 3 µm
    b. Core Non-Circularity: ≤5%
    c. Cladding Diameter: 125± 2 µm
    d. Cladding Non-Circularity: <2.0%
    e. Core-to-Cladding Concentricity: ≤ 3 µm
    f. Coating Diameter: 245 ± 2 mm
    g. Refractive Index Profile: Graded index

h. Numerical Aperture: 0.275 ± 0.015
i. Maximum Attenuation: less than 3.0 dB/km at 850 nm and 1.0 dB/km at 1300 nm.

2. IEEE 802.3ae Performance: The fiber shall support laser-based 10 Gigabit Ethernet (10GbE) operation for up to 550 meters.
3. Attenuation at the Water Peak: The attenuation coefficient at 1380 nm shall not exceed the attenuation coefficient at 1300 nm by more than 1.0 dB/km.
4. Macrobend Attenuation: The attenuation due to 100 turns of fiber around a 75-± 2 mm diameter mandrel shall not exceed 0.5 dB at 850 nm or 1300 nm.

G. The cable shall be manufactured by:
1. Superior Essex ArmorTex Series GIGAlite-10, GIGAlite 10XB

2.04 FIBER OPTIC CONNECTORS

A. The MM optical connector shall be LC UPC type.
B. The connector ferrule shall be ceramic or glass-in-ceramic. The optical fiber within the connector ferrule shall be secured with an adhesive.
C. The attenuation per mated pair shall not exceed 0.35 dB (individual) and 0.2 dB (average). Connectors shall sustain a minimum of 200 mating cycles per EIA/TIA-455-21 without violating specifications.
D. The connector shall meet the following performance criteria:
1. Cable Retention (FOTP-6) 0.2 dB
2. Durability (FOTP-21) 0.2 dB
3. Impact (FOTP-2) 0.2 dB
4. Thermal Shock (FOTP-3) 0.2 dB
5. Humidity (FOTP-5) 0.2 dB

E. Connectors shall be field terminated and polished or fusion spliced. Mechanical, quick connect or index-gel based connectors are not allowed.
F. Manufacturer:
1. Ortronics

PART 3 EXECUTION

3.01 TESTING

A. Refer to Section 27 0000 for additional requirements.
B. Field Test Requirements for Fiber Optic Cabling System
1. The fibers utilized in the installed cable shall be traceable to the manufacturer. Upon request by the Owner, the Contractor shall provide cable manufacturer's test report for each reel of cable provided. These test reports shall include the manufacturers on reel attenuation test results at 850-nm and 1300-nm for each optical fiber of each reel prior to shipment from the manufacturer.
2. Factory data shall be provided upon request, showing on-the-reel bandwidth performance results as tested at the factory.
3. Every fiber optic backbone link in the installation shall be tested in accordance with the field test specifications defined by the Telecommunications Industry Association (TIA) standard ANSI/TIA/EIA-568-C or by the appropriate network application standard(s), whichever is more demanding.
4. The test shall include the representative connector performance at the connecting hardware associated with the mating of patch cords. The test does not, however, include the performance of the connector at the interface with the test equipment.
5. 100% of the installed cabling links shall be tested and shall pass the requirements of the standards mentioned above and as further detailed in this document. Any failing link shall be diagnosed and corrected at no additional cost to the Owner. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests

for all links shall be provided in the test results documentation in accordance with RFP.

6. Trained technicians who have successfully attended an appropriate training program and have obtained a certificate as proof thereof shall execute the tests. These certificates may have been issued by any of the following organizations or an equivalent organization:
   a. The manufacturer of the fiber optic cable and/or the fiber optic connectors
   b. The manufacturer of the test equipment used for the field certification
   c. Training organizations authorized by BICSI
7. Field test instruments for multimode fiber cabling shall meet the requirements of ANSI/TIA/EIA-526-14-A. The light source shall meet the launch requirements of ANSI/EIA/TIA-455-50B, Method A. This launch condition can be achieved either within the field test equipment or by use of an external mandrel wrap (as described in clause 11 of ANSI/TIA/EIA-568-C.1) with a Category 1 light source.
8. Field test instruments for singlemode fiber cabling shall meet the requirements of ANSI/EIA/TIA-526-7.
9. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.
10. The fiber optic launch cables and adapters shall be of high quality and the cables shall not show excessive wear resulting from repetitive coiling and storing of the tester interface adapters.
11. The Pass or Fail condition for the link-under-test is determined by the results of the required individual tests.
12. Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter.
13. A representative of the Owner shall be invited to witness field testing. The representative shall be notified of the start date of the testing phase five business days before testing begins.
14. A representative of the Owner will select a random sample of 5% of the installed links. The results obtained shall be compared to the data provided by the installation Contractor. If more than 2% of the sample results differ in terms of the Pass/Fail determination, the installation Contractor, under supervision of the Owner representative, shall repeat 100% of the testing. The cost of retesting shall be borne by the installation Contractor.

C. Fiber Performance Test Parameters

1. The link attenuation shall be calculated by the following formulas specified in ANSI/TIA/EIA standard 568-B.
   a. Link Attenuation = Cable_Attn + Connector_Attn + Splice_Attn
   b. Cable_Attn (dB) = Attenuation_Coefficient (dB/km) * Length (Km)
   c. The values for the Attenuation_Coefficient are listed in the table below:

Type of Optical Fiber	Wavelength (nm)	Attenuation_Coefficient (dB/km)
Multimode OM4 50/125 µm	850	3.0
	1300	1.5

   d. Connector_Attn (dB) = number_of_connector_pairs * connector_loss (dB)
   e. Maximum allowable mated connectors_loss = 0.50 dB
   f. Splice_Attn (dB) = number of splices (S) * splice_loss (dB)
   g. Maximum allowable splice_loss = 0.1 dB (when tested bidirectionally)
2. Link attenuation does not include any active devices or passive devices other than cable, connectors, and splices—i.e., it does not include such devices as optical bypass switches, couplers, repeaters, or optical amplifiers.
3. Test equipment that measures the link length and automatically calculates the link loss based on the above formulas is preferred.

4. The above link test limits attenuation are based on the use of the One Reference Jumper Method specified by ANSI/TIA/EIA-526-14A, Method B and ANSI/TIA/EIA-526-7, Method A.1. The user shall follow the procedures established by these standards or application notes to accurately conduct performance testing.
5. The backbone link (multimode/singlemode) shall be tested in two directions at both operating wavelengths to account for attenuation deltas associated with wavelength.
6. Multimode backbone links shall be tested at 850 nm and 1300 nm in accordance with ANSI/EIA/TIA-526-14A.
7. Because backbone length and the potential number of splices vary depending upon site conditions, the link attenuation equation shall be used to determine limit (acceptance) values.
8. Multimode backbone links are designed to be used with network applications that use laser light sources (underfilled launch conditions). However, the link attenuation equation has been based upon the use of a light source categorized as Category 1, Overfilled.
9. Singlemode backbone links shall be tested at 1310 nm and 1550 nm in accordance with ANSI/TIA/EIA-526-7, Method A.1. All singlemode links shall be certified with test tools using laser light sources at 1310 nm and 1550 nm.

3.02 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.03 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

3.04 FIBER OPTIC CABLE INSTALLATION REQUIREMENTS

A. Cable slack shall be provided in each backbone fiber optic cable. This slack is exclusive of the length of fiber that is required to accommodate termination requirements and is intended to provide for cable repair and/or equipment relocation. The cable slack shall be stored in a fashion as to protect it from damage and be secured in the termination enclosure or a separate enclosure designed for this purpose. Multiple cables may share a common enclosure.
B. A minimum of 15 feet of slack cable (each cable) shall be coiled and secured at each end.

END OF SECTION

SECTION 27 1500
COMMUNICATIONS HORIZONTAL CABLING

PART 1 GENERAL

1.01 SCOPE

A. This section describes the products and execution requirements relating to telecommunications voice, data and video horizontal (station) cabling and termination components.
B. Horizontal cabling is the cabling between the work area telecommunications outlet and the telecommunications room (TR). Horizontal cabling is often referred to as “station cabling”.
C. Station cabling shall not exceed 250’ as directed by the Owner. Please refer to article 3.05 of this specification for more information.
D. The horizontal cabling system will consist of the following:
    1. Unshielded Twisted Pair (UTP) Cable
    2. Outlet Termination Modules (jacks)
    3. Outlet Termination Plates
    4. Above Ceiling Cable Support Systems
    5. Horizontal Cable Testing Requirements
    6. Cable Pathway/Sleeve Requirements

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 0000.

2.02 CATEGORY 6 HORIZONTAL COPPER CABLES

A. All cables and equipment shall be furnished, tested, installed and wired by the Contractor.
B. All horizontal data cables shall terminate on modular patch panels in the telecommunications closet as specified on the Drawings.
C. This specification defines the requirements for commercially available high performance Category 6 cable.
D. This cable shall be suitable for installation free-air, in building risers, in conduit, and/or in cable tray and shall carry CMP rating.
E. The cable design described herein shall exceed transmission performance of Category 6 cables.
F. Cables shall be Underwriters Laboratory (UL) listed, comply with Article 800 (Communications Circuits) of the National Electrical Code, and meet the specifications of NEMA (low loss), UL 444, and ICEA. Conductor shall also conform to the requirements for solid annealed copper wire in accordance with ASTM B 3.
G. All cables, termination components, and support hardware shall be furnished, tested, installed, and wired by the Contractor.
H. The jacket color for data cables shall be the following:
    1. YELLOW – Standard Data
    2. PINK – Security Cameras
I. IMPORTANT: Cable and termination components (jack, patch panel, wiring blocks) are specified to function as a system. The compatibility of the cable to be installed with the proposed termination components shall be recognized and documented by the termination component manufacturer.
J. Manufacturers:
    1. Superior Essex

2.03 CATEGORY 6A HORIZONTAL COPPER CABLES

A. All cables and equipment shall be furnished, tested, installed and wired by the Contractor.
B. All horizontal data cables shall terminate on modular patch panels in the telecommunications closet as specified on the Drawings.
C. All wireless access points shall utilize Category 6a cable unless noted otherwise.
D. This cable shall be suitable for installation free-air, in building risers, in conduit, and/or in cable tray and shall carry CMP rating.
E. The cable design described herein shall exceed transmission performance of Category 6a cables.
F. Category 6a cables shall be bundled separately from lower Category rated cabling.
G. Cables shall be Underwriters Laboratory (UL) listed, comply with Article 800 (Communications Circuits) of the National Electrical Code, and meet the specifications of NEMA (low loss), UL 444, and ICEA. Conductor shall also conform to the requirements for solid annealed copper wire in accordance with ASTM B 3.
H. All cables, termination components, and support hardware shall be furnished, tested, installed, and wired by the Contractor.
I. The jacket color for data cables shall be the following:

1. BLUE – Wireless Access Points (non-Erate)
2. GREEN – Wireless Access Points (Erate)

J. IMPORTANT: Cable and termination components (jack, patch panel, wiring blocks) are specified to function as a system. The compatibility of the cable to be installed with the proposed termination components shall be recognized and documented by the termination component manufacturer.

K. Manufacturers:

1. Superior Essex

2.04 INFORMATION OUTLET

A. General

1. Station cables shall each be terminated at their designated workstation location in the connector types described in the subsections below. Included are modular jacks, faceplates, and surface mount raceway. The combined assembly is referred to as the Standard Information Outlet (SIO). These connector assemblies shall snap into a mounting frame.
2. SIOs shall be mounted in new outlet boxes, where existing boxes are in place, on surface mount raceway typically in surface raceway with barrier, in floor mount interface boxes, or on power poles either currently owned or new.
3. The telecommunications outlet frame shall accommodate or incorporate the following:
   a. A minimum of four (4) modular jacks, when installed on a wall-mounted assembly.
   b. A mechanism for adjusting the surface plate to a plumb position.
4. When multiple jacks are identified in close proximity on the Drawings. The Contractor shall determine the optimum compliant configuration based on the products proposed.
5. The same orientation and positioning of jacks and connectors shall be utilized throughout the installation. Prior to installation, the Contractor shall submit the proposed configuration for each SIO type for review by the Consultant.

B. Modular Jack

1. Data jacks shall be non-keyed 8-pin modular jacks.
2. Termination components shall be designed to maintain the cable's pair twists as closely as possible to the point of mechanical termination.
3. Jacks shall utilize a four-layer printed circuit board to control NEXT.
4. Jack housings shall fully encase and protect printed circuit boards and IDC fields.
5. Modular jack contacts shall accept 2500 plug insertions.
6. Modular jack contacts shall be formed flat for increased surface contact with mated plugs. These contacts shall be arranged on the PC board in two staggered arrays of four to maximize contact spacing and minimize crosstalk.
7. Modular jack contacts shall be constructed of Beryllium copper for maximum spring force and resilience.
8. Contact Plating shall be a minimum of 50 micro inches of gold in the contact area over 50 micro-inch of nickel, compliant with FCC part 68.5.
9. Jack termination shall be 110 IDC, integral to the jack housing, laid out in two arrays of four contacts.
10. Jacks shall utilize a paired punch down sequence. Cable pairs shall be maintained up to the IDC, terminating all conductors adjacent to its pair mate to better maintain pair characteristics designed by the cable manufacturer.
11. Jacks shall utilize tin lead plated (60% tin/40%lead) phosphor bronze 110 insulation displacement contacts.
12. Jacks shall terminate 22-26 AWG stranded or solid conductors.
13. Jacks shall terminate insulated conductors with outside diameters up to .050".
14. Jacks shall be compatible with single conductor 110 impact termination tools.

15. Jacks shall be compatible with EIA/TIA 606 color code labeling and accept snap on icons for identification or designation of applications.
16. Category 6 jacks shall be the following color:
    a. YELLOW – Standard Data
    b. PINK – Security Cameras
17. Category 6A jacks shall be the following color:
    a. BLUE – Wireless Access Points (non-Erate)
    b. GREEN – Wireless Access Points (Erate)
18. Jacks shall be marked as either T568A or T568B wiring.
19. Category 6 jacks shall be manufactured by:
    a. Ortronics Series II
20. Category 6a jacks shall be manufactured by:
    a. Ortronics Series II

C. Outlet Faceplates
1. Faceplates shall match the electrical outlets for material type and color.
2. Faceplates shall incorporate recessed designation strips at the top and bottom of the frame for identifying labels. Designation strips shall be fitted with clear plastic covers.
3. Any unused jack positions shall be fitted with a removable blank inserted into the opening.
4. Modular jacks shall have capability to incorporate a dust cover that fits over and/or into the jack opening. The dust cover shall be designed to remain with the jack assembly when the jack is in use. No damage to the jack pinning shall result from insertion or removal of these covers. Dust covers that result in deformation of the jack pinning shall not be accepted.
5. Wall-mounted “voice only” outlets shall be installed where identified on the floor plan Drawings to accommodate wall-mounted telephone sets. The wall plate shall be of stainless steel construction, accommodate one RJ-45 jack, mount on a standard single gang outlet box or bracket, and include mating lugs for wall phone mounting.
6. All standard information outlets and the associated jacks shall be of the same manufacturer throughout each/the building. An allowable exception, however, is the wall-mounted “voice only” outlet described above.
7. Faceplates shall be manufactured by modular jack manufacturer.

D. Surface Mount Interface Box
1. Low profile, surface mount boxes shall incorporate recessed designation strips at the top for identifying labels. Designation strips shall be fitted with clear plastic covers.
2. The box shall feature built-in cable management for both fiber and copper applications.
3. Any unused jack positions shall be fitted with a removable blank inserted into the opening.
4. Modular jacks shall have capability to incorporate spring-loaded shutter door for added protection from dust and other airborne contaminants. The dust cover shall be designed to remain with the jack assembly when the jack is in use.
5. The box shall have the capability to incorporate optional magnets that can be internally mounted.
6. Surface mount box shall be manufactured by modular jack manufacturer.

PART 3 EXECUTION

3.01 TESTING

A. Refer to Section 27 0000 for additional requirements.

3.02 TWISTED PAIR TEST EQUIPMENT

A. Test equipment used under this contract shall be from a manufacturer who has a minimum of five years' experience in producing field test equipment. Manufacturers shall be ISO 9001 certified.
B. All test tools of a given type shall be from the same manufacturer and have compatible electronic results output. Test adapter cable shall be approved by the manufacturer of the test equipment. Baseline accuracy of the test equipment shall exceed TIA Level III, as indicated by independent laboratory testing.
C. Test equipment shall:
    1. Be capable of certifying Category 5E, 6 and 6A permanent links.
    2. Have a dynamic range of at least 100dB to minimized measurement uncertainty.
    3. Be capable of storing full frequency sweep data for all tests and printing color graphical reports for all swept measurements.
    4. Include S-band time domain diagnostics for NEXT and return loss.
    5. Be capable of running individual NEXT, return loss, etc., measurements in addition to AutoText.
    6. Include a library of cable types, stored by major manufacturer.
    7. Store at least 1000 Category 5e, 6 or 6A autotests in internal memory.
D. The measurement reference plane of the test equipment shall start immediately at the output of the test equipment interface connector. There shall not be a time domain dead zone of any distance that excludes any part of the link from the measurements.
E. The approved manufacturer of the test equipment is Fluke and JDSU/Viavi.

3.03 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.04 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

3.05 STATION CABLING

A. Information outlet cables with copper media (voice & data UTP and "TV" coax) shall be located as detailed on the Project Drawings.
B. The Contractor shall utilize these documents in determining materials quantities and routing.
C. Station cables shall be run to the information outlet from the telecommunications room serving each area in conduit, free-air above drop ceiling, in cable tray, and/or in modular furniture.
D. The maximum station cable drop length for UTP cables shall not exceed 250 feet in order to meet data communications performance specifications. This length is measured from the termination panel in the wiring closet to the outlet and shall include any slack required for the installation and termination. The Contractor shall install station cabling in a fashion to avoid unnecessarily long runs.
E. Contractor shall verify cable lengths comply with published standards; prior to installation of any horizontal cabling, this Contractor shall verify cable paths and confirm no horizontal cable will exceed 250 total feet. If it is determined that the cable will exceed 250', this Contractor shall route the cabling to another telecommunications room or determine shorter path so cables are under 250'. If this is not possible, the Contractor shall notify the Consultant prior to installation so a new IDF location may be coordinated.
F. If, upon testing the installed cabling exceeds the allowed 250', the Contractor shall provide a new IDF within 250' of the affected outlets and shall replace the non-compliant cables with new cabling to the new IDF, all at no additional cost to the Owner. The new IDF shall meet all Owner standards outline in these specifications.
G. All cables shall be installed splice-free unless otherwise specified.
H. During pulling operation, an adequate number of workers shall be present to allow cable observation at all points of duct entry and exit as well as the feed cable and operate pulling machinery.

I. Avoid abrasion and other damage to cables during installation.
J. All cable shall be free of tension at both ends. In cases where the cable shall bear some stress, Kellom grips may be used to spread the strain over a longer length of cable.
K. Where installed free-air, installation shall consider the following:
    1. Cable shall run at right angles and be kept clear of other trades' work.
    2. Cables shall be supported according to code, using "J-hooks" anchored to ceiling concrete, walls, piping supports, or structural steel beams.
    3. Hooks shall be designed to maintain cable bend to larger than the minimum bend radius (typically 4x the cable diameter).
    4. Supports shall be spaced at a maximum 4-foot interval unless limited by building construction. If cable "sag" at mid-span exceeds 6 inches, another support shall be used.
L. Cable shall never be laid directly on the ceiling grid.
M. Cables shall not be attached to existing cabling, plumbing, or steam piping, ductwork, ceiling supports, or electrical or communications conduit.
N. Manufacturers' minimum bend radius specifications shall be observed in all instances. Use of plastic cable ties is not acceptable. Cable bundles shall be neatly dressed with use of Velcro type straps.
O. Cable sheaths shall be protected from damage from sharp edges. Where a cable passes over a sharp edge, a bushing or grommet shall be used to protect the cable.
P. A coil of one foot in each cable shall be placed in the ceiling at the last support (e.g., J-hook) before the cables enter a fishable wall, conduit, surface raceway, or box. At any location where cables are installed into movable partition walls or modular furniture via a service pole, approximately 15 feet of slack shall be left in each station cable under 250 feet in length to allow for change in the office layout without re-cabling. These "service loops" shall be secured at the last cable support before the cable leaves the ceiling and shall be coiled from 100% to 200% of the cable recommended minimum bend radius.
Q. To reduce or eliminate EMI, the following minimum separation distances from ≤480V power lines shall be adhered to:
    1. Twelve (12) inches from power lines of <5-kVa
    2. Eighteen (18) inches from high voltage lighting (including fluorescent)
    3. Thirty-nine (39) inches from power lines of 5-kVa or greater
    4. Thirty-nine (39) inches from transformers and motors
R. All openings shall be sleeved and firestopped per prevailing code requirements upon completion of cable installation.

3.06 INFORMATION OUTLET

A. Information outlets shall be flush mounted on wall-mounted boxes, in floor-mounted boxes, on surface raceway, or on modular furniture.
B. Any outlets to be added where these conditions are not met shall be positioned at a height matching that of existing services or as directed otherwise by the Site Coordinator and the Consultant. Nominal height (from finished floor to center line of outlet) in new installation shall be as follows:
    1. Standard Voice & Data Outlet (SIO) shall match adjacent electrical outlets.
    2. Wall-Mounted Telephone Outlet (Standard Voice only) shall meet ADA requirements for both front and side reach access.
C. The Contractor shall coordinate the style of the telecommunication outlets to be installed in the floor mount boxes and surface mount raceways with the Owner.

3.07 ELEVATOR INTERFACE

A. The Contractor shall furnish and install an elevator interface box outside of the elevator equipment room.

1. The Contractor shall provide an elevator telecommunications junction box located outside of the Elevator Machine Room, for interface of telecommunication cable to the elevator cab(s). This requirement complies with ANSI A17.1 code which prevents work within the Elevator Machine Room, other than specific elevator work.
2. Telecommunications J-box shall include a keyed lockable door. Additionally, the J-box shall have proper punch down blocks and data jacks suitable for terminating all cables within the J-box.
3. The Contractor shall provide any voice/data cables to this enclosure as required.
4. Electronics or cable for other systems such as security shall not be placed within this enclosure.
5. Coordinate exact location of elevator security junction box with the Elevator Contractor, Architect, and Consultant, prior to installation.
6. Cables entering the elevator telecommunications J-box and elevator equipment room shall be appropriately labeled by the Contractor, so that the Elevator Contractor can connect the appropriate wires to the elevator controllers. Wires should be individually labeled to separate them from other elevator functions and to assist the Elevator Contractor in making proper connection points.

3.08 CABLE TERMINATION

A. At the telecommunication closet, all data and voice cables shall be positioned on termination hardware in sequence of the outlet ID, starting with the lowest number.
B. Termination hardware (blocks and patch panels) positioning and layout will be reviewed and approved by the Consultant prior to construction. The review does not exempt the Contractor from meeting any of the requirements stated in this document.
C. Cable Termination – Data/Voice UTP
    1. Data/voice patch panels shall be designed and installed in a fashion as to allow future station cabling to be terminated on the panel without disruption to existing connections.
    2. Data patch panels shall be sized to accommodate a minimum of 20% growth in the quantity of stations relative to the initial installation.
    3. At information outlets and data/voice patch panels, the installer shall ensure that the twists in each cable pair are preserved to within 0.5 inch of the termination for data/voice cables. The cable jacket shall be removed only to the extent required to make the termination.
D. Cable Termination – Fiber Optic
    1. All fibers shall be terminated using the specified connector type.
    2. All terminated fibers at the telecommunications closets shall be mated to couplings mounted on patch panels. Couplings shall be mounted on a panel that, in turn, snaps into the housing assembly. Any unused panel positions shall be fitted with a blank panel inhibiting access to the fiber optic cable from the front of the housing.
    3. All couplings shall be fitted with a dust cap.
    4. Fibers from multiple locations may share a common enclosure, but they shall be segregated on the connector panels and clearly identified. Fibers from multiple destinations may be secured in a common enclosure, provided they are clearly identified as such. Fibers from different locations shall not share a common connector panel (e.g., “insert”).
    5. Slack in each fiber shall be provided as to allow for future re-termination in the event of connector or fiber end-face damage. Adequate slack shall be retained to allow termination at a 30” high workbench positioned adjacent to the termination enclosure(s). A minimum of one meter (~39”) of slack shall be retained regardless of panel position relative to the potential work area.
    6. If the cable is armored the Contractor shall install a plastic twist-on bushing on each end of interlocking armored fiber to protect cable from sharp edges of the armor.

3.09 TEST DATA – COPPER MEDIA

A. The test result records saved by the tester shall be transferred into a Windows-based database utility that allows for the maintenance, inspection, and archiving of these test records. A guarantee shall be made that these results are transferred to the PC unaltered, i.e., “as saved in the tester” at the end of each test. Comma separated value (CSV) format is not acceptable.

B. The database for the completed job – including twisted-pair copper cabling links, if applicable –shall be stored and delivered on CD-ROM. This CD-ROM shall include the software tools required to view, inspect, and print any selection of test reports.

C. A paper copy of the test results shall be provided that lists all the links that have been tested with the following summary information:

1. The identification of the link in accordance with the naming convention defined in the overall system documentation.
2. The overall Pass/Fail evaluation of the copper channel-under-test, including the NEXT worst-case margin (margin is defined as the difference between the measured value and the test limit value).
3. The overall Pass/Fail evaluation of the fiber link-under-test, including the Attenuation worst-case margin (margin is defined as the difference between the measured value and the test limit value).
4. The date and time the test results were saved in the memory of the tester.

3.10 COPPER STATION CABLES

A. Station cabling testing shall be from the jack at the outlet in the work area to the patch panel on which the cables are terminated.

B. Testing shall be of the permanent link. Contractor shall warrant performance, however, based on channel performance and provide patch cords that meet channel performance criteria. All cabling not tested strictly in accordance with these procedures shall be retested at no cost to the Owner.

C. Testing shall be from the jack at the SIO to the patch panel on which the cables are terminated at the wiring hub.

D. Horizontal “station” cables shall be free of shorts within the pairs and shall be verified for continuity, pair validity and polarity, and wire map (conductor position on the modular jack). Any defective, split, or mispositioned pairs shall be identified and corrected.

E. Testing of the cabling systems rated at TIA Category 5e/6/6a and above shall be performed to confirm proper functioning and performance.

F. Testing of the transmission performance of station cables (Category 5e/6/6a) shall include the following:

1. Length
2. Attenuation
3. Pair to Pair NEXT
4. ACR
5. PSNEXT Loss
6. Return Loss
7. Pair to Pair ELFEXT Loss or ACRF
8. PSEFEXT Loss or PS-ACRF
9. Propagation Delay
10. Delay Skew
11. Return Loss

G. The maximum length of station cable shall not exceed 90 meters, which allows 10 meters for equipment and patch cables.

H. Worst case performance at 20°C, based on a horizontal cable length of 90 meters and equipment cord length of 4 meters, shall be as follows:

1. CATEGORY 6 (Permanent LINK)

Frequency (MHz)	Insertion Loss (Maximum dB)	NEXT Loss Pair to Pair (dB)	PS-NEXT Loss (dB; Worst Case)	ELFEXT Loss Pair to Pair (dB)	PSELFEXT loss (dB)
1.0	1.9	65.0	62.0	64.2	61.2
4.0	3.5	64.1	61.8	52.1	49.1
8.0	5.0	59.4	57.0	46.1	43.1
10.0	5.5	57.8	55.5	44.2	41.2
16.0	7.0	54.6	52.2	40.1	37.1
20.0	7.8	53.1	50.7	38.2	35.2
25.0	8.8	51.5	49.1	36.2	33.2
31.25	9.8	50.0	47.5	34.3	31.3
62.5	14.1	45.1	42.7	28.3	25.3
100.0	18.0	41.8	39.3	24.2	21.2
200.0	26.1	36.9	34.3	18.2	15.2
250.0	29.5	35.3	32.7	16.2	13.2

2. CATEGORY 6a (Permanent LINK)

Frequency (MHz)	Insertion Loss (Maximum dB)	NEXT Loss Pair to Pair (dB)	PS-NEXT Loss (dB; Worst Case)	ACRF Pair to Pair (dB)	PS-ACRF (dB)
1.0	1.9	65.0	62.0	64.2	61.2
4.0	3.5	64.1	61.8	52.1	49.1
8.0	5.0	59.4	57.0	46.1	43.1
10.0	5.5	57.8	55.5	44.2	41.2
16.0	7.0	54.6	52.2	40.1	37.1
20.0	7.8	53.1	50.7	38.2	35.2
25.0	8.8	51.5	49.1	36.2	33.2
31.25	9.8	50.0	47.5	34.3	31.3
62.5	14.1	45.1	42.7	28.3	25.3
100.0	18.0	41.8	39.3	24.2	21.2
200.0	26.1	36.9	34.3	18.2	15.2
250.0	29.5	35.3	32.7	16.2	13.2
300.0	32.7	34.0	31.4	14.6	11.6
400.0	38.5	29.9	27.1	12.1	9.1
500.0	43.8	26.7	23.8	10.2	7.2

I. In the event results of the tests are not satisfactory, the Contractor shall make adjustments, replacements, and changes as necessary and shall then repeat the test or tests that disclosed faulty or defective material, equipment, or installation method. The Contractor shall make additional tests as the Consultant deems necessary at no additional expense to the Owner or Consultant.

J. All data shall indicate the worst-case result, the frequency at which it occurs, the limit at that point, and the margin. These tests shall be performed in a swept frequency manner from 1 MHz to highest relevant frequency, using a swept frequency interval that is consistent with TIA and ISO requirements. Information shall be provided for all pairs or pair combination and in both directions when required by the appropriate standards.

K. Cables shall be tested to the maximum frequency defined by the standards covering that performance category. Transmission Performance Testing shall be performed using a test instrument designed for testing to the specified frequencies. Test records

shall verify “PASS” on each cable and display the specified parameters—comparing test values with standards-based “templates” integral to the unit.

END OF SECTION

SECTION 27 1600
COMMUNICATIONS CONNECTING CORDS

PART 1 GENERAL

1.01 SCOPE

A. This section describes the products relating to high quality Category 6 voice and data patch cords.
B. In this section the term patch cords refers to the cords that connect Owner provided data network electronics to the horizontal cable infrastructure.
C. It is important that the horizontal cable system and the provided patch cords work as one complete system for guaranteed channel performance. Patch cords shall be manufactured by the same manufacturer as the jack and patch panels.
D. The Contractor shall provide and deliver all cords as listed in this section. The Owner will be responsible for installation of cords.

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0523 – Pathways for Technology Systems
D. Section 27 0526 – Grounding and Bonding for Technology Systems
E. Section 27 1100 – Communications Equipment Rooms
F. Section 27 1300 – Communications Backbone Cabling
G. Section 27 1500 – Communications Horizontal Cabling
H. Section 27 1800 – Communications Labeling and Identification
I. Section 27 3000 – Voice Communications
J. Section 27 4000 – AV/Multimedia General Requirements
K. Section 27 4100 – Audio Visual Systems
L. Section 27 5100 – Distributed Communications Systems
M. Section 27 6000 – Physical Security General Requirements
N. Section 27 6200 – Electronic Access Control System
O. Section 27 6400 – Video Surveillance System
P. Section 27 6600 – Intrusion Detection System

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 00 00.

2.02 CATEGORY 6 AND 6A PATCH CORDS

A. The Owner has the right to determine the final length of the patch cords after the contract is awarded.
B. All patch cords shall be round and consist of eight insulated 23 AWG, stranded copper conductors, arranged in four color-coded twisted pairs within a flame retardant jacket and be backwards compatible with lower performing categories. Modular patch cords shall utilize ISO termination method that is designed to reduce and control near-end cross talk (NEXT) and far end cross talk (FEXT) without compromising signal impedance.
C. Both ends of the cord shall be equipped with modular 8-position (RJ45 style) plugs wired straight through with standards compliant wiring. All modular plugs shall exceed FCC CFR 47 part 68 subpart F and IEC 603.7 specifications, and have 50 micro inches of gold plating over nickel contacts. Cable shall be label-verifiable. Cable jacket shall be factory marked at regular intervals indicating verifying organization and performance level. Patch cords shall have color-coded insert molded strain relief boot with a latch guard to protect against snagging. Additional color-coding shall be available by the use of snap-in icons.
D. Patch cords shall be wired straight through. Pin numbers shall be identical at each end and shall be paired to match T568B patch panel jack wiring per ANSI/TIA/EIA-568-B. Patch cords shall be unkeyed.
E. The manufacturer of the cords shall be the same as the manufacturer for UTP termination hardware (jacks & patch panels). Cords shall be highest quality patch cords available by connectivity manufacturer.
F. The patch cords shall match the Category rating of the jack and cable it will be connecting to.
G. Contractor shall confirm patch cord lengths with Owner prior to ordering.
H. This Contractor shall provide the following patch cords (for pricing purposes only; refer to section 3.04 below):

Qty	Length	Notes	Category	Color
1 per drop	3-9 feet	MDF/IDF – Standard Data	Cat6	Yellow
1 per drop	3-9 feet	MDF/IDF – Cameras	Cat6	Pink
1 per drop	3-9 feet	MDF/IDF – WAPs (non-Erate)	Cat6A	Blue
1 per drop	3-9 feet	MDF/IDF – WAPs (Erate)	Cat6A	Green
1 per drop	10-15 feet	Workstation – Standard Data	Cat6	Yellow
1 per drop	10-15 feet	Workstation – Cameras	Cat6	Pink
1 per drop	10-15 feet	Workstation – WAPs (non-Erate)	Cat6A	Blue
1 per drop	10-15 feet	Workstation – WAPs (Erate)	Cat6A	Green

2.03 FIBER OPTIC PATCH CORDS

A. The Owner has the right to determine the final length of the patch cords after the contract is awarded.
B. All MM fiber optic patch cords shall:
   1. Be duplex 2-3mm tight buffer design with Aqua jacket.
   2. Have LC-LC connectors with straight thru connectors (A-A Polarity).
   3. Have 50-micron OM3 core.
   4. Have 8-9 micron OS2 core.
C. This Contractor shall provide the following patch cords (for pricing purposes only; see section 3.04 below):

Qty	Length	Notes

1 per drop	3 meters	MM Non-Plenum

PART 3 EXECUTION

3.01 TESTING

A. Refer to Section 27 0000 for additional requirements.

3.02 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.03 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

3.04 ORDERING AND DELIVERY

A. Prior to ordering patch cords the Contractor shall schedule meeting with Owner and Consultant to verify patch cord lengths, colors and quantities.
B. Contractor shall coordinate delivery of patch cords with Owner. Contractor shall have list of delivered cords and shall have Owner sign delivery sheet at time of delivery.

END OF SECTION

SECTION 27 1800
COMMUNICATIONS LABELING AND IDENTIFICATION

PART 1 GENERAL

1.01 SCOPE

A. This section describes the products and execution requirements relating to labeling of telecommunications cabling, termination components, and related subsystems. Covered systems include the following:
   1. Equipment room backboards and equipment racks
   2. Station cable and terminating equipment
   3. Telecommunications grounds and related components

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0523 – Pathways for Technology Systems
D. Section 27 0526 – Grounding and Bonding for Technology Systems
E. Section 27 1100 – Communications Equipment Rooms
F. Section 27 1300 – Communications Backbone Cabling
G. Section 27 1500 – Communications Horizontal Cabling
H. Section 27 1600 – Communications Connecting Cords
I. Section 27 3000 – Voice Communications
J. Section 27 4000 – AV/Multimedia General Requirements
K. Section 27 4100 – Audio Visual Systems
L. Section 27 5100 – Distributed Communications Systems
M. Section 27 6000 – Physical Security General Requirements
N. Section 27 6200 – Electronic Access Control System
O. Section 27 6400 – Video Surveillance System
P. Section 27 6600 – Intrusion Detection System

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 00 00.

2.02 LABELS

A. All labels shall be permanent and be machine generated (e.g., Brady or Panduit). No handwritten or non-permanent labels shall be allowed. Labels shall be Brady “I.D. Pro” or XC-Plus or equivalent. Labeling on backboards and/or equipment racks may be pre-cut adhesive type.
B. Characters on all labels shall be black printed on a white background.
C. Label size shall be appropriate to the cable size(s), outlet faceplate layout, patch panel design, or other related equipment sizes and layouts.
D. All labels to be used on cables shall be self-laminating, white/transparent vinyl, and be wrapped around the cable sheath. The labels shall be of adequate size to accommodate the circumference of the cable being labeled and properly self-laminated over the full extent of the printed area of the label.
E. Labels used to identify innerduct carrying fiber optic cable shall be labeled with a durable yellow polyethylene tag that reads “CAUTION Fiber Optic Cable” and includes blank spaces for adding (1) fiber count and (2) destination information. An example of a compliant product is VIP Products’ “Caution Write-On Coverall Tag.”

PART 3 EXECUTION

3.01 TESTING

A. Refer to Section 27 0000 for additional requirements.

3.02 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.03 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

3.04 GENERAL

A. The Contractor shall match the Owner’s standard labeling scheme.
B. Clean surfaces before attaching labels.
C. Install all labels firmly. Labels attached to terminating equipment such as backboards, faceplates, 110 blocks, and patch panels shall be installed plumb and neatly on all equipment.

3.05 LABELING OF CABLING AND TERMINATION COMPONENTS

A. Backboard and Equipment Racks
    1. Backboards and equipment racks shall be labeled by the Contractor identifying the telecommunication room. Additionally, equipment racks shall have an alpha character after the room number unique to that particular communications closet. For example, TR1-A would be the first rack in TR1.
    2. Character height shall be 1-inch (minimum).
B. Cabling
    1. Horizontal cables shall have a machine generated wrap around cable label within 4” of each end of the cable. Label shall be clearly legible and meet TIA-EIA 606 standards. Character height shall be .25” (minimum).
    2. Voice/data/video backbone cables shall have a machine generated wrap around cable label within 12” of each end of the cable. Label shall be clearly legible and meet TIA-EIA 606 standard. Character height shall be .5” (minimum).

3.06 FIBER OPTIC BACKBONE, RISER CABLES, AND TERMINATION COMPONENTS

A. All fiber optic backbone and copper (inter-building, riser, and tie) cables shall be identified AT BOTH ENDS with a designation that identifies where the opposite end of the same cable terminates (e.g., equipment room or telecommunications room I.D.). In addition, labeling of all fiber optic cables shall include the number of fibers in the cable.
B. Each fiber optic termination panel shall be clearly labeled indicating the destination of the cable(s) and the fiber number of each fiber position. The cable identifiers are to be secured to (1) the side and (2) the front cover of the panel enclosure.

3.07 STANDARD INFORMATION OUTLET (SIO) FACEPLATES

A. All faceplates shall be clearly labeled indicating the destination of the cable(s) (telecommunication room number), the data patch panel(s) letter designation, the data port number(s) on the data patch panel(s), and the voice cable number(s).
B. Telecommunications outlets are to be labeled (1) on the cover of the assembly and (2) on each cable terminated at that location.
C. Station cables shall be labeled within two inches of the cable end.

3.08 DATA PATCH PANELS

A. All data patch panels shall be clearly labeled indicating the telecommunication room number, the data patch panel letter designation, and the data port number on the data patch panel (ports 1 through 48). Each telecommunication room shall start with data patch panel ‘A’ and continue through the alphabet.
B. A data port schedule for each telecommunication room shall be created in spreadsheet format (Excel) with the telecommunication room number, data patch panel letter designations, data port numbers, and room numbers identified in the spreadsheet. In addition, for each data patch panel port, a field shall be provided in the spreadsheet for the Owner to manage the cabling infrastructure by recording the device and any special notes pertaining to the room utilizing the data cable terminated to the port.
C. Refer to Telecommunication “T” Series Project Drawings for standard information outlet faceplate and data & voice patch panel labeling scheme requirements. A sample of the data and voice port schedules is to be provided to the Owner, in the cable record book and in electronic format (Excel spreadsheet), with final documents provided on the Project Drawings.

3.09 FIBER OPTIC CABLES AND TERMINATION COMPONENTS

A. All fiber optic cables, termination enclosures and connector panels, and splice closures shall be clearly labeled.
B. In addition, labeling of all fiber optic cables shall include the number of fibers in the cable.
C. Each fiber optic termination panel shall be clearly labeled indicating (1) the destination(s) of the cable(s) and (2) fiber number of each fiber position. The cable identifiers are to be secured to (1) the side and (2) the front cover of the panel enclosure.

3.10 GROUND SYSTEM LABELING

A. All grounds shall be labeled as close as practical to the point of termination (for ease of access to read the label). Labels shall be nonmetallic and include the following statement: “WARNING: If this connector or cable is loose or must be removed, please call the building telecommunications manger.” Refer to ANSI/TIA/EIA 606 for additional labeling requirements.

END OF SECTION

SECTION 27 4000
AV MULTIMEDIA GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 SCOPE

A. Refer to Section 27 00 00 for additional project scope information.
B. Successful bidder shall provide, install, configure, and provide warranty service for audiovisual systems, including displays, audio/video/graphics switching and distribution systems, integrated control systems, and other equipment as described herein.

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0523 – Pathways for Technology Systems
D. Section 27 0526 – Grounding and Bonding for Technology Systems
E. Section 27 1500 – Communications Horizontal Cabling
F. Section 27 1600 – Communications Connecting Cords
G. Section 27 1800 – Communications Labeling and Identification
H. Section 27 4100 – Audio Visual Systems

1.03 REFERENCE

A. In addition to any requirements below, Contractor shall abide by requirements delineated in 27 0000 including but not limited to:
    1. General: Definitions, reference standards and codes, qualifications, pre-construction submittals, construction progress submittals, closeout submittals, and correction period.
    2. Products: Substitutions, product specifications, miscellaneous material, cable, connectors, power devices, and interface panels.
    3. Execution: Coordination, testing, training, warranty, and cable management.

1.04 DEFINITIONS

A. HDCP: High-bandwidth Digital Content Protection or a security protocol designed to limit unauthorized use of protected content. Where applicable, HDCP compliant devices shall be utilized per design specifications. Use of HDCP compliant systems designed herein is the responsibility of the end user and compliance with Owner's Fair Use policies.
B. EDID, E-EDID: Extended Display Information Data, Enhanced-Extended Display Information Data or a remotely readable (read by a source) data file that resides in a display or specialized audiovisual device – commonly referred to as a "sink" – describing the capabilities of the sink to a connected source.
C. Configuration: the software and firmware programming that defines and creates the functionality, levels, presets, and settings of devices.
D. Configure: To define functionality, levels, presets, and settings of device(s) using software and/or firmware.
E. Programmer: Contractor personnel engaged in developing the configuration of systems.
F. DSP: Digital Signal Processing, or Digital Signal Processor.
G. AEC: Acoustic Echo Cancellation.
H. Fixed Architecture: Referring to software providing fixed processing paths with adjustable processing objects in a predetermined sequence.
I. Open Architecture: Referring to software providing infinitely variable Programmer selected processing paths with adjustable processing objects arranged in any sequence deemed appropriate by Programmer.

1.06 QUALIFICATIONS

A. Primary AV Contractor shall have at least one (1) employee assigned to the project in a design or management role, and at least one (1) employee assigned to the project in an installing technician role, holding at least one of the follow certifications:
   1. CTS (InfoComm International)
   2. CTS-I (InfoComm International
   3. CTS-D (InfoComm International)
   4. EST-L2 (National Systems Contractor Association)

B. DSP Programmer
   1. Training: Programmer shall have received manufacturer-provided and/or manufacturer approved training in the configuration of the DSP systems being provided.
   2. Certification: Programmer shall hold the highest applicable manufacturer programming certification(s) offered by the manufacturer(s) of the DSP hardware.

C. Control System Programmer
   1. Training: Programmer shall have received manufacturer-provided and/or manufacturer approved training in the configuration of the integrated control systems being provided.
   2. Certification: Programmer shall hold the applicable manufacturer programming certification(s) or be an authorized independent programmer of the integrated control systems.
      a. For AMX: AMX Certified Expert (ACE Programming Expert)
      b. For Crestron: Crestron Certified Programmer
      c. For Extron: Extron Control Professional
      d. Or approved equal

D. Refer to subsequent sections for section specific qualification requirements.

1.07 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 00 00 for additional requirements.
B. Structurally Mounted Elements: Including but not limited to monitors, projectors, projection screens, and loudspeakers.
C. Frequency Assignment Plans: Provide for all wireless microphones.

D. Custom Engraving: Layout and labeling/engraving of custom products including wall plates and interconnection panels. Provide engraving detail with material and finish detail.
E. Power Distribution: Plan for distribution and switching of AC and DC power to all audiovisual devices, including sequencing order of outlets and banks. Time delay to be field configured as necessary for proper system power up and down.
F. Colors: Confirm color option selections with Architect per location for items such as speakers, projectors, plates, etc.
G. Layouts of physical and virtual user controls in graphical format. This shall include:
    1. Engraved buttons and overlays
    2. Machine-printed adhesive labels
    3. Graphical user interfaces for touch panels or web interfaces
    4. Descriptive write-up of function(s) of each button for each page.
H. Copy of manufacturer configuration software, or link to manufacturer website download page for accessing configuration software.
    1. Version: Submitted software shall be identical version used to create Audio DSP configuration.
I. Integrated control system review shall be done via web conference with Consultant.
J. Contractor shall make changes as requested by Consultant in pre-construction submittal review.

1.08 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.09 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.
B. Quick-Reference Guides: Contractor shall create a concise quick-reference guide covering normal system operation and basic troubleshooting procedures for each room/system type. Length of each quick-reference guide shall be commensurate with the information needed for successful operation, subject to Owner approval.
    1. Upon Owner approval, Contractor shall provide two (2) laminated copies and one (1) digital copy for each room/system type.
C. Serial Numbers: Contractor shall provide a list of serial numbers for all supplied components with serial numbers and with a unit price greater than $99. Organize list by room/system type.

1.10 CORRECTION PERIOD

A. Length of Period: Contractor shall offer a one year correction period to Owner for this system. Contractor shall repair all equipment and cabling problems at no additional cost to Owner during the correction period.
B. Commencement: Correction period shall begin at date of Final Acceptance.
C. Final Acceptance: shall be defined as the date at which all contract work (save for a correction period) is complete, including punch list completion & verification, closeout submittals, and written verification by the Owner is obtained by the Contractor that the systems have been accepted.
D. Response: Contractor shall respond by phone within two (2) hours to calls for service or assistance from Owner during normal business hours for the duration of the correction period.
E. On-site Response: Contractor shall respond on-site within eight (8) business hours from the time of the initial phone contact in the event that the issue cannot be resolved over the phone.
F. Equipment on Loan: Contractor shall loan equipment for any broken, defective, or non-functional equipment that cannot be repaired and returned within one week. Contractor shall provide shipping, delivery, and integration at no additional cost to Owner.

Equipment shall be comparable in size, speed, brightness, and relevant performance specifications, as determined by Owner.

G. Projection Lamps: Projection lamps are to be warranted by Contractor for a minimum of 90 days, or the rated life expectancy of the lamp, whichever comes first.

H. Damaged Equipment: Equipment that is damaged due to intentional misuse, abuse or negligence is not covered under this warranty; however, Contractor shall assist Owner in putting the system back in working order in the shortest possible timeframe while charging normal service rates for labor and equipment.

1.11 OWNERSHIP

A. Property Rights: Contractor assigns to Owner any and all intellectual property rights and applications made by Contractor, or its agents or employees in connection with the performance of this contract. Contractor also acknowledges and agrees that services rendered in connection with the performance of this contract shall be a “work made for hire” within the meaning of Section 201 inventions of the Copyright Law of 1976.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 0000.

2.02 PRODUCT SPECIFICATIONS

A. Provisions: Product specifications are provided in subsequent sections to Contractor for the appropriate configuration and/or provision of accessories as well as for a guide to indicate key features for possible substitutions.

B. Where wireless microphone systems are specified, Contractor shall determine optimal frequency range for final product selection and submit Manufacturer’s recommended frequency band for Owner and Consultant approval prior to ordering equipment. Contractor shall provide congruent frequency band products where like systems are specified for interoperability of components. Where three (3) or more wireless microphones are specified within the same system, Contractor shall provide and install necessary antennae distribution for optimal performance, to be submitted for Owner and Consultant approval during pre-construction phase.

C. Interconnections: Contractor shall be responsible for providing populated, grommeted, or blank cover plates for all wall and floor box openings intended for audiovisual systems.

D. Twisted Pair (TP) Category Cabling: Contractor shall use twisted pair Category cable as recommended by manufacturer of transmission equipment for optimal bandwidth and signal timing. Where cable type is not specified by manufacturer, Contractor shall use shielded twisted pair Category 6 cabling. Cable type shall be detailed in pre-construction submittals with any deviations from manufacturer recommendations expressly noted.

E. Mounts: Contractor shall fabricate mounts for projectors, monitors, loudspeakers, cameras, etc. as necessary, and shall modify standard mounts as required for optimal mounting configurations. Intended hardware shall be detailed in shop drawing submittals.

1. Custom mounting configurations shall be submitted in shop drawings for review.
2. Contractor shall provide all hardware as necessary, including flanges, Unistrut, threaded pipe, column extensions, yokes, clamps, threaded rod, aircraft cable, and any other hardware required to securely mount equipment.
3. All ceiling tile penetrations shall be neatly finished with a plate, grommet and/or escutcheon ring.

2.03 MISCELLANEOUS MATERIAL

A. Required Equipment: Contractor shall provide additional system components typically and reasonably required to make system operational even though not specifically indicated in Drawings, Appendices or Specifications including, but not limited to, cable, connectors, connecting accessories, adaptors, power supplies, power strips, rack mounting adapters and shelves, cover plates and closure panels, relays and switches, remote antenna mounts, terminal blocks, and related connector and termination hardware required by but not supplied with the equipment.
B. Blank Fill Panels: Contractor shall provide blank fill panels to cover any openings in equipment racks provided under this contract whether specified in the equipment schedules or not. Fill panels shall match finish of specified rack hardware.
C. Power Distribution Strips: Contractor shall provide power distribution strips as necessary for distributing power within equipment racks and consoles. Strips shall be UL listed, be securely mountable, and appropriate for professional installation.
D. Wall Openings: Contractor shall provide blank faceplates to cover any unused openings within the project area. Faceplate type and finish to match electrical outlets in the project.
E. Input Cables: Contractor shall provide all interconnection cables shown on the project drawings, as well as end-user input cables at all locations where laptops and other user devices are intended to be connected.
F. Keys: Keys for like equipment shall be identical.
G. Wireless Transceivers: Where wireless transceivers are specified (including, but not limited to wireless microphones, wireless assistive listening devices, etc.) Contractor shall verify frequency band range of existing Owner wireless systems. Contractor shall provide wireless transceiver system(s) compatible with existing equipment for interoperability.
H. Cable Sleeving:
    1. Shall be black expandable sleeving, with ends neatly turned under 2”, held in place either by nylon tie-wrap, or heat-shrink tubing. Tie wraps, if used, shall not deform cables within the umbilical. Cables requiring sleeving include:
        a. Exposed cabling outside of wire management in console furniture.
        b. Cable umbilicals connecting to or from wall, floor, or ceiling plates consisting of more than one wire.
    2. Contractor shall coordinate as necessary so that all low-voltage cabling (including Ethernet) are included in a single umbilical

2.04 POWER DEVICES

A. Refer to Section 27 0000 for additional requirements.
B. All large venue audio amplifiers shall be on sequenced outlets.

2.05 FIRE STOPPING MATERIALS

A. Refer to Section 27 0000 for additional requirements.

PART 3 EXECUTION

3.01 EQUIPMENT

A. As required by Section 27 0000.
    1. Safety: Contractor shall use proper structural installation techniques and maintain a minimum 5:1 safety margin.
    2. Custom Mounting Finish: Custom mounting hardware shall be painted by Contractor to match either color of wall, ceiling or equipment, at Consultant’s discretion.

3.02 SPARE PARTS AND REMOTE CONTROLS

A. Projector lamps and filters
B. Remote controls and batteries

C. Adapters

3.03 INTERCONNECTION

A. As required by Section 27 0000.

1. Interpretation: Contractor shall make system interconnections as indicated on Drawings and specified herein. Contractor shall interpret Drawings using an understanding of the equipment and general system topology (both existing and future/specified). Contractor shall provide power and control lines to and from power supplies, remotely controlled equipment and other devices even though not explicitly indicated on Drawings or listed in equipment tables.
2. Additional: Contractor shall be responsible for associated equipment signals not specifically documented in provided drawings. These include synchronizing signals, transmitting and receiving antennas, and LAN connections to equipment provided and/or installed by Contractor.
3. Mass Notifications: Contractor shall ensure that audio systems are appropriately managed by emergency notifications so that emergency notifications are not impeded by the audio system.

3.04 CABLE MANAGEMENT

A. As required by Section 27 0000.

1. Above Ceiling: Cabling located above ceilings shall be tied off to and supported by ceiling supports or other structures at a minimum of eighteen (18) inches above the ceiling.
2. Not on Ceiling: Cabling shall not lie on the ceiling.
3. Wall Cabling: Cables installed in a horizontal fashion along wall surfaces shall be installed in surface raceway approved by Owner and Consultant.
4. Floor Cabling: Cabling placed at floor level such as microphones shall be installed on the floor in the shortest possible route to the nearest wall considering traffic patterns and in an enclosure designed for that use and offering protection from foot traffic.
5. Desk Cabling: Where a cable is installed inside desk furniture, a means of protecting the cables and holding cabling to a fixed surface shall be installed.
6. Grommets: Holes in horizontal furniture surfaces for cable pass-through shall be provided with appropriate sized grommet. Grommet shall be black unless otherwise specified or required.
7. Stub-ups: Where conduit is stubbed-up through the floor and exposed, Contractor shall wrap cables with black expandable sleeving and secure at least three (3) inches below level of conduit top.
    a. Where conduit is stubbed-up through floor and concealed within furniture, Contractor shall install tether comprised of aircraft cabling to limit the distance furniture may be moved away from stubbed-up conduit. Cabling service loop exiting stubbed-up conduit and entering furniture shall be longer than the corresponding tether, providing protection against movement of furniture that would otherwise damage installed cabling.
8. Umbilicals: Exposed cable umbilicals, such as those between instructional furniture and a floor- or wall-mounted plate, shall be covered in black expandable sleeving, with neatly finished ends (heat-shrink or Consultant-approved method).

3.05 CONNECTOR TERMINATION

A. As required by Section 27 00 00.

1. Video Connectors: Video connectors (BNC, RCA, and F) shall be terminated using a crimp tool or dies designed specifically for the connectors being applied.
2. XLR Connectors: Terminate XLR type connectors wired pin 2 high, pin 3 low, and pin 1 shield.
3. UTP: UTP cable shall be terminated with appropriate crimps tools or tools specified by manufacturer.

3.06 GROUNDING

A. Audiovisual equipment racks shall be grounded to the telecommunication grounding system with a minimum 6 AWG grounding cable. Refer to Section 27 0000 and 27 0526 for additional grounding requirements.

3.07 TESTING & INSPECTION

A. General Information: As required by Section 27 0000.
B. Notification: Prior to start of testing, provide a list to Consultant of test equipment make, model numbers and calibration dates that will be used.
C. Testing: Contractor shall perform complete testing on system before inspection. Selected systems may be retested during inspection at Owner's discretion.
D. Display/Output checks: Contractor shall verify that visual and audio outputs from the system are high-quality and without noticeable distortion or feedback at normal operating levels.
E. Wiring and Labeling: Contractor shall check all inputs and outputs for correct wiring and labeling.
F. Loudspeakers: Contractor shall measure the impedance of each speaker line leaving the equipment racks. For full range devices, use a frequency of 1000 Hz. For band limited devices, use a frequency appropriate for the operating range of the transducer. When documenting results, Contractor shall include the calculated impedance based on number of units on a line and the size and distance of the run. Contractor shall correct any field readings that differ more than 20% from the calculated impedance. Contractor shall use an electronic polarity checker to test each reinforcement speaker. Speakers shall have the same relative polarity.

3.08 COMPUTER GRAPHICS

A. Computer graphics shall be crisp and focused with respect to color alignment. If color alignment is not registered properly, Contractor shall identify source of problem and correct. EDID and other auto-registration features shall be set within AV equipment where required for optimal system performance.

3.09 TRAINING

A. General Information: As required by Section 27 0000 and following section(s).
B. Coordination and Personnel: Training shall be coordinated with Owner's schedule, and Contractor personnel who provide training are subject to Owner's approval.

3.10 PROJECT CLOSEOUT

A. Completion: System shall be considered complete when all of the following has occurred:
    1. Testing has been completed to the satisfaction of Owner and Consultant.
    2. Punch-listed items have been addressed to the satisfaction of Owner.
    3. As-built drawings and system documentation has been turned over to Owner and Consultant.
    4. Complete operational training has been conducted with Owner's staff.
    5. System Commissioning Process has been completed.
B. Acceptance: Contractor shall secure written Acceptance of systems in the form of authorized Owner signature on Acceptance Document. This shall constitute the Date of Acceptance.

END OF SECTION

SECTION 27 5100
DISTRIBUTED COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.01 SCOPE

A. Refer to Section 27 0000 for additional project scope information.
B. The Category 6 cabling to each IP enabled device shall be provided by the structured cabling Contractor. Patch cords for the IP devices to the network switches shall be furnished by this Contractor and installed by the Owner with participation by this Contractor. Patch cords from the IP device to the data jack shall be furnished by this Contractor and installed by this Contractor.
C. System installation shall include, but not be limited to, installation, programming, and configuration of system components as well as all associated software upgrades, patches, and maintenance for the first year.
D. The contractor shall provide public address call points and clock devices as shown in drawings. These devices shall be interconnected with the existing campus communications and clock systems. It shall be the responsibility of the contractor to determine the type and quantity of control and distribution devices required to provide a complete and functional system. Existing devices outside the scope of work which might be affected by the work shall be covered and maintained in place. If an existing device must be removed as part of the renovation, the contractor shall be responsible for covering, maintaining, and reinstalling the device in the existing location. Such devices shall be tested prior to system check out and if any existing devices are found to be faulty, they shall be replaced at no cost to the Owner.

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional requirements.

1.04 REFERENCE STANDARDS AND CODES

A. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.
B. Training: Programmer shall have received manufacturer-provided and/or manufacturer approved training in the configuration of the distributed communications system(s) being provided.
C. Certification: Programmer shall hold the highest applicable manufacturer programming certification(s) offered by the manufacturer(s) of the distributed communications system(s) hardware.

D. Submittal: Certification certificate shall be submitted with distributed communications system(s) submittals.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.07 PRE-INSTALLATION PROCEDURES

A. Refer to section 27 0000 for additional requirements.

1.08 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.09 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.10 DRAWING SHEETS

A. New devices and Category 6 cabling shall be provided at each location with a label “N#-##.”
B. New devices and Category 6 cabling shall be provided to replace existing devices and cable at each location with a label “E#-##”.
C. Existing devices and cabling shall be demolished at each location with a label “D#-##”. In these cases, the Contractor shall patch and paint the holes in drywall, provide a cover plate for recessed concrete or replace the ceiling tile. Ceiling tiles will be provided by the Owner.

1.11 MOUNTING AND INSTALLATION

A. Contractor shall provide the appropriate mounting hardware for all ceiling types and wall types where devices will be located.
B. Exterior devices shall be installed in a sealed backbox with a weather hood.

1.12 CODE AND STANDARD REQUIREMENTS

A. All work and materials shall conform in every detail to the rules and requirements of the National Fire Protection Association and any other codes as required by the AHJ.
B. All materials shall be listed by UL and shall bear the UL label. If UL has no published standards for a particular item, then other national independent testing standards shall apply and such items shall bear those labels. Where UL has an applicable system listing and label, the entire system shall be so labeled.
C. Other applicable codes and standards are as follows:
    1. ANSI/IEEE C2 – National Electrical Safety Code
    2. NFPA 70 – National Electrical Code
    3. TIA/EIA 568-C-1, 2, 3 Standards

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Basis of design shall be Valcom. Substitutions are not acceptable.

2.02 INTERCOM SYSTEM GENERAL DESCRIPTION

A. The Intercom System shall utilize a IP SIP based headend capable of communicating with IP, SIP, 2-wire digital and 4-wire analog intercom stations as well as outputs to connect to paging systems as an extension.
B. The system shall be capable of line supervision, speaker supervision and microphone supervision of each station and provide immediate notification of failures.
C. The system shall be capable of server to server or server to virtual server failover.
D. The system shall be capable of full duplex by default or selectable half duplex or simplex.
E. The system shall be capable of group calls, all calls and individual station calls.

F. The system shall be capable of initiating emergency calls by pushing a call button.
G. The system shall be capable of silencing individual call stations that become a nuisance.
H. The system shall be capable of connecting to a VoIP telephone or analog PBX system to initiate intercom calls or pages.
    1. The Contractor shall provide the interface that is compatible with the Owners system. The Owner's existing system is a Valcom IP6000.
I. The system shall be fully firmware and software upgradable from a centralized network location.
J. All software required for programming and licenses required for operation of the system shall be provided.
K. Manufacturer:
    1. Rauland

2.03 AUDIO GATEWAY

A. PoE
B. Provides analog audio output and relay control
C. Acceptable Product:
    1. Valcom VE-8001

2.04 PAGING ZONES

A. New devices added to the existing system shall conform to the existing zoning standards. New modules and amplification shall be provided to add communication devices as required.

2.05 ZONE PAGE MODULE

A. Acceptable Product:
    1. Valcom VE-8004 with V-C124P power supply

2.06 PAGING SPEAKERS

A. All speakers shall operate from a 24-volt distribution system.
B. Speakers shall have audio and physical characteristics that are compatible with the total system.
C. Loudspeaker locations shown in the drawings are approximate and subject to change based on field conditions. Contractor shall abide by the submittal process described in the division 27 specifications to coordinate final loudspeaker locations.
D. Refer to drawings and details for specific product information.

2.07 PAGING VOLUME CONTROLS

A. Analog attenuator with priority relay-actuated bypass
B. Decora-style wall plate
C. Provide power and interface modules as required for full system functionality.
D. Acceptable Product:
    1. Quam QC10P
    2. Or Rauland equal

2.08 AMPLIFIERS

A. The Contractor shall supply and install appropriate number and size of amplifiers to ensure amplifiers will normally be operating at no more than 80% of the rated power. The installation shall meet manufacturer recommendations.
B. Acceptable Product:
    1. Ashly NE series

2.09 CABLE

A. Cable shall be provided and installed that meets manufacturer recommendations for equipment and signal types that are being transmitted. Refer to Division 27 specifications for UTP cable requirements.
B. 25v speaker cable shall be 18 awg, 2-conductor, twisted, shielded cable. Provide plenum rated cable when required.
C. Digital intercom cable shall be 22 awg, 2-conductor, twisted, shielded cable. Provide plenum rated cable when required.
D. Analog intercom cable shall be 18 awg, 2-conductor, twisted, shielded cable. Provide plenum rated cable when required.
E. 75 ohm RG-6 Quad Shield
    1. Center conductor: 18 AWG bare copper covered steel; 0.040" O.D. (nominal); foamed polyethylene dielectric.
    2. Quad Shield:
        a. First shield: aluminum-polypropylene-aluminum laminated tape with overlap bonded to dielectric.
        b. Second shield: 60% 34 AWG bare aluminum braid wire.
        c. Third shield: non-bonded aluminum foil tape.
        d. Fourth shield: 40% 34 AWG bare aluminum braid wire.
    3. Provide plenum cable when installed in a plenum air handling space.
    4. Manufacturer:
        a. Belden
        b. Windy City Wire
        c. Or approved equal

2.10 WIRELESS CLOCK SYSTEM

A. General
    1. Install new clock devices as shown in drawings, to be synchronized to existing campus clock system.
    2. All new clocks shall be hard-wired for power. Battery operated clocks are not acceptable.
    3. All new clock devices shall be digital with red digits.
    4. Clocks in corridors and small common areas shall have 2.5-inch digits.
    5. Clocks in large assembly areas requiring more than 75 feet of viewing distance shall have 4-inch digits.
    6. Contractor shall provide wire guards for clocks in gymnasiums.
    7. Contractor shall provide any transmitters/repeaters as necessary to keep all clocks reliably synchronized.
    8. Acceptable Manufacturer:
        a. Valcom
        b. Or Dallas ISD approved equal
B. Single-Faced, 2.5-inch Digital Clock (D1):
    1. Valcom VL5 20
C. Dual-Faced, 4-inch Digital Clock (D2):
    1. Valcom VL5 22
D. Single-Faced, 4-inch Digital Clock (D1 in gymnasium and cafeteria)
    1. Valcom VL5 50

PART 3 EXECUTION

3.01 TESTING

A. Refer to Section 27 0000 for additional requirements.

3.02 TRAINING

A. Refer to Section 27 0000 for additional requirements.

3.03 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

3.04 INSTALLATION PRACTICES

A. All services provided shall be professional and conform to the highest standards for industry practices. The Owner reserves the right to halt any installation due to poor workmanship. All work shall be defect free, and the installer shall replace, at their expense, any work found to be defective.
B. The Owner reserves the right to halt any installation due to failure of Contractor to observe installation-free periods due to instructional or administrative requirements. To the maximum extent possible, the Owner will provide advance notice of such periods.
C. Contractor is responsible for providing a complete and functional intercom and PA systems.
D. All manufactured items, materials, and equipment shall be applied, installed, connected, erected, used, and adjusted as recommended by the manufacturers, or as indicated in their published literature, unless specifically noted herein to the contrary.
E. Contractor shall follow these standards and approved submittals for locations of power supplies. The Owner intends to limit the number and location of power supplies to facilitate more effective long-term support and maintenance of the system.

3.05 COORDINATION

A. Contractor shall provide up to 8 hours (up to four, 2-hour sessions) of scheduled and dedicated coordination time to assist Owner with network configuration.
B. Verify that the manufacturer approved or recommended server hardware and operating system meets the Owner's IT department standards prior to ordering.
C. Coordinate server power, cooling, and mounting requirements with Owner prior to installation.
D. Coordinate virus scan/security software requirements with Owner and manufacturer prior to installation.

3.06 TRAINING

A. Provide system operations, administration, and maintenance training by factory-trained personnel qualified to instruct.
    1. Contractor shall provide up to 12 hours of scheduled and dedicated training time in four (4) three (3) hour sessions for administration and management of the systems.
    2. Contractor shall provide up to 2 hours of scheduled and dedicated training time for maintenance personnel.
    3. Provide printed training materials for each trainee, including product manuals, course outline, workbook and student guides.
    4. Provide hands-on training with operational equipment.
    5. Training shall be oriented to the specific systems being installed under this contract as designed and specified.
    6. Contractor shall provide all necessary documentation of system operating parameters prior to scheduled training sessions.

3.07 AESTHETICS

A. All cables and equipment terminating at panels frames shall be vertically straight, with no cables crossing each other, from twelve inches inside the ceiling area to the termination block.
B. All cable bundles shall be combed and bundled to accommodate individual termination block rows and panels.
C. All surface-mounted devices shall be firmly secured level and plumb
D. All rack mount equipment shall be securely installed.

3.08 HARDWARE LAYOUT

A. Hardware positioning and layout shall be reviewed and approved by the Consultant and Owner prior to construction. The review does not exempt Contractor from meeting any of the requirements stated in this document.

3.09 DEVICE CABLING/WIRING INSTALLATION PRACTICES

A. All external wire and cables shall be supported in maximum five foot intervals from the structure or as required to maintain not more than 12" cable sag between supports and without over tensioning the cables. Provide j-hooks as needed where cable tray or raceway is not available.
B. Contractor shall coordinate installation with Division 27 0500 cabling Contractor to ensure there is at least 2-inches of physical separation between security cabling and voice/data cabling throughout cable path. Voice/data cabling Contractor has first claim to cable tray.
C. 70-Volt speaker cabling shall not share cable pathways with other cabling.
D. All cables, regardless of length, shall be labeled within 18" of both ends with an identifier that is keyed to the door, room, or corridor number as identified.
E. All cables shall have 6-foot service loops neatly coiled in the equipment room. During initial cable rough-in, Contractor shall have sufficient slack to route anywhere within the equipment room.
F. Cabling shall be adequately supported with Velcro wire wraps and horizontal support cable managers fastened to rack frame. Cables shall be dressed in a neat and orderly fashion. Any cabling or equipment installation that is deemed unacceptable by the Owner or Consultant shall be replaced or corrected by the Contractor at no additional cost. **Plastic zip ties are not allowed.**
G. All cables are to run at right angles to the structure, placed above the ceiling in halls or corridors.
H. Cables shall not run above red iron joist.
I. Contractor shall make every effort to conceal wiring and other apparatus into walls, floors, and ceilings, assuming code and good engineering practice allows and suggests.
J. Ties and straps shall be installed snugly without deforming cable insulation. Ties shall be spaced at uneven intervals not to exceed four feet. No sharp burrs shall remain where excess length of the cable tie has been cut.
K. Contractor shall notify Owner immediately if obstruction or hazard is discovered in a pathway provided by others.
L. Cable shall be stored and handled to assure that it is not stretched, kinked, crushed, or abraded in any way. Bend radiuses shall meet manufacturer specifications and/or recommendations. Cable shall not be installed in ambient temperatures or moisture conditions above or below the manufacturer’s rating.
M. No splices shall be installed in any UTP cable unless prior approval from Consultant is given.

3.10 CABLE TERMINATION

A. Termination hardware (blocks and patch panels) positioning and layout shall be reviewed and approved by the Owner prior to construction. The review does not exempt Contractor from meeting any of the requirements stated in this document.

3.11 INTEGRATION WITH PHYSICAL SECURITY SYSTEMS

A. The intercom system shall be integrated with the video surveillance system, electronic access control system and intrusion detection systems.
    1. The integration interface shall be via an Ethernet interface.
    2. The intercom to video surveillance integration shall be via SIP (Session Initiation Protocol) interface.
        a. The intercom stations shall operate in a SIP to SIP mode with the video surveillance system listening and recording the audio to the associated camera time synchronized for seamless video/audio playback.

B. The intercom stations shall be associated with cameras from the video surveillance system.
C. The Contractor shall provide any and all licensing to integrate the systems together including any additional items to be added to the yearly maintenance agreement.
D. The Contractor shall provide any needed expansion boards for integration.
E. The system shall integrate with Microsoft Active Directory.
F. The system shall integrate with Microsoft Exchange Server for the purpose of sending email notifications.
G. Refer to each integrated systems specification sections for additional specific integration requirements.
H. The intercom and PA systems shall be time syncing to a common NTP server as all the integrated systems.
I. The Contractor shall set up a meeting between the Owner, Consultant and manufacturer to determine the exact functionality of the integration before the installation and integration starts.

3.12 FIRE STOPPING

A. Fire stopping of openings between floors, fire-rated walls, and smoke-rated walls, created by others for Contractor to pass cable through, shall be the responsibility of the Contractor. Sealing material and application of this material shall be accomplished in such a manner that is acceptable to the local fire and building authorities having jurisdiction over this work.
B. Contractor shall be responsible for providing a waterproof seal in and around any openings to the outside environment intended for use by the Contractor.
C. Any existing openings discovered that should be fire stopped should be brought to the attention of the Owner.

3.13 SYSTEM TESTING PROCEDURES

A. Prior to energizing or testing the system, ensure the following:
    1. All products are installed in a proper and safe manner per the manufacturer's instructions.
    2. Dust, debris, solder, splatter, etc., is removed.
    3. Cable is dressed, routed, and labeled; connections are consistent with regard to polarity.
    4. All products are neat, clean, and unmarred, and parts are securely attached.
B. Contractor shall ensure that each device in the system is functioning normally and in such a manner as to meet the functional and performance requirements in this specification.
C. Contractor shall be responsible for the following testing procedures:
    1. Measure each area's ambient noise level during normal business operation.
    2. Provide amplifier(s) and estimate speaker transformer tap values that provide acceptable performance without exceeding 80% of the amplifier's RMS power.
    3. Acceptable performance is deemed to mean that a voice page or intercom call is 15 dB over the Ambient Noise level when measured at 5 feet above finished floor. Make all necessary adjustments per Owner and Consultant request.
D. Contractor is ultimately responsible to ensure the overhead paging system voice pages are a minimum of 15 dB over the Ambient Noise Level in each area without exceeding 80% of the amplifiers' rated power.
E. Inspection: After Contractor's testing is complete and the system is properly adjusted, the Contractor shall contact the Owner to schedule a "spot test" of the system with the Owner and Consultant. Contractor shall make changes/adjustments per Owner and Consultant's request at no additional cost to Owner. These adjustments may include but not be limited to:
    1. Adjusting volume control of amplifier.
    2. Adjusting local volume control of individual speaker.

3. Re-tapping up to 20% of speakers at different wattage.

3.14 SYSTEM INSPECTION

A. Contractor shall coordinate with project representative for inspection after Contractor has completed testing of entire system.
B. Contractor shall have trained Contractor representative and testing equipment on site during inspection to assist with spot verification of tests.
C. Contactor shall verify with Project Representative the precise positioning of camera aim and shall make fine adjustments as requested.

3.15 LABELING

A. Contractor shall neatly label all security devices and cabling at both ends. All labels shall be on Project as-built drawings.

3.16 DOCUMENTATION

A. Upon completion of the installation, Contractor shall provide full documentation sets to the Consultant for approval as described in section 27 0000 and 27 6000. All documentation shall become the property of the Owner.
B. Documentation shall include the additional specific items detailed in the subsections below:
    1. Contractor shall provide hard copy and electronic forms of the final test results.
    2. Contractor shall provide a document including the following:
        a. Device label/identifier
        b. Location of each drop by orientation/permanent landmark in the room
        c. Contractor shall provide accurate as-built Construction Drawings. The drawings are to include cable routes and device locations.

3.17 PRE-CHECKOUT

A. The Contractor shall demonstrate the following to Owner during system demonstration:
    1. The intercom stations are fully installed and functional.
    2. Calls can be placed and operate in full duplex mode.
    3. All-call functionality is working correctly.
    4. Individual zones can be paged.
    5. Integrations are functional.

3.18 FINAL ACCEPTANCE

A. In addition to closeout requirements in section 27 0000 and 27 6000, Contractor shall demonstrate the following before final approval.
    1. Owner training is complete.
    2. Punch list items are complete.
    3. As-built documentation is complete and submitted to Owner/Consultant.

3.19 ANNUAL SUPPORT AGREEMENT

A. An annual support agreement (after the 1st year full of support/warranty) shall not be part of the bid. The Contractor shall work directly with the Owner at the end of the project to determine the ongoing hardware/software support. The Contractor shall send the Consultant a copy of the support agreement for review prior to finalization.

3.20 FINAL PROCEDURES

A. Perform final procedures in accordance with section 27 0000 and 27 6000.

END OF SECTION

SECTION 27 6000
PHYSICAL SECURITY GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 SCOPE

A. Refer to Section 27 0000 for additional project scope information.
B. This section describes the general product and execution requirements related to furnishing and installing Physical Security Systems. Physical Security Systems includes Video Surveillance, Electronic Access Control, Intrusion Detection, PLC/HMI systems and their sub systems.
C. This is a 24/7/365 mission critical facility and all systems shall be capable of a 99.99% uptime by utilizing redundant power supplies, enterprise grade components, UPS power and fail over.
D. Contractor shall be responsible for providing complete and functional systems as described in this specification and project drawings.
E. Contractor shall provide low voltage power and control lines to and from power supplies, remotely controlled equipment, and other devices, even though not explicitly indicated on drawings or listed in equipment tables.
F. Contractor shall be, or Contractor shall provide, an Electrical Contractor for provision of high voltage power and conduits/raceway, where necessary.
G. Contractor shall be responsible for any and all related programming and end-user training unless noted otherwise.
H. Dallas ISD shall work directly with the district-preferred vendor to facilitate installation of access control systems and video surveillance systems, unless noted otherwise. Any work shown on the drawings pertaining to these systems are for reference only. Contractor shall provide infrastructure to support these device locations. Where the drawings indicate that security devices shall be provided by the contractor, the contractor shall utilize the district-preferred vendor to facilitate this work.
I. Contractor shall ensure that new devices being integrated into existing systems are compatible and will provide full functionality as intended by the manufacturer. New devices shall meet or exceed functionality as directed by Owner standards.

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0523 – Pathways for Technology Systems
D. Section 27 0526 – Grounding and Bonding for Technology Systems
E. Section 27 1100 – Communications Equipment Rooms
F. Section 27 1500 – Communications Horizontal Cabling
G. Section 27 1600 – Communications Connecting Cords
H. Section 27 1800 – Communications Labeling and Identification
I. Section 27 5100 – Distributed Communications Systems
J. Section 27 6200 – Electronic Access Control System
K. Section 27 6400 – Video Surveillance System
L. Section 27 6600 – Intrusion Detection System

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. Refer to Section 27 0000 for additional requirements.

B. Training: Programmer shall have received manufacturer-provided and/or manufacturer approved training in the configuration of the physical security system(s) being provided.
C. Certification: Programmer shall hold the highest applicable manufacturer programming certification(s) offered by the manufacturer(s) of the physical security system(s).
D. Submittal: Certification certificate shall be submitted with physical security system(s) submittals.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.
B. Hardware, Application Software, and Network Requirements: A system description including analysis and calculations used in sizing equipment required by the Physical Security Systems. The description shall show how the equipment will operate as a system to meet the performance requirements of the systems. The following information shall be supplied as a minimum:
    1. Server(s) processor(s), disk space and memory size
    2. Workstation(s) processor(s), disk space and memory size
    3. Operating System(s) Software, where software is provided or upgraded
    4. Application Software, with Optional and Custom Software Modules supplied in this project
    5. Integration Schemes: Proposed connectivity, software, development requirements, and SDK information, for inter-system communication.
    6. Network reliability requirements
    7. Number and location of LAN ports required
    8. Number of IP addresses required.
    9. Other specific network requirements, preferences, and constraints
    10. Backup/archive system size and configuration
    11. Start-up operations
    12. Description of site (field) control equipment (Controllers/Field Panels) and their configuration
    13. Access control power calculations.
    14. Battery backup requirements

1.07 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.08 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.
B. Quick-Reference Guides: Contractor shall create a concise quick-reference guide covering normal system operation and basic troubleshooting procedures for each room/system type. Length of each quick-reference guide shall be commensurate with the information needed for successful operation, subject to Owner approval.
    1. Upon Owner approval, Contractor shall provide two (2) laminated copies and one (1) digital copy for each room/system type.
C. Serial Numbers: Contractor shall provide a list of serial numbers for all supplied components with serial numbers and with a unit price greater than $99. Organize list by room/system type.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Unless noted otherwise, products in this section are intended as a basis of design and are open to substitutions per the product substitution procedures defined in Section 27 0000.

2.02 KVM

A. The contractor shall provide a KVM for each rack or cabinet housing a server or multiple servers including servers for access control.
B. The KVM shall have a 19” monitor with integrated mouse pad and keyboard.
C. The KVM shall have video inputs and USB connectors with 8 ports.
D. The KVM shall be IP enabled for remote management.
E. The contractor shall provide with a 4-post to 2-post converter (CPI #12751-719 or equal) when mounted to a 2-post rack.
F. Tripp-lite B020-U08-19-IP
    1. Or approved equal

2.03 GROUNDING AND BONDING

A. The Contractor shall bond and ground the primary protectors and the metallic member of cable sheaths to building ground utilizing a minimum of 14-awg and no greater then 6-awg at the closest point of entrance as practical, not exceeding 50 feet, in accordance with the NEC.

2.04 REFER TO INDIVIDUAL SECTIONS FOR ADDITIONAL PRODUCT INFORMATION.

2.05 FIRE STOPPING MATERIALS

A. Refer to Section 27 0000 for additional requirements.

PART 3 EXECUTION

3.01 NETWORK TIME PROTOCOL (NTP) SYNCHRONIZATION

A. All security systems as well as additional integrated systems such as intercom/PA, SQL/database servers and data logging servers shall synchronize to a common NTP server.
B. All systems including servers and workstations shall be within 250ms of each other or less depending on specific system requirements such as failover. The synchronization frequency shall be no less than every 1 hour. The Contractor shall use software such as NetTime (www.timesynctool.com) installed on the servers.
C. The Contractor shall coordinate with the Owner for a NTP server connection address.
D. Workstations on the private security network shall have an NTP client such as NetTime operating as a Windows service to sync the workstations clock to the same NTP server as the rest of the security systems.

3.02 TESTING

A. Refer to Section 27 0000 for additional requirements.

3.03 TRAINING

A. Refer to Section 27 0000 for additional requirements.
B. On-Site Training
    1. General: Present, review and describe equipment and materials to the Owner and Owner's operating personnel and fully demonstrate the operation and maintenance of the systems, equipment and devices specified herein.
    2. Include with new systems, Contractor to arrange and provide for video recording of each onsite training session.
        a. Provide professional video and audio recording of each software screen option with Owner approval of content.
        b. Provide end user video recording for all training levels.
    3. Training shall comprise two separate levels of training;
        a. User Group upon substantial completion of the project.
            1) User group training shall include a site/building walk through indicating locations of equipment and their usage.
            2) User group training shall include the operation of workstation capability of system monitoring, command override and report generation.

b. Maintenance Group upon completion of the project prior to close out.
    1) Maintenance group training shall include a site/building walk through indicating locations of equipment and their usage at up to six representative sites.
    2) Review of a-build documentation at each controller location.
    3) Troubleshooting techniques in hardware and software.
4. The training shall cover the overall system, each individual system, each subsystem, and each component. The training shall also cover procedures for database management, normal operations, and failure modes with response procedures for each failure. Each procedural item shall be applied to each equipment level.

C. Duration: Refer to the individual sections for the minimum time requirements.

3.04 WARRANTY

A. Refer to Section 27 0000 for additional requirements.
B. Furnish and guarantee maintenance, repair and inspection service for the system using factory trained authorized representatives of the manufacturer of the equipment for a period of one year after final acceptance of the installation.
C. Third Party Device warranties are transferred from the manufacturer to the Contractor, which may then transfer third party warranties to the Owner. Specific third party warranty details, terms and conditions, remedies and procedures, are either expressly stated on, or packaged with, or accompany such products. The warranty period may vary from product to product. These products include but are not limited to devices that are directly interconnected to the field hardware or computers and are purchased directly from the manufacturer.
D. Purpose
    1. The Contractor shall repair any system malfunction or installation deficiency discovered by the Owner or their representatives during the burn in and warranty period.
    2. The Contractor shall correct any installation deficiencies found against the contract drawings and specifications discovered by the Owner or their representatives during the warranty period.

3.05 EXAMINATION OF SITE AND DOCUMENTS

A. Bidder shall examine all documents, shall visit the site(s) prior to submitting proposal, record their own investigations, and shall inform themselves of all conditions under which the Work is to be performed at the site(s) of the Work, including the structure of the ground, the obstacles that may be encountered, and all of the conditions of the documents, including superintendence of the Work, requirements of temporary environmental controls, the time of completion, list of Subcontractors, and all other relevant matters that may affect the Work or the proposal process.
B. Verify cable lengths comply with published standards.
C. Notify Owner/Consultant of installation that would exceed maximum lengths prior to installation of cable.
D. Contactor shall consult with Owner/Consultant regarding alternative routing or location of cable.
E. Do not proceed until unsatisfactory conditions have been corrected.
F. Failure to make the examination shall not result in any Change Order requests.
G. The Bidder shall base the proposal on the site(s) examination, materials complying with the plans and specifications and shall list all materials where the proposal form requires.
H. The commencement of work by the Contractor shall indicate acceptance of existing conditions, unless a written notice of exceptions has been provided to the Owner/Consultant prior to commencement.
I. If the Contractor observes, during preliminary examinations or subsequent work, existing violations of fire stopping, electrical wiring, grounding, or other safety- or code-

related issues, the Contractor shall report these to the Owner/Consultant in a timely manner.

3.06 SPARE PARTS

A. Licenses
B. Cameras
C. Card Readers

3.07 INSTALLATION REQUIREMENTS

A. Refer to Section 27 0000 for additional requirements.
B. Contractor shall furnish and install all cables, connectors, and equipment as shown on Drawings and as specified herein.
C. It is the Contractor's responsibility to survey the site and include all necessary costs to perform the installation as specified. This includes any modifications required to route and conceal horizontal distribution wiring.
D. Beginning installation means Contractor accepts existing conditions.
E. The Contractor shall be responsible for identifying and reporting to the General Contractor any existing damage to walls, flooring, tiles, and furnishings in the work area prior to start of work. All damage to interior spaces caused by the installation of cable, raceway, or other hardware shall be repaired by the Contractor.
F. Repairs shall match preexisting color and finish of walls, floors, and ceilings. Any Contractor-damaged ceiling tiles, floor, and carpet shall to be replaced to match color, size, style, and texture.
G. Where unacceptable conditions are found, the Contractor shall bring this to the attention of the construction supervisor immediately. A written resolution will follow to determine the appropriate action to be taken.
H. All wiring shall be run "free-air," in conduit, in a secured plastic raceway or in modular furniture as designated on the Drawings. All cable shall be free of tension at both ends. PLENUM rated cable shall be used in areas used for air handling.
I. Avoid abrasion and other damage to cables during installation.
J. The cable system will be tested and documented upon completion of the installation as defined in the section below.
K. All manufactured items, materials, and equipment shall be applied, installed, connected, erected, used, and adjusted as recommended by manufacturers or as indicated in their published literature, unless specifically noted herein to the contrary.

3.08 COOPERATION

A. The Contractor shall cooperate with Consultant's and Owner's personnel in locating work in a proper manner.
B. Should it be necessary to raise, lower, or move longitudinally any part of the work to better fit the general installation, such work shall be done at no extra cost to the Owner, provided such decision is reached prior to actual installation. The Contractor shall check location of electrical outlets with respect to other installations before installing.

3.09 COMMISSIONING SUBMITTALS

A. Provide the following to the Owner no later than 30 days prior to system commissioning/programming.
    1. Commissioning Test Plan and Check-Off List: Specified elsewhere in this document.
    2. Software: One set of fully functional software in manufacturer's original media packaging, temporarily licensed for a 30-day evaluation period.
    3. Web-based Training: Access to web-based training modules.

3.10 COMMISSIONING

A. Provide programming and commissioning for each system as described in individual sections below.

B. Contractor shall develop and submit a plan for coordination of settings and programming issues with the Consultant and Owner no later than 30 days prior to performing programming and commissioning.
C. The security Contractor is required to place entire system into full and proper operation as designed and specified.
D. Verify that all hardware components are properly installed, connected, communicating, and operating correctly.
E. Verify that all system software is installed, configured, and complies with specified functional requirements.
F. Perform final acceptance testing in the presence of Owner's representative, executing a point-by-point inspection against a documented test plan that demonstrates compliance with system requirements as designed and specified.
    1. Submit documented test plan to Owner at least 14 days in advance of acceptance test, inspection, and check-off.
    2. Conduct final acceptance tests in presence of Owner's representative, verifying that each device point and sequence is operating correctly and properly reporting back to control panel and control center.
    3. Acceptance by Owner is contingent on successful completion of check-off; if check-off is not completed due to additional work required, re-schedule and perform complete check-off until complete in one pass, unless portions of system can be verified as not adversely affected by additional work.
    4. The system shall not be considered accepted until all acceptance test items have been successfully checked-off. Beneficial use of part or all of the system shall not be considered as acceptance.

3.11 OPERATION AND MAINTENANCE MANUALS

A. Part One: Notwithstanding requirements specified elsewhere, submit the following labeled as the "Operating and Maintenance Manual" within thirty (30) days after Final Acceptance of the Installation:
    1. Record Drawings: Submit two (2) copies of revised versions of drawings as submitted in the "Shop and Field" and "Equipment Wiring Diagrams" Submittals showing actual device locations, conduit routing, wiring and relationships as they were constructed. Include nomenclature showing as-built wire designations and colors. Drawings shall include room numbers coinciding with Owner space planning numbering. Drawings shall be submitted in electronic editable AutoCAD 2018 files, in ".dwg" format, on a digital storage medium.
    2. Manuals: Submit two (2) copies of each of the following materials in bound manuals, or electronic PDF copies, with labeled dividers:
        a. A final Bill of Material for each system
        b. Equipment Instruction Manuals: Complete, project specific comprehensive instructions for the operation of devices and equipment provided as part of this work.
        c. Manufacturers Instruction Manuals: Specification sheets, brochures, Operation Manuals and service sheets published by the manufacturers of the components, devices and equipment provided.
        d. Include information for testing, repair, troubleshooting, assembly, disassembly and recommended maintenance intervals.
        e. Provide a replacement parts list with current prices. Include list of recommended spare parts, tools, and instruments for testing and maintenance purpose.
        f. Performance, Test and Adjustment Data: Comprehensive documentation of performance verification according to parameters specified herein.
        g. Warranties: Provide an executed copy of the Warranty Agreement and copies of all manufacturer's Warranty Registration papers as described herein.

B. Part Two: Within fourteen (14) days of receipt of Consultant reviewed Operating and Maintenance Manual (Phase One), submit three (3) electronic copies in AutoCAD 2018 editable .dwg format of the reviewed Record Drawings and three (3) copies of the reviewed Operating and Maintenance Manuals to the Owner, in digital format.
    1. Within each equipment enclosure and/or terminal cabinet, the Contractor shall place a Single Line drawing of the system(s) and the respective Terminal Cabinet Wiring Diagram in a clear plastic sleeve permanently attached to the inside cover of the terminal cabinet.
    2. In each equipment enclosure the Contractor shall place a drawing providing device locations served by the equipment within the enclosure with identification that is identical to the wiring tags and with the software description of each point.
    3. The Contractor shall provide to the Owner one (1) copy of new administration and user software, including required graphical maps, in digital format.
C. Sufficient information, (detailed schematics of subsystems, assemblies and subassemblies to component level) clearly presented, shall be included to determine compliance with drawings and specifications.

3.12 CLOSEOUT PROCEDURES

A. Notification: Contractor shall provide written notification to Architect/Consultant and Owner when Contractor is satisfied that the work has been completed and is ready for inspection.
B. Closeout Submittals: Contractor shall provide closeout documentation to the Architect/Consultant. The Architect/Consultant shall receive the closeout submittals no less than 72 hours prior to the scheduled inspection time.
C. Inspection: Contractor shall be present for the inspection by the Architect/Consultant. Contractor shall supply all testing equipment needed to verify compliance with the specifications found in Bid package.
D. Punch List: Work or materials found to be incomplete, of unsatisfactory quality, failing to meet the specifications in the Bid package, and/or unacceptable to the Architect/Consultant shall be documented by the Architect/Consultant and provided to Contractor to rectify.
E. Re-Inspection: If a re-inspection is necessary, the costs of the Architect/Consultant's additional travel, hours, and expenses may be deducted by the Owner from the contract amount due Contractor.
F. Punch List Approval: The punch list shall be considered complete only after having been signed by the Owner and Architect/Consultant.
G. The system has successfully completed a 30-day performance period.
H. Payment Authorization: Final payment will be authorized only after all closeout procedures and requirements have been followed and fulfilled by Contractor and approved in writing by the Owner and Architect/Consultant, including punch list(s) and/or re-inspection(s).

3.13 SERVICE CONTRACT

A. The service contract shall cover equipment and software related to this contract, and shall provide for the following parts and services, without additional cost to the Owner:
    1. Bi-yearly inspections, preventative maintenance and testing of equipment and components in Year One of the warranty period.
    2. Annual inspections, preventive maintenance, and testing of equipment and components in Years Two and above of the warranty period.
    3. Regular Service, Emergency Service, and Call-Back Service
    4. Labor and Repairs
    5. Equipment, and Materials and transportation cost.
B. Response Time: Response time for service calls.

1. Emergency service calls where system is not responding to staff directed commands through the computer systems shall be within 2 hours to the project site.
2. Emergency service calls where controllers are not reporting shall be within 2 hours to the project site.
3. Normal service calls for device malfunctions shall be within 24 hours during normal working hours to the site.

C. Repair Time: Contractor shall stock parts in sufficient quantities such that repair or replacement shall be guaranteed within 12-hours. Temporary replacements within this time period shall be acceptable, provided temporary replacements do not compromise system functionality, and provided permanent replacement is achieved within 72 hours. Contractor may contact Owner representative for use of Owner supplied spare parts where delay of system repair will have negative impact on system performance.
D. Commencement: The warranty begins at the time of issuance of the statement of "Final Acceptance of the Installation" by the Owner.
E. Transferability: The warranty shall be transferable to any person or persons at the discretion of the Owner.
F. Transmittal: A copy of this Warranty shall be delivered to, and signed for by the Owner's representative whose primary responsibility is the operation and care of these systems. A copy of the signed Warranty document shall be delivered for review as part of the Final Submittals.
G. Registration: Register Warranty papers for all equipment and software in the name of the Owner. Furnish reproductions of all equipment Warranty papers to the Owner with the Final Submittals.
H. Subcontracting: Warranty service work may not be subcontracted except with specific permission and approval by the Owner.
I. Resolution of Conflicts
    1. The Owner retains the right to resolve unsatisfactory warranty service performance at any time by declaring the work unsatisfactory, stating specific areas of dissatisfaction in writing.
    2. If the Contractor or his approved Subcontractor does not resolve such stated areas of dissatisfaction within thirty (30) days, the Owner may appoint any alternative service agency or person to fulfill the terms of the Warranty; the cost of which shall be borne by the Contractor. This action may be taken repeatedly until the Owner is satisfied that Warranty service performance is satisfactory. Satisfactory resolution of a malfunction shall be considered adequate when the device, equipment, system or component which is chronically malfunctioning is brought into compliance with the standards of performance as contained herein and published by the manufacturers of the equipment installed.

END OF SECTION

SECTION 27 6200
ELECTRONIC ACCESS CONTROL SYSTEM

PART 1 GENERAL

1.01 SCOPE

A. This specification section covers the furnishing and installation of a new and complete enterprise-wide, low-voltage, Electronic Access Control System (EACS).
B. Contractor shall furnish and install access control hardware devices, mounting brackets, power supplies, switches, controls, consoles and other components of the system as shown and specified.
C. Contractor shall furnish and install access control related software to allow this system expansion. Software includes required license addition for access control readers and electrified portals, workstations and required physical security system Integration.
D. Furnish and install outlets, junction boxes, conduit, connectors, wiring, and other accessories necessary to complete the system installation. Requirements shall be in accordance with Division 26 0000, Electrical.
E. Refer to Section 27 0000 for additional project scope information.

1.02 PRECEDENCE

A. Obtain, read and comply with General Conditions and applicable sub-sections of the contract specifications. Where a discrepancy may exist between any applicable sub-section and directions as contained herein, this section shall govern.

1.03 RELATED WORK

A. Division 08 - Door Hardware
B. Division 14 - General Elevator Requirements
C. Section 27 0000 – General Technology Requirements
D. Section 27 0500 – Communications General Requirements
E. Section 27 0523 – Pathways for Technology Systems
F. Section 27 0526 – Grounding and Bonding for Technology Systems
G. Section 27 1100 – Communications Equipment Rooms
H. Section 27 1500 – Communications Horizontal Cabling
I. Section 27 1600 – Communications Connecting Cords
J. Section 27 1800 – Communications Labeling and Identification
K. Section 27 5100 – Distributed Communications Systems
L. Section 27 6000 – Physical Security General Requirements
M. Section 27 6400 – Video Surveillance System
N. Section 27 6600 – Intrusion Detection System

1.04 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.05 REFERENCE STANDARDS AND CODES

A. IEC 60839-11-5:2020 - Open Supervised Device Protocol (OSDP)
B. Refer to Section 27 0000 for additional requirements.

1.06 QUALIFICATIONS

A. Lock installers for fire rated doors are to be trained and certified by the manufacturer via Intertek Qualified Personnel (IQP) Raceway and Hardware Installer Program on the proper installation and adjustment of fire, life safety, and security products in compliance with NFPA 80 including: hanging devices; locking devices; closing devices; and seals.
    1. Trained and qualified raceway installers are required to ensure modifications do not affect the integrity of fire doors. Doors must remain compliant with NFPA 80.

B. Refer to Section 27 0000 for additional requirements.

1.07 PRE-CONSTRUCTION SUBMITTALS

A. The Contractor shall submit the access control hardware layouts which includes the number of controllers, sub-panels and other associated devices per location.
B. The Contractor shall submit full power calculations which includes the anticipated power loads, number and type of power supplies including all power supply boards, number of 120VAC circuits required, battery backup including the quantities of batteries to meet requirements, PoE loads, fire alarm connection requirements, etc.
C. Refer to Section 27 0000 and 27 6200 for additional requirements.

1.08 PRE-INSTALLATION PROCEDURES

A. For in-use, existing facilities or retrofit projects, the Contractor shall assign all applicable electronics IP addresses, passwords and pre-build out all the enclosures including the interconnects within the enclosure prior to being delivered to the project or installed.
B. The Contractor shall cable all controlled or monitored doors, intercoms, etc. and terminate this cable in the access control panels no less than 3 weeks prior to substantial completion regardless of the status of the field devices such as door hardware, card readers, intercoms, etc.
C. The Contractor shall program the access control system no less than 2 weeks prior to substantial completion so when field devices are installed and terminated, associated door hardware and full system functionality can be tested. Programming shall include all doors, associated inputs, outputs, and interoperability regardless of final field device status.
D. The Contractor shall perform final connections and testing onsite when field devices such as electrified door hardware has been installed.
E. Refer to section 27 0000 and 28 0000 for additional requirements.

1.09 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 requirements.

1.10 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

A. Any devices intended for interconnection to the existing access control system (ACS) shall match or be an upgrade for existing devices of similar type and functionality. No substitutions are allowed.

2.02 ELECTRONIC ACCESS CONTROL HARDWARE

A. New ACS hardware shall match existing ACS hardware.
B. In the case that new ACS hardware that matches existing ACS hardware cannot be obtained, the contractor shall provide new hardware that is a direct upgrade or manufacturer-recommended replacement.

2.03 CARD READERS

A. New card readers shall match existing ACS card readers.
B. In the case that new matching card readers cannot be obtained, the contractor shall provide new card readers that are a direct upgrade or manufacturer-recommended replacement.

2.04 SURGE PROTECTION FOR WIEGAND COMMUNICATION

A. The Contractor shall provide a surge protector for all exterior card readers not directly attached to a building which would include any pedestal mounted reader, gate reader or any other exposed reader potentially prone to surges.

B. Mount unit outside of the access control/power supply panels. Provide with appropriate mounting and enclosures as required.
C. There shall be a minimum of a 36” shielded cable from the surge protector to the device to allow for adequate clamping time.
D. When protector is mounted in interior, dry or weather sealed enclosure:
    1. Nominal voltage rating of 12V AC/DC. Provide correct module per required voltage level if different from 12V.
    2. 20,000A surge current rating.
    3. Protects 2-pair per module.
    4. Accepts up to 10AWG cable
    5. Connect directly to ground.
    6. UL 497B listed
    7. Provide quantity of modules as required for the application.
    8. Provide base mounting plate as required for the application.
    9. Manufacturer:
        a. Ditek DTK-2MB Mounting Base
        b. (2) Ditek DTK-2MHLP12B Surge Modules
        c. Or approved equal

2.05 SURGE PROTECTION FOR LOW VOLTAGE AC/DC POWER

A. The Contractor shall provide a surge protector for all exterior devices being supplied by low voltage power. This does not include devices directly connected to a building where the risks of surges are negligible.
B. There shall be a minimum of a 36” shielded cable from the surge protector to the device to allow for adequate clamping time.
C. When protector is mounted in interior, dry or weather sealed enclosure:
    1. Nominal voltage rating of 24V AC/DC. Provide correct module per required voltage level if different from 24V.
    2. 20,000A surge current rating.
    3. Protects 2-pair per module.
    4. Accepts up to 10AWG cable
    5. Connect directly to ground.
    6. UL 497B listed
    7. Provide quantity of modules as required for the application.
    8. Provide base mounting plate as required for the application.
    9. Manufacturer:
        a. Ditek DTK-2MB Mounting Base
        b. Ditek DTK-2MHLP24B Surge Module
        c. Or approved equal

2.06 SURGE PROTECTION FOR 120 VAC POWER

A. The Contractor shall provide a surge protector for all 120VAC supplied panels and enclosure when there is a critical risk of surges. This does not include interior panels which only serve interior devices or devices connected directly to a building where the risks of surges are negligible.
B. There shall be a minimum of a 36” of cable from the surge protector to the load to allow for adequate clamping time.
C. Exterior, enclosure or other mounted:
    1. Nominal voltage rating of 120VAC, single-phase, 20A continuous load.
    2. Parallel connected.
    3. 50,000 A surge current rating.
    4. UL 1449 Type 1 SPD listed
    5. LED indicator.
    6. NEMA 4X rated.
    7. Maintain a minimum of 3’ of cable from the surge protector to the load.
    8. Manufacturer:

a. Ditek DTK-120HW
b. Or approved equal

D. Interior, wall mount:
1. Nominal voltage rating of 120VAC, single-phase, 20A continuous load.
2. Series connected.
3. 54,000 A surge current rating.
4. 35db of EMI/RFI filtering.
5. UL 1449 Type 2 SPD listed
6. UL 1289 EMI/RFI Noise Filtering listed.
7. LED indicator.
8. Form C dry contacts for remote monitoring.
9. Include with NEMA 4X enclosure.
10. Maintain a minimum of 3’ of cable from the surge protector to the load.
11. Manufacturer:
a. Ditek DTK-TSS4D
b. Or approved equal

2.07 POWER SUPPLIES AND ACCESS CONTROL ENCLOSURES

A. Provide a power supply/chargers and sub-assemblies to power various access controller boards, locking hardware and other access control or security system components. The Contractor shall select the appropriate enclosure, power supply and sub-assemblies for each application. The Contractor shall include network monitoring modules for all power supplies.

B. Enclosures
1. Shall be capable of accommodating power supplies, sub-assemblies and other manufactures access control controller boards when required.
2. Wall mountable.
3. Include a cam-lock and tamper switch.
4. Trove 2 enclosures when housing access control electronics.
5. eFlow or Maximal enclosures when only power supply components will be within the enclosure.

C. Power Supplies
1. 115 VAC input
2. 12VDC or 24VDC selectable outputs at:
a. 4 amp continuous power @ 12VDC or 24VDC.
b. 6 amp continuous power @ 12VDC or 24VDC.
c. 10 amp continuous power @ 24VDC.
3. High capacity battery charging circuit.
4. Form “C” supervision contacts for AC Low, AC Fail, and battery presence.
5. Supervised Fire Disconnect.
6. Low power Disconnect.
7. Class 2 aux. output.
8. UL 294 listed sub-assembly for access control.

D. Batteries
1. The Contractor shall provide a minimum of (2) 12V, 7ah, sealed Absorbent Glass Mat (AGM) style batteries with F style terminals per power supply.
2. Provide adequate battery backup as required by Authority Having Jurisdiction (AHJ) or a minimum of 4-hours.
3. Manufacturer:
a. Interstate Power Patrol FAS1075
b. Power Sonic PS-1270
c. Or approved equal

E. Sub-Assemblies
1. The Contractor shall provide all sub-assemblies to meet the project requirements

2. Access Control Module
    a. Independently controlled fused protected outputs:
        1) Fail-Safe and/or Fail-Secure power outputs.
        2) Dry form “C” 5 amp rated relay outputs (fused).
        3) Any combination of the above
3. Access Control System trigger inputs:
    a. Normally open (NO) inputs.
    b. Open collector sink inputs.
    c. Any combination of the above.
4. Fire Alarm Disconnect:
    a. Individually selectable for any or all outputs.
    b. Latching or non-latch input FACP disconnect.
    c. Normally open (NO), normally closed (NC) dry contact or polarity reversal from FACP signaling circuit trigger input.
    d. LED indicates that the Fire Alarm Disconnect has been activated.
    e. Form “C” relay output for auxiliary reporting.
5. Multi-Output Power Distribution Module
    a. Single input distributed over eight (8) outputs.
    b. Fused protected outputs.
    c. Output terminals shall accommodate up to 12AWG wires.
6. Multi-Output Power Distribution Module with Dual Inputs
    a. Two (2) inputs distributed over eight (8) outputs.
    b. Outputs shall be configurable by input.
    c. Fused protected outputs.
    d. Output terminals shall accommodate up to 12AWG wires.
7. Network Communication Modules
    a. Power Supply Network Interface
        1) Interface for up to two (2) eFlow power supply/chargers.
        2) Two (2) Network controlled From “C” relays.
        3) Event timers.
    b. Network Power Distribution Module
        1) Two (2) inputs distributed over eight (8) outputs.
        2) Outputs shall be configurable by input.
        3) Fused protected outputs.
        4) Emergency disconnect interface by output.
        5) Selectable battery back-up by output.
        6) Output terminals shall accommodate up to 12AWG wires.
    c. Common monitoring features
        1) Network interface via LAN/WAN.
        2) Centralized dashboard for monitoring all power supplies. Provide appropriate hardware/software required.
        3) Remote reporting of status via email and/or SNMP trap messaging.
        4) AC, low battery and battery presence monitoring.
        5) Alert messages of System Service required.
        6) System log.
        7) On demand determination of system status.
        8) Reset of individual outputs as required for remote diagnostics.
        9) Monitor enclosure temperature.
        10) Static or DHCP IP address configuration.
        11) SSL Secure Sockets Layer encryption.
8. Voltage Regulator
    a. The Contractor shall provide a voltage regulator to provide constant 5VDC or 12VDC outputs for access control boards, modules or other applicable components as well as a voltage regulator for door hardwiring or controllers requiring 12VDC.
    b. 24vdc Input.

c. Selectable 5 or 12VDC output.
d. Output rating of 6amp max.
e. Stackable with both Networkable and dual input power distribution modules for space savings.

9. Power supplies and sub-assemblies shall be manufactured by Altronix or approved equal:
   a. eflow4NB - 4amp 12vdc/24vdc power supply (UL listed Sub-assembly).
   b. eFlow6NB - 6amp 12vdc/24vdc power supply (UL listed Sub-assembly).
   c. eFlow104NB - 10amp 24vdc power supply (UL listed Sub-assembly).
   d. ACM8 - Eight (8) output, fused Access Control Module (UL listed Sub-assembly).
   e. ACMS8 – Dual input, eight (8) output, fused Access Control Module (UL listed Sub-assembly).
   f. Linq2 - Network Communication Module (UL listed Sub-assembly).
   g. Linq8PD - Dual input, eight (8) output, fused Network Communication Module (UL listed Sub-assembly).
   h. PDS8 - Dual input, eight (8) output, fused power distribution module (UL listed Sub-assembly).
   i. VR6 - Voltage Regulator (UL listed Sub-assembly).

2.08 HIGH CURRENT POWER SUPPLIES FOR ELECTRIC LATCH RETRACTION

A. 115 VAC input, 6.3A.
B. (2) 20VDC to 26.4VDC individually controlled lock outputs.
C. Provides up to 15 amps for up to 300ms for high inrush applications and up to .75 amps continuous holding current.
D. Auxiliary 12VDC always on output up to .75A.
E. High capacity battery charging circuit.
   1. Provide adequate battery backup as required by Authority Having Jurisdiction (AHJ) or a minimum of 1-hour when power supply is not connected to a UPS circuit.
F. (2) Normally Open trigger inputs.
G. Normally closed FACP trigger input.
H. Trouble relay output indicating low DC output voltage.
I. UL 294 listed sub-assembly for access control.
J. Include with lockable enclosure.
K. Provide with appropriate gauge wire to allow for remote mounting according to manufacturer’s recommendations.
L. Manufacturer:
   1. Altronix StrikeIt1
   2. Or approved equal

2.09 CABLING

A. Provide cabling per manufacturer’s recommendations and code requirements for riser rated, plenum, and non-plenum cable types.
B. UTP data cabling required will be provided, installed, terminated and tested by the Division 27 structured cabling Contractor.
C. UTP patch cables will be provided and installed by the Owner in the IDF and provided by Owner and installed by Contractor at the door. The EACS Contractor shall provide the Owner a list of patch cable lengths at the door side.
D. Wiegand cables for electronic access-controlled doors shall be a composite bundled cable and include the following cables and conductor counts:
   1. Card reader, Wiegand – 6 conductor, 22 awg shielded.
   2. Lock power – 4 conductor, 18 awg unshielded.
   3. Door contact – 2 conductor, 22 awg unshielded
   4. Request to exit and/or latch detection/spare – 4 conductor, 22 awg unshielded

E. Manufacturer (Wiegand):
   1. Belden (Wiegand) #658AFS
   2. General Cable (Wiegand) #4EPL1S
   3. Superior Essex (Wiegand) #AC-A1x-68
   4. Or approved equal

F. OSDP cables for electronic access-controlled doors shall be a composite bundled cable and include the following cables and conductor counts:
   1. Card reader, OSDP – 2 conductor stranded, twisted, 24 awg, 100% foil shield with 90% tinned copper braid shield with drain, 120 ohm nominal impedance, 12.5 pF/ft capacitance, designed for RS-485.
   2. Card reader power - 2 conductor, 18 awg unshielded, may be within same jacket as card reader cable.
   3. Lock power – 4 conductor, 18 awg unshielded.
   4. Door contact – 2 conductor, 22 awg unshielded
   5. Request to exit and/or latch detection/spare – 4 conductor, 22 awg unshielded

G. Manufacturer (OSDP):
   1. Belden – #Y66871
   2. Sterling Wire and Cable - #SWC-8920
   3. Paige Datacom - #236750807
   4. Windy City Wire - #4461030-OSDP
   5. Or approved equal

H. Cables for RS-485/OSDP in panel or remote controller or secondary card reader shall be: 2 conductor stranded, twisted, 24 awg, 100% foil shield with 90% tinned copper braid shield with drain, 120 ohm nominal impedance.
   1. Manufacturer:
      a. Belden #82841
      b. Or approved equal

I. OSDP cables for electronic access-card reader only doors not requiring composite cabling such as secondary/daisy-chained OSDP card readers shall be:
   1. Card reader, OSDP – 2 conductor stranded, twisted, 24 awg, 100% foil shield with 90% tinned copper braid shield with drain, 120 ohm nominal impedance, designed for RS-485.
   2. Card reader power - 2 conductor, 18 awg unshielded
   3. Manufacturer (OSDP):
      a. Sterling Wire & Cable # S182241PRS-10
      b. Or approved equal

J. Cables for PoE locks shall be installed by the Division 27 cabling contractor. Horizontal cable shall be terminated above the door within a j-box to provide a disconnect point for the patch cable to the PoE hinge.

2.10 DOOR CONTACTS/DOOR POSITION SWITCHES (DC)

A. All doors with card readers and all doors shown for monitored only shall have a door position switch. When the door position switches are not shown in the Division 08 specifications, the security contractor shall furnish and install them. The Security Contractor shall be responsible for the connection of all door position devices to the access control system and other systems if sharing the same door position switch. Door position devices shall be integral to the door hardware whenever possible. The Contractor shall refer to the door hardware schedule and coordinate with the door hardware Contractor on locations and requirements.
B. Sealed and potted magnetic reed switch in contact housing.
C. Provide DPDT for applications with multiple security systems (Access Control/Intrusion Detection or PLC) utilizing a single door contact.
D. Door contacts shall be appropriately sized for any established holes within door frames.

E. Parts provided are basis of design. Determination of final part number is the responsibility of Contractor.
F. Provide color that matches door as close as possible.
G. Provide recessed switch whenever possible.
H. Provide armored whip for surface mount contacts.
I. Provide with a 1k/2k end of line (EoL) pre-built resistor pack. GRI (George Risk Industries, Inc.) 6644 series or approved equal.
J. Provide GRI (George Risk Industries, Inc.) 180 Series for recessed applications.
    1. Magnasphere
    2. Nascom
    3. Or approved equal.
K. Provide GRI (George Risk Industries, Inc.) 4400 series for surface mount applications.
    1. Magnasphere
    2. Nascom
    3. Or approved equal.
L. Provide GRI (George Risk Industries, Inc.) MC-180 Series for hollow top channel applications.
    1. Magnasphere
    2. Nascom
    3. Or approved equal.
M. Provide GRI (George Risk Industries, Inc.) 4532 Series for overhead door applications.
    1. Magnasphere
    2. Nascom
    3. Or approved equal.

2.11 REQUEST TO EXIT (REX) DEVICES

A. All doors with card readers shall have a request to exit with the exception of doors with a card reader in and a card reader out. When integrated request to exit devices are not shown in the Division 08 specifications, the security contractor shall furnish and install motion-based request to exit devices. The Security Contractor shall be responsible for the connection of all request to exit devices integral to the door, motion based or other to the access control system. Request to Exit devices shall be integral to the door hardware whenever possible. The Contractor shall refer to the door hardware schedule and coordinate with the door hardware Contractor on locations and requirements. Motion based Request to Exit devices shall only be used when not available in the door hardware.
B. Provide with a 1k/2k end of line (EoL) pre-built resistor pack when utilized to release doors with magnetic locks or other high security applications. GRI (George Risk Industries, Inc.) 6644 series or approved equal.
C. Independent adjustable beam pattern.
D. Provide with mounting plate or wall mounting plate to mount over a single-gang backbox when required.
E. Provide white or black color that matches door as close as possible.
F. (2) Form C relay contacts each rated 1 A at 30 VAC or VDC for resistive loads.
G. DC Power draw: 39mA max @ 12 VDC.
H. Dimensions: 1.8”H x 6.75”W x 1.75”D.
I. Utilize contact closure REX hardware built into the handle or crashbar whenever possible.
J. Provide Bosch DS160/161
    1. Provide with TP160/161 mounting plate when mounted over a backbox.
    2. Or approved equals.

2.12 ELECTRIFIED HARDWARE (EH)

A. The Security Contractor shall be responsible for the connection of all electrified hardware to the access control system. This shall include providing centralized power supplies located next to or integral to the access control panels. The Contractor shall coordinate with the door hardware specifications and schedules for additional information.

2.13 ADA POWER ASSIST DOOR OPERATOR INTEGRATION RELAYS

A. The Contractor shall provide all necessary relays to interface to the ADA operators at access-controlled doors with ADA door operators. The ADA operator interface shall be managed by the access control system. Local “smart relays” are not allowed.
B. Hardwired paddles
    1. Provide with a DPDT relay. Replace existing relay in paddle as necessary.
    2. Manufacturer:
        a. Altronix RB1224
        b. Or approved equal
C. Wireless paddles
    1. Provide with DPDT wireless relay transmitter and receiver. Replace existing relay in paddle as necessary.
    2. Manufacturer:
        a. Larco Atek 234475 transmitter and Larco Atek 233804 receiver
        b. Or approved equal

2.14 DOOR RELEASE BUTTON, UNDER COUNTER

A. SPDT, momentary push button
B. Guard ring around button to prevent accidental activation
C. Mount with button facing back of desk
D. Coordinate exact mounting location after deck or counter is fully complete and the sitting position has been decided.
E. Manufacturer:
    1. Alarm Controls TS-18
    2. Or approved equal

2.15 PANIC/DURESS/LOCKDOWN BUTTONS

A. Exact device type and style to be coordinated with Owner prior to approval or purchase. A selection of button options shall be presented to the Owner for review.
B. Button shall be hardwired.
C. Provide with a 1k/2k end of line (EoL) pre-built resistor pack. GRI (George Risk Industries, Inc.) 6644 series or approved equal.
D. Buttons within a single space may be wired in parallel and be programmed as a zone.
E. Manufacturer:
    1. Under desk – Honeywell 269R
    2. Wall push type – STI-USA Stopper Station #SS2432LD-EN
        a. Blue, flush cover, latching with key to unlock, Text = LOCKDOWN. Coordinate exact text to use with Owner prior to purchase. Provide with appropriate power supply connection for illumination.
    3. Or approved equals
F. Include a minimum of $50 per device allowance to select a button style during the project based on each locations needs.

2.16 MAGNETIC DOOR HOLDS

A. The Security Contractor shall be responsible for the connection of all electrified magnetic door hold open intended for security to the access control system. This shall include providing centralized power supplies located next to or integral to the access control panels. The Contractor shall coordinate with the door hardware specifications and schedules for additional information.

B. Die cast housing
C. Mounting options include:
    1. Floor-mounted
    2. Recessed wall-mounted
    3. Surface wall-mounted
D. 35 pound holding force
E. Fail-safe
F. 24V powered
G. UL listed
H. Manufacturer:
    1. Allegion LCN
        a. Sentronic SEM 7800 Series
        b. Coordinate finish options with Owner, Architect and Consultant.
        c. Provide appropriate mounting options as required.
        d. Provide with appropriate extensions as required.
            1) LCN SEM series for short length extensions, stack as required.
            2) Edwards 1500 series for mid length extensions.
            3) Utilize mag hold open extension chains for long extensions.
            4) Floor mounting may be required when other options to not work.
    2. Assa Abloy Rixon
    3. Or approved equal

2.17 IP SIP SINGLE/DUAL/QUAD BUTTON INTERCOM WITH INTEGRATED IP CAMERA

A. Exterior rated with vandal proof housing.
B. 1, 2 or 4 illuminated programmable buttons capable of calling one, two or four different extensions.
C. NEMA 4X, IP 69 rated.
D. IK10 impact resistance rated.
E. PoE or 12 VDC powered.
F. (2) relays for device control and monitoring. An output shall be connected to the access control system headend for remote door unlock via DTMF.
G. QoS support. The Contractor shall configure the unit for QoS and use a DSCP value of 46 for audio and 32 for streaming video.
H. Supports NTP time synchronization. The Contractor shall coordinate with the Owner to obtain the NTP IP address to configure the unit.
I. Contain a built-in web server making video and configuration available to multiple clients in a standard operating system and browser environment using HTTP, without the need for additional software.
J. Be equipped with an integrated event functionality, which can be triggered by: video motion detection, button press, DTMF, audio, schedule, camera tampering, embedded third party applications, external input, audio detection, edge storage disruption detection, ect. The camera shall provide memory for pre & post alarm recordings. Event functions shall be configurable via the web interface.
K. IEEE 802.1X (Authentication) compliant.
L. Provide with appropriate surface mount backbox based on field conditions. Do not recess mount.
M. TR069 capable with cloud monitoring and provisioning service.
N. Provide an additional 22awg, 2-conductor cable from the access control headend to each intercom for door unlock integration.
O. Integrated Intercom specifications:
    1. SIP VoIP compliant
    2. Supports peer to peer mode.
    3. Support multiple profiles for SIP mode and peer to peer mode. The Contractor shall set up a peer to peer profile for direct communication to a SIP enabled VoIP video phone intercom master station.

4. Capable of dialing up to 3 independent extensions for group or roll over.
5. 2-way, full duplex audio
6. AAC-LC audio encoding @ 16 kHz.
7. 94 db audio output over integrated speaker.
8. Built-in echo cancellation and noise reduction.

P. Integrated camera specifications:

1. Be designed to provide at least two simultaneous video streams in all resolutions, simultaneous including a SIP video stream, at a selectable range up to 30 frames per second (60Hz mode) using H.264 or MJPEG.
2. Support the following video resolutions: 160x90 to 640x480.
3. 135 degrees horizontal by 109 degrees vertical field of view.
4. Integrated LED for illumination.
5. ONVIF Profile S compliant.
6. Provide with (1) Video Management System license per intercom to record the integrated camera.

Q. Manufacturer and Model:

1. 2N/Axis IP Force 1-button #01337-001
2. 2N/Axis IP Force 2-button #01340-001
3. 2N/Axis IP Force 4-button #01343-001
4. Provide with (1) Gold license #01380-001 for each intercom
5. Provide with Torx security screws #01345-001

2.18 IP SIP INTERCOM MASTER STATION DESK PHONE

A. IP SIP compliant VoIP desk phone with color LCD screen for intercom calling.
B. 16 lines and up to 16 SIP accounts.
C. 1024x600, 7” capacitive 5-point touch screen.
D. Android 7.0 operating system with Google Play Store and 3rd party application support.
E. Dual switched, auto-sensing 10/100/1000Mbps ethernet ports.
F. PoE/PoE+ powered.
G. Dual band, 802.11 (2.4 GHz and 5 GHz) Wi-Fi capable.
H. TLS 1.2, SRTP and HTTPS encryption.
I. TR069 capable with cloud monitoring and provisioning service.
J. Integrated Bluetooth 4.0 with EDR.
K. RJ9 headset jack, USB port and 3.5mm stereo headset with microphone.
L. Programmable DTMF soft button overlay on video calls.
M. Integrated 720P video camera.
N. Integrated H.264 video decoder up to 720P at 30 FPS not to exceed 2Mbps.
O. Can receive and display H.264 IP video on 7” color display.
P. Manufacturer and Model:

1. Grandstream GVX3370 (Axis #01695-001)
2. No substitutions without prior approval.

2.19 DOOR LOOPS (POWER TRANSFER LOOPS)

A. Provide new power transfer loops at the top of the doors for retrofit applications.
B. Provide all necessary materials and labor to connect existing electrified panic hardware and new access control system where appropriate.
C. Power transfer loop shall be armored stainless steel door loop with metal end caps.
D. Minimum interior diameter of 3/8” and exterior diameter of 1/2”.
E. Field verify the lengths required for each door.
F. Provide RCI #9508.

1. Or approved equal.

PART 3 EXECUTION

3.01 PHYSICAL SECURITY SYSTEMS AND INTERCOM INTEGRATION

A. The electronic access control system shall be integrated with the video surveillance system and intrusion detection system.
   1. The access control/intrusion detection interface shall be via an Ethernet interface. Contact closure integration shall only be utilized if the system is existing and cannot be upgraded to Ethernet. The Contractor shall supply all necessary expansion boards if contact closure integration will be required.
   2. The access control/video surveillance integration shall be via a native IP interface.
   3. The video surveillance /intrusion detection interface shall be via an Ethernet interface.

B. The Contractor shall provide any and all licensing to integrate the systems together including any additional items to be added to the yearly maintenance agreement.

C. The following minimum features shall be included in the integration; the following list is not all inclusive or exhaustive. The integration shall be a turnkey solution:
   1. Call up live and/or recorded video from an alarm or event.
   2. Graphical maps showing camera icons.
   3. “Mouse over” camera viewing through the DVR/NVR browser and graphical maps.
   4. Playback controls for recorded video.
   5. Camera names brought in from the VMS.
   6. PTZ camera mouse control.
   7. Database entries for intrusion arm/disarm events on individual keypads.
   8. Database entries for intrusion alarm events.
   9. Graphical map symbols for intrusion keypads tied to camera views.
   10. Intrusion devices or zones tied to camera views.
   11. Alarm pop-ups and events shall include instructions and a sequence of operation to deal with events on the Intrusion Detection System, Video Management System and Electronic Access Control System.
   12. Intercom pop-ups when call button is pressed with the ability to unlock the door.
   13. Time syncing via common NTP server.

D. The Contractor shall set up a meeting between the Owner, Consultant and manufacturer to determine the exact functionality of the integration before the integration starts.

3.02 SYSTEM PROGRAMMING

A. The Contractor shall provide all programming necessary for a turnkey system.

B. Programming shall include but not limited to setting all required IP addressing, setting passwords, firmware upgrades, adding the devices into the software, partitioning, area/zone creation, device naming, mapping, cross system integration, etc.

3.03 SYSTEM PARTITIONING, ZONING AND NAMING

A. The Contractor shall program each facility to be in its own partition. Some facilities may require sub-partitions to control user access to certain areas. Each manufacturer may use different names for partitions, zones, areas, etc. Adapt as required.

B. All devices, inputs, outputs and other applicable software/hardware entities shall be named by the Contractor which includes naming at the administration/interface level in additional to the user facing interface.

C. As a basis to start, the following partition, zoning and naming shall be followed:
   1. Partition: Building name
      a. Zone 1: Building name and zone name such as exterior, 1st floor, etc.
         1) Device 1: Building name and floor/zone name - Door # or device name
         2) Device 2: Building name and floor/zone name - Door # or device name
         3) Repeat as required
      b. Zone 2: Building name and zone name such as 2nd floor, etc.
         1) Device 1: Building name and floor/zone name - Door # or device name
         2) Device 2: Building name and floor/zone name - Door # or device name

3) Repeat as required
c. Repeat zones as required.
2. Repeat Partitions as required.

D. The Owner shall have the final say. The Contractor shall schedule a coordination meeting with the Owner and Consultant to coordinate actual project structure and naming prior to starting any programming.

3.04 INSTALLATION PROCEDURES

A. The Contractor shall cable all controlled or monitored doors, intercoms, etc. and terminate this cable in the access control panels no less than 3 weeks prior to substantial completion regardless of the status of the field devices such as door hardware, card readers, intercoms, etc.
B. The Contractor shall program the access control system no less than 2 weeks prior to substantial completion so when field devices are installed and terminated, associated door hardware and full system functionality can be tested. Programming shall include all doors, associated inputs, outputs, and interoperability regardless of final field device status.
C. The Contractor shall perform final connections and testing onsite when field devices such as electrified door hardware has been installed.

3.05 ADA POWER ASSIST DOOR OPERATOR INTERFACE

A. Certain electric locking mechanisms with card access shall be connected (hardwired) to the ADA Power Assist Door Operator pushbutton. In this scenario, card reader shall be interfaced to the ADA Door Operator pushbutton to approve activation of door motor based on card authorization or pre-programmed security schedule.
B. Door motor/operator shall not be energized until authorized by the security system to prevent operation and eventual burn-out of the motor from hitting the button with the security system activated.
C. The door shall allow free egress via push paddle regardless if the door is in a locked or unlocked state.
D. The paddles and operators shall be tied through the access control system, so the actions appear in the device trees, are mappable, logged and can be scheduled or overridden.
E. Contractor shall provide all necessary cable, hardware, relays, I/O modules, interfaces, and system programming to support all necessary functionality.
F. All logic and programming shall be controlled through the access control system. Local logic boards, smart relays, etc. shall not be utilized.

3.06 DOOR RELEASE BUTTONS

A. Door release buttons shall be tied through the inputs of the access control system.
B. The button release shall be interfaced in a way that the actions appear in the device trees, are mappable, logged and can be scheduled or overridden.
C. Contractor shall provide all necessary cable, hardware, relays, I/O modules, interfaces, and system programming to support all necessary functionality.

3.07 REMOTE INTERCOM RELEASE

A. Remote intercom release relays shall be tied through the inputs of the access control system.
B. The intercom release shall be interfaced in a way that the actions appear in the device trees, are mappable, logged and can be scheduled or overridden.
C. Contractor shall provide all necessary cable, hardware, relays, I/O modules, interfaces, and system programming to support all necessary functionality.

3.08 PANIC/DURESS BUTTONS

A. Panic/Duress buttons shall be tied through dedicated inputs of the access control system.

B. The buttons shall be interfaced in a way that the actions appear in the device trees, are mappable and logged.
C. When a panic/duress button is activated an event to action shall occur notifying client workstations. These alarms shall be activated on a map with a clear red flashing icon. Any associated or integrated cameras shall pop-up.
D. Additional actions may be required and shall be coordinated with the Owner and Consultant.
E. Contractor shall provide all necessary cable, hardware, relays, I/O modules, interfaces, and system programming to support all necessary functionality.

3.09 FIRE ALARM INTERFACE

A. Certain electric locking mechanisms shall be connected (hardwired) to the building fire alarm system for fail safe release upon any fire alarm. A single low voltage/low current normally closed dry contact from the fire alarm system shall be provided by others in each room with Security Control Panels. This contact shall open on any fire alarm condition.
B. The access control system shall provide an output to the fire alarm system to release mag hold opens on alarm.
C. The fire alarm system shall provide an output to the access control system to trigger various rules and actions in the access control system.
D. All doors equipped with mag locks shall be connected to a fire alarm relay to release on fire alarm.
E. All doors secured with a card reader in and out shall be connected to a fire alarm relay to release on fire alarm.
F. The Contractor shall provide all additional UL listed failsafe relays and power supplies as necessary to interface to this contact and unlock all of these doors.
G. The Contractor shall verify fail safe and fail secure locking requirements with the Architect, door hardware contractor/provider and the AHJ.

3.10 MAGNETIC DOOR HOLD OPEN INTERFACE

A. Magnetic door hold opens identified to be controlled by the security system shall be interfaced to the access control system via I/O expansion modules.
B. These shall be capable of being controlled by schedule or by override in the event of an emergency.
C. Contractor shall provide all necessary cable, hardware, I/O modules, power supplies, interfaces, and system programming to support all necessary functionality.

3.11 END OF LINE SUPERVISION

A. The Contractor shall furnish and install end-of-line resistors to provide end-of-line supervision on all access control input devices. This shall include but is not limited to door position switches, request to exit devices, door release buttons, and duress/panic buttons.
B. The Contractor shall furnish and install resistors as near to the field device as possible. Supervision resistance values shall be natively compatible with the associated control panel.
    1. Mercury Security based installations shall utilize 1K resistors to provide a 1K / 2K ohm resistance values from associated inputs.

3.12 RS-485 AND OSDP BASED COMMUNICATION

A. RS-485 based communication busses utilized by the access control system shall be compliant with the RS-485 communication standard, including RS-485 end-of-line termination requirements.
B. RS-485 communication busses include control panel and module communication, OSDP based reader communication, and RS-485 based intelligent lock gateways.
C. The Contractor shall furnish and install 120-ohm end of line termination at control panels, modules, readers, and other peripherals where applicable.

D. Termination shall be integral to the hardware where available. The Contractor shall furnish and install a 120-ohm resistor to terminate equipment not featuring on-board RS-485 termination.
E. The Contractor shall furnish and install 1K-ohm pull down/line bias resistors between the DAT/TR- and GND lines on interface modules and controllers. The pull down/line bias resistor shall be installed at the panel for each reader.
F. The Contractor shall configure OSDP devices to communicate at a minimum of 38,400 baud rate. The default 9,600 baud rate is not acceptable.

3.13 PASSWORDS

A. The Contractor shall coordinate a secure project password with the Owner and Consultant. This password shall be documented by the Contractor and used for all devices.

3.14 TESTING

A. Refer to Section 27 0000 for additional requirements.
B. Prior to energizing or testing the system, ensure the following:
    1. All products are installed in a proper and safe manner per the manufacturer's instructions.
    2. Dust, debris, solder, splatter, etc., is removed.
    3. Cable is dressed, routed, and labeled; connections are consistent with regard to polarity.
    4. All products are neat, clean, and unmarred, and parts are securely attached.
C. Contractor shall ensure that each device in the security system is functioning normally and in such a manner as to meet the functional and performance requirements in this specification.

3.15 TRAINING

A. Refer to Section 27 0000 for additional requirements.
B. Provide system operations, administration, and maintenance training by factory-trained personnel qualified to instruct.
    1. Contractor shall provide up to 6 hours of scheduled and dedicated training time in three (3) two (2) hour sessions for administration and investigation.
    2. The Contractor shall provide up to 2 hours of dedicated training time for badge creation, printing and printer maintenance.
    3. Provide printed training materials for each trainee, including product manuals, course outline, workbook or student guides, and written examinations for certification.
    4. Provide hands-on training with operational equipment.
    5. Training shall be oriented to the specific system being installed under this contract as designed and specified.
    6. Contractor shall provide all necessary documentation of system operating parameters prior to scheduled training sessions.

3.16 WARRANTY

A. Refer to Section 27 0000 for additional requirements.

3.17 INSTALLATION PRACTICES

A. All services provided shall be professional and conform to the highest standards for industry practices. The Owner reserves the right to halt any installation due to poor workmanship. All work shall be defect free, and the installer shall replace, at their expense, any work found to be defective.
B. The Owner reserves the right to halt any installation due to failure of Contractor to observe installation-free periods due to instructional or administrative requirements. To the maximum extent possible, the Owner will provide advance notice of such periods.
C. Contractor is responsible for providing a complete and system.

D. All manufactured items, materials, and equipment shall be applied, installed, connected, erected, used, and adjusted as recommended by the manufacturers, or as indicated in their published literature, unless specifically noted herein to the contrary.
E. Contractor shall follow these standards and approved submittals for locations of power supplies. The Owner intends to limit the number and location of power supplies to facilitate more effective long-term support and maintenance of the system.
F. Installation of locks on fire rated doors which require any modification or drilling of the door shall be done in accordance with the NFPA by a properly qualified and certified installer. The doors field WH-ETL labelling shall be properly updated.

3.18 COORDINATION

A. Contractor shall provide up to 8 hours (up to four, 2-hour sessions) of scheduled and dedicated coordination time to assist Owner with sequence of operation, rule creation and coordination as requested by Owner or Consultant.

3.19 AESTHETICS

A. All cables and equipment terminating at panels frames shall be vertically straight, with no cables crossing each other, from twelve inches inside the ceiling area to the termination block.
B. All cable bundles shall be combed and bundled to accommodate individual termination block rows and panels.
C. For any given telecom room, a horizontal and vertical alignment for all mounting hardware will be maintained to provide a symmetrical and uniform appearance to the distribution frame.
D. All surface-mounted devices shall be firmly secured level and plumb
E. All rack mount equipment shall be securely installed.

3.20 HARDWARE LAYOUT

A. Hardware positioning and layout shall be reviewed and approved by the Owner prior to construction. The review does not exempt Contractor from meeting any of the requirements stated in this document.

3.21 SERVER INSTALLATION PRACTICES

A. Verify that the manufacturer approved server hardware, OS meets the Owner’s IT standards prior to ordering.
B. Coordinate server power, cooling, and mounting requirements with Owner prior to installation.
C. Coordinate virus scan/security software requirements with Owner and manufacturer prior to installation.

3.22 DEVICE CABLING/WIRING INSTALLATION PRACTICES

A. All external wire and cables shall be supported in maximum 5 foot intervals from the structure or as required to maintain not more than 12" cable sag between supports and without over tensioning the cables. Provide j-hooks as needed where cable tray or raceway is not available.
B. Contractor shall coordinate installation with Division 27 cabling Contractor to ensure there is at least 2-inches of physical separation between security cabling and voice/data cabling throughout cable path. Voice/data cabling Contractor has first claim to cable tray.
C. All cables, regardless of length, shall be labeled within 18" of both ends with an identifier that is keyed to the door, room, or corridor number as identified.
D. All cables shall have 6-foot service loops neatly coiled in the equipment room. During initial cable rough-in, Contractor shall have sufficient slack to route anywhere within the equipment room.
E. Cabling shall be adequately supported with Velcro wire wraps and horizontal support cable managers fastened to rack frame. Cables shall be dressed in a neat and orderly fashion. Any cabling or equipment installation that is deemed unacceptable by the

Owner or Consultant shall be replaced or corrected by the Contractor at no additional cost. Plastic zip ties are not allowed.

F. All cables are to run at right angles to the structure, placed above the ceiling in halls or corridors.
G. Cables shall not run above red iron joist.
H. Contractor shall make every effort to conceal wiring and other apparatus into walls, floors, and ceilings, assuming code and good engineering practice allows and suggests.
I. Ties and straps shall be installed snugly without deforming cable insulation. Ties shall be spaced at uneven intervals not to exceed four feet. No sharp burrs shall remain where excess length of the cable tie has been cut.
J. Contractor shall notify Owner immediately if obstruction or hazard is discovered in a pathway provided by others.
K. Cable shall be stored and handled to assure that it is not stretched, kinked, crushed, or abraded in any way. Bend radiuses shall meet manufacturer specifications and/or recommendations. Cable shall not be installed in ambient temperatures or moisture conditions above or below the manufacturer's rating.
L. No splices shall be installed in any cable.

3.23 CABLE TERMINATION

A. Termination hardware (blocks and patch panels) positioning and layout shall be reviewed and approved by the Owner prior to construction. The review does not exempt Contractor from meeting any of the requirements stated in this document.

3.24 FIRE STOPPING

A. Fire stopping of openings between floors, fire-rated walls, and smoke-rated walls, created by others for This Contractor to pass cable through, shall be the responsibility of the This Contractor. Sealing material and application of this material shall be accomplished in such a manner that is acceptable to the local fire and building authorities having jurisdiction over this work.
B. Contractor shall be responsible for providing a waterproof seal in and around any openings to the outside environment intended for use by the Contractor

3.25 SYSTEM INSPECTION

A. Contractor shall coordinate with project representative for inspection after Contractor has completed testing of entire system.
B. Contractor shall have trained Contractor representative and testing equipment on site during inspection to assist with spot verification of tests.

3.26 LABELING

A. Contractor shall neatly label all security devices and cabling at both ends. All labels shall be on Project as-built drawings.

3.27 DOCUMENTATION

A. Upon completion of the installation, Contractor shall provide full documentation sets to the Consultant for approval as described in section 27 60 00. All documentation shall become the property of the Owner.
B. Documentation shall include the additional specific items detailed in the subsections below:
    1. Contractor shall provide hard copy and electronic forms of the final test results.
    2. Contractor shall provide a document including the following:
        a. Door label/identifier
        b. Location of each drop by orientation/permanent landmark in the room
        c. Contractor shall provide accurate as-built Construction Drawings. The drawings are to include cable routes and device locations.

3.28 PRE-CHECK OUT

A. The Contractor shall demonstrate the following to Owner during system demonstration.

1. The card readers are fully installed and functional.

3.29 FINAL ACCEPTANCE

A. In addition to closeout requirements in section 27 6000, This Contractor shall demonstrate the following before final approval.
   1. Owner training is complete.
   2. Punch list items are complete.
   3. As-built documentation is complete and submitted to Owner/Consultant.

3.30 FINAL PROCEDURES

A. Perform final procedures in accordance with section 27 6000.

END OF SECTION

SECTION 27 6600
INTRUSION DETECTION SYSTEM

PART 1 GENERAL

1.01 SCOPE

A. This specification section covers the complete replacement of the existing campus Intrusion Detection System (ISD). The Contractor shall provide all necessary hardware and labors to provide a fully functional IDS systems and coordinate any additional requirements (i.e. power and data).
B. The Contractor shall furnish and install a new Intrusion Detection System (IDS) throughout the campus, as specified.
    1. Note: The contractor shall schedule time inspect to be familiar with the campus before bidding.
        a. New Areas: Are shown where new hardware shall be placed.
        b. Other Areas: It is the responsibility of this contractor supply similar IDS functionality throughout the remainder of the campus.
        c. No additional changes or adds to the contract shall be allowed due to the unfamiliarity of the campus or based on assumptions.
        d. The existing system shall be demolished including all end devices and cabling and replaced with new cabling and intrusion hardware throughout the entire campus.
    2. Contractor shall furnish, install and program all intrusion detection hardware devices, mounting brackets, power supplies, switches, detectors, controls, consoles cables, and other components of the system as specified.
    3. Contractor shall provide all necessary materials, hardware, software and cabling required to furnish a fully functional system as specified.
    4. Provide all required programming, testing, and commissioning for a complete turn-key system.
    5. Contractor shall confirm system monitoring program requirements with Dallas ISD-IT-CSS, Central Dispatch, and M&O
    6. Furnish and install outlets, junction boxes, conduit, connectors, wiring, and other accessories necessary to complete the system installation.
        a. Requirements shall be in accordance with Division 26 0000, Electrical.
        b. Refer to Section 27 0000 for additional project scope information.

1.02 RELATED WORK

A. Section 27 0000 – General Technology Requirements
B. Section 27 0500 – Communications General Requirements
C. Section 27 0523 – Pathways for Technology Systems
D. Section 27 0526 – Grounding and Bonding for Technology Systems
E. Section 27 1100 – Communications Equipment Rooms
F. Section 27 1500 – Communications Horizontal Cabling
G. Section 27 1600 – Communications Connecting Cords
H. Section 27 1800 – Communications Labeling and Identification
I. Section 27 5100 – Distributed Communications Systems
J. Section 27 6000 – Physical Security General Requirements

1.03 DEFINITIONS

A. Refer to Section 27 0000 for additional definitions.

1.04 REFERENCE STANDARDS AND CODES

A. National Electric Code, Article 760.
B. National Fire Alarm Code (NFPA 72).
C. Administrative Council for Terminal Attachments (ACTA):

1. ANSI/TIA-968-A-2002 Technical Requirements for Connection of Terminal Equipment to the Telephone Network.

D. American National Standards Institute (ANSI):
   1. ANSI C63.4 Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

E. Federal Communications Commission (FCC):
   1. Title 47 C.F.R. Part 15; Class B – Radiated and Conducted Emissions.
   2. Title 47 C.F.R. Part 68; rules governing the connection of Terminal Equipment (TE) to the Public Switched Telephone Network (PSTN).

F. The National Institute of Standards and Technology of the United States of America (NIST):
   1. Federal Information Processing Standards Publications 197 (FIPS 197) –Advanced Encryption Standard (AES).

G. Underwriters Laboratories, Inc. (UL):
   1. UL 50 - Enclosures for Electrical Equipment.
   2. UL 294 – Access Control System Units.
   3. UL 365 - Police Station Connected Burglar Alarm Units and Systems.
   4. UL 609 - Local Burglar Alarm Units and Systems.
   5. UL 985 - Household Fire Warning System Units.
   6. UL 1023 - Household Burglar Alarm System Units.
   7. UL 1076 – Proprietary Burglar Alarm Units and Systems
   8. UL 1610 - Central Station Burglar-Alarm Units.
   9. UL 60950-1 - Information Technology Equipment - Safety.
   10. UL 636 – Hold up alarms

H. Refer to Section 27 0000 for additional requirements.

1.05 QUALIFICATIONS

A. The Contractor shall be a Napco certified dealer.
B. Refer to Section 27 0000 for additional requirements.

1.06 PRE-CONSTRUCTION SUBMITTALS

A. The Contractor shall submit the intrusion detection hardware layouts which includes the number of controllers, sub-panels and other associated devices per location.
B. The Contractor shall submit full power calculations which includes the anticipated power loads, number and type of power supplies including all power supply boards, number of 120VAC circuits required, battery backup including the quantities of batteries to meet requirements.
C. Refer to Section 27 0000 for additional requirements.

1.07 PRE-INSTALLATION PROCEDURES

A. For in-use, existing facilities or retrofit projects, the Contractor shall assign all applicable electronics IP addresses, passwords and pre-build out all the enclosures including the interconnects within the enclosure prior to being delivered to the project or installed.
B. The Contractor shall cable all monitored doors, detectors, etc. and terminate this cable in the control panels no less than 3 weeks prior to substantial completion regardless of the status of the field devices.
C. The Contractor shall program the intrusion detection system no less than 2 weeks prior to substantial completion so when field devices are installed and terminated, the full system functionality can be tested. Programming shall include all monitored doors, associated inputs, outputs, and interoperability regardless of final field device status.
D. The Contractor shall perform final connections and testing onsite when field devices has been installed.
E. Refer to section 27 0000 for additional requirements.

1.08 CONSTRUCTION PROGRESS SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

1.09 CLOSEOUT SUBMITTALS

A. Refer to Section 27 0000 for additional requirements.

PART 2 PRODUCTS

2.01 ALARM CONTROL PANEL

A. Intrusion detection systems are monitored by an AES-Multinet receiver at Dallas ISD's central monitoring system. Intrusion Detection systems are to report to central monitoring system via an AES 7007 Burglary Subscribers IntelliNet 2.0 or Dallas ISD approved equal.
   1. If central monitoring system is not available, signal is to be sent to Southwest Dispatch or as directed by Dallas ISD designated representative.
   2. Provide twelve months of monitoring service required as part of the install.

B. Manufacturer:
   1. High schools requiring 96-255 zones: NAPCO Gemini X-255 (https://www.napcosecurity.com/products/gemx255/)

2.02 EXPANSION MODULES:

A. Locate module and power supply inside enclosure and install near electrical outlet within telecom rooms/closets throughout the building for ease of installation.
B. All expansion modules to be tied into the main intrusion detection panel.
C. Provide external power supply with each expansion module.

2.03 BATTERIES AND BACKUP

A. The Contractor shall provide a minimum of (1) 12V, 7ah, sealed Absorbent Glass Mat (AGM) style batteries with F style terminals per power supply and (1) per control panel. Provide additional as required based on calculated power load.
B. Provide adequate battery backup as required by Authority Having Jurisdiction (AHJ) or a minimum of 8-hours.
C. Manufacturer:
   1. Interstate Power Patrol FAS1075
   2. Power Sonic PS-1270
   3. Or approved equal

2.04 END OF LINE SUPERVISION

A. All monitored intrusion detection devices shall include EoL monitoring.
B. Provide a dual 1k + 1k end of line (EoL) pre-built resistor pack. GRI (George Risk Industries, Inc.) 6644 series or approved equal.
   1. Adjust resistance values as required by the manufacturer.

2.05 DOOR CONTACTS/DOOR POSITION SWITCHES (DC)

A. The Security Contractor shall be responsible for the connection of all door position devices to the intrusion detection system. Door position devices shall be integral to the door hardware whenever possible. The Contractor shall refer to the door hardware schedule and coordinate with the door hardware Contractor on locations and requirements.
B. Sealed and potted magnetic reed switch in contact housing.
C. Provide DPDT for applications with multiple security systems (Access Control/Intrusion Detection or PLC) utilizing a single door contact.
D. Door contacts shall be appropriately sized for any established holes within door frames.
E. Parts provided are basis of design. Determination of final part number is the responsibility of Contractor.
F. Provide color that matches door as close as possible.

G. Provide recessed switch whenever possible.
H. Armored whip for surface mount contacts.
I. Provide GRI (George Risk Industries, Inc.) 180 Series for recessed applications.
    1. Or approved equal.
J. Provide GRI (George Risk Industries, Inc.) 4400 series for surface mount applications.
    1. Or approved equal.
K. Provide GRI (George Risk Industries, Inc.) MC-180 Series for hollow top channel applications.
    1. Or approved equal.
L. Provide GRI (George Risk Industries, Inc.) 4532 Series for overhead door applications.
    1. Or approved equal.

2.06 MOTION DETECTORS

A. The motion detector shall be a multi-technology, IR and range adaptive radar device.
B. Each detector shall be home run to the nearest expansion module or main intusion panel
    1. Provide power distribution, as required.
C. Reduces false alarms by sensing both heat, physical motion and compensation algorithms.
D. Wide angle: 60’ x 80’ standard coverage, selectable 25’ x 33’ coverage.
E. Long range: 8.5’ x 100’ standard coverage, selectable 3.3’ x 25’ coverage.
F. Active white light suppression
G. Dynamic temperature compensation
H. Draft and insect immunity
I. Sensor data fusion
J. Power requirements: 9-15 VDC
K. Maximum current draw of 26ma at 12VDC.
L. Can be mounted between 7’-10’ with no adjustments.
M. Provide with appropriate mounting hardware, Bosch B328 (wall), B338 (ceiling) or equal.
N. White.
O. Manufacturer:
    1. Wide Angle: Bosch ISC-PDL1-W18G
    2. Narrow Angle, long range: Bosch ISC-PDL1-WC30G
    3. Or approved equal

2.07 360 MOTION DETECTORS

A. The motion detector shall be a multi-technology, IR and range adaptive radar device with anti-mask.
B. Each detector shall be home run to the nearest expansion module or main intrusion panel
    1. Provide power distribution, as required.
C. Reduces false alarms by sensing both heat, physical motion and compensation algorithms.
D. 360 Degree coverage: 52’ diameter.
E. Active white light suppression
F. Dynamic temperature compensation
G. Draft and insect immunity
H. Sensor data fusion
I. Power requirements: 9-15 VDC
J. Maximum current draw of 24ma at 12VDC.
K. Can be mounted between 8’-20’ with no adjustments.
L. Mounts to standard 1-gang 3.5” rectangular electrical box.

M. White.
N. Manufacturer:
    1. 360-degree: Bosch DS9370
    2. Or approved equal

2.08 PANIC AND DURESS BUTTONS

A. Stainless steel cover
B. DPDT contacts for connecting to multiple systems
C. Fully supervised
D. Reset key for testing and resetting alarms
E. Recessed latching button to prevent accidental activation
F. Coordinate exact mounting location with Owner prior to purchase and installation
G. Manufacturer:
    1. Honeywell 269R
    2. Or approved equal

2.09 INTRUSION DETECTION PANEL ENCLOSURES

A. Provide a power supply/chargers and sub-assemblies to power various intrusion controller boards, detectors, audible/visual alarms and other access control or security system components. The Contractor shall select the appropriate enclosure, power supply and sub-assemblies for each application.
B. Enclosures
    1. Shall be capable of accommodating power supplies, sub-assemblies and other manufactures boards when required.
    2. Wall mountable.
    3. Include a cam-lock and tamper switch.
    4. Provide with main backplane and door backplane.
    5. Manufacturer:
        a. Altronix Trove2BH2 with TBHD2 door backplane or as appropriate for intrusion panel manufacturer.
C. Sub-Assemblies
    1. The Contractor shall provide all sub-assemblies to meet the project requirements.
    2. Access Control Module
        a. Independently controlled fused protected outputs:
            1) Fail-Safe and/or Fail-Secure power outputs.
            2) Dry form “C” 5 amp rated relay outputs (fused).
            3) Any combination of the above
    3. Access Control System trigger inputs:
        a. Normally open (NO) inputs.
        b. Open collector sink inputs.
        c. Any combination of the above.
    4. Multi-Output Power Distribution Module
        a. Single input distributed over eight (8) or sixteen (16) outputs.
        b. Fused protected outputs.
        c. Output terminals shall accommodate up to 12AWG wires.
    5. Multi-Output Power Distribution Module with Dual Inputs
        a. Two (2) inputs distributed over eight (8) outputs.
        b. Outputs shall be configurable by input.
        c. Fused protected outputs.
        d. Output terminals shall accommodate up to 12AWG wires.
    6. Power supplies and sub-assemblies shall be manufactured by Altronix or approved equal:
        a. Altronix ACMS8 – Dual input, eight (8) output, fused Access Control Module (UL listed Sub-assembly).

b. Altronix PDS8 - Dual input, eight (8) output, fused power distribution module (UL listed Sub-assembly).
c. Altronix PD16W – Selectable dual input, sixteen (16) output, fused power distribution module (UL listed Sub-assembly).

2.10 ROOF BEAM DETECTION

A. Locations: On roofs with HVAC equipment.
   1. Consider aesthetics and potential vandalism.
B. Penetration of roof membrane or flashing by devices, mounting, or conduits is not allowed.
C. Confirm the extent of each campus roof beam detection system with Dallas ISD-M&O.
   1. Roof beam detection is typically limited to the first roof level.
   2. Possible Exceptions: Where there is ladder access to/from another level or other campus specific concern.

2.11 POWER TRANSFORMER

A. The Contractor shall provide all required transformers and power supplies.
B. The power supplies shall be hardwired. Pluggable “wall wart” transformers are forbidden.
C. Provide with enclosure as required.
D. 115 VAC input.
E. Provides both a 16 VAC output and 18 VAC output @ 18.7A/16.7A to power both the control panel and power supply panel.
F. Manufacturer:
   1. Altronix
      a. T1618300K
         1) Mount within Altronix Trove 2 enclosure on main backplane in the upper left corner.
   2. Or approved equal

2.12 CABLES

A. Door Contacts, Panic/Duress Buttons: 22-gauge, two-conductor, unshielded, stranded cable shall be provided for all door contacts. The cable shall be white in color and plenum rated.
B. Motion Detectors: 22-gauge, four-conductor, shielded, stranded cable shall be provided for all motion detectors. The cable shall be white in color and plenum rated. Provide 18-guage where distances and voltage drop require it.
C. Keypads/Bus: 18-guage, four-conductor, non-shielded, non-twisted, stranded cable shall be provided for keypads. The cable shall be white in color and plenum rated. Keypad cabling shall not exceed 390 feet. Cable impedance shall not exceed 100 ohms.

PART 3 EXECUTION

3.01 PHYSICAL SECURITY INTEGRATION

A. The intrusion detection system shall be integrated with the electronic access control system.
   1. The access control/intrusion detection interface shall be via an Ethernet interface. Contact closure integration is not acceptable.
B. The Contractor shall provide any and all licensing to integrate the systems together including any additional items to be added to the yearly maintenance agreements.
C. Refer to the Electronic Access Control specifications for additional specific integration requirements.

D. The Intrusion system shall be time syncing to a common NTP server across all security systems.
E. The Intrusion system shall synchronize users enrolled or removed through the access control system.
F. The Intrusion system shall disarm on first in authorized and valid card read. Authorized means the user has the appropriate permissions to disarm the intrusion system.
G. The Contractor shall set up a meeting between the Owner, Consultant and manufacturer to determine the exact functionality of the integration before the integration starts.

3.02 SYSTEM PROGRAMMING

A. The Contractor shall set the Ethernet communications to TCP/IP.
B. The Contractor shall enable 128-bit AES encryption when required.
C. The Contractor shall program all inputs EoL resistance values. All inputs shall have an EoL unless specifically submitted on and approved by the Consultant.
D. The Contractor shall configure mail server SMTP settings and port. The Contractor shall coordinate with the Owner on email accounts to be added.
E. Programming system configuration parameters (hardware and software, zone/circuit numbers, communication parameters).
F. Programming operational parameters such as opening/closing reports and windows, system response text displays of events, activation of relays that drive auxiliary devices, and identifying types of zones/loops.
G. Programming passcodes according to the authorities and functions defined by the Owner.
H. The Contractor shall program all compliance and panel wide parameters including onboard and add-on module ethernet parameters, Cloud Remote Connect settings, report routing, power supervision, RPS parameters, miscellaneous settings, etc.
I. The Contractor shall set all point, point profiles, area and debounce times according to the requirements, best practices and Owner requirements. The Contractor shall create custom point profiles as required for desired functionality.
J. The Contractor shall set all Area necessary parameters including force arm/bypass, exit delay time, restart time, area type, part on, exit/entry delay warning, area re-arm time, etc.
K. The Contractor shall assist with entering users, authority levels and PINs.
L. Other system programming tasks required by the owner. These additional programming requirements shall be coordinated between the owner and the contractor.
M. Operational Testing: The contractor shall perform thorough operational testing, walk testing, and verify that all system components are fully operational.
N. Hard-copy System Printout: The contractor shall submit a hard-copy system printout of all components tested and certify 100 percent operation indicating all devices/panels/units have passed the test criteria set forth by the manufacturer.
O. Acceptance Test Plan Form: An acceptance test plan form shall be prepared/provided by the contractor prior to the acceptance walk-through.
P. This form shall include separate sections for each device/panel/unit as well as a column indicating the manufacturer's performance allowance/margin, a column indicating the result of the testing performed by the contractor (pass/fail), and an empty column for recording findings during the walk-through.

3.03 SYSTEM PARTITIONING, ZONING AND NAMING

A. The Contractor shall program each facility to be in its own partition. Some facilities may require sub-partitions to allow arming and disarming of specific areas. Each manufacturer may use different names for partitions, zones, areas, etc. Adapt as required.
B. All devices, inputs, outputs and other applicable software/hardware entities shall be named by the Contractor.
C. As a basis to start, the following partition, zoning and naming shall be followed:

1. Partition: Building name
    a. Zone 1: Building name and zone name such as 1st floor, gym, auditorium, etc.
        1) Device 1: Building name and floor number – detector or device name
        2) Device 2: Building name and floor - detector or device name
        3) Repeat as required
    b. Zone 2: Building name and zone name such as 2nd floor, etc.
        1) Device 1: Building name and floor - detector or device name
        2) Device 2: Building name and floor - detector or device name
        3) Repeat as required
    c. Repeat zones as required.
2. Repeat Partitions as required.

D. Device Naming
    1. All devices shall be named based on Owner direction.

E. The Owner shall have the final say. The Contractor shall schedule a coordination meeting with the Owner and Consultant to coordinate actual project structure and naming prior to starting any programming.

3.04 MONITORING SERVICE AND COMMUNICATIONS INTEGRATION

A. The Contractor shall program the intrusion panels to communicate to the Owner's preferred monitoring service which may be their own internal monitoring or an external service.
B. The Contractor shall program all applicable route groups for primary and backup using the appropriate communication formats accepted by the monitoring service. Set AES encryption where required.

3.05 MOTION DETECTOR INSTALLATION REQUIREMENTS

A. Point away from outside traffic. Position 360 detectors farther from walls. Microwave energy passes through non-metallic walls.
B. Point or position away from direct and indirect sunlight.
C. Point or position away from glass or other objects that rapidly change temperatures.
D. Point or position away from moving or rotating objects such as fans.
E. Mount the detector on a solid and vibration free surface.
F. Avoid mounting the detector within 1 ft (minimum) of any fluorescent light fixtures.
G. Long range, narrow angle detectors should be mounted in the center of hallways when possible.
H. Wide angle detectors should be mounted in corners of the areas being covered when possible.
I. Wide angle detectors mounted in spaces smaller than 25' x 33' should have the DIP switch set to reduce the coverage from the maximum.
J. Long range, narrow angle detectors mounted in corridors shorten than 3.3' x 25' should have the DIP switch set to reduce the coverage from the maximum.
K. Detectors should have the down lens enabled unless specifically noted otherwise.

3.06 END OF LINE SUPERVISION

A. The Contractor shall furnish and install end-of-line resistors to provide end-of-line supervision on all intrusion input devices. This shall include but is not limited to door position switches, motion detectors, glass break detectors, duress/panic buttons and all other inputs being monitored.
B. The Contractor shall furnish and install resistors as near to the field device as possible. Supervision resistance values shall be natively compatible with the associated control panel.

3.07 WIRELESS SURVEY

A. The Contractor shall perform a wireless survey prior to the purchase, rough-in, cabling or installation of the wireless devices.

B. The wireless survey shall be used to determine the optimal device placement which shall be documented and sent to the Consultant for review.

3.08 PASSWORDS

A. The Contractor shall coordinate a secure project password with the Owner and Consultant. This password shall be documented by the Contractor and used for all devices.

3.09 SYSTEM GROUNDING

A. The Contractor shall ground all components of the system to the telecommunications grounding system and ground fault detection shall be enabled according to UL requirements.

3.10 WARRANTY

A. Refer to Section 27 0000 for additional requirements.
B. Contractor shall guarantee all materials, equipment, etc., for one (1) year from date of substantial completion of work. This guarantee shall include labor, material, and travel time.
C. All Intrusion Alarm systems, materials, and labor shall be under warranty for 1 year from date of final acceptance.

3.11 GENERAL

A. Prerequisites
   1. The Contractor shall maintain a competent (single point of contact) project supervisor, along with competent technical personnel acceptable to the Owner and Consultant, during the entire installation process. Best efforts shall be made to avoid change of the project supervision during the project without prior written approval from the Owner and/or Consultant.
   2. The Contractor installing any equipment/devices shall be responsible for providing all interconnecting cables to and/or between same equipment that may be required to make equipment fully operational.

B. Requirements and Responsibilities
   1. The Contractor shall provide, furnish, deliver, transport, erect, install, configure, and connect completely all of the material and equipment described herein or depicted on project drawings. The Contractor shall supply all other incidental material required, such as interconnecting cables, to make the work complete, and to install all systems in a turnkey operating condition.
   2. Perform this work in accordance with acknowledged industry and professional standards and practices, existing build conditions, and as specified herein. Provide and install all materials, devices, components, and equipment for complete, operational systems.
   3. Coordinate all efforts and verify field conditions with those of related trades. In the event of any conflicts, delays or improper preparatory work by others, notify the Owner or Owner’s Consultant: The Owner and Owner’s Consultant’s decision will be binding.

3.12 INSTALLATION PRACTICES

A. All services provided shall be professional and conform to the highest standards for industry practices. The Owner and Owner’s Consultant reserve the right to halt any installation due to poor workmanship. All work shall be defect free, and the installer shall replace, at their expense, any work found to be defective.
B. The Contractor shall exercise care during installation - damage to cables or equipment will not be accepted. The Contractor shall remove any damaged cabling or equipment and replace with new.
C. Contractor is responsible for providing a complete and functional intrusion alarm system.

D. Contractor shall provide low voltage power and control lines to and from power supplies, remotely controlled equipment, and other devices, even though not explicitly indicated on drawings or listed in equipment tables.
E. All manufactured items, materials, and equipment shall be applied, installed, connected, erected, used, and adjusted as recommended by the manufacturers, or as indicated in their published literature, unless specifically noted herein to the contrary.
F. The Contractor shall follow these standards and approved submittals for locations of power supplies. The Owner intends to limit the number and location of power supplies to facilitate more effective long-term support and maintenance of the system.
G. The Contractor shall provide rack shelves or rack mounting ears for any equipment that is not rack mountable. All equipment installed using shelves shall be fastened to the rack shelf.
H. Install plates as required on back boxes where they exist. Provide cut-in back boxes where boxes do not exist.
I. Install surface mounted cable raceway systems that match the surface color and/or the other surface mounted raceways, where cables cannot run within fishable walls.
J. The Contractor installing any RF devices shall be aware that RF devices may cause interference to equipment and shall take whatever precautions necessary to avoid causing interference.
K. The Owner will provide programming information needed to help Contractor with configuration of system. The Contractor shall have the responsibility to program the system, assure proper communications between controlling points and any monitoring companies, and to adjust any system or device causing false alarm conditions.
L. Consideration shall be given not only to operation efficiency, but also to overall aesthetic factors.

3.13 COORDINATION

A. Contractor shall provide up to 4 hours (up to two, 2-hour sessions) of scheduled and dedicated coordination time to assist Owner with sequence of operation, zone coordination, rule creation and coordination as requested by Owner or Consultant.

3.14 TRAINING

A. Provide system operations, administration, and maintenance training by factory-trained personnel qualified to instruct.
    1. Contractor shall provide up to 4 hours of scheduled and dedicated training time in two (2) two (2) hour sessions for system use and maintenance.
    2. Contractor shall provide up to 1 hours of scheduled and dedicated training time in two (2) thirty (30) minutes sessions for system arming and disarming per site.
    3. Provide printed training materials for each trainee, including product manuals, course outline, workbook or student guides, and written examinations for certification.
    4. Provide hands-on training with operational equipment.
    5. Training shall be oriented to the specific system being installed under this contract as designed and specified.
    6. Contractor shall provide all necessary documentation of system operating parameters prior to scheduled training sessions.

3.15 SUPPORT

A. The Contractor shall make available technical resources, as deemed necessary by the Owner, for database integration projects.

3.16 AESTHETICS

A. All cables terminating at the panel frames shall be vertically straight, with no cables crossing each other, from twelve inches inside the ceiling area to the termination block.
B. All cable bundles shall be combed and bundled to accommodate individual termination block rows and panels.

C. A horizontal and vertical alignment for all mounting hardware shall be maintained to provide a symmetrical and uniform appearance to the distribution frame.
D. All surface-mounted devices shall be firmly secured and level.

3.17 HARDWARE LAYOUT

A. Hardware positioning and layout shall be according to project drawings.

3.18 DEVICE CABLING/WIRING INSTALLATION PRACTICES

A. Contractor shall coordinate with the Electrical Contractor their requirements for conduits and proper AC power to service all equipment installed by Contractor, in locations where power is not available.
B. Contractor shall provide for proper ground system to all equipment.
C. Each cable group that can cause interference to another group shall be separated by sufficient distance so as not to cause signal contamination or interference.
D. All external wire and cables shall be supported in maximum five foot intervals from the structure, or as required to maintain not more than 12" cable sag between supports and without over tensioning the cables.
E. All cables, regardless of length, shall be marked with indelible color-coded labels within 18" of both ends with an identifier that is keyed to the door, room, or corridor number as identified. Labels shall be directly hot stamped or factory stamped, closed sleeve method. Adhesive strip labels may only be used if protected by transparent heat-shrink tubing. There shall be no unmarked cables at any place in any part of any system. Marking codes used on cables shall correspond and be shown clearly on as-built drawings.
F. Each cable shall be marked at all cable ends with a standard nomenclature (Device, #, closet letter).
G. All cables shall be separated into like groups, according to signal or power levels, and routed separately to eliminate signal contamination and crosstalk - this includes both inside and outside of equipment racks.
H. All cables shall have 6-foot service loops neatly coiled in accessible ceiling. During initial cable rough-in, the Contractor shall have sufficient slack to route anywhere within Telecommunications Room. Coordinate exact panel and power supply mounting locations with Electrical Contractor.
I. Cabling shall be adequately supported with Velcro wire wraps and horizontal support cable managers fastened to rack frame. Velcro straps shall be installed snugly without deforming cable insulation. Cables shall be dressed in a neat and orderly fashion. Any cabling or equipment installation that is deemed unacceptable by the Owner or Consultant shall be replaced or corrected by the Contractor at no additional cost.
J. Cable Ties shall be installed snugly without deforming cable insulation. Ties shall be spaced at uneven intervals not to exceed four feet. No sharp burrs shall remain where excess length of the cable tie has been cut.
K. All cables are to run at right angles to the structure, placed above the ceiling in halls or corridors.
L. Cables shall not run above red iron joist.
M. Contractor shall make every effort to conceal wiring and other apparatus into walls, floors, and ceilings, assuming code and good engineering practice allows and suggests.
N. Contractor shall notify Owner or Owner’s Consultant immediately if obstruction or hazard is discovered in a pathway provided by others.
O. Cable shall be stored and handled to assure that it is not stretched, kinked, crushed, or abraded in any way. Bend radiuses shall meet manufacturer specifications and/or recommendations. Cable shall not be installed in ambient temperatures or moisture conditions above or below the manufacturer’s rating.
P. No splices shall be installed in any cable.
Q. No security device cabling shall have an accessible disconnect outside of a secured equipment room or within a backbox.

R. Any exposed exterior cable shall be contained in waterproof conduit with the appropriate waterproof fittings.
S. All cables are to run at right angles to the structure, placed above the ceiling in halls and corridors.
T. Contractor shall make every effort to conceal wiring and other apparatus into walls, floors and ceilings, assuming any applicable codes and good engineering practice allows and suggests.
U. All cabling systems installed in public areas shall be installed within walls, ceiling or floors or within surface wiring pathways as dictated by codes and good engineering practices.
V. Contractor shall notify Owner or Owner's Consultant immediately if obstruction or hazard to cable paths are discovered and seek corrective actions
W. The cables shall be supported by properly insulated wire support hangers, bridal rings, "D" rings, ladder cable tray, or inner duct as may be necessary to support cables.
X. Contractor shall seal any cable penetrations they may use or make where the penetration is part of a firewall or acoustic barrier.

3.19 EQUIPMENT CABINET WIRE AND CABLE INSTALLATION

A. All power cables, control cables, and high level cables shall be grouped to one side of the equipment rack while low level cables grouped to the other side.
B. All equipment rack wiring and cabling shall be neatly laced, and ends dressed with heat shrink tubing, and all cables shall have service loops between the horizontal tie bar and the connection to equipment. Rack cabling shall be adequately supported with tie wraps or Velcro wire wraps, and horizontal support bars to rack frame as it enters or exits the front or back of equipment.
C. All equipment rack wiring and cabling shall be neatly dressed.
D. Rack cabling shall be adequately supported with Velcro wire wraps and horizontal support cable managers fastened to rack frame.

3.20 CONNECTORS/CONNECTIONS

A. Moisture Resistance: All connectors shall be crimped or applied in such a way as to prevent moisture from entering the connector or cable.
B. Preparation: Cables shall be carefully prepared and connectors installed as directed by the manufacturer. Proper stripping devices and crimping tools shall be used.
C. Terminations: Connectors shall be carefully fitted to mating devices on equipment to avoid damage to mating contacts, inserts, or bodies. Specialized terminations shall be made in a neat and secure manner, suited to the service of the wire, and as directed by the manufacturer. In all cases, where the manufacturer specifies the terminations, those terminations shall be used.
D. Termination Testing: The strength of the termination shall be tested by manually pulling on the connector and cable. Any terminations that exhibit movement, loose cable, or insecure connections shall be re-terminated.

3.21 SPECIAL TECHNIQUES

A. Waterproofing: Contractor shall be responsible for providing a waterproof seal in and around any openings to the outside environment intended for use by the Contractor.

3.22 FIRE STOPPING

A. Fire stopping of openings between floors, fire-rated walls, and smoke-rated walls, created by others for the Contractor to pass cable through, shall be the responsibility of the Contractor. Sealing material and application of this material shall be accomplished in such a manner that is acceptable to the local fire and building authorities having jurisdiction over this work.
B. Any openings created by, or for Contractor, and left unused, shall be sealed up as part of this work by the Contractor.

3.23 TEST REQUIREMENTS FOR DEVICE CABLING

A. Contractor shall perform continuity tests to ensure cables are free of shorts within the pairs, and shall verify cables for continuity, pair validity and polarity, and conductor position.

3.24 SYSTEM TESTING PROCEDURES

A. Prior to energizing or testing the system, ensure the following:
   1. All products are installed in a proper and safe manner per the manufacturer's instructions.
   2. Dust, debris, solder, splatter, etc., is removed.
   3. Cable is dressed, routed, and labeled; connections are consistent with regard to polarity.
   4. All products are neat, clean, and unmarred, and parts are securely attached.

B. Contractor shall ensure that each device in the security system is functioning normally and in such a manner as to meet the functional and performance requirements in this specification.

3.25 SYSTEM INSPECTION

A. Contractor shall coordinate with Consultant for inspection after Contractor has completed testing of entire system.
B. Contractor shall have trained Contractor representative and testing equipment on site during inspection to assist with spot verification of tests.
C. Contractor shall demonstrate to Consultant the functionality of the system, including the selection of various display modes and accessing system functions.
D. Contractor shall verify with Consultant the precise positioning of all devices and shall make fine adjustments as requested.

3.26 LABELING

A. Contractor shall neatly label all security devices and cabling at both ends. All labels shall be on project as-built drawings.
B. Contractor shall label both ends of the cable within four (4) inches of the termination with the same label identifier. These will be machine printed, Brady (or equivalent) labels.
C. Panels shall have labels showing cable numbers and far end locations for each cable terminated in the cabinet.

3.27 DOCUMENTATION

A. Upon completion of the installation, Contractor shall provide full documentation sets to the Consultant for approval. All documentation shall become the property of the Owner.
B. Documentation shall include the items detailed in the subsections below:
   1. Contractor shall provide hard copy and electronic forms of the final test results.
   2. Contractor shall provide a document including the following:
      a. Device label/identifier
      b. Location of each device by room or corridor number
C. Contractor shall provide accurate as-built Construction Drawings. The drawings are to include cable routes and device locations.
D. Consultant will provide floor plans in paper and electronic formats (".dwg," AutoCAD and ".dxf") on which as-built construction information can be added. The Contractor shall modify these documents accordingly to denote as-built information as defined above and then return the documents to the Owner.

3.28 FINAL ACCEPTANCE

A. The Contractor shall demonstrate the following before final approval.
   1. Owner training is complete.
   2. Punch list items are complete.
   3. As-built documentation is complete and submitted to Owner/Consultant.

3.29 CLOSEOUT PROCEDURES

A. Closeout Submittals: Contractor shall provide closeout documentation to the Consultant. The Consultant shall receive the closeout submittals no less than 72 hours prior to the scheduled inspection time.
B. Inspection: Contractor shall be present for the inspection by the Consultant. Contractor shall supply all testing equipment needed to verify compliance with the specifications.
C. Punch List: Work or materials found to be incomplete, of unsatisfactory quality, failing to meet written system specifications, and/or unacceptable to the Consultant, shall be documented by the Consultant and provided to Contractor to rectify.
D. Re-Inspection: If a re-inspection is necessary, the costs of the Consultant's additional travel, hours, and expenses may be deducted by the Owner from the contract amount due Contractor.
E. Punch List Approval: The punch list shall be considered complete only after having been signed by the Owner and Consultant.

3.30 CLEANING

A. Prior to system final turnover to Owner:
    1. Remove all dirt and debris from equipment racks and equipment rooms.
    2. Clean all equipment filters, vents, and fans.
    3. Clean all enclosures and back box interiors thoroughly before installing plates, panels, or covers.

END OF SECTION

SECTION 28 0500

COMMON WORK RESULTS FOR ELECTRONIC SAFETY AND SECURITY

PART 1 – GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Every item of labor, material, devices and appurtenances for installing a complete Electronic Safety and Security System and other related systems included in Division 28 of the Specifications.
   1. Section 28 05 26 – Grounding And Bonding For Electronic Safety And Security Systems
   2. Section 28 05 28 – Pathways for Electronic Safety and Security
   3. Section 28 05 53 – Identification for Electronic Safety And Security
   4. Section 28 10 00 – Electronic Access Control and Intrusion Detection
   5. Section 28 20 00 – Electronic Surveillance
   6. Section 28 31 00 - Fire Detection And Alarm

1.03 RELATED WORK:

A. General: See all other portions of these Contract Documents and apply to those portions of work, relating to the following Electronic Safety and Security Systems: Electronic Access Control and Intrusion Detection, Fire Detection and Alarm, Electronic Surveillance, the same as if repeated herein in its entirety. The Division 28 Trades shall provide and install all wiring, all equipment, all electronics, all software and accessories as specified and shown on the drawings and as needed to provide complete and operational systems. Division 28 Trades shall provide to Division 26 special boxes, cabinets, racks, hangers, and etc. for installation.

B. Division 21 – Fire Suppression

C. Division 23 - Mechanical

D. Division 26 – Electrical

E. Division 27 - Communications

1.04 WORK NOT INCLUDED:

A. Provide roughing-in, including the empty boxes, conduit, pull strings, etc. under Division 26 for the following related Sections:
   1. Section 28 05 26 – Grounding And Bonding For Electronic Safety And Security Systems
   2. Section 28 10 00 – Electronic Access Control and Intrusion Detection
   3. Section 28 20 00 – Electronic Surveillance
   4. Section 28 31 00- Fire Detection And Alarm

1.05 DRAWINGS:

A. Where conduit, equipment, devices and other electrical appurtenances are shown on the drawings, the general arrangement of such items on the electrical drawings shall be followed as closely as actual building construction and the work of other trades will permit. Because of the small scale of the electrical drawings, it is not feasible to indicate all offsets, fittings and accessories which may be required. The Contractor shall investigate the construction conditions affecting the work and provide fittings and accessories as required to meet actual conditions.

1.06 QUALITY ASSURANCE:

A. Equipment and material used in the project shall be new and undamaged. The installation shall fit into the space allotted and shall allow adequate, acceptable, clearances for entry, servicing, safety,

and maintenance. The Contractors shall coordinate the work to ensure that the equipment may be moved into place without altering building components or other installations. All electronic safety and security systems (above) work shall be performed by a a licensed Texas Electrical Contractor(s) whose technicians, mechanics, or tradesmen shall be skilled and certified in the trade involved. All Division 28 work shall be performed under the direct supervision of the equipment systems' authorized technician with a locally recognized and accepted master electrician's license. All work under Division 28 shall be provided by a single-source Division 28 vendor/subcontractor approved by the Owner to be utilized for this work.

B. Equipment and material in existing installations may be reused where specifically indicated on the drawings.

1.07 REFERENCES:

A. The complete installation and all materials and equipment under Division 28 shall conform to the current International Building Code including all applicable portions of the National Electrical Code (NEC) and all other governing codes, regulations and certifications. All wiring methods shall adhere to Division 28 specified wiring methods.

B. All equipment used shall bear the Underwriters Laboratory (U.L.) label for the intended application, or other organizations label if acceptable to the Authority having jurisdiction and concern with product evaluation.

C. In addition, the following codes, standards, and regulations shall apply to the complete installation and all materials and equipment. These are referred to by their accompanying abbreviations.

1.	National Electrical Code (NFPA No. 70) 2023	NEC
2.	National Electrical Manufacturers Association	NEMA
3.	Underwriters Laboratories, Inc.	UL
4.	Telecommunications Building Wiring Standards	TIA/EIA
5.	All Systems' Installation Certification Compliance Documents for Installing Trades	
6.	National Fire Protection Association	NFPA
7.	Uniform Federal Accessibility Standards	UFAS
8.	Americans with Disabilities Act Accessibility Guideline	ADAAG

D. The above standards are intended as a minimum and shall be exceeded if required by the Contract Documents. In the event information contained in the Contract Documents conflicts with one of the above mentioned codes, the codes shall take precedence.

1.08 PERMITS, LICENSES, TAXES AND INSPECTION CERTIFICATES:

A. All permits, bonds, licenses, inspection fees and taxes required for the execution of the work shall be obtained and paid for by the Contractor. Under each phase of the Division 28 work, the Contractor shall furnish three copies of certificates of final acceptance to the Engineer from any inspection authority having jurisdiction.

B. At the completion of the job, provide the Engineer with three (3) copies of the fire alarm inspection certificate from the Authority having jurisdiction, if such inspection is provided and/or required by the locality.

OR

A. All bonds, licenses, and connection fees, inspection fees, and taxes required for the execution of the work shall be obtained and paid for by the Contractor. The contractor is advised that since this project is on State property, Building Codes and Zoning Ordinances of local political sub-divisions do not legally apply. Building permits required by the locality consistent with the Governors memorandum of September 11, 1973, will be obtained and paid by the Owner.

1.09 REGULATIONS AND STANDARDS:

A. The completed installation and all materials and equipment shall conform to local ordinances and codes, other regulations and standards listed herein or in related sections. These are intended as a

minimum and shall be exceeded if required by the specifications or the Drawings. In the event of conflict between the codes, standards, or regulations, and information contained in the Contract Documents, the applicable code, standards, or regulation shall take precedence.

1.10 SUBMITTALS:

A. Submit shop drawings, product data and samples in accordance with Division 1 for all items as specified in related sections of these specifications. One (1) electronic (PDF) copy of the submittal shall be submitted. One (1) electronic (PDF) copy of the submittal will be returned to the Contractor. If additional copies are required, they will be the responsibility of the Contractor. Where drawings are submitted, the Contractor shall submit a minimum of two (2) sets of full scale prints. One (1) copy will be marked and returned to the Contractor, and the Contractor shall be responsible for all additional copies required for his use. All submittal data shall be correctly identified to show project name, and the exact model, style or size of item being submitted. Improperly identified submittals will not be reviewed by the Engineer. Each item submitted for review shall bear the Subcontractor's stamp which states that they have reviewed the submission, that it is complete, and that in their opinion it meets the contract requirements. Contractor's stamp shall identify the paragraph and page number for which the submittal is being made. Any submission which has not been reviewed and stamped by the Electrical Trade will not be reviewed by the Engineer. No reviews prior to award of Contract will be considered or accepted.

B. Shop drawings, diagrams, catalog data and such other data necessary to fully describe and substantiate compliance with these Contract Documents shall be submitted as follows:
   1. All the equipment and materials where submissions are specifically required by other Divisions of these Contract Documents.
   2. All the equipment and materials that are indicated with a [S] behind the product title. This shall include submission of the specified products equipment and materials.
   3. All the equipment and materials that are acceptable equal substitution.
   4. If submission is NOT required for the SPECIFIED products "shop drawings and product data" under 1. and 2. above, the Contractor shall NOT submit the SPECIFIED products "shop drawings and product data".
   5. Samples, in good working order, shall be submitted in accordance with Division 1, complete with all installation and service drawings and instructions. All samples will be returned at the submitter’s expense unless otherwise indicated. Samples may be subject to destructive testing by Engineer.

C. Operation and Maintenance manuals shall be submitted in accordance with Division 1 and shall include a copy of all accepted shop drawings, installation and maintenance data, operation instructions, parts lists, and the name, address and telephone number of supplier or nearest representative. All electrical and electronic devices, equipment and systems marked [O/M] in these specifications shall be included and all other such electrical and electronic items which will require servicing before the duration of its useful life has been reached. Manuals shall be presented to the Engineer for review and transmitted to the Owner before the final payment is recommended.

D. Equivalents:
   1. Not all of the Manufacturers, trade names and/or model numbers are indicated herein, or on the drawings.
   2. Unless definitely stated otherwise and upon complying with Division 1, the Contractor may use any article of equal appearance, which in their judgment is equal to the article that is specified and is accepted by the Engineer.
   3. Where three (3) or more manufacturers are named in the specifications for any item, the Contractor shall use one of the three (3) listed manufacturers. **No other manufacturers shall be reviewed or accepted.** Manufacturers that are listed first in these specifications and on drawings were used as a basis of design.
   4. It will be the responsibility of the Contractor to verify all connections, physical sizes and capacities of all other manufacturer's items, both named or proposed. If the equipment necessitates changes in power distribution, conduit, wiring, lighting, wiring, or any other building systems from that indicated on the drawings, the Contractor shall be responsible for

all additional costs included and notify other trades of the changes. Where such changes are required, detail drawings indicating all required changes shall be submitted for review at the same time the manufacturers drawings are submitted for approval.

5. Refer to Division 1 for substitutions.

E. The ten day prior approval requirements of The Instructions to Bidders, AIA 701, are waived for this Division of the Specifications, and unless stated otherwise, the Contractor may use items that he deems as equivalent in quality and performance to the specified item subject to final acceptance of substituted items by the Engineer upon his review of shop drawings. (**This paragraph cannot be used with BCOM jobs.)**

F. Guarantee: Electronic safety and security systems equipment, materials and labor required by these specifications and accompanying drawings shall be guaranteed to be free from defective materials or workmanship for a period of one year after final acceptance of the project except extended warranties as specified elsewhere in these documents on specific items of equipment will be furnished by the Trade providing the equipment. Defects in material or workmanship occurring during this period shall be corrected with new material and equipment or additional labor at no cost to the Owner. Manufacturer's certificates of warranty shall be transmitted to the Owner before final payment is recommended.

1.11 WARRANTIES:

A. The Contractor shall warrant for a period of one year all work provided under the Contract to include, but not necessarily limited to, all systems, equipment, materials, and workmanship. This shall not be construed to limit any extended warranty periods of longer than one year for specific items or systems specified elsewhere in the Contract Documents.

B. The warranty period shall commence on the date of acceptance by the Owner and shall cover all parts and labor as required to fulfill the warranty at no cost to the Owner.

C. Refer to Division 1 for additional warranty requirements.

D. Information on all warranties shall be included in the O&M manuals specified herein to be provided to the Owner.

1.12 COORDINATION OF WORK:

A. General: The contract documents indicate the extent and general arrangement of the electronic safety and security systems. The Contractor shall be responsible for the coordination and proper relation of the electronic safety and security system work to the building structure and to the work of other trades. No additional compensation or extension of completion time will be granted for extra work caused by the lack of coordination.

B. Cooperation: The Contractor shall provide dimensions and locations of all openings, shafts and similar items to the proper trades and install work as required so as not to interfere with, or delay, installation of systems under construction in the buildings.

C. Locations of lines and equipment shall be determined from actual field measurements. The outlines of the building shown on the electrical drawings are intended only as a guide to indicate relative locations of the electronic safety and security work. Refer to the existing buildings and structural components to determine actual measurements. If conflicts prevent installation of electronic safety and security work at the locations indicated, minor deviations shall be made subject to acceptance by the Engineer, and without additional compensation.

D. Cutting and Patching: See Division 1 and Division 26.

E. Roughing-In: Equipment, racks, cabinets, manual pull stations, smoke detectors, devices, and other similar items shall align vertically or horizontally with each other, the building structure and features thereof when it appears obvious and logical that they should. All mounting heights shall be within the limits of IBC and ADAAG.

F. Damage to Other Work: The Division 28 Trades are responsible for damage to other work caused by his work or workmen. Repairing of damaged work shall be done by the Trade who installed the work, and as directed by the Engineer; the cost of which shall be paid for by the Division 28 Trades.

1.13 ASBESTOS:

A. Asbestos Free Materials: The intention of these drawings and specifications is that there be no asbestos containing materials installed on this project. To the best of the Engineers' knowledge, none of the material or equipment specified herein or shown on the drawings contain asbestos. The Contractor shall make every effort to prevent any asbestos materials from being installed in or used on the construction of the project. At the completion of the project, the Contractor shall certify by letter that to the best of his knowledge, no asbestos containing materials were used for or in the construction of this project.

B. Existing Materials:

1. Discovery: If during the construction of this project, work involving friable asbestos is suspected or encountered, all work in this area shall be discontinued and the Owner or the Owner's representative, shall be notified immediately and the Owner with his own forces or by separate contract shall be responsible for complete investigation, removal, and disposition of the friable asbestos hazard in accordance with applicable laws and regulations. If the Contractor claims that delay or additional cost is involved because of such action by the Owner, he shall make such claim as provided elsewhere in the contract documents.
2. Removal: All work involving the removal of friable asbestos will be done under a separate contract.

1.14 GRAPHICS DATABASE:

A. This project's Computer Aided Design & Drafting (CADD) drawing files may be purchased directly from the Engineer for use in preparing computer graphics specific to the project. See Appendix A at the end of this Section for Letter of Indemnification and ordering instructions.

PART 2 - PRODUCTS

2.01 MANUFACTURERS AND MATERIALS:

A. General: Manufacturers and materials shall be as specified in subsequent sections of these specifications and as noted on the drawings. Similar types of equipment shall be the products of the same manufacturer unless specified otherwise.

2.02 SLEEVES AND INSERTS:

A. General: Sleeves and inserts shall be provided and correctly located in the structure, as required for the work.

B. Inserts shall be steel and of proper size for loads encountered.

2.03 ACCESS DOORS:

A. Provide for all junction boxes or any item requiring access. Doors shall be of sufficient size and so located that the concealed items may be serviced or completely removed and replaced. Doors required for work shall be furnished as a part of this Division to the General Contractor for installation. Doors in acoustic tile ceilings shall be furnished in multiples of tile sizes. Doors are not required in exposed grid type ceilings where tiles are removable. Doors shall be metal access doors with cam lock, style to match ceiling or wall construction. Doors occurring in rated construction shall be fire rated U.L. labeled access doors correlated to preserve the integrity of the rated construction. Doors shall be prime finish steel except those in toilets, shower rooms, locker rooms, kitchens and other similar areas shall be aluminum with natural anodized finish. Doors shall match the access doors in Division 23 and meet the acceptance of the Architect.

PART 3 – EXECUTION

3.01 INSTALLATION:

A. General: Materials and equipment shall be installed in accordance with manufacturer's instructions to conform with the details and application as specified in subsequent sections of these specifications and indicated on the drawings.

B. Supports: Provide necessary supports for all equipment and appurtenances as required; this includes, but is not limited to, frames or supports for items such as cabinets, junction boxes, conduit, outlet boxes, and other similar items requiring supports. Foundation drawings, bolt setting information and foundation bolts shall be furnished by the subcontractors furnishing the equipment for all equipment required to be bolted to the floor, wall or above ceiling structure.

C. Sleeves: Provided by Division 26.

D. Temporary Requirements: Openings in equipment shall be kept capped at all times until connection is made to the system. The ends of all conduits and equipment openings shall be kept capped properly with approved devices. Approved devices are items such as specially molded plastic caps and sheet metal caps.

E. Access Doors: Provide access doors for all concealed electric equipment, pull boxes, junction boxes or any item requiring access. Doors shall be of sufficient size and so located that the concealed items may be serviced or completely removed and replaced. Doors required for Division 28 work shall be furnished by Electrical Trade to the Contractor for installation. Doors in acoustic tile ceilings shall be furnished in multiples of tile sizes. Doors are not required in exposed grid type ceilings where tiles are removable.

F. Painting: All work under this Division shall be painted in accordance with Section 28 05 53, Identification for Electronic Safety and Security Systems.

3.02 EXISTING WORK AND DEMOLITION:

A. Demolition: Remove all existing wiring, junction boxes, outlets, devices, cabinets, etc., indicated for demolition. Additional amounts of demolition may be required to accommodate desired renovations and new construction. Not all demolition may be shown on the drawings. All existing electronic safety and security systems equipment not indicated for demolition shall remain in place.

B. Equipment Removed: The Owner will select and retain such existing electronic safety and security systems equipment and materials which are indicated to be removed and not reused, as he desires. All other existing equipment and materials indicated to be removed, and not reused shall become the property of the Contractor, who shall remove them from the premises within the time frame specified under other Divisions of this Contract Document.

C. Equipment Relocated: All existing equipment and materials indicated to be relocated shall be disconnected, removed, and relocated. All equipment and materials shall be protected from damage during demolition.

D. Service Interruption: Attention is called to the fact that the existing facility shall remain in operation throughout the construction period. All necessary temporary arrangements shall be made as required to keep all security, alarm, control, etc., circuits in continuous operation during this period except for scheduled outages for change-overs. The outage shall be kept to the minimum and carefully scheduled to suit the Owner.

E. Miscellaneous: In all altered portions of the buildings, the Electronic Safety and Security Systems Trade shall remove or alter as necessary all existing work that does not fit with the new construction. All existing work or areas that are not altered shall be reconnected as required. Where indicated changes to non-safety and security facilities require minor safety and security systems changes, these changes shall be accomplished even if not specifically indicated. Only a small portion of the existing work is shown on the drawings. Contractors submitting proposals shall visit the site to determine the scope of work under this heading as no additional compensation will be granted because of existing conditions even though the existing conditions may not be indicated

on the drawings. Contractor shall thoroughly inspect the electronic safety and security systems in reworked areas and bring to the attention of the Engineer all defective or unserviceable material not scheduled for removal or replacement. Demolition shall not begin until the work schedule is approved by the Owner. The work shall be scheduled to prevent any disruption to the normal operations of the building. Refer to other Divisions for work phasing.

3.03 FIELD QUALITY CONTROL:

A. Verification [V]: Upon completion of the project, the Contractor shall submit a separate letter of certification (or compliance) to the Owner/Engineer that each of the following systems or equipment functions properly, conforms to all requirements of these specifications and all requirements of the manufacturer of the systems.

1. Section 28 10 00 – Electronic Access Control and Intrusion Detection
2. Section 28 20 00 – Electronic Surveillance
3. Section 28 31 00- Fire Detection And Alarm

3.04 MANUFACTURER'S ASSISTANCE:

A. Qualified technical representatives of manufacturers shall be available to visit the project and provide required assistance for any problems or trouble areas of any systems, material or equipment used in the project. Manufacturer's engineering assistance shall also be available for above problems or trouble areas. The Contractor shall purchase all materials, equipment or systems with these services included in the purchase price or otherwise be prepared to have the above service provided when needed or requested by the Engineer without additional compensation. Where one manufacturer's equipment constitutes the majority of the components or devices to make a system, the manufacturer's technically qualified representative shall inspect and accept the completed installation whether or not especially requested by the Engineer.

3.05 INSTRUCTION AND TRAINING OF OWNER'S REPRESENTATIVE:

A. The Division 28 Trades shall instruct and train the representatives of the Owner in the proper operation and maintenance of all elements of the Electronic safety and security systems. Competent representatives of the Contractor shall spend one (1) week for each Division 28 system. The times and locations for instruction and training to the Owner’s personal shall be set by the Owner at times and locations determined by the Owner over a period once the systems are functional for instruction and training. The instruction and training shall be given to all personal as deemed necessary by the Owner. The instruction and training shall prepare the Owner to fully operate and maintain all of the above systems.

3.06 CONSTRUCTION STATUS REPORT:

A. Each item of discrepancies noted on Construction Status Report prepared by the Architect/Engineer shall be answered in detail in writing by the Contractor before payment can be recommended.

3.07 DESCRIPTION OF ALTERNATES: Refer to the other Divisions of the Contract Specification (Manual) for description of alternates. **(On BCOM projects, use the words “additive bid items”.)**

END OF SECTION

APPENDIX A
LETTER OF INDEMNIFICATION

Project Name:

Project Location:

At the Contractors request, Stratus will provide electronic files of the Revit Models for their convenience and use, subject to the following terms and conditions:

Stratus electronic files are compatible with Autodesk Revit Product version for which they were designed. Autocad files will be provided in the Autocad 2018 DWG format. Stratus makes no representation as to the compatibility of these files with your hardware or your software.

Data contained on these electronic files is part of Stratus's instruments of service and shall not be used by you or anyone else receiving this data through or from you for any purpose other than as a convenience in the preparation of project layout for the referenced project. Any other use or reuse by you or by others will be at your sole risk and without liability or legal exposure to Stratus. You agree to make no claim and hereby waive, to the fullest extent permitted by law, any claim or cause of action of any nature against Stratus, its officers, directors, employees, agents, or subconsultants which may arise out of or in connection with your use of the electronic files.

Furthermore, you shall, to the fullest extent permitted by law, indemnify and hold harmless Stratus from all claims, damages, losses, and expenses, including attorney's fees arising out of or resulting from your use of these electronic files.

These electronic files are not Contract Documents. Significant differences may exist between these electronic files and corresponding hard copy Contract Documents due to Addenda, Change Orders, or other revisions. Stratus makes no representation regarding the accuracy or completeness of the electronic files you receive. In the event that a conflict arises between the signed documents prepared by Stratus and the electronic files, the signed Contract Documents shall govern. You are responsible for determining if any conflict exists. By your use of these electronic files, you are not relieved of your duty to fully comply with the Contract Documents, including and without limitation, the need to check, confirm, and coordinate all dimensions and details, take field measurements, verify field conditions and coordinate your work with that of other contractors for the project.

The use of the Revit Model files prepared by the Engineer shall not in any way negate the Contractor's responsibility for coordination with other trades or for the proper checking and coordination of dimensions, details, member sizes and gage, and quantities of materials as required to facilitate complete and accurate fabrication and erection.

All information added to the drawings by the Contractor shall be in a distinctively heavier pen weight and different font, such that all Contractor information can be clearly distinguished from the original files.

Any information added by the Contractor, which represents a proposed change to the original design, shall be clearly identified by flagging or other distinctive presentation. Because of the potential that the information presented on the electronic files can be modified, unintentionally or otherwise, Stratus reserves the right to remove all indicia of its ownership and/or involvement for each electronic display.

Under no circumstances shall delivery of the electronic files for use by you deemed a sale by Stratus, and Stratus makes no warranties, either expressed or implied, of merchantability and fitness for any particular purpose. In no event shall Stratus be liable for any loss of profit or any consequential damages.

The Engineer believes that no licensing or copyright fees are due to others on account of the transfer of the Revit Model files, but to the extent any are, the Contractor will pay the appropriate fees and hold the Engineer harmless from such claims as may arise.

Any purchase order number provided by the Contractor is for the Contractor's accounting purposes only. The Contractor's purchase order terms and conditions are void and are not a part of this agreement.

The Recipient further agrees that the drawing files will only be used in graphics preparation for the above-referenced project.

SECTION 28 0526

GROUNDING AND BONDING FOR ELECTRONIC SAFETY AND SECURITY SYSTEMS

PART 1 – GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Equipment Grounding Conductor (EGC)

B. Isolated Grounding Conductor (IGC)

1.03 RELATED WORK:

A. Section 26 05 26 – Grounding and Bonding for Electrical Systems

B. Section 27 05 26 – Grounding and Bonding for Communication Systems

1.04 REFERENCES:

A. NFPA 70 (NEC), Article 250

1.05 DESCRIPTION:

A. An insulated equipment grounding conductor, color coded per section 26 05 19, and the NEC, shall be provided for each alternating current circuit without exception.

1.06 TESTS:

A. The equipment grounding conductor shall be tested for continuity and proper bonding to metallic equipment enclosures, outlet boxes, wiring devices and similar items.

PART 2 – PRODUCTS - NOT USED

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Equipment Grounding Conductor (EGC):

1. Provide a separate insulated grounding conductor, color-coded as per Section 26 05 19, enclosed in the same raceway with the phase conductors for all alternating current circuits, even though not necessarily shown on the drawings.
2. The equipment grounding conductor shall be secured to the equipment enclosure at the source of power and at the apparatus being served by the alternating current supply.
3. The minimum size for the grounding conductor shall be as specified in Table 250.122 of NEC.
4. Existing alternating current circuits: If an equipment grounding conductor is not present in the existing feeder or branch circuit to be reworked, Division 28 shall provide new phase, neutral, and grounding conductors from the related panelboard to the indicated outlet.

B. Isolated Grounding Conductor (IGC):

1. Provide a separate insulated grounding conductor, color-coded as per Section 26 05 19, enclosed in the same raceway with the phase conductors, the neutral conductor and the equipment grounding conductor (EGC) for all alternating current circuits, which feed isolated grounding receptacles and panelboards, even though not necessarily shown on the drawings.

2. The isolated grounding conductor shall be secured to the isolated ground bar at the respective panelboard, and to each isolated ground receptacles' isolated grounding screw.
3. The minimum size for the isolated grounding conductor shall be the same as that specified for the equipment grounding conductor. Refer to Table 250.122 of the NEC.

END OF SECTION

SECTION 28 0528

PATHWAYS FOR ELECTRONIC SAFETY AND SECURITY

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Empty conduit system for Electronic Safety and Security Systems including Electronic Access Control and Intrusion Detection, and Electronic Surveillance.

1.03 RELATED WORK:

A. Section 26 05 00 – Common Work Results for Electrical

B. Section 26 05 26 – Grounding and Bonding for Electrical Systems

C. Section 26 05 33 – Raceway and Boxes for Electrical Systems

D. Section 26 05 36 – Cable Trays for Electrical Systems

E. Section 26 05 53 – Identification for Electrical Systems

F. Section 28 05 00 – Common Work Results for Electronic Safety and Security

G. Section 28 05 26 – Grounding and Bonding for Electronic Safety and Security Systems

H. Section 28 05 28 – Identification for Electronic Safety and Security

1.04 GENERAL OPERATION AND DESCRIPTION:

A. General: The Electronic Access Control and Intrusion Detection and Electronic Surveillance systems shall consist of a complete (partial) empty conduit system as indicated.

B. The raceway for this system shall be furnished and installed by the Division 26 electrical contractor in accordance with all related specification sections in Division 26 and 28. The Electronic Safety and Security System Trade shall coordinate this work with Division 26.

1.05 REFERENCES:

A. The complete installation, including additions and modifications, shall be in accordance with:
   1. National Electrical Code Article 800.
   2. Minimum standards of Electronics Industries Association (EIA).

PART 2 – PRODUCTS - NOT USED

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General: The Contractor shall provide all conduit, junction boxes, and materials required for the installation of an empty conduit Electronic Safety and Security System in accordance with the specifications and drawings. Any material and/or equipment necessary for the proper operation of the system not specified or described herein shall be deemed part of this specification.

B. Wiring:
   1. Partial Conduit Raceway System: All wiring methods (conduit only) shall be in accordance with NFPA-70, Article 800, and all other codes specified herein. All wiring to be installed under another contract.
   2. Electronic Safety and Security Raceway System: Provide empty raceway system for motion detection, card readers, key pads, camera, and other electronic safety and security systems outlets and/or devices with conduit, boxes, cabinets, etc., as shown. Outlets, raceways and plates as specified in Division 26. All conduit runs to have long sweep radius elbows; condulets not permitted. There shall be a maximum of two 90° bends between outlets. Any run over 100'-0" in length shall have a pull box where approved by the Electronic Safety and Security System Trade. Provide fish wires as previously specified. Cabinets shall be flush or surface mounted as required.
   3. Furnish and install a 1" conduit from each outlet/device to the nearest accessible ceiling void.
   4. All Electronic Safety and Security systems conduits, boxes, etc., shall be grounded to the building grounding electrode system (BGES) and properly bushed.

C. All boxes, conduits, etc., shall be of proper size, as determined by the Electronic Safety and Security Trade and shall be clearly marked for easy identification.

3.02 FIELD QUALITY CONTROL:

A. The Contractor shall submit the following information to the Architect/Engineer.
   1. "As-built" conduit layout diagrams.

END OF SECTION

SECTION 28 0553

IDENTIFICATION FOR ELECTRONIC SAFETY AND SECURITY

PART 1 – GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. Prepare and paint Division 28 equipment supports and miscellaneous materials located in Equipment Rooms, IDF's, MDF and other utility areas housing mechanical, electrical, safety and security equipment.

B. Identification of cabinets, racks, equipment and other system enclosures.

1.03 WORK NOT INCLUDED:

A. Painting of factory finished Division 28 Equipment such as Access Control, Electronic Surveillance, Fire Detection and Alarm, etc.

1.04 RELATED WORK:

A. Section 26 05 53 – Identification for Electrical Systems

B. Section 27 05 53 – Identification for Communications

C. Section 28 05 00 – Common Work Results For Electronic Safety And Security

D. Section 28 05 28 – Pathways for Electronic Safety and Security

E. Section 28 10 00 – Electronic Access Control and Intrusion Detection

F. Section 28 20 00 – Electronic Surveillance

G. Section 28 31 00 - Fire Detection And Alarm

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Except as otherwise specified, materials shall be the products of the following manufacturers:
   1. Sherwin-Williams
   2. Pratt and Lambert
   3. Devoe
   4. Benjamin Moore

2.02 MATERIALS:

A. Deliver all paints and materials to the project site in their original containers with all labels intact and legible at the time of use.

B. Sherwin-Williams Industrial Maintenance Coatings System 4000 products are listed below to establish color and a standard of quality.
   1. All Hangers and Supports: One coat Series 54 Gloss Black Alkyd Enamel.
   2. Factory Finished Equipment finishes shall be cleaned and properly touched up with equipment manufacturers touch-up paint unless finish is severely damaged or of unacceptable quality. In the latter case, the entire finish shall be restored in accordance with painted procedures herein specified.

PART 3 - EXECUTION

3.01 WORKMANSHIP:

A. The work shall be accomplished by qualified mechanics skilled in the painting trade. Painting of equipment and other materials shall not commence until all testing is complete and systems are ready for operation. Materials shall be evenly spread, and smoothly flowed on without runs or sags. Each coat shall be thoroughly dry before application of succeeding coats.

3.02 PROTECTION OF WORK:

A. The painters shall protect all adjacent surfaces with drop covers during the process of painting. Upon completion, paint spots, if any, shall be removed from all surfaces not intended to be painted.

3.03 PREPARATION OF SURFACE:

A. Surfaces to be painted shall be completely dry before applying paint. Metal surfaces shall be cleaned with mineral spirits before applying materials. Rust and scale shall be removed by wire brushing or sanding. Galvanized surfaces shall be chemically treated with crystalline zinc phosphate in strict accordance with the manufacturer's recommendations. Surfaces shall not be painted when the temperature is, or is likely to be, near the freezing point, nor when they are exposed to hot sun.

3.04 IDENTIFICATION OF BOXES AND EQUIPMENT:

A. After **all** painting is completed, operating and control parts of the equipment and systems shall be properly identified with laminated engraved plastic nameplates fastened with sheet metal screws, bolts or permanent adhesive. Pressure sensitive tape is **not** acceptable. Identification symbols or designations shall be the same as shown on the contract documents.

B. Boxes; Concealed and Surface Mounted: Each enclosure shall be **neatly** identified by stencil marking, which shall indicate service contained, circuit numbers (or zone numbers). Stencil letters shall be upper case (Capital) not less than one half inch high and painted with Series 54 black gloss enamel. All fire alarm system boxes shall be painted red.

C. See Section 26 05 53 for identification of conduit associated with these systems.

D. The Division 28 Systems shall have an engraved informational laminated nameplate with the installing trade's name, telephone number and address for the Owner to obtain preventive maintenance, service or parts. The nameplate shall include the job order number, shop number or other identification, which will identify the related equipment.

If the above address and telephone number is a branch office, the main office or manufacturer's address and telephone number shall be included.

END OF SECTION

SECTION 28 3100

FIRE DETECTION AND ALARM

PART 1 – GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 WORK INCLUDED:

A. A complete Automatic/Manual Microprocessor Based Fire Alarm system.

B. Connecting the Fire Suppression Systems to the Fire Alarm System.

C. Providing the duct mounted smoke detectors as indicated by Division 23.

1.03 RELATED WORK:

A. Division 23 – Heating, Ventilation, and Air Conditioning

B. Division 26 – Electrical

C. Division 27 - Communications

D. Section 28 05 00 – Common Work Results For Electronic Safety And Security

E. Section 28 05 26 – Grounding And Bonding For Electronic Safety And Security Systems

F. Section 28 05 53 – Identification For Electronic Safety And Security

1.04 GENERAL DESCRIPTION:

A. General: Provide a complete stand-alone microprocessor based emergency voice fire alarm system that displays all individual device address, custom messages, time and date, and event on a single LCD display. The fire alarm system shall be intelligent device addressable, analog detecting, low voltage and modular construction with multiplexed communication operation in full compliance with applicable codes and standards, as specified herein and indicated on the drawings. The system shall be wired, connected and left in first class operating condition. The system and system extensions, including graphic display annunciator(s), shall include, but not limited to the following for a complete operating system.

1. Master system CPU including all modules for fire detection; voice and strobe alarms, network for each system indicated.
2. RS-485-LAN, NFPA Style 7 configuration.
3. Circuit interface panels including all modules.
4. Power supplies, batteries and battery chargers.
5. Equipment enclosures.
6. Intelligent addressable manual pull stations, heat detectors, analog smoke detectors, alarm monitoring modules and supervised control modules.
7. Connection of conventional non-addressable devices and fire suppression systems as required for performance to this specification.
8. Annunciator panels and provisions for printer(s) and video display terminal(s).
9. Audible and visual evacuation signals.
10. Load control relays and enclosures.
11. Capable of color graphic displays and historical archiving.
12. Software and firmware as required to provide a complete functioning system.
13. Wiring and raceway, outlet boxes, and junction boxes.
14. Installation, testing and Certification and education labor.

15. MULTIPLEX, system driven remote LCD alpha numeric displays/commands center(s) (RCC) with the fire alarm system and remote locations, where indicated.
16. Interface modules and wiring from this system to an U.L. listed central station via digital alarm communicator provided by the Contractor.
17. Graphic remote annunciators for the building fire alarm and sprinkler flow alarms, supervision and trouble conditions.
18. Door release system

B. Fire Suppression System Connections and Interfaces:
   1. Connect the sprinkler fire suppression system to the Fire Alarm. Display the system's individual device address, custom messages, time and date, and event on LCD display of the fire alarm.
   2. Connect the Kitchen hood fire suppression with proper addressable interface modules to the fire alarm system.

C. Provide the duct mounted smoke detectors indicated on Division 23 drawing.

1.05 SYSTEM OPERATION:

A. Activation of any fire alarm initiating device shall cause the following actions and indications:
   1. Display a custom message describing the device originating the local alarm condition, at the local fire alarm control panel and including its related RCC LCD alpha numeric displays. The LCD annunciators shall display the alarm condition via unique messages as required by Owner. LED type annunciator displays, conventional and graphic style shall indicate alarm zoning as specified.
   2. Under general alarm operation, the FACP shall sound the audible signals, and flash the synchronized strobes in the building.
      a. Audible signals shall be silenceable from the FACP or its related RCC(s) by an alarm acknowledge switch, if permitted by the Authority having jurisdiction. The alarm acknowledge indication shall be transferred to a visual indicator on the FACP and related RCC (s) and the alarm signals shall resound for a subsequent alarm condition, reported by a different device.
      b. The FACP shall transmit a descriptive alarm to the DACT. The alarm transmission shall be capable of transmitting the minimum of the building address, the room, type of device, to inform the fire department of a manual, water-flow or detection alarm; and location.
      c. The FACP shall transmit the fully addressed alarm to all related remote command centers (RCC's) (**future**) terminal and printer.
      d. The Authority having jurisdiction shall be requested to allow the audible silencing of the tone portion of the evacuation alarm during the flow of any fire suppression system in the form of written authorization.
   3. Shut down the indicated air handling units within the smoke zone of alarm origin. A direct connection to Division 23 HVAC control circuits via Intelligent System (Addressable) interface modules is required.
   4. Start elevator "capture" (recall) per direction of the appropriate smoke detectors.
   5. Release doors being held open by fire alarm electromagnetic door holders.
   6. Record within the non-volatile system historical memory the occurrence of the event, the time and date of occurrence and the device initiating the event.

B. Activation of any supervisory circuit or fire suppression system abnormal, shall cause the following actions and indications:
   1. Display the origin of the supervisory condition report at each local alarm control panel and RCC alphanumeric LCD display, LED graphic displays and the **future** terminal and printer.
   2. Activate supervisory audible and visual signals as indicated audible signals shall be silenceable from the local fire alarm control and RCC panel by an alarm acknowledge switch. The supervisory indication shall be transferred to a visual indicator on the control panel and the supervisory signals shall resound for a subsequent supervisory condition, reported by a different device.
   3. Provide an addressed signal for all **supervisory** alarms.

4. Record within the non-volatile system historical memory and the **future** terminal and printer the occurrence of the event, the time of occurrence and the device initiating the event.

C. Receipt of a trouble report such as primary power loss, open or grounded initiating or signaling circuit wiring, open, grounded or shorted indication system wiring, device communication failure, battery disconnect at each new local fire alarm control panel shall cause the following actions and indications:

1. Display at the local alarm control panel and its related RCC and the **future** terminal and printer, an alphanumeric LCD display, with the origin of the trouble condition report.
2. Activate trouble audible and visual signals at the control panel and RCC panel as indicated on the drawings. Audible signals shall be silenceable from the related fire alarm control and its related RCC; by a trouble acknowledge switch. The trouble indication shall be transferred to a visual indicator on the control panel and the trouble signals shall resound for a subsequent trouble condition reported by a different device.
3. Provide an alarm system single auxiliary closure for the system **trouble** alarm. Offsite trouble reports for primary system power failure shall be automatically delayed for a period of time equal to 25% of the system standby battery capacity to eliminate spurious reports as a result of power fluctuations if permitted by the Authority having jurisdiction. Extend the fire alarm systems auxiliary contact via wiring to the DACT. This extension is in addition to the **future** terminal and printer.
4. Record within the non-volatile system historical memory the occurrence of the event, the time of occurrence and the device initiating the event.

1.06 QUALITY ASSURANCE

A. Source Quality Control: Materials and equipment shall be new, unused and U.L listed for use as a Fire Protective Signalizing System. The Fire Alarm System shall be listed and on file with the U.L. “Certificate of Compliance” upon completion of the system.

B. The system and components shall be supplied by one single manufacturer of established reputation and experience who shall have produced similar apparatus and who shall be able to refer to similar installations rendering satisfactory service.

C. The installing trade shall furnish the services of the Fire Alarm System manufacturer’s authorized technical representative who is qualified in the installation ad operation of the system being provided, and who shall be qualified and experienced in the inspection, testing, and maintenance of fires alarm systems. This local authorized technical representative shall be:

1. Factory trained and certified by manufacturer of the system being installed. Fire Alarm Trade shall submit “letter of certification” and proof of continuing education.
2. An on-site National Institute for Certification in Engineering Technologies (NICET) Fire Alarm certified **Level 3** Senior Engineering Technician to supervise on site NICET certified personnel.
3. Trained and qualified personnel employed by and organization listed by a national and Texas recognized testing laboratory (U.L.) for the servicing of maintaining and testing of fire alarm systems.

D. Certification shall be submitted verifying the ‘Fire Alarm Trade” is the manufacturer’s authorized dealer and installer has NICET certified personnel (indicate levels) and whose local project office is listed in the U.L. “Fire Protection Equipment Directory”.

E. The installing Trade shall furnish the services of the Fire Alarm System manufacturer’s authorized technical representative who is qualified in the installation and operation of the system being provided, and who is listed and on file with the Underwriters Laboratories (U.L.) Inc. The above Fire Alarm System manufacturers authorized technical representative shall be hereinafter known as the “Fire Alarm Technician” and his employer as the “Fire Alarm Trade”. The Fire Alarm Technician and his employer shall be capable of providing Underwriters Laboratories “Follow-Up Service” to identify that the fire alarm system is installed, tested and maintained in accordance with U.L.’s requirements and issue a U.L. “Certificate of Compliances” and NFPA-72 “Record of Completion”. The Fire Alarm Technician shall supervise the hook-up, final testing and adjustment of the system,

and provide instruction to the Owner's representative. The Fire Alarm System installation shall include wiring, components, connections, adjustment, testing and certification. The Installing Trade shall provide conduit, junction boxes and pull boxed as indicated; and required by Fire Alarm System manufacturer drawings or Fire Alarm Trade instructions. The Fire Alarm Trade shall furnish a low voltage wiring, special back boxes, cabinets, enclosures and similar items to the Electrical Trade for installation by the electrical trade in accordance with the fire alarm system manufacturer's drawings, Fire Alarm Trade instructions, and as indicated.

F. The Fire Alarm Trade shall also furnish a list of similar or equal installations and shall show company experience in this type of work.

1.07 REFERENCES:

A. The complete installation, including additions and modifications, shall be in accordance with:
   1. 2024 International Building Code (2024 IBC).
   2. National Electrical Code Article 760 & 800.
   3. National Fire Protection Association Standard 72, 13.
   4. Listed by Underwriters Laboratories, Inc.
   5. ASME/ANSI 117.1 (2017).
   6. All of the above references shall be current issue in effect at time of bid.
   7. Authority having jurisdiction's regulations, mandates and certification processes that are either part of applicable local government ordinance or applicable state law.

1.08 SUBMITTALS

A. Submit shop drawings and product data in accordance with Section 28 31 00.
   1. Shop Drawings: The Fire Alarm System manufacturer and Fire Alarm Trade shall provide a one-line riser diagram indicating route and conduit size, external wiring and connections of system proposed; furnish complete operating instructions, including schematic and wiring diagrams of the systems, engineering data sheets on each component and complete servicing data including part numbers of the various components. A schematic diagram of the complete systems is not shown on the contract documents.
   2. Product Data: Submit application, technical, and installation data.

B. Submit Operation and Maintenance Manuals in accordance with Section 28 31 00. The Operation and Maintenance Manuals' shall include the documentation as described in the 2019 NFPA 72 1-6.2.2.

C. **Substitution**: If the system being submitted by Contractor does not meet the specified points of the system operation, the Contractor shall state what specific points their system's operation differs from the specified points of the specified system operation. A differential report shall be submitted to the Design Engineers as part of the review process referencing every paragraph of this specification.

1.09 WARRANTY, SERVICES:

A. The Fire Alarm System manufacturer and Fire Alarm Trade shall warrant this system for a minimum of two (2) years from date of acceptance by the Design Engineer and Owner against defective parts and/or workmanship and shall provide parts and labor to fulfill this warranty at no cost to Owner.

B. Refer to Division 1 for submission of warranty.

C. Qualified service and parts shall be available to call on within a 50 mile basis.

D. The installing Trade shall include the cost of the above Fire Alarm System manufacturer's authorized technical representative providing maintenance of the installed system for a period of one (2) years, after final acceptance, in compliance with the Underwriters Laboratories (U.L.) Guidelines. On-the-premises service furnished at other than normal working hours shall also be available and shall be charged at normal hour labor rates. The above representative shall be prepared to offer Owner a service contract after the warranty period has ended through the Owner's procedural method and in accordance with NFPA 72.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. The system specified herein is based on the arrangement of a Notifier “NFS2-3030” series intelligent analog, voice, fire alarm system and how the system components are grouped into the basic panels, additional modules, auxiliaries and accessories. It is the intent of this specification to allow the total assembly of components to accomplish the specified operation and installation herein and not the exact arrangement of the various subcomponents. An alternative to the Notifier fire alarm system is the Edwards “EST3” fire alarm system. The alternates shall fully comply with the specifications without any qualifications or exceptions. Where proprietary items are involved, consideration will be given for acceptable alternatives.

2.02 MAIN FIRE ALARM CONTROL PANEL OR NETWORK NODE:

A. Main FACP or network node shall be a NOTIFIER Model NFS2-3030 and shall contain a microprocessor based Central Processing Unit (CPU) and power supply in a single board design. The CPU shall communicate with and control the following types of equipment used to make up the system: intelligent addressable smoke and thermal (heat) detectors, addressable modules, printer, annunciators, and other system controlled devices.

B. Operator Control
   1. Acknowledge Switch:
      a. Activation of the control panel acknowledge switch in response to new alarms and/or troubles shall silence the local panel piezo electric signal and change the alarm and trouble LEDs from flashing mode to steady-ON mode. If multiple alarm or trouble conditions exist, depression of this switch shall advance the LCD display to the next alarm or trouble condition.
      b. Depression of the Acknowledge switch shall also silence all remote annunciator piezo sounders.
   2. Alarm Silence Switch:
      a. Activation of the alarm silence switch shall cause all programmed alarm notification appliances and relays to return to the normal condition after an alarm condition. The selection of notification circuits and relays that are silenceable by this switch shall be fully field programmable within the confines of all applicable standards. The FACP software shall include silence inhibit and auto-silence timers.
   3. Alarm Activate (Drill) Switch:
      a. The Alarm Activate switch shall activate all notification appliance circuits. The drill function shall latch until the panel is silenced or reset.
   4. System Reset Switch:
      a. Activation of the System Reset switch shall cause all electronically-latched initiating devices, appliances or software zones, as well as all associated output devices and circuits, to return to their normal condition.
   5. Lamp Test:
      a. The Lamp Test switch shall activate all local system LEDs, light each segment of the liquid crystal display and display the panel software revision for service personal.

C. System Capacity and General Operation
   1. The control panel or each network node shall provide, or be capable of expansion to 636 intelligent/addressable devices.
   2. The control panel or each network node shall include Form-C alarm, trouble, supervisory, and security relays rated at a minimum of 2.0 amps @ 30 VDC. It shall also include four Class B (NFPA Style Y) or Class A (NFPA Style Z) programmable Notification Appliance Circuits.
   3. The control panel or each network node shall support up to 8 additional output modules (signal, speaker, telephone, or relay), each with 8 circuits for an additional 64 circuits. These circuits shall be either Class A (NFPA Style Z) or Class B (NFPA Style Y) per the project drawings.
   4. The system shall include a full featured operator interface control and annunciation panel that

shall include a backlit Liquid Crystal Display (LCD), individual color coded system status LEDs, and an alphanumeric keypad with easy touch rubber keys for the field programming and control of the fire alarm system.

5. The system shall be programmable, configurable, and expandable in the field without the need for special tools, PROM programmers or PC based programmers. It shall not require replacement of memory ICs to facilitate programming changes.
6. The system shall allow the programming of any input to activate any output or group of outputs. Systems that have limited programming (such as general alarm), have complicated programming (such as a diode matrix), or require a laptop personal computer are not considered suitable substitutes. The FACP shall support up to 20 logic equations, including "and," "or," and "not," or time delay equations to be used for advanced programming. Logic equations shall require the use of a PC with a software utility designed for programming.
7. The FACP or each network node shall provide the following features:
    a. Drift compensation to extend detector accuracy over life. Drift compensation shall also include a smoothing feature, allowing transient noise signals to be filtered out.
    b. Detector sensitivity test, meeting requirements of NFPA 72, Chapter 7.
    c. Maintenance alert, with two levels (maintenance alert/maintenance urgent), to warn of excessive smoke detector dirt or dust accumulation.
    d. Nine sensitivity levels for alarm, selected by detector. The alarm level range shall be .5 to 2.35 percent per foot for photoelectric detectors and 0.5 to 2.5 percent per foot for ionization detectors. The system shall also support sensitive advanced detection laser detectors with an alarm level range of .03 percent per foot to 1.0 percent per foot. The system shall also include up to nine levels of Prealarm, selected by detector, to indicate impending alarms to maintenance personnel.
    e. The ability to display or print system reports.
    f. Alarm verification, with counters and a trouble indication to alert maintenance personnel when a detector enters verification 20 times.
    g. PAS pre-signal, meeting NFPA 72 3-8.3 requirements.
    h. Rapid manual station reporting (under 3 seconds) and shall meet NFPA 72 Chapter 1 requirements for activation of notification circuits within 10 seconds of initiating device activation.
    i. Periodic detector test, conducted automatically by the software.
    j. Self optimizing pre-alarm for advanced fire warning, which allows each detector to learn its particular environment and set its prealarm level to just above normal peaks.
    k. Cross zoning with the capability of counting: two detectors in alarm, two software zones in alarm, or one smoke detector and one thermal detector.
    l. Walk test, with a check for two detectors set to same address.
    m. Control-by-time for non-fire operations, with holiday schedules.
    n. Day/night automatic adjustment of detector sensitivity.
    o. Device blink control for sleeping areas.
8. The FACP shall be capable of coding main panel node notification circuits in March Time (120 PPM). Panel notification circuits (NAC 1, 2, 3 and 4) shall also support Two-Stage operation, Canadian Dual Stage (3 minutes) and Canadian Dual Stage (5 minutes). Two stage operation shall allow 20 Pulses Per Minute (PPM) on alarm and 120 PPM after 5 minutes or when a second device activates. Canadian Dual stage is the same as Two-Stage except will only switch to second stage by activation of Drill Switch 3 or 5 minute timer. The panel shall also provide a coding option that will synchronize specific strobe lights designed to accept a specific "sync pulse."
9. All strobe devices shall be synchronized and shall flash at the rate determined by the Local Authority Having Jurisdiction.

D. Central Microprocessor

1. The microprocessor shall be a high speed, 16-bit RISC device and it shall communicate with, monitor and control all external interfaces. It shall include an EPROM for system program storage, Flash memory for building-specific program storage, and a "watch dog" timer circuit to detect and report microprocessor failure.

2. The microprocessor shall contain and execute all control-by-event programs for specific action to be taken if an alarm condition is detected by the system. Control-by-event equations shall be held in non-volatile programmable memory, and shall not be lost even if system primary and secondary power failure occurs.
3. The microprocessor shall also provide a real-time clock for time annotation of system displays, printer, and history file. The time-of-day and date shall not be lost if system primary and secondary power supplies fail. The real time clock may also be used to control non-fire functions at programmed time-of-day, day-of-week, and day-of-year.
4. A special program check function shall be provided to detect common operator errors.
5. An auto-program (self-learn) function shall be provided to quickly install initial functions and make the system operational.
6. For flexibility and to ensure program validity, an optional Windows(TM) based program utility shall be available. This program shall be used to off-line program the system with batch upload/download, and have the ability to upgrade the manufacturers (FLASH) system code changes. This program shall also have a verification utility, which scans the program files, identifying possible errors. It shall also have the ability to compare old program files to new ones, identifying differences in the two files to allow complete testing of any system operating changes. This shall be in compliance with the NFPA 72 requirements for testing after system modification.

E. System Display
1. The system shall support the following display mode options:
   a. 80 character display option. The display shall include an 80-character backlit alphanumeric Liquid Crystal Display (LCD) and a full PC style QWERTY keypad.
2. The display shall provide all the controls and indicators used by the system operator:
   a. The 80-character display shall include the following operator control switches: ACKNOWLEDGE, ALARM SILENCE, ALARM ACTIVATE (drill), SYSTEM RESET, and LAMP TEST.
3. The display shall annunciate status information and custom alphanumeric labels for all intelligent detectors, addressable modules, internal panel circuits, and software zones.
4. The display shall also provide Light-Emitting Diodes.
   a. The 80-character display shall provide 8 Light-Emitting-Diodes (LEDs) that indicate the status of the following system parameters: AC POWER, FIRE ALARM, PREALARM WARNING, SECURITY ALARM, SUPERVISORY SIGNAL, SYSTEM TROUBLE, DISABLED POINTS, and ALARM SILENCED.
   b. The 80-character display keypad shall be an easy to use QWERTY type keypad, similar to a PC keyboard. This shall be part of the standard system and have the capability to command all system functions, entry of any alphabetic or numeric information, and field programming. Two different password levels shall be provided to prevent unauthorized system control or programming.
5. The system shall support the display of battery charging current and voltage on the 80-character LCD display.

F. Signaling Line Circuits (SLC)
1. Each FACP or FACP network node shall support up to two SLCs. Each SLC interface shall provide power to and communicate with up to 159 intelligent detectors (ionization, photoelectric or thermal) and 159 intelligent modules (monitor or control) for a loop capacity of 318 devices. The addition of the optional second loop shall double the device capacity, supporting a total of 636 devices. Each SLC shall be capable of NFPA 72 Style 4, Style 6, or Style 7 (Class A or B) wiring.
2. CPU shall receive analog information from all intelligent detectors to be processed to determine whether normal, alarm, prealarm, or trouble conditions exist for each detector. The software shall automatically maintain the detector's desired sensitivity level by adjusting for the effects of environmental factors, including the accumulation of dust in each detector. The analog information shall also be used for automatic detector testing and for the automatic determination of detector maintenance requirements.

G. Serial Interfaces

1. The system shall include two serial EIA-232 interfaces. Each interface shall be a means of connecting UL Listed Information Technology Equipment (ITE) peripherals.
    a. The system shall include an EIA-485 port for the serial connection of optional annunciators and remote LCD displays.
    b. The EIA-485 interface may be used for network connection to a proprietary-receiving unit.

H. Notification Appliance Circuit (NAC) Module
1. The Notification Appliance Circuit module shall provide four fully supervised Class A or B (NFPA Style Z or Y) notification circuits. An expansion circuit board shall allow expansion to eight circuits per module.
2. The notification circuit capacity shall be 3.0 amperes maximum per circuit and 6.0 amperes maximum per module.
3. The module shall not affect other module circuits in any way during a short circuit condition.
4. The module shall provide eight green ON/OFF LEDs and eight yellow trouble LEDs.
5. The module shall also provide a momentary switch per circuit that may be used to manually turn the particular circuit on or off or to disable the circuit.
6. Each notification circuit shall include a custom label inserted to identify each circuit's location. Labels shall be created using a standard typewriter or word processor.
7. The notification circuit module shall be provided with removable wiring terminal blocks for ease of installation and service. The terminal strips shall be UL listed for use with up to 12 AWG wire.
8. Each circuit shall be capable of, through system programming, deactivating upon depression of the signal silence switch.

I. Control Relay Module
1. The control relay module shall provide four Form-C auxiliary relay circuits rated at 5 amperes, 28 VDC. An expansion circuit board shall allow expansion to eight Form-C relays per module.
2. Each relay circuit shall be capable of being activated (change in state) by any initiating device or from any combination of initiating devices.
3. The relay module shall provide 8 green ON/OFF LEDs and 8 yellow LEDs (indicates disabled status of the relay).
4. The module shall provide a momentary switch per relay circuit that may be used to manually turn the relay ON/OFF or to disable the relay.
5. Each relay circuit shall include a custom label inserted to identify its location. Labels shall be created using a standard typewriter or word processor.
6. The control relay module shall be provided with removable wiring terminal blocks for ease of installation and service. The terminal blocks shall be UL listed for use with up to 12 AWG wire.

J. Enclosures:
1. The control panel shall be housed in a UL-listed cabinet suitable for surface or semi-flush mounting. The cabinet and front shall be corrosion protected, given a rust-resistant prime coat, and manufacturer's standard finish.
2. The back box and door shall be constructed of 0.060 steel with provisions for electrical conduit connections into the sides and top.
3. The door shall provide a key lock and shall include a glass or other transparent opening for viewing of all indicators. For convenience, the door may be site configured for either right or left hand hinging.

K. Power Supply:
1. An off-line switching power supply shall be available for the fire alarm control panel or network node and provide 6.0 amps of available power for the control panel and peripheral devices.
2. Provisions will be made to allow the audio-visual power to be increased as required by adding modular expansion audio-visual power supplies.
3. Positive-Temperature-Coefficient (PTC) thermistors, circuit breakers, or other over-current protection shall be provided on all power outputs. The power supply shall provide an integral battery charger for use with batteries up to 60 AH or may be used with an external battery and charger system. Battery arrangement may be configured in the field.
4. The power supply shall continuously monitor all field wires for earth ground conditions, and

shall have the following LED indicators:

Ground Fault LED
AC Power Fail LED
NAC on LED (4)

5. The main power supply shall operate on 120 VAC, 60 Hz, and shall provide all necessary power for the FACP.
6. The main power supply shall provide a battery charger using dual-rate charging techniques for fast battery recharge and be capable of charging batteries up to 60 AH.
7. All circuits shall be power-limited, per UL864 requirements.

L. Field Charging Power Supply (FCPS): The FCPS is a device designed for use as either a remote 24 volt power supply or used to power Notification Appliances.
   1. The FCPS shall offer up to 6.0 amps (4.0 amps continuous) of regulated 24 volt power. It shall include an integral charger designed to charge 7.0 amp hour batteries and to support 60 hour standby.
   2. The Field Charging Power Supply shall have two input triggers. The input trigger shall be a Notification Appliance Circuit (from the fire alarm control panel) or a relay. Four outputs (two Style Y or Z and two Style Y) shall be available for connection to the Notification devices.
   3. The FCPS shall include an attractive surface mount backbox.
   4. The Field Charging Power Supply shall include the ability to delay the AC fail delay per NFPA requirements.
   5. The FCPS include power limited circuitry, per 1995 UL standards.

M. Specific System Operations
   1. Smoke Detector Sensitivity Adjust: A means shall be provided for adjusting the sensitivity of any or all addressable intelligent detectors in the system from the system keypad. Sensitivity range shall be within the allowed UL window and have a minimum of 9 levels.
   2. Alarm Verification: Each of the intelligent addressable smoke detectors in the system may be independently selected and enabled to be an alarm verified detector. The alarm verification delay shall be programmable from 5 to 30 seconds and each detector shall be able to be selected for verification. The FACP shall keep a count of the number of times that each detector has entered the verification cycle. These counters may be displayed and reset by the proper operator commands.
   3. Point Disable: Any addressable device or conventional circuit in the system may be enabled or disabled through the system keypad.
   4. Point Read: The system shall be able to display or print the following point status diagnostic functions:
      a. Device status
      b. Device type
      c. Custom device label
      d. View analog detector values
      e. Device zone assignments
      f. All program parameters
   5. System Status Reports: Upon command from an operator of the system, a status report will be generated and printed, listing all system status.
   6. System History Recording and Reporting: The fire alarm control panel shall contain a history buffer that will be capable of storing up to 800 events. Up to 200 events shall be dedicated to alarm and the remaining events are general purpose. Systems that do not have dedicated alarm storage, where events are overridden by non-alarm type events, are not suitable substitutes. Each of these activations will be stored and time and date stamped with the actual time of the activation. The contents of the history buffer may be manually reviewed, one event at a time, or printed in its entirety. The history buffer shall use non-volatile memory. Systems that use volatile memory for history storage are not acceptable substitutes.
   7. Automatic Detector Maintenance Alert: The fire alarm control panel shall automatically interrogate each intelligent detector and shall analyze the detector responses over a period of time. If any intelligent detector in the system responds with a reading that is above or below normal limits, then the system will enter the trouble mode, and the particular detector will be

annunciated on the system display, and printed on the optional printer. This feature shall in no way inhibit the receipt of alarm conditions in the system, nor shall it require any special hardware, special tools or computer expertise to perform.

8. Pre-Alarm Function: The system shall provide two levels of pre-alarm warning to give advance notice of a possible fire situation. Both pre-alarm levels shall be fully field adjustable. The first level shall give an audible indication at the panel. The second level shall give an audible indication and may also activate control relays. The system shall also have the ability to activate local detector sounder bases at the pre-alarm level, to assist in avoiding nuisance alarms.
9. Software Zones: The FACP shall provide 100 software zones, 10 additional special function zones, 10 releasing zones, and 20 logic zones.
10. The fire alarm control panel shall include a walk test feature. It shall include the ability to test initiating device circuits and notification appliance circuits from the field without returning to the panel to reset the system. Operation shall be as follows:
    a. Alarming an initiating device shall activate programmed outputs, which are selected to participate in walk test, for 3 seconds.
    b. Introducing a trouble into the initiating device shall activate the programmed outputs for 8 seconds.
    c. All devices tested in walk test shall be recorded in the history buffer.
11. Waterflow Operation
    a. An alarm from a waterflow detection device shall activate the appropriate alarm message on the main panel display, turn on all programmed notification appliance circuits and shall not be affected by the signal silence switch.
12. Supervisory Operation
    a. An alarm from a supervisory device shall cause the appropriate indication on the system display, light a common supervisory LED, but will not cause the system to enter the trouble mode.
13. Signal Silence Operation
    a. The FACP shall have the ability to program each output circuit (notification, relay, speaker etc) to deactivate upon depression of the signal silence switch.
14. Non-Alarm Input Operation
    a. Any addressable initiating device in the system may be used as a non-alarm input to monitor normally open contact type devices. Non-alarm functions are a lower priority than fire alarm initiating devices.
15. Combo Zone
    a. A special type code shall be available to allow waterflow and supervisory devices to share a common addressable module. Waterflow devices shall be wired in parallel, supervisory devices in series.

2.03 SYSTEM COMPONENTS:

A. Programmable Electronic Speakers:
   1. Electronic speaker shall operate on 24 VDC nominal.
   2. Electronic speakers shall be field programmable without the use of special tools, at a sound level of at least 90 dBA measured at 10 feet from the device.
   3. Shall be flush mounted as shown on plans.

B. Strobe lights shall meet the requirements of the ADA, UL Standard 1971, be fully synchronized, and shall meet the following criteria:
   1. The maximum pulse duration shall be 2/10 of one second.
   2. Strobe intensity shall meet the requirements of UL 1971.
   3. The flash rate shall meet the requirements of UL 1971.
   4. Visual devices shall be SpectrAlert series.

C. Audible/Visual Combination Devices:
   1. Shall meet the applicable requirements of Section A listed above for audibility.
   2. Shall meet the requirements of Section B listed above for visibility.
   3. Audible/Visual devices shall be SpectrAlert series.

D. Duct Smoke Detectors
   1. Duct smoke detectors shall be a 24 VDC type with visual alarm and power indicators, and a reset switch. Each detector shall be installed upon the composite supply/return air ducts(s), with properly sized air sampling tubes.

E. Waterflow Indicator:
   1. Waterflow Switches shall be an integral, mechanical, non-coded, non-accumulative retard type.
   2. Waterflow Switches shall have an alarm transmission delay time which is conveniently adjustable from 0 to 60 seconds. Initial settings shall be 30-45 seconds.
   3. All waterflow switches shall come from a single manufacturer and series.
   4. Waterflow switches shall be provided and connected under this section but installed by the mechanical contractor.
   5. Where possible, locate waterflow switches a minimum of one (1) foot from a fitting which changes the direction of the flow and a minimum of three (3) feet from a valve.

F. Sprinkler and Standpipe Valve Supervisory Switches:
   1. Each sprinkler system water supply control valve riser, zone control valve, and standpipe system riser control valve shall be equipped with a supervisory switch. Standpipe hose valves, and test and drain valves shall not be equipped with supervisory switches.
   2. PIV (post indicator valve) or main gate valves shall be equipped with a supervisory switch.
   3. The switch shall be mounted so as not to interfere with the normal operation of the valve and adjusted to operate within two revolutions toward the closed position of the valve control, or when the stem has moved no more than one-fifth of the distance from its normal position.
   4. The supervisory switch shall be contained in a weatherproof aluminum housing, which shall provide a 3/4 inch (19 mm) conduit entrance and incorporate the necessary facilities for attachment to the valves.
   5. The switch housing shall be finished in red baked enamel.
   6. The entire installed assembly shall be tamper proof and arranged to cause a switch operation if the housing cover is removed, or if the unit is removed from its mounting.
   7. Valve supervisory switches shall be provided and connected under this section and installed by mechanical contractor.
      a. This unit shall provide for each zone: alarm indications, using a red alarm a yellow trouble long-life LEDs and control switches for the control of fire alarm control panel functions. The annunciator will also have an ON-LINE LED, local piezo electric signal, local acknowledge/lamp test switch, and custom slide-in zone/function identification labels.
      b. Switches shall be available for remote annunciation and control of output points in the system, system acknowledge, telephone zone select, speaker select, global signal silence, and global system reset within the confines of all applicable standards.

G. Alphanumeric LCD Type Annunciator:
   1. The alphanumeric display annunciator shall be a supervised, remotely located back-lit LCD display containing a minimum of eighty (80) characters for alarm annunciation in clear English text.
   2. The LCD annunciator shall display all alarm and trouble conditions in the system.
   3. An audible indication of alarm shall be integral to the alphanumeric display.
   4. The display shall be UL listed for fire alarm application.
   5. It shall be possible to connect up to 32 LCD displays and be capable of wiring distances up to 6,000 feet from the control panel.
   6. The annunciator shall connect to a separate, dedicated "terminal mode" EIA-485 interface. This is a two-wire loop connection and shall be capable of distances to 6,000 feet. Each terminal mode LCD display shall mimic the main control panel.
   7. The system shall allow a minimum of 32 terminal mode LCD annunciators. Up to 10 LCD annunciators shall be capable of the following system functions: Acknowledge, Signal Silence and Reset, which shall be protected from unauthorized use by a keyswitch or password.
   8. The LED annunciator shall offer an interface to a graphic style annunciator and provide each of the features listed above.

H. All interfaces and associated equipment are to be protected so that they will not be affected by voltage surges or line transients consistent with UL standard 864.

I. Universal Digital Alarm Communicator Transmitter (UDACT). The UDACT is an interface for communicating digital information between a fire alarm control panel and an UL-Listed central station.

1. The UDACT shall be compact in size, mounting in a standard module position of the fire alarm control cabinet. Optionally, the UDACT shall have the ability for remote mounting, up to 6,000 feet from the fire alarm control panel. The wire connections between the UDACT and the control panel shall be supervised with one pair for power and one pair for multiplexed communication of overall system status. Systems that utilize relay contact closures are not acceptable.
2. The UDACT shall include connections for dual telephone lines (with voltage detect), per UL/NFPA/FCC requirements. It shall include the ability for split reporting of panel events up to three different telephone numbers.
3. The UDACT shall be completely field programmable from a built-in keypad and 4 character red, seven segment display.
4. The UDACT shall be capable of transmitting events in at least 15 different formats. This ensures compatibility with existing and future transmission formats.
5. Communication shall include vital system status such as:
    - Independent Zone (Alarm, trouble, non-alarm, supervisory)
    - Independent Addressable Device Status
    - AC (Mains) Power Loss
    - Low Battery and Earth Fault
    - System Off Normal
    - 12 and 24 Hour Test Signal
    - Abnormal Test Signal (per UL requirements)
    - EIA-485 Communications Failure
    - Phone Line Failure
6. The UDACT shall support independent zone/point reporting when used in the Contact ID format. In this format the UDACT shall support transmission of up to 2,040 points. This enables the central station to have exact details concerning the origin of the fire or response emergency.

J. Field Wiring Terminal Blocks

For ease of service all panel I/O wiring terminal blocks shall be removable, plug-in types and have sufficient capacity for #18 to #12 AWG wire. Terminal blocks that are permanently fixed are not acceptable.

2.04 SYSTEM COMPONENTS - ADDRESSABLE DEVICES

A. Addressable Devices – General:

1. Addressable devices shall use simple to install and maintain decade, decimal address switches. Devices shall be capable of being set to an address in a range of 001 to 159.
2. Addressable devices, which use a binary-coded address setting method, such as a DIP-switch, are not an allowable substitute.
3. Detectors shall be intelligent (analog) and addressable, and shall connect with two wires to the fire alarm control panel Signaling Line Circuits.
4. Addressable smoke and thermal detectors shall provide dual alarm and power/polling LEDs. Both LEDs shall flash green under normal conditions, indicating that the detector is operational and in regular communication with the control panel, and both LEDs shall be placed into steady red illumination by the control panel, indicating that an alarm condition has been detected. If required, the LED flash shall have the ability to be removed from the system program. An output connection shall also be provided in the base to connect an external remote alarm LED.
5. The fire alarm control panel shall permit detector sensitivity adjustment through field programming of the system. The panel on a time-of-day basis shall automatically adjust

sensitivity.

6. Using software in the FACP, detectors shall automatically compensate for dust accumulation and other slow environmental changes that may affect their performance. The detectors shall be listed by UL as meeting the calibrated sensitivity test requirements of NFPA Standard 72, Chapter 7.
7. The detectors shall be ceiling-mount and shall include a separate twist-lock base with tamper proof feature. Bases shall include a sounder base with a built-in (local) sounder rated at 85 DBA minimum, a relay base and an isolator base designed for Style 7 applications.
8. The detectors shall provide a test means whereby they will simulate an alarm condition and report that condition to the control panel. Such a test may be initiated at the detector itself (by activating a magnetic switch) or initiated remotely on command from the control panel.
9. Detectors shall also store an internal identifying type code that the control panel shall use to identify the type of device (ION, PHOTO, THERMAL).
10. Detectors will operate in an analog fashion, where the detector simply measures its designed environment variable and transmits an analog value to the FACP based on real-time measured values. The FACP software, not the detector, shall make the alarm/normal decision, thereby allowing the sensitivity of each detector to be set in the FACP program and allowing the system operator to view the current analog value of each detector.
11. Addressable devices shall store an internal identifying code that the control panel shall use to identify the type of device.
12. Addressable modules shall mount in a 4-inch square (101.6 mm square), 2-1/8 inch (54 mm) deep electrical box.

B. Addressable Double-Action Manual Fire Alarm Box (manual station)

1. Addressable manual fire alarm boxes shall, on command from the control panel, send data to the panel representing the state of the manual switch and the addressable communication module status. They shall use a key operated test-reset lock, and shall be designed so that after actual emergency operation, they cannot be restored to normal use except by the use of a key.
2. All operated stations shall have a positive, visual indication of operation and utilize a key type reset.
3. Manual fire alarm boxes shall be constructed of Lexan with clearly visible operating instructions provided on the cover. The word FIRE shall appear on the front of the stations in raised letters, 1.75 inches (44 mm) or larger.

C. Intelligent Photoelectric Smoke Detector:

1. The detectors shall use the photoelectric (light-scattering) principal to measure smoke density and shall, on command from the control panel, send data to the panel representing the analog level of smoke density.

D. Intelligent Thermal Detectors:

1. Thermal detectors shall be intelligent addressable devices rated at 135 degrees Fahrenheit (58 degrees Celsius) and have a rate-of-rise element rated at 15 degrees F (9.4 degrees C) per minute. It shall connect via two wires to the fire alarm control panel signaling line circuit.

E. Intelligent Duct Smoke Detector:

1. The smoke detector housing shall accommodate either an intelligent ionization detector or an intelligent photoelectric detector, of that provides continuous analog monitoring and alarm verification from the panel.
2. When sufficient smoke is sensed, an alarm signal is initiated at the FACP, and appropriate action taken to change over air handling systems to help prevent the rapid distribution of toxic smoke and fire gases throughout the areas served by the duct system.

F. Addressable Dry Contact Monitor Module:

1. Addressable monitor modules shall be provided to connect one supervised IDC zone of conventional alarm initiating devices (any N.O. dry contact device) to one of the fire alarm control panel SLCs.
2. The IDC zone shall be suitable for Style D or Style B operation. An LED shall be provided that

shall flash under normal conditions, indicating that the monitor module is operational and in regular communication with the control panel.

3. For difficult to reach areas, the monitor module shall be available in a miniature package and shall be no larger than 2-3/4 inch (70 mm) x 1-1/4 inch (31.7 mm) x 1/2 inch (12.7 mm). This version need not include Style D or an LED.

G. Two Wire Detector Monitor Module:

1. Addressable monitor modules shall be provided to connect one supervised IDC zone of conventional 2-wire smoke detectors or alarm initiating devices (any N.O. dry contact device).
2. The IDC zone may be wired for Class A or B (Style D or Style B) operation. An LED shall be provided that shall flash under normal conditions, indicating that the monitor module is operational and in regular communication with the control panel.

H. Addressable Control Module:

1. Addressable control modules shall be provided to supervise and control the operation of one conventional NACs of compatible, 24 VDC powered, polarized audio/visual notification appliances.
2. The control module NAC may be wired for Style Z or Style Y (Class A/B) with up to 1 amp of inductive A/V signal, or 2 amps of resistive A/V signal operation.
3. Audio/visual power shall be provided by a separate supervised power circuit from the main fire alarm control panel or from a supervised UL listed remote power supply.
4. The control module shall be suitable for pilot duty applications and rated for a minimum of 0.6 amps at 30 VDC.

I. Addressable Relay Module:

1. Addressable Relay Modules shall be available for HVAC control and other building functions. The relay shall be form C and rated for a minimum of 2.0 Amps resistive or 1.0 Amps inductive. The relay coil shall be magnetically latched to reduce wiring connection requirements, and to ensure that 100% of all auxiliary relay or NACs may be energized at the same time on the same pair of wires.

J. Isolator Module:

1. Isolator modules shall be provided to automatically isolate wire-to-wire short circuits on an SLC Class A or Class B branch. The isolator module shall limit the number of modules or detectors that may be rendered inoperative by a short circuit fault on the SLC loop segment or branch. At least one isolator module shall be provided for each floor or protected zone of the building.
2. If a wire-to-wire short occurs, the isolator module shall automatically open-circuit (disconnect) the SLC. When the short circuit condition is corrected, the isolator module shall automatically reconnect the isolated section.
3. The isolator module shall not require address-setting, and its operations shall be totally automatic. It shall not be necessary to replace or reset an isolator module after its normal operation.
4. The isolator module shall provide a single LED that shall flash to indicate that the isolator is operational and shall illuminate steadily to indicate that a short circuit condition has been detected and isolated.

2.05 BATTERIES:

A. The battery shall have sufficient capacity to power the fire alarm system for not less than twenty-four hours plus 5 minutes of alarm upon a normal AC power failure.

B. The batteries are to be completely maintenance free. No liquids are required. Fluid level checks for refilling, spills, and leakage shall not be required.

C. If necessary to meet standby requirements, external battery and charger systems may be used.

2.06 FACP (CONTROL) RELAYS & CONTACTORS:

A. Provide for the control of air handler motor starters, control relays and contractors as follows:

1. All relays and contractors shall be supervised as required by NFPA 101 and mounted within three feet of the device controlled.
2. Refer to Section 26 20 00 for relays and Contactors.

2.07 GRAPHIC REMOTE ANNUNCIATORS:

A. Graphic Remote Annunciators shall be flush or semi-flush mounted with LED indicators for alarm, supervision, trouble conditions for all initiating alarm zones as scheduled. Provide weatherproof versions where indicated to be exposed to the exterior. The sprinkler flow graphic remote annunciators shall be WSA “ION TWO” series. The fire alarm graphic annunciator shall be WSA “FAA-200" LED series. Acceptable equal graphic display annunciators will be given consideration.

2.08 ELECTROMAGNETIC DOOR HOLDERS:

A. Provide where indicated on the drawings, 24 volt wall mounted electromagnetic door holders, Notifier FM series, controlled from the fire alarm control panel, to release when the general alarm is activated. The holders shall be furnished complete with all adapters, extensions and accessories necessary to suit the door limits of travel and distances to the wall, and shall be coordinated with the Architect for locations and mounting height. Wall or floor mounted door holders are indicated on the drawings. All wiring shall be concealed.

2.09 DOCUMENT CABINET

A. Provide one (1) wall mounted, lockable document cabinet per NFPA 72. Document cabinet shall be red with white lettering that states “SYSTEM RECORD DOCUMENTS”. Locate the cabinet on wall adjacent to fire alarm control panel. Provide final approved shop drawings, contract fire alarm drawings, owner’s manuals, etc. in document box.

PART 3- EXECUTION

3.01 INSPECTION:

A. The Fire Alarm Trade shall be responsible for all arrangements for testing and approval of the Fire Alarm System by the Authority having jurisdiction before the Fire Alarm System is accepted by the Project Manager.

3.02 INSTALLATION:

A. General: The Fire Alarm Trade shall provide all new equipment, accessories and material required for the installation of the fire alarm system in accordance with the specifications and drawings. Any material and/or equipment necessary for the proper operation of the system that is not specified or described herein shall be deemed part of this specification.

B. Wiring Methods:
1. All wiring methods shall be in accordance with NFDA-70, Article 760, and all other codes specified herein.
2. Provide proper number and size of wires as required for proper operation of the system in accordance with the system’s manufacturer’s instructions and the above codes.
3. All non-power limited wiring shall be installed in a separate conduit system, as specified in Section 26 05 19.
4. All shielded power limited cable shall be installed in a partial conduit system per NEC Article 760 and as specified in Section 26 05 23 for plenum and non-plenum applications.
5. No wiring other than that directly associated with fire alarm detection, alarm or auxiliary fire protection functions shall be permitted in fire alarm conduits, (except in the cable tray, in accordance with the NEC and if permitted by the TIA/EIA standards for compatibility with other listed TIA/EIA systems).
6. Wiring splices are to be avoided to the extent possible, and if needed they must be made only in junction boxes and shall be crimp connected.
7. Transposing or changing color coding of wires shall not be permitted.

8. Crimped type connections are not acceptable for final connections at terminating locations.
9. All conductors shall be labeled on each end with "E-Z markers" or equivalent.
10. Conductors in cabinets shall be carefully formed and harnessed so that each drops off directly opposite to its termination.
11. Cabinet terminals shall be numbered. All controls, function switches, etc., shall be clearly labeled on all equipment panels.
12. All connections to panels, devices and detectors shall be made with screw terminal connections, or method approved by fire alarm manufacturer.
13. All wiring shall be checked and tested to ensure that there are no grounds, opens or shorts.
14. All fire alarm addressable signal line circuits (SLC) shall be Style 6 (pre-1988 Class A). Return circuit route shall **not** be in the same conduit.
15. The wiring for the fire alarm system is not shown on the drawings. The actual circuit routing of the fire alarm system shall be by the Fire Alarm Trade based on the location of the devices, circuit limitations and wire limitations.
16. All fire alarm hard wired indicating appliance circuits (IAC) shall be style Z (pre-1988 Class A).
17. All fire alarm signal line circuits, and other wiring leaving the building location shall have surge arresters or transient protectors as required by U.L., NEC and equipment manufacturer.
18. All fire alarm systems' wiring 100 volts and less is part of Section 26 31 00. All fire alarm systems' wiring 101 volt and above is part of Division 26.
19. All boxes, conduits, etc., shall be of proper size, as determined by the Fire Alarm System Trade, shall be clearly marked for easy identification, continuously grounded together and bonded to the existing building grounding electrode system (BGES). The Fire Alarm Trade shall furnish special boxes to the Electrical Trade for installation by the Electrical Trade.

C. Duct Mounted Smoke Detectors:
1. Duct mounted smoke detectors that are indicated on Division 23 drawings, shall be furnished and installed by Section 28 31 00.
2. The exact quantity and location shall be obtained from the Division 23 drawings including, but not limited to diagrams, plans and details.
3. Division 28 shall provide the Interlock for the related air handler, fan and/or motorized duct smoke damper through the auxiliary relay (s) of the duct mounted smoke sensors or Intelligent System (Addressable) interface module, as indicated by Division 23 schematics.
4. Division 23 shall install the sampling tubes and mounting plate. The remote alarm lamp and reset test station shall be located in the occupied area below or adjacent to the unit. This station shall be accessible from the floor.
5. The remote alarm lamp and reset test station shall be located in the occupied area or adjacent to the unit. This station shall be mounted on adjacent wall at 60” AFF and shall be readily accessible.

D. The activation of smoke sensor(s) shall operate through an Intelligent System (Addressable) interface module or base relay to the remote alarm indicator on the ceiling above the entrance door to the area. Individual sensor's base can drive one (1) remote alarm indicator without a relay.

E. All smoke sensors shall be installed only after the final clean up by all of the Trades, but before inspection by the Local Authority Having Jurisdiction. No compensation shall be given for smoke sensors that are required to be replaced if installed before this date.

F. All ceiling smoke and heat sensors shall be properly located from HVAC supply and return discharges per NFPA 72E distances.

G. Remote Command Centers (RCC): Provide remote LCD alpha-numeric display/command center(s) as indicated on the drawings.

H. All fire alarm systems' Intelligent System (Addressable) interface modules shall be mounted adjacent to the controlled equipment. Auxiliary relays located in ceiling mounted sensor bases shall be in the same room as the controlled equipment and within the NFPA limits.

I. Each application for visual indicating appliances (strobe) intensity requirements shall meet or exceed ADAAG guidelines, ADAAG General Section 2.2 Equivalent Facilitation, NFPA 72 (Chapter

6) and ANSI 117.1. All visual indicating appliances shall be synchronized to minimize adverse neurological stimulation. The visual and audible indicating appliances shall be separately circuited for audible silencing. Visual signals shall be mounted at the “ADA not to exceed” height of 88 inches above the highest level of the finish floor or six inches below the ceiling, whichever is lower unless the Authority having jurisdiction indicates otherwise. The subscript number adjacent to the indicating appliance indicates the minimum required candela for the space.

J. The sprinkler flow and fire alarm remote graphic display(s) shall be reviewed by the Architect, Engineer and Owner before fabrication. The Fire Alarm Trade shall provide room, area and building description lettering in accordance with the Owner’s instructions.

K. The sprinkler flow remote waterproof alarm bell and strobe shall only indicate water flow alarm.

L. The fire alarm remote alarm contact shall be connected to the UDACT. Upon alarm (or trouble) the digital communicator shall transmit the proper signal to the Owner-contracted central station.

M. Connect the sprinkler fire suppression system to the FACP, through Intelligent System (Addressable) interface modules, for flow, supervision and trouble complete with anti-tamper switches as required. Sprinkle flow switches (FS or PS) and electrically supervised valves (ESV) are indicated on Division 21 drawings and are furnished in-place. Connect the Elevator Pre-Action System in the same manner, including the heat detection and supervision.

N. Connect the kitchen hood chemical fire suppression systems to the FACP through Intelligent System (Addressable) interface modules, for flow, supervision and trouble. These devices shall be connected to the fire alarm system with intelligent system interface modules for general alarm, supervision and trouble as required.

O. Provide wall mounted magnetic door holders where indicated. Connect to 24 VDC output without standby batteries. All door holders shall release on general alarm or loss of normal 24 VDC power. Provide armature extensions and adapters as required and coordinate with door swing arc. Holders shall be mounted eight (8) inches below the top of the door. All wiring shall be concealed. Verify exact location and mounting height with Architect to prevent damage to doors (s).

P. In addition to the system devices shown on the drawings, the Contractor shall include a total of five (5) additional smoke detectors, five (5) additional manual pull stations, five (5) additional duct smoke detectors, five (5) additional visual only indicating appliances, and five (5) additional horn/strobe indicating appliances. These additional devices shall be spare to be turned over to the Owner at the completion of the project. The Contractor shall install the above additional devices, as required by the Local Authority Having Jurisdiction, at no additional cost.

3.03 TECHNICAL ASSISTANCE:

A. Instruction: The Fire Alarm Technician shall instruct the Authority having jurisdiction and the Owner and Fire Department personnel on the correct operation of the system after the installation is completed.

3.04 FIELD QUALITY CONTROL:

A. General: Upon completion of the installation, the Fire Alarm Systems Technician shall perform all necessary NFPA tests and adjustments. The above representative shall then submit a Record of Completion and an Underwriters Laboratories (U.L.) Certificate of Compliance to the Owner and Design Engineers that each system and the network functions and conforms to all the requirements of the manufacturer of the equipment, the Contract Documents, and all requirements of the Uniform Statewide Building Code including IBC 2003 907.2.10.4 acceptance test for the type of building in which the system is installed. The U.L. "Certificate of Compliance" shall be filed at U.L. for inspection by the insurance underwriters and all other authorities. The NFPA 72 "Record of Completion" shall be filed with the Local Authority having jurisdiction.

B. The Fire Alarm System Trade shall enlist the service of a 3rd party inspector to perform all electrical and mechanical tests of the system. The Fire Alarm System Trade shall notify the Owner and Engineer in writing one (1) week prior to 3rd party testing. Testing agency shall verify functionality,

location, and levels of system control panel, components, audible, and visual indicating appliances. Testing agency shall be submitted and approved by Loudoun County Building and Development department prior to selection.

C. The Fire Alarm Technician shall perform all electrical and mechanical tests required by the fire alarm systems manufacturer's form. All test and report costs shall be in the Contract price. A checkout report shall be prepared by the installation technicians and submitted in triplicate, one copy of which will be registered with the equipment manufacturer. The report shall include, but not be limited to:
   1. A complete list of equipment installed and wired.
   2. Indication that all equipment is properly installed and functions and conforms with these specifications.
   3. Tests of individual zones and addressable devices as applicable.
   4. Serial numbers, locations by zone and model number for each installed detector.
   5. Voltage (sensitivity) settings for each photoelectric detector as measured in place with the HVAC system operating.
   6. IBC 709.2.10.4 Acceptance Test
   7. Technician's name, certificate number and date.

D. After completion of all tests and adjustments listed above, the Fire Alarm Trade shall submit the following information to the Design Engineers.
   1. "As-built" conduit layout diagrams including wire color code and/or tag number.
   2. Complete "as-built" wiring diagrams.
   3. Detailed catalog data on all installed system components.
   4. Copy of the test report described in Par. B.

E. Final tests and inspection shall be held in the presence of the Project Manager and to his or her satisfaction. The Fire Alarm Trade shall supply personnel and required auxiliary equipment for this test without additional cost.

F. The completed smoke detection system shall be tested to ensure that it is operating properly. This test will consist of exposing the installed units to a standard fire test. Failure of the devices to sense the smoke shall be considered a failure of the system and all detectors in that system shall be readjusted or replaced. Acceptance of the system shall also require a demonstration of the stability of the system. This shall be adequately demonstrated if the system operates for a ninety (90) day test period without any unwarranted alarms. Should an unwarranted alarm(s) occur, the Fire Alarm Trade shall readjust or replace the detector(s) and begin another ninety (90) day test period. As required by the Design Engineers, the Fire Alarm Trade shall recheck the detectors using the fire test after each readjustment or replacement of detectors. This test shall not start until Owner has obtained beneficial use of the building under tests.

G. If the requirements provided in the paragraph above are not completed within one (1) year after beginning the tests described therein, the Fire Alarm Trade shall replace the system with another acceptable manufacturer and the process repeated until acceptance of the equipment by the Design Engineers, Owner and Project Manager.

H. After completion of all tests and adjustments listed above, the Fire Alarm Trade shall turn over the Fire Alarm System data disk to the Owner. The data disk will be considered to be the property of the Owner upon acceptance of the Fire Alarm System by the Project Manager.

END OF SECTION

SECTION 31 05 16

AGGREGATES FOR EARTHWORK

PART 1 - GENERAL

1.01 WORK INCLUDED

This section of the specifications describes the various classes of Aggregate Fill. All of the classes of Aggregate Fill contained in this specification may not be used on this project. The classes of Aggregate Fill used on this project are shown on the drawings or specified in other sections of the specifications. This specification section does not include installation. Installation of Aggregate Fill is included in other sections of the specifications and/or on the drawings.

1.02 QUALITY ASSURANCE

CLASSIFICATION TESTING

A. CONTRACTOR TESTING

1. Arrange and pay for the services of an independent testing laboratory to sample and test proposed Aggregate Fill materials.
2. Submit the test results to the Engineer and obtain approval prior to providing Aggregate Fill.

B. OWNER TESTING

The Owner shall arrange and pay for additional testing on the Aggregate Fill after delivery to the project site as determined necessary by the Engineer.

C. CONTAMINATION CERTIFICATION

1. Obtain a written, notarized certification from the Supplier of each proposed Aggregate Fill source stating that to the best of the Supplier's knowledge and belief there has never been contamination of the source with hazardous or toxic materials.
2. Submit these certifications to the Engineer prior to proceeding to furnish Aggregate Fill to the site. The lack of such certification on a potential Aggregate Fill source shall be cause for rejection of that source

1.03 STANDARDS

Aggregate Fill shall be classified into the appropriate class listed below according to ASTM testing procedures as specified for the various classes.

American Society for Testing Materials standards:

ASTM C33 Specification for Concrete Aggregates
ASTM C88 Test Method for soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
ASTM C125 Terminology Relating to Concrete and Concrete Aggregates
ASTM C131 Test Method for Resistance to Degradation of Small-Size coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
ASTM C535 Test Method for Resistance to Degradation of Large-Size coarse Aggregate by

Abrasion and Impact in the Los Angeles Machine
ASTM D448 Classification for Standard sizes of Aggregate for Road and Bridge Construction

PART 2 - PRODUCTS

2.01 MATERIALS; CLASSIFICATIONS

A. CLASS I AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable materials and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D448, size number 57:

Sieve Size Square Opening	Percent Passing
1-1/2"	100
1"	95 - 100
1/2"	25 - 60
No.4	0 - 10
No. 8	0 - 5

B. CLASS 2 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable materials and have a percentage of wear of not more than 40% when tested in accordance with ASTM Method C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D448, size number 67:

Sieve Size Square Opening	Percent Passing
1"	100
3/4"	90 - 100
3/8"	20 - 55
No.4	0 - 10
No.8	0 - 5

C. CLASS 3 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt clay, or other unsuitable materials and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D448, size number 7:

Sieve Size Square Opening	Percent Passing
3/4"	100
1/2"	90 - 100
3/8"	40 - 70
No.4	0 - 15
No.8	0 - 5

D. CLASS 4 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt,

clay, or other unsuitable materials and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM Method C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D448, size number 467:

Sieve Size Square Opening	Percent Passing
2"	100
1-1/2"	95 - 100
3/4"	35 - 70
3/8"	10 - 30
No. 4	0 - 5

E. CLASS 5 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable materials and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D448, size number 357:

Sieve Size Square Opening	Percent Passing
2-1/2"	100
2"	95 - 100
1"	35 – 70
1/2"	10 - 30
No. 4	0 - 5

F. CLASS 6 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable materials and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D448, size number 1:

Sieve Size Square Opening	Percent Passing
4"	100
3 - 1/2"	90 - 100
2 - 1/2"	25 - 60
1 - 1/2"	0 - 15
3/4"	0 - 5

G. CLASS 7 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable materials and shall have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D448, size number 6:

Sieve Size Square Opening	Percent Passing
1"	100

3/4"	90 - 100
1/2"	20 - 55
3/8"	0 - 15
No.4	0 - 5

H. CLASS & AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable materials and shall have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D448, size number 56:

Sieve Size Square Opening	Percent Passing
1-1/2"	100
1"	90 - 100
3/4"	40 - 85
1/2"	10 - 40
3/8"	0 - 15
No. 4	0 - 5

I. CLASS 9 AGGREGATE FILL: Consist of washed and screened gravel and natural sands or sands manufactured by crushing stones complying with the requirements of ASTM C33, "Standard Specifications for Concrete Aggregates", except that the gradation shall be as follows:

Sieve Size Square Opening	Percent Passing
1/2"	100
3/8"	95 - 100
No. 4	80 - 95
No. 8	65 – 85
No. 16	50 – 75
No. 30	25 – 60
No. 50	10 – 30
No. 100	0 - 10

Class 9 Aggregate Fill shall have not more than 45% passing any sieve and retained on the next consecutive sieve of those shown above, and its fineness modulus, as defined in ASTM C125, shall be not less than 2.3 nor more than 3.1.

J. CLASS 10 AGGREGATE FILL: Consist of washed and screened natural sands or sands manufactured by crushing stones complying with the requirements and tests of “Standard Specifications for Concrete Aggregates”, ASTM C33. The gradation as included in ASTM C33 is as follows:

Sieve Size Square Opening	Percent Passing
3/8”	100
No. 4	95-100
No. 8	80-100
No. 16	50-85
No. 30	25-60
No. 50	10-30
No. 100	2-10

Class 10 Aggregate Fill shall have not more than 45% passing any sieve and retained on the next consecutive sieve of those shown above, and its fineness modulus, as defined in ASTM C125, shall be not less than 2.3 nor more than 3.1.

K. CLASS 11 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable material and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation:

Sieve Size Square Opening	Percent Passing
1-3/4"	100
7/8"	65 - 90
3/8"	50 - 70
No.4	35 - 55
No.40	15 - 30
No.100	0 - 12 (Wet Sieve Method)

L. CLASS 12 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable material and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation:

Sieve Size Square Opening	Percent Passing
1-1/2”	100
1"	85 - 100
3/4"	60 - 95
3/8"	50 - 80
No.4	40 - 65
No.16	20 - 40
No.100	0 - 12 (Wet Sieve Method)

M. CLASS 13 AGGREGATE FILL: Consist of durable particles of crushed stone free of silt, clay, or other unsuitable material and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and shall meet the following gradation:

Sieve Size Square Opening	Percent Passing
1-3/4"	100
7/8"	65 - 90
3/8"	50 - 70
No. 4	35 - 55
No. 40	15 - 30
No. 100	0 - 3 (Wet Sieve Method)

N. CLASS 14 AGGREGATE FILL. Consist of durable particles of crushed stone free of silt, clay, or other unsuitable material and have a percentage of wear of not more than 40% when tested in accordance with ASTM C131 or C535. When material is subjected to five

(5) cycles of the sodium sulfate soundness test in accordance with ASTM C88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation:

Sieve Size Square Opening	Percent Passing
1-1/2"	100
1"	85 - 100
3/4"	60 - 95
3/8"	50 - 80
No.4	40 - 65
No. 16	20 - 40
No.100	0 - 3 (Wet Sieve Method)

O. CLASS 15 AGGREGATE FILL. Consist of durable particles of silica sand, washed clean chemically inert, and packaged by the Supplier. The material shall meet applicable regulatory requirements for monitor well filter pack. The source of the material shall be approved by the Engineer and shall meet the following gradation requirements.

Sieve Size Square Opening	Percent Passing
No.20	98 - 100
No.40	0 - 2

END OF SECTION

SECTION 31 11 00

CLEARING AND GRUBBING

PART 1 - GENERAL

1.01 WORK INCLUDED

Furnish labor, materials, equipment, and incidentals necessary to perform operations in connection with clearing, grubbing, and disposal of cleared and grubbed materials.

1.02 QUALITY ASSURANCE; DEFINITIONS

A. CLEARING: Clearing is defined as the removal of trees, shrubs, bushes, and other organic matter at or above original ground level.

B. GRUBBING: Grubbing is defined as the removal of stumps, roots, boards, logs, and other organic matter found at or above ground level.

PART 2 - PRODUCTS [Not Used]

PART 3 - EXECUTION

3.01 PREPARATION

A. Mark areas to be cleared and grubbed prior to commencing clearing operations. Engineer shall approve clearing and grubbing limits prior to commencement of clearing operations.

B. Trees and shrubs outside of the clearing limits, which are within 10' of the clearing limits, shall be clearly marked to avoid damage during clearing and grubbing operations.

C. Remove trees and brush outside the clearing limits, but within the immediate vicinity of the work, upon receipt of approval by the Engineer, when the trees or brush interfere with or retard the progress of construction operations.

D. Clearly mark trees and shrubs within the clearing limits, which are to remain, and protect the trees and shrubs from damage during the clearing and grubbing operations.

E. The clearing limits shall not extend beyond the project limits.

F. Establish the clearing limits as follows:

1. Embankments plus 10' beyond the top of the excavation.
2. Excavations plus 5' beyond the top of the excavation.
3. Concrete structures plus 10' beyond the edge of the footing.
4. New roadways and new parking areas plus 5' beyond the edge of pavement.
5. Retaining walls plus 10' beyond the edge of the footing.
6. Underground utility trench top width plus 8'.

G. Establish the grubbing as follows:

1. Embankments plus 2' beyond the toe of the embankment.
2. Concrete structures plus 2' beyond the edge of the footing.
3. New roadways and new parking areas plus 1' beyond the edge of pavement.
4. Retaining walls plus 2' beyond the edge of the footing.

3.02 INSTALLATION

A. CLEARING

Clearing shall consist of the felling, cutting up, and the satisfactory disposal of trees and other vegetation, together with the down timber, snags, brush, rubbish, fences, and debris occurring within the area to be cleared.

B. GRUBBING

1. Grubbing shall consist of the removal and disposal of stumps and roots larger than 1" in diameter.
2. Extend grubbing to the depth indicated below: In the case of multiple construction items, the greater depth shall apply.

a) Footings - 18" below the bottom of the footing.
b) Walks - 12" below the bottom of the walk.
c) Roads and Taxiways - 18" below the bottom of the subgrade.
d) Parking Areas - 12" below the bottom of the subgrade.
e) Runways - 24" below the bottom of the subgrade.
f) Embankments - 24" below existing ground.
g) Concrete Structures - 18" below the bottom of the concrete.
h) Retaining Walls - 18" below the bottom of the footing.

3.03 FIELD QUALITY CONTROL

BURNING NOT PERMITTED

Completely remove timber, logs, roots, brush, rotten wood, and other refuse from the Owner's property. Disposal of materials in streams shall not be permitted and no materials shall be piled in stream channels or in areas where it might be washed away by floods. Timber within the area to be cleared shall become the property of the Contractor, and the Contractor may cut, trim, hew, saw, or otherwise dress felled timber within the limits of the Owner's property, provided timber and waster material is disposed of in a satisfactory manner. Materials shall be removed from the site daily unless permission is granted by the Engineer to store the materials for longer periods.

END OF SECTION

SECTION 31 14 00

SITE PREPARATION

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes: Clearing the site of vegetation, site improvements and obstructions to make way for new work.

1.02 PROJECT CONDITIONS

A. Existing Conditions: Contractor shall visit the site and verify the nature and extent of clearing work required.

B. Protection: Contractor shall be responsible for the protection of adjoining property and improvements outside the limits of the work. Protect paving from damage by heavy equipment and trucks. Take precautions to prevent injury to trees which are to remain.

PART 2 - PRODUCTS [Not used]

PART 3 - EXECUTION

3.01 PERFORMANCE

A. Clearing:

1. Remove trees, shrubs, and other vegetation from within the area of the site where shown on the drawings. Grub out roots to a depth of at least 18 inches below natural grade.
2. Dig out and remove buried obstructions to a depth of 24" below natural grade or 24" below the intended excavation elevation, whichever is lower.
3. Unless otherwise specified on the drawings, trees with calipers greater than 3" shall not be cleared (removed).

B. Pavement Removal

Bituminous and concrete pavements shall be removed to neatly sawed edges. Saw cuts shall be made full depth. If a saw cut in concrete pavement falls within 3' of an existing score joint, construction joint, saw joint, cold join, expansion joint, or edge, the concrete shall be removed to that joint or edge. All saw cuts shall be parallel and/or perpendicular to the line of existing pavement. If an edge of a cut is damaged subsequent to saw cutting, the concrete shall again be sawed to a neat, straight line for the purpose of removing the damaged area.

C. Disposal:

1. Clean up and remove from the site existing stumps, logs, broken paving rubble, and trash.
2. Clean up and remove from the site the stumps, logs, broken paving, rubble, and debris resulting from the clearing and grubbing operations.
3. Material to be wasted shall be legally disposed of off-site.
4. Burning of combustible materials on the site will not be permitted.

5. Remove and dispose of excess soil off site in a legal manner. No extra pay.

3.02 BACKFILLING

A. All holes, cavities, and depressions in the ground caused by site preparation operations will be backfilled and tamped to normal compaction and will be graded to prevent ponding of water and to promote drainage. In areas that are to be immediately excavated, the Architect/Engineer may permit holes, etc., to remain open.

3.03 STORM WATER MANAGEMENT PRACTICES

A. During the progress of the work, the contractor shall maintain existing storm water erosion and silt control measures in place at the site and shall provide additional erosion control barriers, silt fences, and other techniques in accordance with best management practices. Refer to Section 31 23 00 for additional requirements and land disturbance permit requirements.

END OF SECTION

SECTION 31 23 33

TRENCHING AND BACKFILLING

PART 1 - GENERAL

1.01 WORK INCLUDED

Furnish labor, materials, equipments and incidentals necessary to perform operations in trenching, pipe bedding, backfilling, clearing, grubbing and site preparation, handling, storage, transportation and disposal of excavated material; pumping and dewatering, preparation of subgrades, protection of adjacent property; fills, grading; and other appurtenant work. Trenching, backfilling, and pipe embedment procedures shall be in full compliance with Section 31 41 33, Trench Shielding. Earth removed from excavations and which is not required for backfill shall be removed from the site by the Contractor at his own expense unless arrangements arc made with the Owner through his representative to allow disposal on site. If permitted, the Contractor shall dump and spread excess earth in a manner agreed upon by the Contractor and the Owner Excavation, other than trench excavation and embankment fills are not part of this specification section

1.02 QUALITY ASSURANCE

CLASSIFICATION

A. Excavations shall include material of whatever nature encountered, including but not limited to clays, sands, gravels, conglomeritic boulders, weathered clay shales, rock, debris and abandoned existing structures. Excavation and trenching shall include the removal and subsequent handling of materials excavated or otherwise handled in the performance of the work.

B. Bidders must satisfy themselves as to the actual existing subsurface conditions prior to the submittal of a proposal to complete the proposed work.

C. Trench excavation shall consist of excavation to the lines and grades indicated, required for installation of the pipe, pipe bedding, backfill, and to accommodate trench safety systems

1.03 SUBMITTALS

A. Submittals shall be in accordance with SECTION 01 33 23 – Shop Drawings, Product Data, and Samples and SECTION 01 23 00 – Alternates, Submittals and shall include:

1. Sieve analysis on embedment materials.
2. Test results indicating soil resistivity for embedment material used on metal pipe.

1.04 STANDARDS

The following publications, referred to hereafter by basic designation only, form a part of this specification to the extent indicated by the references thereto:

ASTM D-48 “Standard Classification for Sizes of Aggregate for Road and Bridge Construction"
ASTM D-698 "Moisture-Density Relationship of Soils and Soil Aggregate Mixtures, Using 5.5 -Ib Rammer and 12 Inch Drop"
ASTM D-1556 "Density of Soil in Place by the Sand Cone Method"

ASTM D-2487 "Classification of Soils for Engineering Purposes"
ASTM D-2922 "Density of Soil and Soil - Aggregate In-Place by Nuclear Methods"
ASTM D-3017 "Moisture Content of Soil and Soil - Aggregate In-Place by Nuclear Methods"
ASTM D-4253 "Test Methods for Maximum Index Density of Soils Using a Vibratory Table"
ASTM D-4254 "Test Methods for Minimum Index Density of Soils and Calculations of Relative Density"

Any other testing required by these specifications and not specifically referenced to a standard shall be performed under ASTM or other appropriate standards as designated by the Engineer.

Reference herein or on the drawings to soil classifications shall be understood to be according to ASTM D-2487, "Classification of Soils for Engineering Purposes" unless indicated otherwise.

1.05 DELIVERY AND STORAGE

Excavated materials to be used for backfilling may be deposited in stockpiles at points convenient for re-handling the material during the backfilling process. The location of stockpiles shall be within the limits of construction easements or public right-of-way. The location of stockpiles is subject to the approval of the Owner or the Owner's representative. Keep drainage channels clear of stockpiled materials.

1.06 JOB CONDITIONS

Place no embedment or backfill material during freezing weather or upon frozen subgrades or previously placed frozen embedment or backfill materials.

PART 2 - PRODUCTS

2.01 MATERIALS

A. CONCRETE FOR BACKFILL, BLOCKING, CRADLING AND ENCASEMENT. Unless other strength requirements arc designated, concrete used shall be 4,000 psi as specified in Section 03 30 00, CAST-IN-PLACE CONCRETE.

B. CLASS 1 EARTH FILL: Limited to clays and sandy clays classified as CH material with a liquid limit greater than or equal to 50, a plasticity index greater than or equal to 25, and a minimum of 60% passing the No. 200 sieve, which arc free of organic materials

C. CLASS 3 EARTH FILL- Consist of any materials classified as CH, CL, SM, SP, SP-SM, SC, and GC, which have a minimum plasticity index of 4, which are free of organic materials.

D. CLASS 12 EARTH FILL: Consist of soils suitable for topsoil which are relatively free of stones or other objectionable debris, which have sufficient humus content to readily support vegetative growth. The suitability of soils for topsoil shall be subject to the approval of the Engineer.

E. CLASS 2 AGGREGATE FILL: [For Reinforced Concrete or Concrete Cylinder Pipe] Consist of durable particles of crushed stone free of silt, clay, or other unsuitable materials and have a percentage of wear of not more than 40% when tested in accordance with ASTM Method C-13 1 or C-535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C-88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D-448, size number 67:

Sieve Size Square Opening	Percent Passing
1"	100
3/4"	90 - 100
3/8"	20 - 55
No. 4	0 - 10
No. 8	0 - 5

F. CLASS 3 AGGREGATE FILL: [For Iron, Cast Iron, or Corrugated Metal Pipe] Consist of durable particles of crushed stone free of silt, clay, or other unsuitable materials and have a percentage of wear of not more than 40% when tested in accordance with ASTM C-131 or C-535. When material is subjected to five (5) cycles of the sodium sulfate soundness test in accordance with ASTM C-88, Sodium Sulfate Solution, the weighted percentage of loss shall not exceed 12%. The source of the material shall be approved by the Engineer and meet the following gradation in accordance with ASTM D-448, size number 7:

Sieve Size Square Opening	Percent Passing
3/4"	100
½"	90 - 100
3/8"	40 - 70
No. 4	0 - 15
No. 8	0 - 5

G. CLASS 10 AGGREGATE FILL: or Iron-reinforced Concrete, Vitrified Clay, PVC, Fiberglass, or Asbestos Cement Pipe] Consist of washed and screened natural sands or sands manufactured by crushing stones complying with the requirements and tests of "Standard Specifications for Concrete Aggregates", ASTM C-33. The gradation as included in ASTM C-33 is as follows:

Sieve Size Square Opening	Percent Passing
8"	00
No. 4	95 - 100
No .8	80 - 100
No. 16	50 - 85
No. 30	25 - 60
No. 50	10-30
No. 100	2-10

Class 10 Aggregate Fill shall have not more than 45°/O passing any sieve and retained on the next consecutive sieve of those shown above, and its fineness modulus, as defined in ASTM C-125, shall be not less than 2.3 nor more than 3.1.

H. CEMENT: Type I Portland Cement

2.02 MIXES; SAND-CEMENT BACKFILL [OR EMBEDMENT]

A. A minimum sand and cement mixture of 27 parts sand and 2 parts cement will be required.

Fine Sand	1 Cubic Yard
Cement	1 Bag (Minimum)
Water	Optimum Moisture

B. Sand shall be free of any cohesive material and shall meet the following gradation and plasticity index requirements:

Sieve Size	Percent Passing
1"	100
½"	95 - 100
No. 40	80 - 100
Plasticity Index	10 Maximum
Liquid Limit	25 or less

2.03 FABRICATIONS [Not Used]

2.04 MANUFACTURED PRODUCTS [Not Used]

PART 3 - EXECUTION

3.01 PREPARATION

A. SITE

1. Clear sites of logs, trees, roots, brush, tree trimmings and other objectionable materials and debris which are to be occupied by pipe trenches, and grub stumps. Designate material not salvaged for reuse as surface material as spoiled and dispose of material in accordance with Paragraph E - DISPOSAL OF SPOIL MATERIAL, of this section.
2. Do not remove trees outside of the required working area unless their removal is authorized in writing by the Engineer and with the approval of the local governing authority. Adequately protect the trees left standing from permanent damage by construction operations. Standing trees may be trimmed where necessary to facilitate construction, but only with written authorization from the Engineer.

B. DEWATERING

1. Provide and maintain adequate dewatering equipment to remove and dispose of surface and ground water entering the excavations, trenches, or other parts of the work. Keep each excavation dry during subgrade preparation and continually thereafter until the proposed pipe is installed. Maintain the proper procedures necessary to protect against damage to the proposed work from hydrostatic pressure, flotation, or other water related causes.
2. Dewater excavations which extend down to or below ground water elevation by lowering and keeping the ground water level a minimum of 2-feet below the bottom of the excavation.
3. Divert surface water or otherwise prevent water from entering excavated areas to the fullest extent possible without causing damage to adjacent property.
4. Provide and maintain any piping or conduit necessary to facilitate drainage. Do not alter area drainage patterns to the extent that adjacent property and landowners become threatened with localized flooding and/or water damage. Should such a situation occur, the Contractor shall be responsible for repairing the damage at no additional cost to the Owner.

C. PROTECTION OF EXISTING STRUCTURES AND UTILITIES

1. Prior to the start of construction, communicate with the local representatives of utilities companies, including but limited to oil, gas, telephone, and communications companies, as well as local water and sewer utilities operating in the location of the proposed construction area. Seek the utility companies' assistance in locating existing facilities to avoid conflicts during construction. The

location, number, depth, and owner of utilities indicated are for information purposes only, and all utilities and structures may not be shown or may not be in the location shown.

2. Where construction endangers adjacent structures, utilities, embankments and/or roadways, the Contractor shall, at his own expense, carefully support and protect such structures so that no damage occurs throughout the construction process. In case damage should occur, the Contractor shall be responsible for restoring the damaged structure to a condition acceptable to the Owner of that structure and shall bear all cost of such reparations.
3. Repair or replace damaged street surfaces, driveways, sidewalks, curbs, gutters, fences, drainage structures, or other such facilities to the satisfaction of the Owner. Structures shall be returned to a condition equal to or better than the original condition and of same or better material and quality.

D. BLASTING

Blasting shall not be allowed in any instance.

E. DISPOSAL OF SPOIL MATERIAL

1. Suitable material from excavations which meets the requirements for pipe backfill material as indicated, except stripping excavation, may be reused. Designate the remaining excavated materials as spoiled material and dispose of material off the site in accordance with all applicable laws, ordinances, and codes. Contractor shall be responsible for the storage, transportation, and deposition of spoiled material and shall be responsible for acquiring the necessary permits, and the payment of fees and duties at no additional cost to the Owner.
2. No burning of materials shall be permitted on the site.

3.02 TRENCH EXCAVATION

A. GENERAL

The trenches shall be excavated to the alignment and depth indicated or as necessary for the proper installation of the pipe and appurtenances. Brace and dewater the trench if necessary, so that the workmen may work therein safely and efficiently. Any specific requirement listed in Part 3 - EXECUTION may be modified as necessary to meet OSHA requirements. However, if trench widths are wider than indicated, the Contractor shall be responsible for determining the proper class of embedment and piping and the installation.

B. TRENCH WIDTH

The trench widths shall be as shown on the drawings.

C. PIPE FOUNDATION SUBGRADE

1. Excavate the trench to an even grade to permit the installation of the pipe so that the full length of the pipe barrel is supported on the proper depth of bedding material. The entire foundation subgrade area in the bottom of the excavations shall be firm, stable material, and the material shall not be disturbed below required grade except as described in this specification. Where the character of the subgrade material is such that proper subgrade cannot be obtained at the elevation indicated, deepen the excavation to a satisfactory subgrade material.
2. Remove the material until a firm, stable, and uniform bearing is reached, and the subgrade brought back to the required grade with the specified bedding material

compacted in place or with lean concrete material. The expense of replacing any unsatisfactory subgrade shall be borne by the Contractor.

D. CORRECTING FAULTY GRADE

Should any part of the trench be excavated below required grade, correct the trench with bedding material, thoroughly compacted, or with lean concrete, at no additional compensation to the Contractor.

E. CARE OF SURFACE MATERIAL FOR REUSE

If local conditions permit reuse, keep surface material suitable for reuse separate from the general excavation material.

F. TRENCHING METHODS

The use of any suitable trench digging machinery is permitted except in places where such operations may cause damage, above or below ground, in which case, employ hand methods.

G. PIPE CLEARANCE IN ROCK

Remove ledge rock, rock fragments, shale, or other rock to provide proper clearance for bedding materials. Provide adequate clearance for properly jointing pipe laid in rock trenches at bell holes.

3.03 BACKFILL

A. BEDDING WITHING PIPE ZONE

1. CONCRETE CRADLE, ENCASEMENT OR CONCRETE ARCH
   Where indicated, install in the pipe in concrete cradle, encasement, or concrete arch. Take precautions to prevent pipe movement or deflection during construction. Where pipes are placed below structures, completely encase pipes in 1,500 psi concrete, and extend up to bottom of structure.
2. CONCRETE BLOCKING
   Place blocking to rest against firm undisturbed trench walls. The supporting area for each block shall be at least as great as that indicated and shall be sufficient to withstand the thrust, including water hammer, which may develop. Each block shall rest on a firm undisturbed foundation of trench sides and bottom.

B. AGGREGATE FILL BEDDING

1. After the trench has been cut to the depths indicated, bring up the bedding layer to a point slightly above grade in maximum 4" lifts and uniformly compact to the density indicated. Form bell holes and scoop out a trough to grade so that the pipe is uniformly supported by the embedment material. Lay and joint the pipe. Bring up the embedment material in maximum 4" lifts on either side of the pipe to the elevation above the pipe shown on the plans. Uniformly compact the pipe as indicated.
2. After moisture is gone from the embedment material, place and compact the remaining backfill by tampering or other appropriate methods. Water jetting shall not be permitted.

C. COMPACTION REQUIREMENTS

1. Compact earth fill an adhesive aggregate fill in maximum 4" lifts with pneumatic rollers or power hand tampers and make a minimum of eight (8) passes.
2. Compact cohesionless aggregate fill in maximum 4" lifts with vibratory rollers or vibratory plate power hand compactors and make a minimum of eight (8) passes.
3. The acceptability of the compaction equipment shall be based upon the results of a test section.
4. Compact earth fill and cohesive aggregate fill to a minimum of 95% of maximum dry density as determined by ASTM D-698, Standard Proctor.
5. Compact earth fill Class 1 and 2 at a moisture content within minus 0 to plus 5 percentage points of the optimum moisture content. Compact the remaining classes of earth fill and cohesive aggregate fill at a moisture content within minus 2 to plus 5 percentage points of optimum moisture content. The moisture ranges listed above are minimum and maximum limits. A tighter moisture range within these limits may be required to consistently achieve the specified density.
6. Compact cohesionless aggregate fill on which it is not practical to control the density by “Proctor” methods to a minimum of 75% of relative density as determined by ASTM D-4253 and D-4254, or at the discretion of the Engineer, by a field compaction mold method correlated to ASTM D-4253 and D-4254.
7. Compact cohesionless aggregate fill at moisture content within a range that accommodates consistent placement and compaction to the minimum relative density specified above.
8. The Owner will arrange and pay for density and moisture testing. The testing frequency and methods shall be as requested by the Engineer. The Engineer may waive testing requirements on cohesionless bedding where testing is not practical because of limited space between the pipe and trench walls, however, the minimum number of passes of the compaction equipment specified above shall be achieved.

3.04 FINISHING

A. Grade and rake areas smooth and even which do not receive any type of paved surface, to allow drainage to drain away from the structures and toward the roads and streets or the natural drainage course. Break up large clods of earth and remove rocks, trash, and debris near the surface.

B. Finish the top portion of backfill beneath established sodded (lawn) areas with not less than 6" of topsoil corresponding to, or better than, that underlying adjoining sodded areas.

3.05 FIELD QUALITY CONTROL

A. Compact backfill and appropriate embedment material to a minimum of 95% of maximum density at a moisture content of 0 to + 5% of optimum for backfill and at optimum for sand-cement embedment as determined by ASTM D-698-78 (Standard Proctor),

B. Make periodic tests of compaction for conformance with this section by an approved testing laboratory selected and paid for by the Owner. Contractor shall pay for re-testing until acceptable test results are obtained.

3.06 CLEAN AND ADJUST

Remove surplus pipeline materials, tools, rubbish, and temporary structures and leave the construction site clean, to the satisfaction of the Engineer.

END OF SECTION

SECTION 31 25 00

EROSION AND SEDIMENTATION CONTROLS

PART 1 - GENERAL

1.01 WORK INCLUDED

Provide labor, materials, equipment, and incidentals necessary to seed the slopes and other areas as specified. This specification includes seedbed fertilization, watering, mulching, and emulsifying or tacking the mulch and maintenance until final acceptance by the Owner.

1.02 STANDARDS

The seed used on this project will conform to ITEM 164.2 Standard Specifications for Construction of Highways, Streets and Bridges, Texas Department of Transportation.

1.03 DELIVERY AND STORAGE

Deliver seed with each variety separately bagged.

1.04 OPTIONS

A. If dry mechanical methods are used, the fertilizer may be spread at the same time as the seed. After sowing, straw mulch will be mechanically spread over the seeded area.

B. When seed and fertilizer are to be distributed as a water slurry, apply the mixture within thirty (30) minutes of mixing.

PART 2 - PRODUCTS

2.01 MATERIALS

A. SEED: From the previous season's crop, labeled in accordance with the Texas Seed Law.

1. Seed for Fall planting (temporary) shall be one (1) or more of the following small grains as designated by the Engineer: Wheat, oats, cereal rye, or barley.
2. Seed for Spring planting (permanent) shall be Bermuda grass.

B. FERTILIZER

A uniform application of 10-6-4 (nitrogen-phosphorus-potassium) fertilizer at a rate of 18 pounds per 1,000 square feet (800 pounds per acre).

C. MULCH

1. Consisting of straw, wood-fiber, mulch nettings, wood chips or other suitable material approved by the Engineer and free of Johnson grass and other noxious weed seeds.
2. Straw mulch shall be oat, wheat or rice straw, prairie hay, Bermuda grass hay, or

other hay harvested before seed production and approved by the Engineer. The straw mulch will be kept dry and shall not be rotted or molded. A minimum of 50% by weight of the herbage making up the hay shall be l0" in length or longer.

D. TOPSOIL: As specified for Class 12 Earth Fill in Section 31 05 13, SOILS FOR EARTHWORK.

E. HERBICIDE: Contractor shall be responsible for using herbicides in a manner consistent with label requirements and precautions. Only registered herbicides having a minimal residual effect shall be used. Contractor shall strictly adhere to all Federal, State, and local laws governing herbicide usage.

PART 3 - EXECUTION

3.01 PREPARATION [Not Used]

3.02 TOPSOIL PLACEMENT

Place topsoil as specified for Class 12 Earth Fill.

3.03 FALL PLANTING

Fall planting will be temporary only and will be required if construction is completed between September 15 and April 15. The Fall planting is to be followed by a Spring planting of perennial vegetation.

A. SEEDBED PREPARATION

Use a one-way plow, tandem disk, bedder, or equipment which will accomplish similar results. Break or mix the surface of the soil with the tillage equipment. Additional tillage operations will be necessary if required so planting can be on a clean, firm seedbed. Chiseling will be necessary on areas which have been severely compacted.

B. SEEDING

1. Seeding will be required on disturbed or excavated areas and on new embankments of whatever nature unless requested otherwise by the Engineer.

2. Optimum Fall planting dates are September 1 to November 30. Accomplish the seeding for Fall planting within these dates unless approval to do otherwise is obtained from the Engineer. Planting rates when drilled or broadcast are as follows:

Wheat	120	lbs/acre
Oats	128	lbs/acre
Rye	200	lbs/acre
Barley	114	lbs/acre

3.04 SPRING PLANTING

Follow procedures for Spring planting if construction is completed between April 15 and September 15, or after a temporary Fall planting has been made.

A. SEEDBED PREPARATION

Seedbed preparation for Spring planting is the same as that stated in the Fall planting of temporary cover with one addition. Any temporary cover crop must be top killed using an approved contact herbicide or by mechanically undercutting the growing cover crop, leaving residues on or near the soil surface.

B. MULCHING

1. Spread mulch material on the area to be planted if construction was completed too late for planting a temporary fall crop or if insufficient residues are produced by the Fall planting. Mulch the planting areas to control soil erosion and seed loss by wind and water and to promote grass establishment. Apply Mulch hay at the rate of 2 tons per acre and spread uniformly so that about 25% of the ground surface is uniformly visible through the mulch.
2. Anchor the mulch hay by treading into the soil with a straight disk type mulch tiller. Perform disking across the slope along contours. Other types of mulch such as wood cellulose fiber or cotton bur mulch may be used at recommended rates, if approved by the Engineer. Apply mulch in a manner that will not hinder emergence of seedlings.

C. SEEDING

1. Plant Bermuda grass seed between April 15 and Sept. 15. Sow the seed at the rate of 10 pounds of pure live seed (PLS) per 1,000 SF, or more if required to obtain a complete stand of grass. The PLS content is determined by multiplying the seed package weight by the product of the percent purity, and the percent germination, which are contained on the seed label.
2. Accomplish seeding by mechanical means using either broadcasting or drilling type equipment to provide uniform distribution of the seed in the planting areas. Cover Bermuda grass seed with1/4 to 1/2" of approved topsoil. If seed is drilled, the distance between drill rows shall not exceed 12". Hydro-seeding may be used to apply seed, fertilizer, and wood-fiber mulch with the approval of the Engineer.

3.05 MAINTENANCE

A. IRRIGATION

Supply the seeded areas with adequate moisture (4" penetration) at ten (10) day intervals, if needed, for seed germination and plant growth until acceptance by the Owner. Water the seed in a manner which will prevent erosion of the soil. Furnish all water to be used.

B. REPAIR

Repair washouts and other bare soil areas in a seeded area either by re-seeding, sprigging, or spot-sodding, and perform maintenance as needed to establish grass in the area.

C. WEED CONTROL

1. Control competitive weed growth during the establishment period by mowing and/or with herbicides. Chemical usage shall be in accordance with the current recommendations of the Texas Agricultural Experiment Station or local Soil

Conservation Service Field Office Technical Guides. Strictly adhere to all Federal, State, and local laws governing herbicides.

2. Weed control shall be the Contractor's responsibility whether topsoil is from on-site or off-site sources and also for seeded areas which are specified not to receive topsoil.

3.06 SEEDING OF DISTURBED AREAS

A. Disturbed areas will require seeding as specified in this section unless requested otherwise by the Engineer or shown otherwise on the drawings or in the specifications.

B. Any areas which are disturbed by the Contractor which are not shown on the drawings or specified to require disturbance including any approved areas not shown on the drawings, shall be considered as unauthorized disturbed areas. Any such areas shall be seeded as specified in this section at the Contractor's expense and shall not be measured or paid under this section.

3.07 FIELD QUALITY CONTROL; OBSERVATION AND ACCEPTANCE

A. OBSERVATION

Upon completion of the site preparation, mulching, fertilizing, seeding, and maintenance of seeded areas, the Engineer will observe the seeded areas periodically to determine the establishment success. The Engineer will consider soil coverage, purity of the grass stand, and maturity of the plants.

B. ESTABLISHMENT OF STAND AND ACCEPTANCE

The Engineer will determine that a grassed area is established upon fulfillment of the following conditions:

1. The permanent grass stand uniformly covers the planting area, with no exposed soil areas more than 6" across in any dimension.
2. The permanent grass stand is free of over-topping weed species which would compete for sunlight, moisture, and nutrients. In addition, no area of pure weed species greater than 6" across in any dimension shall occur within a permanent grass stand.
3. The majority of the grass plants in a stand shall have a well-established root system to survive if irrigation is discontinued. Establish the permanent grass stand before September 15 to preclude having to perform a temporary Fall seeding. In the event a Fall seeding must be performed, follow-up the temporary seeding with a permanent seeding as specified. Upon final acceptance of the work under this contract, the Owner will assume the responsibility of maintaining the grassed areas.

END OF SECTION

SECTION 31 41 33

TRENCH SHIELDING

PART 1 - GENERAL

1.01 WORK INCLUDED

A. This specification consists of the basic requirements which the Contractor must comply with in order to provide for the safety and health of workers in a trench. This specification is for the purpose of providing minimum performance specifications, and the Contractor shall develop, design, and implement the trench safety system. The Contractor shall bear the sole responsibility for the adequacy of the trench safety system and providing "a safe place to work" for the workman.

B. Should the trench safety protection system require wider trenches than specified elsewhere, the Contractor shall be responsible for the costs associated with determining adequacy of pipe bedding and class, as well as purchase and installation of alternate materials.

1.02 STANDARDS

A. The following standard shall be the minimum governing requirement of this specification and is hereby made a part of this specification as if written in its entirety.

Occupational Safety and Health Standards - Excavations (29CFR Part 1926), U.S. Department of Labor, latest edition.

B. Comply with the applicable Federal, State, and local rules, regulations, and ordinances.

END OF SECTION

SECTION 31 63 29

DRILLED PIERS

PART 1 - GENERAL

1.01 SUMMARY

A. Description of Work: Furnish all labor, materials, services, equipment and appliances required in conjunction with drilled pier foundations complete, including, but not limited to the following:
   1. Layout of drilled piers.
   2. Excavation of drilled piers.
   3. Temporary steel casings – if required.
   4. Furnishing and placing reinforcing steel.
   5. Furnishing and placing concrete.
   6. Placing anchor bolts for steel columns.
   7. Removal of spoil (excavated material) resulting from drilled pier excavations.

B. The extent of drilled piers is shown on the drawings, including locations, diameters of shafts, elevation of top bearing stratum for bidding purposes, top of pier elevations, reinforcement, and details of construction.

C. Related work specified in other sections:
   1. Testing Laboratory Services: Section 01 41 00.
   2. Soil Investigation Data: Section 02 20 00.
   3. Concrete Reinforcement: Section 03 20 00.
   4. Cast-in-Place Concrete: Section 03 30 00.

1.02 QUALITY ASSURANCE

A. Pier drilling contractor shall be required to submit proof of qualifications requirements including:
   1. Minimum of 5 previous projects of similar scope and nature or larger.
   2. Verify having been in business for a minimum of three years.

B. Testing laboratory services:
   1. Refer to section 01 41 00 for additional information concerning laboratory services in conjunction with drilled pier work.
   2. The contractor shall pay for the services of an independent testing agency to design the concrete mix in conjunction with drilled piers and to perform continuous pier drilling observations.

3. Contractor shall give a minimum of 2 days notice to geotechnical consultant for services in conjunction with drilled piers.

C. Drilling Log:
Geotechnical Representative shall keep an exact log of each pier, regardless of soil conditions, indicating:
1. Pier number.
2. Pier location.
3. Depth drilled through overburden.
4. Depth drilled in bearing stratum.
5. Elevation of ground surface.
6. Top elevation of concrete.
7. Top elevation and length of casing.
8. Diameter of shaft.
9. Diameter and type of bell (if bells are required).
10. Estimated inflow of water, source, and depth in bottom of hole when concrete is placed.
11. Description of bearing stratum.
12. Pumping required.

1.03 JOB CONDITIONS

A. Scheduling:
1. Schedule pier drilling so that piers will be filled with concrete within 8 hours after drilling.
2. Fill each pier with concrete not later than the same day it is drilled.

PART 2 – PRODUCTS

2.01 DRILLING EQUIPMENT

A. The equipment used shall be adequate to drill the sizes indicated to depths necessary for a stable foundation, giving consideration to subsurface conditions reported by the Geotechnical Investigation.

2.02 MATERIALS

A. Concrete Reinforcement: As specified in Section 03 20 00.

B. Cement, Aggregates and Admixtures: As specified in Section 03 30 00.

2.03 MIXES

A. As specified in Section 03 30 00.

PART 3 – EXECUTION

3.01 CONSTRUCTION

A. Drilling
   1. Drill piers with power auger foundation drilling rig designed for that purpose. Drill piers vertically, to diameters shown on drawings.
   2. If caving or substantial amounts of ground water are encountered, use casings, if required, to prevent caving and exclude water.

B. Casings
   1. Protective steel casing, at least as large in inside diameter as the nominal shaft size and of sufficient wall thickness to resist crushing by hydrostatic and earth pressures, shall be installed in each pier hole when needed, in the judgement of the Foundation Inspector (s), to prevent caving or fall-in.

C. Casing Removal
   1. An initial jerk of “2” to “4” shall be allowed to start the lift; thereafter, while being removed from the pier hole, the casing must be kept plumb and must be pulled with a smooth, vertical motion (no rotation permitted), without jerks. Vibration of the casing during pulling is not approved. Maintain sufficient head of concrete to prevent reduction in diameter of pier shaft by earth pressure and to prevent extraneous material from mixing with fresh concrete. Coordinate withdrawal of temporary casings with concrete placement to maintain a sufficient need of concrete above casing bottom.
   2. Where cutoff elevation is below ground level, maintain protective casing to the ground surface if necessary to prevent detrimental caving or intrusion of shallow soils into the shaft.
   3. Dowels shall be placed and positioned after the casing has been pulled and the surface of the concrete has been established.

D. Removal of Groundwater Seepage
   1. Water above an average depth of 2” above the bottom of the excavation shall be pumped or removed before placement of concrete. If water cannot be held below this level long enough for concrete to be placed in the normal manner, place concrete by one of the following methods:
      a. Use of a submersible pump in the bottom of a straight hole or in a sump excavated in the bottom of a bell, with concrete being placed to cover the intake pipe before the pump is lifted.
      b. Use of a Tremie pipe or “elephant’s truck”.
      c. Use of pumped-in concrete discharging through a pipe below the water and below the surface of the concrete in the hole.

E. Allowable Tolerances:
   1. The piers shall be installed as indicated on the Drawings and in accordance with these Specifications. No pier shall be off center from its design locations more than 1/24 of the shaft diameter or 3", whichever is less measured at the top of the pier. No vertical pier shall be out of plumb more than 1% of its length. All piers and shafts shall be at least as large in diameter as indicated on the Drawings. Deviations from underream configurations (if required) may be made only with prior written approval of the Structural Engineer.
   2. If any of the above tolerances are exceeded, additional construction (including costs of engineering and redesign) as required by the Structural Engineer, shall be paid for by the Contractor.

3.02 PLACING REINFORCING STEEL AND CONCRETE

A. Do not place steel or concrete until pier holes have been inspected, logged and approved by the Testing Laboratory.

B. Reinforcing steel shall be installed as indicated on the Drawings. All steel shall be free from excessive rust, mud or any foreign material which would hinder bonding of concrete and steel. Reinforcement cages shall be straight and shall conform to the design dimensions. Adequate provision shall be made to ensure that the reinforcement steel will remain in place throughout placement of concrete and that specified concrete cover for the reinforcement steel is attained and maintained. The use of precast concrete spacer blocks or "Centraligner" pier sleds by Pieresearch, Arlington, TX (or equal) is recommended for this purpose.

C. After approval of the excavated pier hole by the Testing Laboratory, concrete shall be placed, if necessary, with the use of a drop chute or tremie, limiting free fall to 25' maximum, such that will not cause segregation of the particles or permit infiltration of water or any other occurrence which would tend to decrease the strength of the concrete or the capacity of the finished pier. All concrete shall be placed in the presence of the Testing Laboratory.

D. Maintain a minimum 3" clearance between bottom of excavation and reinforcement.

3.03 DISPOSAL OF SOIL

Remove spoil from the ground around the excavation before concrete placement is started, and dispose off the site in a legal manner.

1.4 SUBMITTALS

A. Submit under provisions of Section 01 30 00 - Administrative Requirements.

B. Manufacturer's printed product information indicating material compliance and specified options are to be submitted prior to installation. Submit manufacturer's product data sheets on each product to be used.

C. Shop drawings shall include plans, elevations, sections, details, and attachments to other work. Drawings must be submitted for approval and be approved prior to installation.

D. Design data which verifies compliance with design loads specified in Performance Requirements Article. Design data shall be signed and sealed by the qualified professional engineer responsible for their preparation.

E. Submit samples for initial color selection. Submit samples of each specified finish.

1.5 QUALITY ASSURANCE

A. Manufacturing company with engineering and fabrication of custom fencing and gate systems for a minimum of 15 years.

B. Installation company with experienced in manufacturer's products for a minimum of 5 years. The Contractor shall provide trained laborers with prior experience in the type of construction involved as well as experience installing the materials and techniques specified.

C. Obtain each fence system and gates through one source from a single manufacturer.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Upon delivery to the jobsite, inspect all materials for damage that might have occurred during shipment.

B. Handle and store materials in manufacturer's packaging until materials are ready to be installed. Store materials in such a way as to prevent damage and theft.

1.7 PROJECT CONDITIONS

A. Verify actual locations of walls and other construction contiguous with fencing and gates by field measurements before fabrication and indicate measurements on shop drawings. Provide allowance for trimming and fitting onsite.

1.8 COORDINATION AND SCHEDULING

A. Coordinate installation of anchorages for fencing and gates. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors that are to be embedded in concrete or masonry. Deliver such items to the Project Site in time for installation.

B. Schedule installation so wall attachments are made only to completed walls. Do not support systems temporarily by any means that do not satisfy structural performance requirements.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer: Fortress Fence Products, which is located at: 1720 N. First St.; Garland, TX 75040; Toll Free Tel: 866-323-4766; Email: request info (Specifications@fortressbp.com); Web: http://www.fortressfence.com

B. Substitutions: Requests for substitutions will be considered in accordance with provisions of Section 01 60 00 - Product Requirements.

2.2 SITE FENCING AND GATES

A. Ornamental Rackable Aluminum Fence Systems:
   1. Basis of Design: A2 Commercial Aluminum Fencing System as manufactured by Fortress Fence Products, a division of The Fortress Company. Hidden picket to rail fastener system offering high quality aesthetics. Notched Rail andf Pre- Punched Post design.
   2. Standards Compliance: ASTM F2957 for commercial applications. Meets or exceeds.
   3. Available Racking: 28 inch (710 mm), vertical.
   4. Rails: 1-1/2 inches (38 mm).
   5. Pickets: 3/4 inches (19 mm).
   6. Gate Uprights: 2 inches (51 mm).
   7. Air Spaces: 3-3/4 inches (95 mm).
   8. Panel Styles:
      a. Configuration: 4 rail.
      b. Style: Flat Top, Flat Bottom (FT/FB).
   9. Panel Dimensions:
      a. Width: As indicated on the Drawings.
      b. Height: 72 inches (1829 mm).
   10. Gate Styles: Walk Gates, Flat/ 48 inches (1219 mm).
   11. Posts and Accessories:
      a. Posts, End, Line, Corner, Gate: 3 inch square
      b. Cap: Pressed dome.
      c. Wall mount bracket.
      d. Post base and adapter cover.
      e. Swivel bracket.
      f. Gate latch and Hinge kit
   12. Finish: Powder coating. Architectural grade.
      a. Color: Gloss Black
   13. Fastening Connections:
      a. Rail to Post: Slip fit into routings and then secured to the post with one No. 12-14 (0.162 inch minor diameter) by 2-1/2 inch (64 mm) long, hex-washer head, galvanized steel, self-drilling screw
      b. Picket to Picket Retainer: One blind pop rivet to each retainer.
      c. Picket Retainers to Rail: Snap fit into rail - no mechanical connections.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which the work is to be installed, and notify the Contractor in writing, with a copy to the Owner and the Architect, of any conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Stake layout showing locations of gates and posts per submitted shop drawings.
   1. Contact "CALL BEFORE YOU DIG" prior to beginning any excavation work

B. Contact applicable authorities and take necessary precautions prior to beginning any excavation work.

3.3 INSTALLATION

A. Install fences in accordance with manufacturer's written instructions and in accordance with authorities having jurisdiction. Installation shall conform to the specifications referenced elsewhere in this Section and as indicated on the Drawings.

B. Concrete Set Posts: Drill hole in firm soil. Posts holes will be a minimum of 36 inches (mm) deep (environmental conditions or local codes may require a greater depth). Fence post shall be spaced 95 inches (mm) plus or minus 1/4 inch (6 mm) on-center to accommodate installation of brackets on 2-1/2 inch (64 mm) square post. For non-level installations, the on-center post spacing must be measured along the grade.

C. Refer to Division 3 for concrete specification. Recommend minimum 28 day compressive strength of 3,000 psi (20 MPa). Crown concrete at top to shed water.

D. On-center post spacing per manufacturer's drawings.

E. Install brackets onto fence section and posts as indicated in manufacturer's printed instructions for specific fence style. Attach fence sections to brackets with approved fasteners and techniques to ensure that fence sections are parallel to grade within 1/4" in 12 feet.

F. Install gate in accordance with manufacturer's printed instructions and approved signoff drawings. Do not mount gate from wall of a structure. Provide gate post on both sides of a gate. For double drive gate installation, provide concrete center drop to foundation depth and drop rod retainers at center. Lubricate to ensure smooth operation and verify proper latch operation.

3.4 CLEANING

A. Remove cutting and drilling chips that are attached to the fencing, post, brackets, or additions to prevent corrosion.

B. Repair scratches and other installation-incurred damage. Using a spray paint of the appropriate color that includes a zinc additive, repaint and seal any scratches or holes drilled in the fencing, post, brackets, or additions to prevent rust from forming. Clean up debris and unused material and remove from site.

C. Clean up debris and unused material, and remove from site.

3.5 PROTECTION

A. Protect finishes from damage during construction period with temporary protective coverings approved by manufacturer. Remove protective coverings at time of Substantial Completion.

B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in field to shop; make required alterations and refinish entire unit, or provide new units.

END OF SECTION

SECTION 323119
DECORATIVE METAL FENCES AND GATES

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Decorative steel fences.

1.02 RELATED REQUIREMENTS

A. Section 03 3000 - Cast-in-Place Concrete.

B. Section 31 2316 - Excavation.

1.03 REFERENCE STANDARDS

A. ASTM A276/A276M - Standard Specification for Stainless Steel Bars and Shapes 2017.

B. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process 2022.

C. ASTM D2794 - Standard Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact) 1993 (Reapproved 2019).

D. ASTM D3359 - Standard Test Methods for Rating Adhesion by Tape Test 2023.

E. ASTM F2408 - Standard Specification for Ornamental Fences Employing Galvanized Steel Tubular Pickets 2016 (Reapproved 2023).

F. CLFMI WLG 2445 - Wind Load Guide for the Selection of Line Post and Line Post Spacing 2018.

G. NFPA 70 - National Electrical Code Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

1.04 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to start of work of this section; require attendance by affected installers.

1.05 SUBMITTALS

A. See Section 013000 - Administrative Requirements, for submittal procedures.

B. Product Data: Submit manufacturer's data sheets on each product to be used, including:
   1. Preparation instructions and recommendations.
   2. Storage and handling requirements and recommendations.
   3. Installation methods.

C. Design Calculations: For high wind load areas, provide calculations for fence panels and accessory selection as well as line post spacing and foundation details. See CLFMI WLG 2445 for line post and spacing guidance.

D. Shop Drawings:
   1. Indicate plan layout, spacing of components, post foundation dimensions, hardware anchorage, gates, and schedule of components.
   2. Foundation details, concrete design mix and reinforcing schedule for anti-ram barrier system.

E. Samples: Submit two samples of fence panels, 18 inch by 24 inch in size illustrating construction and colored finish.

F. Manufacturer's Warranty.

1.06 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section with minimum five years documented experience.

B. Installer Qualifications: Experienced with type of construction involved and materials and techniques specified and approved by fence manufacturer.

1.07 DELIVERY, STORAGE AND HANDLING

A. Store materials in a manner to ensure proper ventilation and drainage. Protect against damage, weather, vandalism and theft.

1.08 WARRANTY

A. See Section 017800 - Closeout Submittals, for additional warranty requirements.

B. Correct defective Work within a five year period after Date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Decorative Metal Fences and Gates:
1. Ameristar Perimeter Security, USA; www.ameristarperimeter.com.
2. CDH Custom Roll Form, LLC; Palisade Security Fence: www.cdhrollform.com.
3. Knotwood, a brand of OmniMax International; www.knotwood.com.
4. Patriot Custom Metals DBA PalmSHIELD; www.palmshieldlouvers.com.
5. Stewart Iron Works, LLC; www.stewartironworks.com.
6. Substitutions: See Section 016000 - Product Requirements.

2.02 FENCES

A. Fences: Complete factory-fabricated system of posts and panels, accessories, fittings, and fasteners; finished with electrodeposition coating, and having the following performance characteristics:
1. Capable of resisting vertical load, horizontal load and infill performance requirements for fence categories defined in ASTM F2408.

B. Electro-Deposition Coating: Multistage pretreatment/wash with zinc phosphate, followed by epoxy primer and acrylic topcoat.
1. Total Coating Thickness: 2 mils, minimum.
2. Color: As selected by Architect from manufacturer's standard range.
3. Coating Performance: Comply with general requirements of ASTM F2408.
a. Adhesion: ASTM D3359 (Method B); Class 3B with 90 percent or more of coating remaining in tested area.
b. Impact Resistance: ASTM D2794; 60 inch pounds (6.8 N m).

C. Steel: ASTM A653/A653M; tensile strength 45,000 psi (310 MPa), minimum.
1. Hot-dip galvanized; ASTM A653/A653M, G60.
2. 62 percent recycled steel, minimum.

D. Fasteners: ASTM A276/A276M, Type 302 stainless steel; finished to match fence components.

E. Hinges: Finished to match fence components.

F. Latches: Finished to match fence components.

2.03 WELDED STEEL FENCE

A. Provide fence meeting requirements for Industrial class as defined by ASTM F2408.

B. Fence Panels: Fusion welded; 8 feet high by 8 feet long.
1. Panel Style: Three rail.
2. Attach panels to posts with manufacturer's standard panel brackets.

C. Posts: Steel tube.
1. Size: 2-1/2 inches square by 12 gauge, 0.109 inch, with manufacturer's standard cap.

D. Rails: Manufacturer's standard, double-wall steel channel 1-3/4 inch square by 12 gauge, 0.1094 inch with prepunched picket holes.
   1. Picket Retaining Rods: 0.125 inch (3.17 mm) galvanized steel.
   2. Picket-to-Rail Intersection Seals: PVC grommets.

E. Pickets: Steel tube.
   1. Spacing: 3-3/4 inch clear.
   2. Size: 1 inch square by 18 gauge, 0.0478 inch.
   3. Style: Pickets with finial extend above top rail.
   4. Finial: Spear point.

F. Flexibility: Capable of following variable slope of up to 1:2.

G. Color: Black.

2.04 ACCESSORIES

A. Keypad Mounting Supports: Where not factory installed, provide mounting supports for keypad installation.

B. Caps: Cast steel galvanized; sized to post diameter, set screw retainer.

C. Fittings: Sleeves, bands, clips, rail ends, tension bars, fasteners and fittings; steel.

PART 3 EXECUTION

3.01 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.02 PREPARATION

A. Clean surfaces thoroughly prior to installation.

3.03 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Set fence posts in accordance with the manufacturer recommended spacing.

C. When cutting rails immediately seal the exposed surfaces by:
   1. Removing metal shavings from cut area.
   2. Apply zinc-rich primer to thoroughly cover cut edge and drilled hole; allow to dry.
   3. Apply two coats of custom finish spray paint matching fence color.
   4. Failure to seal exposed surfaces in accordance with manufacturer's instructions will negate manufacturer's warranty.

D. Space gate posts according to the manufacturers' drawings, dependent on standard out-to-out gate leaf dimensions and gate hardware selected.
   1. Base type and quantity of gate hinges on the application, weight, height, and number of gate cycles.

E. Excavate post holes in accordance with Section 312316.

F. Install operator in accordance with manufacturer's instructions and in accordance with NFPA 70.

3.04 TOLERANCES

A. Maximum Variation From Plumb: 1/4 inch (6.3 mm).

B. Maximum Offset From Indicated Position: 1 inch (25.4 mm).

C. Minimum Distance from Property Line: 6 inches (152 mm).

3.05 FIELD QUALITY CONTROL

A. See Section 014000 - Quality Requirements, for additional requirements.

B. Post Settings: Randomly inspect three locations against design for:
   1. Hole diameter.
   2. Hole depth.
   3. Hole spacing.

C. Fence Height: Randomly measure fence height at three locations or at areas that appear out of compliance with design.

D. Gates: Inspect for level, plumb, and alignment.

E. Workmanship: Verify neat installation free of defects.

3.06 CLEANING

A. Leave immediate work area neat at end of work day.

B. Clean jobsite of excess materials; scatter excess material from post hole excavations uniformly away from posts. Remove excess material if required.

C. Clean fence with mild household detergent and clean water rinse well.

D. Remove mortar from exposed posts and other fencing material using a 10 percent solution of muriatic acid followed immediately by several rinses with clean water.

E. Touch up scratched surfaces using materials recommended by manufacturer. Match touched-up paint color to factory-applied finish.

F. See Section 017419 - Construction Waste Management and Disposal, for additional requirements.

3.07 CLOSEOUT ACTIVITIES

A. See Section 017800 - Closeout Submittals, for closeout submittals.

B. Demonstration: Demonstrate operation of system to Owner's personnel.
   1. Use operation and maintenance data as reference during demonstration.
   2. Briefly describe function, operation, and maintenance of each component.

3.08 PROTECTION

A. Protect installed products until completion of project.

B. Touch-up, repair, or replace damaged products before Date of Substantial Completion.

END OF SECTION

SECTION 32 84 00

PLANTING IRRIGATION

PART 1 - GENERAL

1.01 SECTION INCLUDES

A. Piping.

B. Manual valves.

C. Pressure-reducing valves.

D. Automatic control valves.

E. Automatic drain valves.

F. Transition fittings.

G. Miscellaneous piping specialties.

H. Sprinklers.

I. Quick couplers.

J. Drip irrigation specialties.

K. Controllers.

L. Boxes for automatic control valves.

1.02 DEFINITIONS

A. Circuit Piping: Downstream from control valves to sprinklers, specialties, and drain valves. Piping is under pressure during flow.

B. Drain Piping: Downstream from circuit-piping drain valves. Piping is not under pressure.

C. Main Piping: Downstream from point of connection to water distribution piping to, and including, control valves. Piping is under water-distribution-system pressure.

D. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

1.03 PERFORMANCE REQUIREMENTS

A, Irrigation zone control shall be automatic operation with controller and automatic control valves.

B. Location of Sprinklers and Specialties: Design location is approximate. Make minor adjustments necessary to avoid plantings and obstructions such as signs and light standards. Maintain 100 percent irrigation coverage of areas indicated.

C. Minimum Working Pressures: Reference drawing notes.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. The following items shall be included in submittal but not limited to:

1. Pipe
2. Controller
3. Electric control valves
4. Freeze sensor
5. Moister sensor
6. Spray nozzles
7. Pop ups heads
8. Rotary heads
9. Gate valves

10. Backflow preventer
11. Wire
12. Flow sensor and master valve

B. Qualification Data: For qualified Installer.

C. Operation and Maintenance Data: For controllers and automatic control valves to include in operation and maintenance manuals.

1. The O&M Manual shall include manufacturer's recommended instructions and maintenance schedule for the complete irrigation system.
2. Provide a copy of the color-coded Controller Chart in the Manual

D. As – Built Drawings

13. Record drawing noting any variations from the Contract Documents. Submit one copy of record " As – Built" prints prior to expiration of the required maintenance period
14. All valves and controller shall be GPS surveyed.
15. All valves shall be numbered with a metal tag and reference to the "As – Built Drawing".

E. Controller Chart: Provide a Controller Chart that is 8 ½ " x 11" and thematically sealed. Chart shall be legible and color – coded for each zone, keying stations of the Controller to valve locations and to irrigation heads served by the station. Place Chart inside door of Controller.

F. Spray irrigation system audit test results. Turf areas 10,000 sf and larger shall be audited by an Irrigation Association certified auditor. The following efficiencies shall be minimal: Fixed spray – 60%, rotors – 70%.

G. Backflow test results.

H. Pressure test results of system pressure test for 1 hour at 100 psi.

I. Installer Qualifications: Licensed in landscaping and irrigation systems with not less than five years experience in the type and scale of work required in this Section.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: Licensed in landscaping and irrigation systems with not less than five years experience in the type and scale of work required in this Section.

B. All irrigation work shall be performed by a single firm specializing in this type of work and possessing the State of Texas Irrigation license. Contractor shall also provide for at least one on-site employee with an irrigation license.

C. Irrigation System: Provide underground irrigation system as a complete unit, including sprinklers, bubblers, drip irrigation heads, controllers, and accessories – produced by acceptable manufacturers as specified herein.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

1.07 PROJECT CONDITIONS

A. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:

1. Notify Construction Manager and Owner no fewer than five 5 days in advance of proposed interruption of water service.

2. Do not proceed with interruption of water service without Construction Manager's written permission.

J. Existing Conditions:

1. Take precaution to insure that equipment and vehicles do not disturb or damage existing site grading, walks, curbs, pavements, utilities, plants, tree protection zones, and other existing items and elements of the Site. Notify the Owner if rock layer(s) or other unanticipated conditions are encountered underground.
2. Utilities: Verify the locations and sizes of stub-outs for water sources indicated on the Contract Drawings as the source of water supply to the underground irrigation system.
3. Existing Utilities: Prior to excavation, determine the locations of all newly constructed and existing utilities. It is the Contractor's responsibility to obtain all necessary spotting services thru the Owner. Do not damage or disturb underground utilities. If a conflict exists between the location of underground utilities and the proposed work, notify the Owner and arrange for field and design adjustments.
4. Unknown Utilities: In the event that uncharted or incorrectly charted utilities are encountered during excavation that conflicts with this work, all work on that part of the job shall cease until the Owner is contacted and resumption of work is authorized by the Owner.
5. Existing Structures: Use extreme caution when working near existing structures. Do not damage existing features unless specifically indicated on the Contract Drawings. Contractor is responsible for incidental damage caused to existing site features and structures. Repairs shall be made at Contractor's expense.
6. Sequencing/Scheduling: Coordinate irrigation system with related work. Grade site within 1"-inch of finish grade prior to trenching. Install irrigation system prior to plant material installation.

1.08 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Spray Sprinklers: Equal to 1 percent of amount installed for each type and size indicated, but no fewer than 2 units.
2. Bubblers: Equal to 2 percent of amount installed for each type indicated, but no fewer than 2 units.
3. Emitters: Equal to 5 percent of amount installed for each type indicated, but no fewer than 5 units.
4. Drip-Tube System Tubing: Equal to 5 percent of total length installed for each type and size indicated, but not less than 100 feet

1.09 WARRANTY

A. General: Warranty underground irrigation system through the specified warranty period of one twelve month calendar period against operational deficiencies due to inferior material or workmanship. Correct deficiencies immediately as directed by the Owner at no additional cost to owner, including damage caused by such defects. Repairs shall be completed within ten business days of notification from the Owner.

B. Settlement: Warranty underground irrigation system through the specified warranty period of one twelve month calendar period against settlement damage. Adjust, restore, or replace pipes, valves, sprinkler heads, planting, paving, or other improvements or damages caused by settlement at no additional cost to the owner. These adjustments and restorations include damage caused to adjacent areas that are not part of the project. Damaged areas shall be restored to their original state.

PART 2 - PRODUCTS

2.01 PIPES, TUBES, AND FITTINGS

A. Comply with requirements in the piping schedule for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

B. PE Pipe with Controlled ID: ASTM F 771, PE 3408 compound; SIDR 11.5and SIDR 15.

1. Insert Fittings for PE Pipe: ASTM D 2609, nylon or propylene plastic with barbed ends. Include bands or other fasteners.

C. PE Pipe with Controlled OD: ASTM F 771, PE 3408 compound, SDR 11.

1. PE Butt, Heat-Fusion Fittings: ASTM D 3261.
2. PE Socket-Type Fittings: ASTM D 2683.

D. Pipe and Pipe Fittings

1. Polyvinyl Chloride Pipe (PVC).

a. Main and Lateral Lines: All plastic pipe which is 2-1/2 inches or smaller shall be Schedule 40 PVC and shall conform to ASTM D1785 – continuously and permanently marked with manufacturer's identification, type, class, nominal pipe size, schedule, and pressure rating [in psi] in accordance with the NSF standard.

b. Main Lines: All main line pipe which is larger than 2-1/2 inches in diameter shall be PVC 1120 or 1220 (SDR-PR) pipe, SDR-21 with a 200 psi pressure rating and conforming to ASTM D3139.

c. Provide pipes in 20 foot lengths, free of holes, blisters, wrinkles or dents. Note: Except for drip irrigation systems all systems are designed to 100 psi. Pressure shall be regulated at source connection to operate at manufacturers recommended pressure.

E. Threaded Nipples: Schedule 80 machined PVC pipe, Type 1, Cell Classification 12454, complying with ASTM D2467.

F. Line location tape: shall be detectable irrigation line marking tape- Thorbrand or equal. Location tape shall be used on all main and lateral lines.

2.02 PIPING JOINING MATERIALS

A. Solvent Cements for Joining PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.

B. Cleaner, Primer and Solvent Cements

1. Cleaner: Uni-Weld 7300 cleaner, ASTM F 656, or approved equal. Cleaner shall be NSF approved.
2. Primer: Uni-Weld 8700, Hi-Etch purple primer, ASTM F656.
3. Cleaner/Primer shall be any color other than clear.
4. Solvent Cements: Uni-Weld 2200 clear, light viscosity type, for lateral lines, Uni-Weld 1700 gray, heavy duty viscosity type, for lateral lines larger than 2-1/2 inch diameter, and Uni-Weld 6700 clear, light viscosity type for Flex/PVC connections – ASTM D 2564. Solvent shall be NSF approved.

C. Sealing Tapes and Pastes:

1. 1. Threaded Connections between PVC and Metal Pipe: Rectorseal No. 100 virgin heavy duty sealing paste, Plasto-joint Stick as manufactured by Lake Chemical Company, or Teflon tape.
2. Metal-to-Metal Connection: Rectorseal No.5 slow dry, soft set pipe thread compound.
3. PVC-to-PVC Connections: Teflon tape.
4. Plastic irrigation head or Plastic valve to pipe Connections: Teflon tape. Thread sealing compound shall not be used on thread connections between nipples and plastic valves.

2.03 BACKFLOW PREVENTION DEVICES

A. Provided on existing system

B. Backflow Preventer shall be certified by licensed certified backflow preventer tester.

C. FEBCO or WATTS Regulator Co.

2.04 QUICK COUPLERS

A. Manufacturers: Subject to compliance with requirements, Provide products by one of the following :

B. Basis-of-Design Product: Subject to compliance with requirements, provide comparable product by one of the following:

1. Rainbird.

C. Description: Factory-fabricated, bronze or brass, two-piece assembly. Include coupler water-seal valve; removable upper body with spring-loaded or weighted, Non- Potable rubber-covered cap.

2.05 MANUAL VALVES

A. Plastic Ball Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. NIBCO INC.
2. Description:
   a. Standard: MSS SP-122.
   b. Pressure Rating: 125 psig minimum 150 psig].
   c. Body Material: PVC.
   d. Type: Union.
   e. End Connections: Socket or threaded.
   f. Port: Full.

B. Bronze Gate Valves:

1. Manufacturers: Subject to compliance with requirements, [provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. NIBCO INC.
   b. Powell Valves.
   c. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
2. Description:
   a. Standard: MSS SP-80, Type 2.
   b. Class: 125.
   c. CWP Rating: 200 psig.
   d. Body Material: ASTM B 62 bronze with integral seat and screw-in bonnet.
   e. Ends: Threaded or solder joint.
   f. Stem: Bronze, nonrising.
   g. Disc: Solid wedge; bronze.
   h. Packing: Asbestos free.
   i. Handwheel: Malleable iron, bronze, or aluminum.

C. Operating Wrenches for Iron Gate Valve Casings: Furnish two 2 steel, tee-handle operating wrench(es) with one pointed end, stem of length to operate deepest buried valve, and socket matching valve operating nut for Project.

1. NIBCO INC.
2. Description:
    a. Standard: MSS SP-70, Type I.
    b. CWP Rating: 200 psig.
    c. Body Material: ASTM A 126, gray iron with bolted bonnet.
    d. Ends: Flanged.
    e. Trim: All bronze.
    f. Disc: Solid wedge.
    g. Packing and Gasket: Asbestos free.

2.06 AUTOMATIC CONTROL VALVES

A. Plastic, Automatic Control Valves:
    1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings.
    2. Description: Molded-glass filled nylon body, normally closed, diaphragm type with manual-flow adjustment, and operated by 24-VAC solenoid. With captured plunger and 150 -200 psi rating. Slow closing with fabric reinforced diaphragm.

2.07 AUTOMATIC DRAIN VALVES

A. Description: Spring-loaded-ball type of corrosion-resistant construction and designed to open for drainage if line pressure drops below 2-1/2 to 3 psig.

2.08 TRANSITION FITTINGS

A. General Requirements: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
B. Transition Couplings:
    1. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
        a. Cascade Waterworks Manufacturing.
        b. Dresser, Inc.; DMD Division.
        c. Ford Meter Box Company, Inc. (The).
        d. JCM Industries.
        e. Smith-Blair, Inc; a Sensus company.
        f. Viking Johnson.
    2. Description: AWWA C219, metal sleeve-type coupling for underground pressure piping.
C. Plastic-to-Metal Transition Fittings:
    1. Manufacturers: Subject to compliance with requirements, [provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
        a. Spears Manufacturing Company.
    2. Description: PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-socket or threaded end.
D. Plastic-to-Metal Transition Unions:
    1. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
        a. Spears Manufacturing Company.

2. Description: MSS SP-107, PVC four-part union. Include one brass or stainless-steel threaded end, one solvent-cement-joint or threaded plastic end, rubber O-ring, and union nut.

2.09 MISCELLANEOUS PIPING SPECIALTIES

A. Water Hammer Arresters: ASSE 1010 or PDI WH 201, with bellows or piston-type pressurized cushioning chamber and in sizes complying with PDI WH 201, Sizes A to F.

B. Pressure Gages: ASME B40.1. Include 4-1/2-inch- diameter dial, dial range of two times system operating pressure, and bottom outlet.

2.10 SPRINKLERS

A. General Requirements: Designed for uniform coverage over entire spray area indicated at available water pressure.

B. Plastic, Pop-up, Gear-Drive Rotary Sprinklers:

1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings

C. Plastic, Surface Spray Sprinklers:

1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings

D. Plastic, Pop-up Spray Sprinklers:

1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings

2.11 CONTROLLERS

A. As noted on plan.

B. Wiring

1. Provide #14 AWG [min. ga.], type UF, single conductor, solid copper wire, color-coded wiring to electric control valves from automatic controller. Wire shall be UL approved for direct underground burial. Exposed wiring leading to controller shall be in a rigid electrical metallic approved tubing. Multi-strand wire is not acceptable.

2. Provide a single wire to each solenoid from controller and a common neutral wire to all solenoids from controller as power supply.

3. Provide two extra zone wires and one extra common wire to furthest valve location with 36-inch loops in standard size valve box.

4. Indicate wire path and size on Contract Drawings.

5. Refer to the Facilities Design Manual for additional requirements.

C. Dry Splice Connectors

1. Rainbird Snap-Tite wire connectors or Spears DS-400 Dri-Splice connectors or approved equal.

2.12 BOXES FOR AUTOMATIC CONTROL VALVES

A. Plastic Boxes:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following shall be black in color:

a. Ametek

B. Drainage Backfill: Cleaned gravel or crushed stone, graded from 3/4 inch minimum to 3 inches maximum.

PART 3 - EXECUTION

3.01 EARTHWORK

A. Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving."

B. Install warning tape directly above pressure piping, 12 inches below finished grades, except 6 inches below subgrade under pavement and slabs.

C. Provide minimum cover over top of underground piping according to the following:

1. Irrigation Main Piping: Minimum depth of 18 inches below finished grade.
2. Lateral Piping: 12 inches
3. Sleeves: 24 inches.

D. Trenching:

1. Stake out all sprinkler head and valve locations prior to trenching for review and approval by the owner.
2. Excavate trenches straight and true with bottom uniformly sloped to low points. Make excavations of sufficient depth and width to permit proper handling and installation of the pipe and fittings. Accurately trim trenches to provide a uniform bed, free from loose soil, rocks, debris, and other sharp edged objects before installing pipe and fittings. In areas where trees are present, adjust trench location beyond the drip line of the trees.
3. Trench depths in rocky areas shall be 6” inches below required depth to allow for pipe bedding. Pipe installed in rocky soil shall be bedded in 6” inches of sand.
4. Trench widths shall allow a minimum of 4” inches between pipes laid in the same trench.
5. Provide a minimum of 24” inches and a maximum of 26” inches of cover for all constant pressure mainline. Provide a minimum of 18” inches and a maximum of 20” inches of cover for all mainline located downstream of the master valve. Provide a minimum of 18 inches and a maximum of 20” inches of cover for all lateral lines not under constant pressure. Provide a minimum of 6” inches of cover for all ½” inch distribution tubing.
6. Keep bottom of trench or excavation free and clear of water.
7. Where existing pavement must be cut to install landscape irrigation system, saw-cut smoothly to straight lines 6” inches wider than trench. Concrete sidewalks, curb & gutter, shall be removed to the nearest joint or saw-cut as directed by the owner.
    a. Repair and replace pavement cuts, sidewalks, curb & gutter with equivalent materials and finishes – match existing. Refer to Section [2] and Standard Detail WU3001 for patching.

3.02 PREPARATION

A. Installation

1. General
    a. Prior to installing irrigation heads, stake or otherwise locate trees and shrub planting areas. Avoid laying irrigation lines in root ball zone.
    b. Install irrigation material and equipment and provide necessary hardware in accordance with the Contract Drawings.
    c. All connections to the water distribution system must comply with Standard Specification Section 02665 – Underground Water Lines for Domestic & Fire Protection Systems.
2. PVC Pipe
    a. Main Line: Verify static water pressure at Point of Connection with pressure noted on Contract Drawings. Notify the Owner with any discrepancies prior to proceeding.
    b. Cut pipe square with the axis, using a fine-tooth hand saw, or ratcheting PVC cutter. Blade edge of cutter shall be straight and sharp to assure square burr-free cuts through PVC pipe. Cutter shall have a pipe supporting plate that adjusts to PVC size, and aids in eliminating pipe deformation and cracking. Remove all burrs prior to solvent welding.

c. Inside of pipes shall be clean and free of dirt, debris, and any foreign matter.

d. Apply cleaner and solvent in accordance with ASTM D 2855 and manufacturer's recommendations.

e. All piping in planters is to rest on a gravel filtration layer and is to be placed prior to placement of soil.

f. Cover and protect open pipe ends, fixtures and equipment from dirt, water, and chemical or mechanical damage during installation.

g. Do not lay pipe in water or in trench when weather conditions are unsuitable for work or when temperature is 32 degrees F or below. Pump out or otherwise remove water encountered or accumulated in excavation to keep the bottom of the trench or excavation free and clear of water during installation.

h. Compression or flow span couplings are not permitted.

i. Avoid having irrigation pipe crossovers. When pipes cross there shall be a minimum vertical clearance of 4" inches between the pipes and trenching shall be adjusted accordingly to provide required cover.

j. Vertical stacking of irrigation lines is not permitted. Where pipes are laid in the same trench there shall be a minimum horizontal separation of 4" inches between pipes.

k. There shall be a minimum separation between fittings used on any single piece of pipe of 3" inches between fittings 1 ½" inches or less and 6" inches between fittings 2" inches and larger.

l. Saddle taps are not permitted on lines greater than 2" inches.

m. Drain entire system to a manual drain valve(s) placed at the low point(s) in the system. Drain valve shall be installed on lines of nominal pipe size of 1½" inches or less.

n. Install drain valve in a standard-body plastic valve box with locking cover and sump pit. Drain-gravel backfill shall be 1-cubic foot of cleaned gravel or crushed stone, graded from ¾ inch min. to 1½" inch maximum.

o. Thoroughly clean fixtures, exposed materials, and equipment.

p. Install detectable Line Marking Tape on all main lines and lines > ¾" inch. Place tape 6 "inches above piping.

3.03 PIPING INSTALLATION

A. Location and Arrangement: Drawings indicate location and arrangement of piping systems. Install piping as indicated unless deviations are approved on Coordination Drawings.

B. Install piping at minimum uniform slope of 0.5 percent down toward drain valves.

C. Install piping free of sags and bends.

D. Install groups of pipes parallel to each other, spaced to permit valve servicing.

E. Install fittings for changes in direction and branch connections.

F. Install unions adjacent to valves and to final connections to other components with NPS 2 or smaller pipe connection.

G. Install flanges adjacent to valves and to final connections to other components with NPS 2-1/2 or larger pipe connection.

H. Install underground thermoplastic piping according to ASTM D 2774.

I. Install expansion loops in control-valve boxes for plastic piping.

J. Lay piping on solid subbase, uniformly sloped without humps or depressions.

K. Install ductile-iron piping according to AWWA C600.

L. Install PVC piping in dry weather when temperature is above 40 deg F. Allow joints to cure at least 24 hours at temperatures above 40 deg F before testing.

M. Install water regulators with shutoff valve and strainer on inlet and pressure gage on outlet. Install shutoff valve on outlet. Install aboveground or in control-valve boxes.

N. Water Hammer Arresters: Install between connection to building main and circuit valves aboveground or in control-valve boxes.

O. Install piping in sleeves under parking lots, roadways, and sidewalks.

P. Install sleeves made of Schedule 40 PVC pipe and socket fittings, and solvent-cemented joints.

Q. Install transition fittings for plastic-to-metal pipe connections according to the following:

1. Underground Piping:

a. NPS 1-1/2 and Smaller: Plastic-to-metal transition fittings.

b. NPS 2 and Larger: AWWA transition couplings.

3.05 JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full D. D. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.

2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

E. PE Piping Fastener Joints: Join with insert fittings and bands or fasteners according to piping manufacturer's written instructions.

F. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.

1. Plain-End PE Pipe and Fittings: Use butt fusion.

2. Plain-End PE Pipe and Socket Fittings: Use socket fusion.

G. PVC Piping Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:

1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.

2. PVC Pressure Piping: Join schedule number, ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.

3. PVC Nonpressure Piping: Join according to ASTM D 2855.

3.06 VALVE INSTALLATION

A. Underground Curb Valves: Install in curb-valve casings with tops flush with grade.

B. Aboveground Valves: Install as components of connected piping system.

C. Pressure-Reducing Valves: Install in boxes for automatic control valves or aboveground between shutoff valves.

D. Drain Valves: Install in underground piping in boxes for automatic control valves.

E. Setting Valves:

1. Do not locate valves beneath paved surfaces.

2. Install valves in a level position.

3. Install all valves, except backflow preventer, with minimum 24” inches cover. Refer to Section 15051, Piping Systems, for backflow preventer installation.
4. Install an isolation valve at the PoC, and at loop or zone isolation points.
5. Install an isolation valve upstream of each electric control valve. Isolation valve may be installed in same valve box with automatic valve.
6. Manual Drain Valves: install at end and low points of the irrigation system. Additional manual drain valves must be installed if there are multiple low points along the system’s run of pipe where water collection may occur.
7. Install Reduced Pressure or Pressure Vacuum Breakers in accordance with Section 15051, Piping Systems.

F. Install sprinklers after hydrostatic test is completed.

G. Install sprinklers at manufacturer's recommended heights.

H. Locate part-circle sprinklers to maintain a minimum distance of 4 inches from walls and 2 inches from other boundaries unless otherwise indicated.

3.07 SPRINKLER INSTALLATION

A. Install sprinklers after hydrostatic test is completed.

B. Install sprinklers at manufacturer's recommended heights.

C. Locate part-circle sprinklers to maintain a minimum distance of 6” inches from walls and other boundaries such as curbs and walks.

D, Sprinkler Heads,

1. Fully flush entire system prior to the installation of sprinkler and bubbler heads. Cap risers as deemed necessary to achieve adequate flushing.

E. Bubblers:

1. Bubblers shall be spaced 180 degrees apart and 12” inches from edge of root ball. On sloped surfaces – install bubbler on uphill side of plant material to be irrigated.

3.08 VALVE BOX INSTALLATION

A. Valve boxes shall be installed as shown on the detail drawings and located as shown on the drawings.

B. Valve boxes shall be installed at and level with finish grade.

C. Valve boxes shall be engraved or embossed on the top side of the lid with the contents of each valve box. Letters and numbers shall be no smaller than 1 inch and no larger than 1 ½” inches

1. Control Valves – brand” Zone Valve” and the # of that valve into the lid.
2. Quick coupling valve – Brand “Q C “into the lid
3. Wire splices Brand “WS” into the lid.
4. Isolation valves – “IV”
5. Drain Valves – “DV”.
6. Air release – “AR”

3.09 CONNECTIONS

A. Comply with requirements for piping specified in Division 22 Section "Facility Water Distribution Piping" for water supply from exterior water service piping, water meters, protective enclosures, and backflow preventers. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment, valves, and devices to allow service and maintenance.

C. Connect wiring between controllers and automatic control valves.

3.10 IDENTIFICATION

A. Identify system components. Comply with requirements for identification specified in Division 22 Section "Identification for Plumbing Piping and Equipment."

B. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplates and signs on each automatic controller.

1. Text: In addition to identifying unit, distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.

C. Warning Tapes: Arrange for installation of continuous, underground, detectable warning tapes over underground piping during backfilling of trenches. See Division 31 Section "Earth Moving" for warning tapes.

3.11 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections.

1.Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

2. Operational Test: After electrical circuitry has been energized, operate controllers and automatic control valves to confirm proper system operation.

3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Any irrigation product will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.12 ADJUSTING

A. Adjust settings of controllers.

B. Adjust automatic control valves to provide flow rate at rated operating pressure required for each sprinkler circuit.

C. Adjust sprinklers and devices, except those intended to be mounted aboveground, so they will be flush with, or not more than 1/2 inch above, finish grade.

3.13 CLEANING

A. Flush dirt and debris from piping before installing sprinklers and other devices.

3.14 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain automatic control valves and controllers.

END OF SECTION

SECTION 32 92 00

TURF AND GRASSES

PART 1 - GENERAL

1.01 SECTION INCLUDES:

A. Sodding.

B. Hydro Mulching

1.02 DEFINITIONS

A. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.

B. Finish Grade: Elevation of finished surface of planting soil.

C. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

D. Pesticide: This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.

E. Pests: Living organisms that occur where they are not desired or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.

F. Planting Soil: Standardized topsoil; existing, native surface topsoil; existing, in-place surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

G. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or top surface of a fill or backfill before planting soil is placed.

H. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.

I. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil, but in disturbed areas such as urban environments, the surface soil can be subsoil.

1.03 SUBMITTALS

A. Product Data: For each type of product indicated.
   1. Pesticides and Herbicides: Include product label and manufacturer's application instructions specific to this Project.

B. Certification of Grass Seed: From seed vendor for each grass-seed monostand or mixture stating the botanical and common name, percentage by weight of each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.
   1. Certification of each seed mixture for turf grass sod. Include identification of source and name and telephone number of supplier.

C. Qualification Data: For qualified landscape Installer.

D. Product Certificates: For soil amendments and fertilizers, from manufacturer.

E. Material Test Reports: For standardized ASTM D 5268 topsoil, existing native surface topsoil, existing in-place surface soil, and imported or manufactured topsoil.

F. Maintenance Instructions: Recommended procedures to be established by Owner for maintenance of turf during a calendar year. Submit before expiration of required initial maintenance periods.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful turf establishment.
   1. Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association
   2. Experience: Three years' experience in turf installation in addition to requirements in Division 01 Section "Quality Requirements."
   3. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
   4. Personnel Certifications: Installer's field supervisor shall have certification in one of the following categories from the Professional Landcare Network:
      a. Certified Landscape Technician - Exterior, with installation specialty area(s), designated CLT-Exterior.
      b. Certified Turfgrass Professional, designated CTP.
      c. Certified Turfgrass Professional of Cool Season Lawns, designated CTP-CSL.
   5. Maintenance Proximity: Not more than two hours' normal travel time from Installer's place of business to Project site.
   6. Pesticide Applicator: State licensed, commercial.

B. Soil-Testing Laboratory Qualifications: An independent laboratory or university laboratory, recognized by the State Department of Agriculture, with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed.

C. Soil Analysis: For each unamended soil type, furnish soil analysis and a written report by a qualified soil-testing laboratory stating percentages of organic matter; gradation of sand, silt, and clay content; cation exchange capacity; sodium absorption ratio; deleterious material; pH; and mineral and plant-nutrient content of the soil.
   1. Testing methods and written recommendations shall comply with USDA's Handbook No. 60.
   2. The soil-testing laboratory shall oversee soil sampling, with depth, location, and number of samples to be taken per instructions from Architect. A minimum of three representative samples shall be taken from varied locations for each soil to be used or amended for planting purposes.
   3. Report suitability of tested soil for turf growth.
      a. Based on the test results, state recommendations for soil treatments and soil amendments to be incorporated. State recommendations in weight per 1000 sq. ft. or volume per cu. yd. for nitrogen, phosphorus, and potash nutrients and soil amendments to be added to produce satisfactory planting soil suitable for healthy, viable plants.
      b. Report presence of problem salts, minerals, or heavy metals, including aluminum, arsenic, barium, cadmium, chromium, cobalt, lead, lithium, and vanadium. If such problem materials are present, provide additional recommendations for corrective action.

D. Preinstallation Conference: Conduct conference at Project site.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Sod: Harvest, deliver, store, and handle sod according to requirements in "Specifications for Turfgrass Sod Materials" and "Specifications for Turfgrass Sod Transplanting and Installation" in TPI's "Guideline Specifications to Turfgrass Sodding." Deliver sod in time for planting within 24 hours of harvesting. Protect sod from breakage and drying.

B. Bulk Materials:
   1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.

2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
3. Accompany each delivery of bulk fertilizers, lime, and soil amendments with appropriate certificates.

1.06 PROJECT CONDITIONS

A. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with initial maintenance periods to provide required maintenance from date of substantial completion.
   1. Spring Planting: After May 1st
   2. Fall Planting: Before September 15th.

B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions.

1.07 MAINTENANCE SERVICE

A. Initial Turf Maintenance Service: Provide full maintenance by skilled employees of landscape Installer. Maintain as required in Part 3. Begin maintenance immediately after each area is planted and continue until acceptable turf is established but for not less than the following periods:
   1. Seeded Turf: 60 days from date of Substantial Completion.
      a. When initial maintenance period has not elapsed before end of planting season, or if turf is not fully established, continue maintenance during next planting season.
   2. Sodded Turf: 30 days from date of Substantial Completion.

B. Continuing Maintenance Proposal: From Installer to Owner, in the form of a standard yearly (or other period) maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

PART 2 - PRODUCTS

2.01 SEED

A. Grass Seed/Wildflower Mix: Fresh, clean, dry, new-crop seed complying with AOSA's "Journal of Seed Technology; Rules for Testing Seeds" for purity and germination tolerances.

B. Seed Species: Seed of grass species as follows, with not less than 95 percent germination, not less than 85 percent pure seed, and not more than 0.5 percent weed seed:
   1. See plant list on plan for seed type and amount.

2.02 TURFGRASS SOD

A. Turfgrass Sod: Number 1 Quality/Premium, including limitations on thatch, weeds, diseases, nematodes, and insects], complying with "Specifications for Turfgrass Sod Materials" in TPI's "Guideline Specifications to Turfgrass Sodding." Furnish viable sod of uniform density, color, and texture, strongly rooted, and capable of vigorous growth and development when planted.

B. Turfgrass species see plant list on plan.

C. Turfgrass Species: Sod of grass species as follows, with not less than 95 percent germination, not less than 85 percent pure seed, and not more than 0.5 percent weed seed.

2.03 INORGANIC SOIL AMENDMENTS

A. Lime: ASTM C 602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:
   1. Class: T, with a minimum of 99 percent passing through No.8 sieve and a minimum of 75 percent passing through No. 60 sieve.

2. Class: O, with a minimum of 95 percent passing through No. 8 sieve and a minimum of 55 percent passing through No. 60 sieve.
3. Provide lime in form of ground dolomitic limestone.

B. Sulfur: Granular, biodegradable, containing a minimum of 90 percent sulfur, and with a minimum of 99 percent passing through No. 6 sieve and a maximum of 10 percent passing through No. 40 sieve.

C. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.

D. Aluminum Sulfate: Commercial grade, unadulterated.

E. Perlite: Horticultural perlite, soil amendment grade.

F. Agricultural Gypsum: Minimum 90 percent calcium sulfate, finely ground with 90 percent passing through No. 50 sieve.

G. Sand: Clean, washed, natural or manufactured, and free of toxic materials.

H. Diatomaceous Earth: Calcined, 90 percent silica, with approximately 140 percent water absorption capacity by weight.

I. Zeolites: Mineral clinoptilolite with at least 60 percent water absorption by weight.

2.04 ORGANIC SOIL AMENDMENTS

A. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1/2-inch sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
1. Organic Matter Content: 50 to 60 percent of dry weight.
2. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

B. Retain one of first two paragraphs below, or retain both if applicable. Retain first paragraph if sphagnum peat moss, an acidic peat, is required. Retain second paragraph if peat types with a neutral pH are required.

C. Wood Derivatives: Decomposed, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture and free of chips, stones, sticks, soil, or toxic materials.
1. In lieu of decomposed wood derivatives, mix partially decomposed wood derivatives with ammonium nitrate at a minimum rate of 0.15 lb/cu. ft**.** of loose sawdust or ground bark, or with ammonium sulfate at a minimum rate of 0.25 lb/cu. ft. of loose sawdust or ground bark.

2.05 FERTILIZERS

A. Organic fertilizers are derived from several sources. Bonemeal in first paragraph below is organic and primarily phosphorous, has an alkaline reaction, and is nonburning. Other organic fertilizers include blood meal, cottonseed meal, seaweed meal, soybean meal, alfalfa meal, and blends of these materials.

B Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
1. Composition: 1 lb/1000 sq. ft. of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.
2. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.

C., Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
1. Composition: 20 percent nitrogen, 10 percent phosphorous, and 10 percent potassium, by weight.

2. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.

2.06 PLANTING SOILS

A. Planting Soil: ASTM D 5268 topsoil, with pH range of 5.5 to 7, a minimum of 6 percent organic material content; free of stones 1 inch or larger in any dimension and other extraneous materials harmful to plant growth. Mix ASTM D 5268 topsoil with the following soil amendments in the following quantities to produce planting soil:
   1. Ratio of Loose Compost to Topsoil by Volume: 1:3.
   2. Ratio of Loose Wood Derivatives to Topsoil by Volume: 1:3

B. Revise first subparagraph below if a specific type of liming material (ground dolomitic limestone, calcitic limestone, mollusk shells, or other type) is required; coordinate with "Inorganic Soil Amendments" Article.

C. Planting Soil: Existing, native surface topsoil formed under natural conditions with the duff layer retained during excavation process and stockpiled on-site. Verify suitability of native surface topsoil to produce viable planting soil. Clean soil of roots, plants, sod, stones, clay lumps, and other extraneous materials harmful to plant growth.
   1. Supplement with another specified planting soil when quantities are insufficient.
   2. Mix existing, native surface topsoil with the following soil amendments in the following quantities to produce planting soil:
      a. Ratio of Loose Compost to Topsoil by Volume: 1:3.
      b. Ratio of Loose Wood Derivatives to Topsoil by Volume: 1:3

D. Planting Soil: Existing, in-place surface soil. Verify suitability of existing surface soil to produce viable planting soil. Remove stones, roots, plants, sod, clods, clay lumps, pockets of coarse sand, concrete slurry, concrete layers or chunks, cement, plaster, building debris, and other extraneous materials harmful to plant growth. Mix surface soil with the following soil amendments in the following quantities to produce planting soil:
   1. Ratio of Loose Compost to Surface Soil by Volume: 1:3.
   2. Ratio of Loose Wood Derivatives to Surface Soil by Volume: 1:3

E. Planting Soil: Imported topsoil or manufactured topsoil from off-site sources. Obtain topsoil displaced from naturally well-drained construction or mining sites where topsoil occurs at least 2 inches deep; do not obtain from agricultural land, bogs or marshes.
   1. Additional Properties of Imported Topsoil or Manufactured Topsoil: Screened and free of stones 1 inch or larger in any dimension; free of roots, plants, sod, clods, clay lumps, pockets of coarse sand, paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, building debris, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, acid, and other extraneous materials harmful to plant growth; free of obnoxious weeds and invasive plants including quackgrass, Johnsongrass, poison ivy, nutsedge, nimblewill, Canada thistle, bindweed, bentgrass, wild garlic, ground ivy, perennial sorrel, and bromegrass; not infested with nematodes, grubs, other pests, pest eggs, or other undesirable organisms and disease-causing plant pathogens; friable and with sufficient structure to give good tilth and aeration. Continuous, air-filled, pore-space content on a volume/volume basis shall be at least 15 percent when moisture is present at field capacity. Soil shall have a field capacity of at least 15 percent on a dry weight basis.
   2. Mix imported topsoil or manufactured topsoil with the following soil amendments and fertilizers in the following quantities to produce planting soil:
      a. Ratio of Loose Compost to Topsoil by Volume: 1:3.
      b. Ratio of Loose Wood Derivatives to Topsoil by Volume: 1:3.

2.07 MULCHES

A. Compost Mulch: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1-inch sieve; soluble salt content of 2 to 5 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:

1. Organic Matter Content: 50 to 60 percent of dry weight.
2. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

2.08 PESTICIDES

A. General: Pesticide, registered and approved by EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

B. Pre-Emergent Herbicide (Selective and Non-Selective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.

C. Post-Emergent Herbicide (Selective and Non-Selective): Effective for controlling weed growth that has already germinated.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas to be planted for compliance with requirements and other conditions affecting performance.
1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
2. Do not mix or place soils and soil amendments in frozen, wet, or muddy conditions.
3. Suspend soil spreading, grading, and tilling operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
4. Uniformly moisten excessively dry soil that is not workable and which is too dusty.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Architect and replace with new planting soil.

3.02 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities, trees, shrubs, and plantings from damage caused by planting operations.
1. Protect grade stakes set by others until directed to remove them.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.03 TURF AREA PREPARATION

A. Limit turf subgrade preparation to areas to be planted.

B. Newly Graded Subgrades: Loosen subgrade to a minimum depth of 4 inches. Remove stones larger than 1 inch in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
1. Apply superphosphate fertilizer directly to subgrade before loosening.
2. Spread topsoil, apply soil amendments and fertilizer on surface, and thoroughly blend planting soil.
   a. Delay mixing fertilizer with planting soil if planting will not proceed within a few days.
   b. Mix lime with dry soil before mixing fertilizer.
3. Spread planting soil to a depth of 4 inches but not less than required to meet finish grades after light rolling and natural settlement. Do not spread if planting soil or subgrade is frozen, muddy, or excessively wet.
   a. Spread approximately 1/2 the thickness of planting soil over loosened subgrade. Mix thoroughly into top 2 inches of subgrade. Spread remainder of planting soil.

b. Reduce elevation of planting soil to allow for soil thickness of sod.

C. Unchanged Subgrades: If turf is to be planted in areas unaltered or undisturbed by excavating, grading, or surface-soil stripping operations, prepare surface soil as follows:
   1. Remove existing grass, vegetation, and turf. Do not mix into surface soil.
   2. Loosen surface soil to a depth of at least 6 inches. Apply soil amendments and fertilizers according to planting soil mix proportions and mix thoroughly into top 4 inches 6 inches of soil. Till soil to a homogeneous mixture of fine texture.
      a. Apply superphosphate fertilizer directly to surface soil before loosening.
   3. Remove stones larger than 1 inch in any dimension and sticks, roots, trash, and other extraneous matter.
   4. Legally dispose of waste material, including grass, vegetation, and turf, off Owner's property.

D. Finish Grading: Grade planting areas to a smooth, uniform surface plane with loose, uniformly fine texture. Grade to within plus or minus 1/2 inch of finish elevation. Roll and rake, remove ridges, and fill depressions to meet finish grades. Limit finish grading to areas that can be planted in the immediate future.

E. Moisten prepared area before planting if soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

F. Before planting, obtain Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

3.04 PREPARATION FOR EROSION-CONTROL MATERIALS

A. Prepare area as specified in "Turf Area Preparation" Article.

B. For erosion-control mats, install planting soil in two lifts, with second lift equal to thickness of erosion-control mats. Install erosion-control mat and fasten as recommended by material manufacturer.

C. Fill cells of erosion-control mat with planting soil and compact before planting.

D. For erosion-control blanket or mesh, install from top of slope, working downward, and as recommended by material manufacturer for site conditions. Fasten as recommended by material manufacturer.

E. Moisten prepared area before planting if surface is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

3.05 SEEDING

A. Sow seed with spreader or seeding machine. Do not broadcast or drop seed when wind velocity exceeds 5 mph. Evenly distribute seed by sowing equal quantities in two directions at right angles to each other.
   1. Do not use wet seed or seed that is moldy or otherwise damaged.
   2. Do not seed against existing trees. Limit extent of seed to outside edge of planting saucer.

B. Sow seed at a total rate of 2 lb/1000 sq. ft.

C. Rake seed lightly into top 1/8 inch of soil, roll lightly, and water with fine spray.

D. Protect seeded areas with slopes exceeding 1:4 with erosion-control blankets and 1:6 with erosion-control fiber mesh installed and stapled according to manufacturer's written instructions.

E. Protect seeded areas with erosion-control mats where shown on Drawings; install and anchor according to manufacturer's written instructions.

F. Protect seeded areas with slopes not exceeding 1:6 by spreading straw mulch. Spread uniformly at a minimum rate of 2 tons/acre to form a continuous blanket 1-1/2 inches in loose thickness over seeded areas. Spread by hand, blower, or other suitable equipment.
   1. Anchor straw mulch by crimping into soil with suitable mechanical equipment.

2. Bond straw mulch by spraying with asphalt emulsion at a rate of 10 to 13 gal./1000 sq. ft. Take precautions to prevent damage or staining of structures or other plantings adjacent to mulched areas. Immediately clean damaged or stained areas.

G. Protect seeded areas from hot, dry weather or drying winds by applying compost mulch within 24 hours after completing seeding operations. Soak areas, scatter mulch uniformly to a thickness of 3/16 inch and roll surface smooth.

3.06 HYDROSEEDING

A. Hydroseeding: Mix specified seed, fertilizer, and fiber mulch in water, using equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into homogeneous slurry suitable for hydraulic application.
   1. Mix slurry with nonasphaltic or asphalt-emulsion or fiber-mulch manufacturer's recommended tackifier.
   2. Apply slurry uniformly to all areas to be seeded in a one-step process. Apply slurry at a rate so that mulch component is deposited at not less than 1500-lb/acre dry weight, and seed component is deposited at not less than the specified seed-sowing rate.
   3. Apply slurry uniformly to all areas to be seeded in a two-step process. Apply first slurry coat at a rate so that mulch component is deposited at not less than 500-lb/acre dry weight, and seed component is deposited at not less than the specified seed-sowing rate. Apply slurry cover coat of fiber mulch (hydromulching) at a rate of 1000 lb/acre.

3.07 SODDING

A. Lay sod within 24 hours of harvesting. Do not lay sod if dormant or if ground is frozen or muddy.

B. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to subgrade or sod during installation. Tamp and roll lightly to ensure contact with subgrade, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.
   1. Lay sod across angle of slopes exceeding 1:3.
   2. Anchor sod on slopes exceeding 1:6 with wood pegs or steel staples spaced as recommended by sod manufacturer but not less than 2 anchors per sod strip to prevent slippage.

C. Saturate sod with fine water spray within two hours of planting. During first week after planting, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches below sod.

3.08 TURF RENOVATION

A. Renovate existing turf.

B. Renovate existing turf damaged by Contractor's operations, such as storage of materials or equipment and movement of vehicles.
   1. Reestablish turf where settlement or washouts occur or where minor regrading is required.
   2. Install new planting soil as required.

C. Remove sod and vegetation from diseased or unsatisfactory turf areas; do not bury in soil.

D. Remove topsoil containing foreign materials such as oil drippings, fuel spills, stones, gravel, and other construction materials resulting from Contractor's operations, and replace with new planting soil.

E. Mow, dethatch, core aerate, and rake existing turf.

F. Remove waste and foreign materials, including weeds, soil cores, grass, vegetation, and turf, and legally dispose of them off Owner's property.

G. Till stripped, bare, and compacted areas thoroughly to a soil depth of 6 inches.

H. Apply soil amendments and initial fertilizers required for establishing new turf and mix thoroughly into top 4 inches of existing soil. Install new planting soil to fill low spots and meet finish grades.

I. Apply sod as required for new turf.

J. Water newly planted areas and keep moist until new turf is established.

3.09 TURF MAINTENANCE

A. Maintain and establish turf by watering, fertilizing, weeding, mowing, trimming, replanting, and performing other operations as required to establish healthy, viable turf. Roll, regrade, and replant bare or eroded areas and remulch to produce a uniformly smooth turf. Provide materials and installation the same as those used in the original installation.
   1. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace materials and turf damaged or lost in areas of subsidence.
   2. In areas where mulch has been disturbed by wind or maintenance operations, add new mulch and anchor as required to prevent displacement.
   3. Apply treatments as required to keep turf and soil free of pests and pathogens or disease. Use integrated pest management practices whenever possible to minimize the use of pesticides and reduce hazards.

B. Watering: Install and maintain temporary piping, hoses, and turf-watering equipment to convey water from sources and to keep turf uniformly moist to a depth of 4 inches.
   1. Schedule watering to prevent wilting, puddling, erosion, Lay out temporary watering system to avoid walking over muddy or newly planted areas.
   2. Water turf with fine spray at a minimum rate of 1 inch per week unless rainfall precipitation is adequate.
   3. First week: Perform watering daily to keep soil on sod pads continuously moist and to maintain moist topsoil to a depth of at least 4 inches. Water to prevent wilting or as approved. Water may be needed more than once a day depending on weather conditions.
   4. Remaining weeks: Perform watering weekly or as needed to keep grass from wilting and to promote growth.

C. Mow turf as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than 1/3 of grass height. Remove no more than 1/3 of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet. Schedule initial and subsequent mowings to maintain the following grass height:
   1. Mow Bermuda grass to a height of 1/2 inch to 1 inch or less.

D. Turf Postfertilization: Apply fertilizer after initial mowing and when grass is dry.
   1. Use fertilizer that will provide actual nitrogen of at least 1 lb/1000 sq. ft. to turf area.

3.10 SATISFACTORY TURF and GRASSES

A. Turf installations shall meet the following criteria as determined by Architect:
   1. Satisfactory Seeded Turf: At end of maintenance period, a healthy, uniform, close stand of grass has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 10 sq. ft. and bare spots not exceeding 5 x 5 inches.
   2. Satisfactory Sodded Turf: At end of maintenance period, a healthy, well-rooted, even-colored, viable turf has been established, free of weeds, open joints, bare areas, and surface irregularities.

B. Use specified materials to reestablish turf, wildflowers and grasses that does not comply with requirements and continue maintenance until turf is satisfactory.

3.11 PESTICIDE APPLICATION

A. Apply pesticides and other chemical products and biological control agents in accordance with requirements of authorities having jurisdiction and manufacturer's written

recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.

B. Post-Emergent Herbicides (Selective and Non-Selective): Apply only as necessary to treat already-germinated weeds and in accordance with manufacturer's written recommendations.

3.12 CLEANUP AND PROTECTION

A. Promptly remove soil and debris created by turf work from paved areas. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.

B. Erect temporary fencing or barricades and warning signs as required to protect newly planted areas from traffic. Maintain fencing and barricades throughout initial maintenance period and remove after plantings are established.

C. Remove nondegradable erosion-control measures after grass establishment period.

END OF SECTION

SECTION 32 93 00

PLANTING

PART 1 - GENERAL

1.01 SECTION INCLUDES:

A. Plants.

B. Planting soils.

C. Tree stabilization.

D. Landscape edgings.

1.02 DEFINITIONS

A. Backfill: The earth used to replace or the act of replacing earth in an excavation.

B. Container-Grown Stock: Healthy, vigorous, well-rooted plants grown in a container, with a well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for type and size of plant required.

C. Finish Grade: Elevation of finished surface of planting soil.

D. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

E. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.

F. Pests: Living organisms that occur where they are not desired, or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.

G. Planting Area: Areas to be planted.

H. Planting Soil: Standardized topsoil; existing, native surface topsoil; existing, in-place surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

I. Plant; Plants; Plant Material: These terms refer to vegetation in general, including trees, shrubs, vines, ground covers, ornamental grasses, bulbs, corms, tubers, or herbaceous vegetation.

J. Root Flare: Also called "trunk flare." The area at the base of the plant's stem or trunk where the stem or trunk broadens to form roots; the area of transition between the root system and the stem or trunk.

K. Stem Girdling Roots: Roots that encircle the stems (trunks) of trees below the soil surface.

L. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

M. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.

N. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil; but in disturbed areas such as urban environments, the surface soil can be subsoil.

1.03 SUBMITTALS

A. Product Data: For each type of product indicated, including soils.
   1. Plant Materials: Include quantities, sizes, quality, and sources for plant materials.

2. Pesticides and Herbicides: Include product label and manufacturer's application instructions specific to the Project.
3. Plant Photographs: Include color photographs in digital 3-by 5inch print format of each required species and size of plant material as it will be furnished to the Project. Take photographs from an angle depicting true size and condition of the typical plant to be furnished. Include a scale rod or other measuring device in each photograph. For species where more than 20 plants are required, include a minimum of three photographs showing the average plant, the best quality plant, and the worst quality plant to be furnished. Identify each photograph with the full scientific name of the plant, plant size, and name of the growing nursery.

B. Samples for Verification: For each of the following:
1. Mulch: 1 pint volume of each mulch required; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch. Each Sample shall be typical of the lot of material to be furnished; provide an accurate representation of color, texture, and organic makeup.
2. Edging Materials and Accessories: Manufacturer's standard size, to verify color selected.

C. Qualification Data: For qualified landscape Installer. Include list of similar projects completed by Installer demonstrating Installer's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.

D. Product Certificates: For each type of manufactured product, from manufacturer, and complying with the following:
1. Manufacturer's certified analysis of standard products.
2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.

E. Material Test Reports: For standardized ASTM D 5268 topsoil and existing native surface topsoil and imported or manufactured topsoil.

F. Maintenance Instructions: Recommended procedures to be established by Owner for maintenance of plants during a calendar year. Submit before start of required maintenance periods.

G. Warranty: Sample of special warranty.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful establishment of plants.
1. Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
2. Experience: five years' experience in landscape installation in addition to requirements in Division 01 Section "Quality Requirements."
3. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
4. Pesticide Applicator: State licensed, commercial.

B. Soil-Testing Laboratory Qualifications: An independent or university laboratory, recognized by the State Department of Agriculture, with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed.

C. Soil Analysis: For each unamended soil type, furnish soil analysis and a written report by a qualified soil-testing laboratory stating percentages of organic matter; gradation of sand, silt, and clay content; cation exchange capacity; deleterious material; pH; and mineral and plant-nutrient content of the soil.
1. Testing methods and written recommendations shall comply with USDA's Handbook No. 60.

2. The soil-testing laboratory shall oversee soil sampling; with depth, location, and number of samples to be taken per instructions from Architect. A minimum of three representative samples shall be taken from varied locations for each soil to be used or amended for planting purposes.
3. Report suitability of tested soil for plant growth.
    a. Based upon the test results, state recommendations for soil treatments and soil amendments to be incorporated. State recommendations in weight per 1000 sq ft. or volume per cu. yd. for nitrogen, phosphorus, and potash nutrients and soil amendments to be added to produce satisfactory planting soil suitable for healthy, viable plants.
    b. Report presence of problem salts, minerals, or heavy metals, including aluminum, arsenic, barium, cadmium, chromium, cobalt, lead, lithium, and vanadium. If such problem materials are present, provide additional recommendations for corrective action.

D. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANSI Z60.1.

E. Measurements: Measure according to ANSI Z60.1. Do not prune to obtain required sizes.
1. Trees and Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container grown stock. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip to tip. Take caliper measurements 6 inches above the root flare for trees up to 4-inch caliper size, and 12 inches above the root flare for larger sizes.
2. Other Plants: Measure with stems, petioles, and foliage in their normal position.

F. Plant Material Observation: Architect may observe plant material either at place of growth or at site before planting for compliance with requirements for genus, species, variety, cultivar, size, and quality. Architect retains right to observe trees and shrubs further for size and condition of balls and root systems, pests, disease symptoms, injuries, and latent defects and to reject unsatisfactory or defective material at any time during progress of work. Remove rejected trees or shrubs immediately from Project site.
1. Notify Architect of sources of planting materials seven days in advance of delivery to site.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of conformance with state and federal laws if applicable.

B. Bulk Materials:
1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
3. Accompany each delivery of bulk fertilizers and soil amendments with appropriate certificates.

C. Do not prune trees and shrubs before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.

D. Handle planting stock by root ball.

E. Deliver plants after preparations for planting have been completed, and install immediately. If planting is delayed more than six hours after delivery, set plants and trees in their appropriate

aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.

1. Do not remove container-grown stock from containers before time of planting.
2. Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist, but not overly-wet condition.

1.06 PROJECT CONDITIONS

A. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.

B. Interruption of Existing Services or Utilities: Do not interrupt services or utilities to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary services or utilities according to requirements indicated:
   1. Notify Architect no fewer than two days in advance of proposed interruption of each service or utility.
   2. Do not proceed with interruption of services or utilities without Architect's written permission.

C. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions and warranty requirements.

1.07 WARRANTY

A. Special Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner, or incidents that are beyond Contractor's control.
      b. Structural failures including plantings falling or blowing over.
      c. Faulty performance of tree stabilization, edgings.
      d. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
   2. Warranty Periods from Date of Substantial Completion:
      a. Trees, Shrubs, Vines, and Ornamental Grasses: 12 months.
      b. Ground Covers, Biennials, Perennials, and Other Plants: Three months.
   3. Include the following remedial actions as a minimum:
      a. Immediately remove dead plants and replace unless required to plant in the succeeding planting season.
      b. Replace plants that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
      c. A limit of one replacement of each plant will be required except for losses or replacements due to failure to comply with requirements.
      d. Provide extended warranty for period equal to original warranty period, for replaced plant material.

1.08 MAINTENANCE SERVICE

A. Initial Maintenance Service for Trees and Shrubs: Provide maintenance by skilled employees of landscape Installer. Maintain as required in Part 3. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established but for not less than maintenance period below.
   1. Maintenance Period: Ends when final punch list items have been completed and accepted by Owner.

B. Initial Maintenance Service for Ground Cover and Other Plants: Provide maintenance by skilled employees of landscape Installer. Maintain as required in Part 3. Begin maintenance

immediately after plants are installed and continue until plantings are acceptably healthy and well established but for not less than maintenance period below.

1. Maintenance Period: Ends when final punch list items have been completed and accepted by Owner.

PART 2 - PRODUCTS

2.01 PLANT MATERIAL

A. General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant Schedule or Plant Legend shown on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

1. Trees with damaged, crooked, or multiple leaders; tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark"); crossing trunks; cut-off limbs more than 3/4 inch in diameter; or with stem girdling roots will be rejected.
2. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.

B. Provide plants of sizes, grades, and ball or container sizes complying with ANSI Z60.1 for types and form of plants required. Plants of a larger size may be used if acceptable to Architect, with a proportionate increase in size of roots or balls.

C. Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which shall begin at root flare according to ANSI Z60.1. Root flare shall be visible before planting.

D. Labeling: Label at least one plant of each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for the plant as shown on Drawings.

E. If formal arrangements or consecutive order of plants is shown on Drawings, select stock for uniform height and spread, and number the labels to assure symmetry in planting.

2.02 INORGANIC SOIL AMENDMENTS

A. Lime: ASTM C 602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:

1. Class: T, with a minimum of 99 percent passing through No. 8 sieve and a minimum of 75 percent passing through No. 60 sieve.
2. Class: O, with a minimum of 95 percent passing through No. 8 sieve and a minimum of 55 percent passing through No. 60 sieve.

B. Sulfur: Granular, biodegradable, and containing a minimum of 90 percent sulfur, with a minimum of 99 percent passing through No. 6 sieve and a maximum of 10 percent passing through No. 40 sieve.

C. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.

D. Aluminum Sulfate: Commercial grade, unadulterated.

E. Perlite: Horticultural perlite, soil amendment grade.

F. Agricultural Gypsum: Minimum 90 percent calcium sulfate, finely ground with 90 percent passing through No. 50 sieve.

G. Sand: Clean, washed, natural or manufactured, and free of toxic materials.

H. Diatomaceous Earth: Calcined, 90 percent silica, with approximately 140 percent water absorption capacity by weight.

I. Zeolites: Mineral clinoptilolite with at least 60 percent water absorption by weight.

2.03 ORGANIC SOIL AMENDMENTS

A. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1-inch sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
   1. Organic Matter Content: 50 to 60 percent of dry weight.
   2. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

B. Sphagnum Peat: Partially decomposed sphagnum peat moss, finely divided or granular texture, with a pH range of 3.4 to 4.8.

C. Muck Peat: Partially decomposed moss peat, native peat, or reed-sedge peat, finely divided or of granular texture, with a pH range of 6 to 7.5, and having a water-absorbing capacity of 1100 to 2000 percent.

D. Wood Derivatives: Decomposed, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture and free of chips, stones, sticks, soil, or toxic materials.
   1. In lieu of decomposed wood derivatives, mix partially decomposed wood derivatives with ammonium nitrate at a minimum rate of 0.15 lb/cu. ft. of loose sawdust or ground bark, or with ammonium sulfate at a minimum rate of 0.25 lb/cu. ft. of loose sawdust or ground bark.

E. Manure: Well-rotted, unleached, stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, debris, and material harmful to plant growth.

2.04 FERTILIZERS

A. Bone Meal: Commercial, raw or steamed, finely ground; a minimum of 4 percent nitrogen and 20 percent phosphoric acid.

B. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.

C. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
   1. Composition: 1 lb/1000 sq. ft. of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.
   2. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.

D. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
   1. Composition: 20 percent nitrogen, 10 percent phosphorous, and 10 percent potassium, by weight.
   2. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.

E. Planting Tablets: Tightly compressed chip type, long-lasting, slow-release, commercial-grade planting fertilizer in tablet form. Tablets shall break down with soil bacteria, converting nutrients into a form that can be absorbed by plant roots.
   1. Size: 10-gram tablets.
   2. Nutrient Composition: 20 percent nitrogen, 10 percent phosphorous, and 5 percent potassium, by weight plus micronutrients.

F. Chelated Iron: Commercial-grade FeEDDHA for dicots and woody plants, and commercial-grade FeDTPA for ornamental grasses and monocots.

2.05 PLANTING SOILS

A. Planting Soil Planting Plan: Existing, in-place surface soil. Verify suitability of existing surface soil to produce viable planting soil. Remove stones, roots, plants, sod, clods, clay lumps, pockets of coarse sand, concrete slurry, concrete layers or chunks, cement, plaster, building debris, and other extraneous materials harmful to plant growth. Mix surface soil with the following soil amendments and fertilizers in the following quantities to produce planting soil:
   1. Ratio of Loose Compost to Surface Soil by Volume: 1:3.
   2. Ratio of Loose Wood Derivatives to Surface Soil by Volume: 1:3.
   3. Weight of Sulphur coated fertilizer 15-5-10 with Micronutrients & Iron per 1000 Sq. Ft.: 20lbs
   4. Volume of Sand Plus 10 Percent Diatomaceous Earth per 1000 Sq. Ft.: 1:3.

2.06 MULCHES

A. Mulch: Free from deleterious materials and suitable as a top dressing of trees and shrubs, consisting of one of the following:
   1. Type: Fine Shredded Hardwood Mulch.

2.07 WEED-CONTROL BARRIERS

A. Nonwoven Geotextile Filter Fabric: Polypropylene or polyester fabric, 3 oz./sq. yd. minimum, composed of fibers formed into a stable network so that fibers retain their relative position. Fabric shall be inert to biological degradation and resist naturally-encountered chemicals, alkalis, and acids.

B. Composite Fabric: Woven, needle-punched polypropylene substrate bonded to a nonwoven polypropylene fabric, 4.8 oz./sq. yd..

2.08 PESTICIDES

A. General: Pesticide registered and approved by EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

B. Pre-Emergent Herbicide (Selective and Non-Selective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.

C. Post-Emergent Herbicide (Selective and Non-Selective): Effective for controlling weed growth that has already germinated.

2.09 TREE STABILIZATION MATERIALS

A. Stakes:
   1. Stakes: T-Posts painted black.
   2. Flexible Ties: Wide rubber or elastic bands or straps of length required to reach.
   3. Tree Guying: 2 Gauge wire.

2.10 LANDSCAPE EDGINGS

A. Steel Edging: Standard commercial-steel edging, rolled edge, fabricated in sections of standard lengths, with loops stamped from or welded to face of sections to receive stakes.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   2. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings comparable product by one of the following or approved equal:
      a. COL-MET
         1355 Pritchett Industrial Dr.

         800. 829. 8225
         www.colmet.com
   3. Edging Size: 3/16 inch wide by 4 inches deep.

4. Stakes: Tapered steel, a minimum of 15 inches long.
5. Accessories: Standard tapered ends, corners, and splicers.
6. Finish: Standard paint.
7. Paint Color: Green.

2.11 MISCELLANEOUS PRODUCTS

A. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.

B. Burlap: Non-synthetic, biodegradable.

C. Planter Filter Fabric: Woven or Nonwoven geotextile manufactured for separation applications and made of polypropylene, polyolefin, or polyester fibers or combination of them.

D. Mycorrhizal Fungi: Dry, granular inoculant containing at least 5300 spores per lb of vesicular-arbuscular mycorrhizal fungi and 95 million spores per lb of ectomycorrhizal fungi, 33 percent hydrogel, and a maximum of 5.5 percent inert material.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas to receive plants for compliance with requirements and conditions affecting installation and performance.
   1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
   2. Do not mix or place soils and soil amendments in frozen, wet, or muddy conditions.
   3. Suspend soil spreading, grading, and tilling operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
   4. Uniformly moisten excessively dry soil that is not workable and which is too dusty.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Architect and replace with new planting soil.

3.02 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

C. Lay out individual tree and shrub locations and areas for multiple plantings. Stake locations, outline areas, adjust locations when requested, and obtain Architect's acceptance of layout before excavating or planting. Make minor adjustments as required.

D. Lay out plants at locations directed by Architect. Stake locations of individual trees and shrubs and outline areas for multiple plantings.

E. Apply antidesiccant to trees and shrubs using power spray to provide an adequate film over trunks (before wrapping), branches, stems, twigs, and foliage to protect during digging, handling, and transportation.
   1. If deciduous trees or shrubs are moved in full leaf, spray with antidesiccant at nursery before moving and again two weeks after planting.

F. Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation.

3.03 PLANTING AREA ESTABLISHMENT

A. Loosen subgrade of planting areas to a minimum depth of 6 inches. Remove stones larger than 1 inch in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
   1. Spread topsoil, apply soil amendments and fertilizer on surface, and thoroughly blend planting soil.
      a. Delay mixing fertilizer with planting soil if planting will not proceed within a few days.
   2. Spread planting soil to a depth of 6 inches but not less than required to meet finish grades after natural settlement. Do not spread if planting soil or subgrade is frozen, muddy, or excessively wet.
      a. Spread approximately one-half the thickness of planting soil over loosened subgrade. Mix thoroughly into top 2 inches of subgrade. Spread remainder of planting soil.

B. Finish Grading: Grade planting areas to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades. Finish Grade shall be below finish grade of building for proper drainage away from building.

C. Before planting, obtain Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

D. Application of Mycorrhizal Fungi: At time directed by Architect, broadcast dry product uniformly over prepared soil at application rate indicated on Drawings.

3.04 EXCAVATION FOR TREES AND SHRUBS

A. Planting Pits and Trenches: Excavate circular planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are not acceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.
   1. Excavate approximately three times as wide as ball diameter container-grown stock.
   2. Excavate at least 12 inches wider than root spread and deep enough to accommodate vertical roots for bare-root stock.
   3. Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.
   4. If area under the plant was initially dug too deep, add soil to raise it to the correct level and thoroughly tamp the added soil to prevent settling.
   5. Maintain required angles of repose of adjacent materials as shown on the Drawings. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
   6. Maintain supervision of excavations during working hours.
   7. Keep excavations covered or otherwise protected when unattended by Installer's personnel.

B. Subsoil and topsoil removed from excavations may be used as planting soil.

C. Obstructions: Notify Architect if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.
   1. Hardpan Layer: Drill 6-inch- diameter holes, 24 inches apart, into free-draining strata or to a depth of 10 feet, whichever is less, and backfill with free-draining material.

D. Drainage: Notify Architect if subsoil conditions evidence unexpected water seepage or retention in tree or shrub planting pits.

E. Fill excavations with water and allow to percolate away before positioning trees and shrubs.

3.05 TREE, SHRUB, AND VINE PLANTING

A. Before planting, verify that root flare is visible at top of root ball according to ANSI Z60.1. If root flare is not visible, remove soil in a level manner from the root ball to where the top-

most root emerges from the trunk. After soil removal to expose the root flare, verify that root ball still meets size requirements.

B. Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.

C. Set container-grown stock plumb and in center of planting pit or trench with root flare 2 inches above adjacent finish grades.
   1. Use planting soil planting plan for backfill.
   2. Carefully remove root ball from container without damaging root ball or plant.
   3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
   4. Place planting tablets in each planting pit when pit is approximately one-half filled; in amounts recommended in soil reports from soil-testing laboratory. Place tablets beside the root ball about 1 inch from root tips; do not place tablets in bottom of the hole.
   5. Continue backfilling process. Water again after placing and tamping final layer of soil.

D. When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of the root ball.

3.06 TREE, SHRUB, AND VINE PRUNING

A. Remove only dead, dying, or broken branches. Do not prune for shape.

B. Prune, thin, and shape trees, shrubs, and vines as directed by Architect.

C. Prune, thin, and shape trees, shrubs, and vines according to standard professional horticultural and arboricultural practices. Unless otherwise indicated by Architect, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character.

D. Do not apply pruning paint to wounds.

3.07 TREE STABILIZATION

A. Install trunk stabilization as follows unless otherwise indicated:
   1. Upright Staking and Tying: Stake trees of 2- through 5-inch caliper. Stake trees of less than 2-inch caliper only as required to prevent wind tip out. Use a minimum of two stakes of length required to penetrate at least 18 inches below bottom of backfilled excavation and to extend to the dimension shown on Drawings above grade. Set vertical stakes and space to avoid penetrating root balls or root masses. See Tree on drawings.
   2. Use two stakes for trees up to 12 feet high and 2-1/2 inches or less in caliper; three stakes for trees less than 14 feet high and up to 4 inches in caliper. Space stakes equally around trees.
   3. Support trees with bands of flexible ties at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree.
   4. Support trees with two strands of tie wire, connected to the brass grommets of tree-tie webbing at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree.

B. Staking : Stake trees more than 14 feet in height and more than 3 inches in caliper unless otherwise indicated. Securely attach no fewer than three guys to stakes 30 inches long, driven to grade.
   1. Site-Fabricated Staking-and-Guying Method:
      a. Support trees with bands of flexible ties at contact points with tree trunk and reaching to turnbuckle. Allow enough slack to avoid rigid restraint of tree.
   2. Proprietary Staking and Guying Device: Install staking and guying system sized and positioned as recommended by manufacturer unless otherwise indicated and according to manufacturer's written instructions.

3.08 GROUND COVER AND PLANT PLANTING

A. Set out and space ground cover and plants other than trees, shrubs, and vines as noted on the planting plan.

B. Use planting soil as shown on planting details on the drawings for backfill.

C. Dig holes large enough to allow spreading of roots.

D. Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.

E. Water thoroughly after planting, taking care not to cover plant crowns with wet soil.

F. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.09 PLANTING AREA MULCHING

A. Install weed-control barriers before mulching according to manufacturer's written instructions. Completely cover area to be mulched, overlapping edges a minimum of 6 inches and secure seams with galvanized pins.

B. Mulch backfilled surfaces of planting areas and other areas indicated.
   1. Trees in Ornamental Grass Areas: Apply mulch ring of 3-inch average thickness, with 24-inch radius around trunks or stems unless otherwise noted on drawings. Do not place mulch within 3 inches of trunks or stems.
   2. Mulch in Planting Areas: Apply 3-inch average thickness of mulch over whole surface of planting area, and finish level with adjacent finish grades. Do not place mulch within 3 inches of trunks or stems.

3.10 EDGING INSTALLATION

A. Steel Edging: Install steel edging where indicated according to manufacturer's written instructions. Anchor with steel stakes spaced approximately 30 inches apart, driven below top elevation of edging.

3.11 PLANT MAINTENANCE

A. Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, adjusting and repairing tree-stabilization devices, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings. Spray or treat as required to keep trees and shrubs free of insects and disease.

B. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.

C. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use integrated past management practices whenever possible to minimize the use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.

3.12 PESTICIDE APPLICATION

A. Apply pesticides and other chemical products and biological control agents in accordance with authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.

B. Pre-Emergent Herbicides (Selective and Non-Selective): Apply to tree, shrub, and ground-cover areas in accordance with manufacturer's written recommendations. Do not apply to seeded areas.

C. Post-Emergent Herbicides (Selective and Non-Selective): Apply only as necessary to treat already-germinated weeds and in accordance with manufacturer's written recommendations.

3.13 CLEANUP AND PROTECTION

A. During planting, keep adjacent paving and construction clean and work area in an orderly condition.

B. Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.

C. After installation and before Substantial Completion, remove nursery tags, nursery stakes, tie tape, labels, wire, burlap, and other debris from plant material, planting areas, and Project site.

3.14 DISPOSAL

A. Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Owner's property.

END OF SECTION

SECTION 33 4600

SUBDRAINAGE

PART 1 GENERAL

1.01 DESCRIPTION:

A. This section specifies providing subway drainage systems except drainage sump pumping systems.

1.02 QUALITY ASSURANCE:
The following Codes, Regulations, Reference Standards, and Specifications apply to work included in this section:

A. Codes and regulations of the jurisdictional authorities.

B. Reference Codes and Standards – Section 01090
1. AASHTO: M252.
2. ASTM: A48, B584, B271, C33, C131, C654, C700, D1785, D2729.
3. FS: QQ – B - 626

1.03 SUBMITTALS:

Submit the following for approval:

A. Product information for all products – perforated pipe, non – perforated pipe, inlets, atrium drains. Include complete catalog information for material and equipment.

PART 2 PRODUCTS

2.01 PLASTIC PIPE AND FITTINGS:

A. Solid, non-perforated, polyvinyl chloride (PVC) pipe: ASTM D2729 or ASTM D1785.

B. Polyethylene, corrugated pipe:
1. AASHTO M252.
2. INDIVIDULA LENGTHS NOT LESS THAN 10 FEET.

C. Fittings:
1. Polyvinyl choloride: ASTM D2729 or ASTM D1785.
2. Polyethylene, corrugated: AASHTO M252.

D. Perforated drainage system as recommended by manufacturer or engineered wood fiber mulch and/or as specified on the drawings.

2.02 CASTINGS:

A. Drainage Castings:
1. Drain inlets, cleanouts, floor and scupper drains: Fabricated from cast iron, ASTM A48, Class 25B with brass parts, Alloy Number 844; or ductile iron, ASTM A 536., Grade 60 – 40 18.
2. Leaded red brass and leaded semi – red brass sand castings: ASTM B584.
3. Copper base alloy centrifugal castings: ASTM B271.

B. Drainage Casting Covers:
1. Cast Irion: ASTM A48, Class 30B.

2. Ductile Iron: ASTM A534, Grade 60 – 40 – 18.
3. Leaded red brass: FS QQ B – 626.

2.03 POROUS SUBGRADE MATERIAL

A. Coarse aggregate: ASTM C33, Size No. 67.

B. Maximum percentage of wear: 45 percent when tested in accordance with ASTM C131

PART 3 – EXECUTION

3.01 EXCAVATION:

Excavate to lines and grades shown in accordance with section 31 01 00, “Earthwork”.

3.02 POROUS MATERIAL PLACEMENT:

A. Place porous material for subgrade around main track drain and drain pipes and for trench backfill as shown.

B. In rock excavation, place material only on stable rock surfaces. Do not place porous subrade material on excavated rock surface until surface has been flushed with water to remove fine dust and sludge.

3.03 PLASTIC PIPE:

A. Lay plastic pipe as specified for porous concrete pipe.

B. Use cast iron, concrete, or vitrified clay pipe for last two feet at exposed termination points. Provide standard adapter fittings for connections between differing pie materials.

C. Use nonpressure pipe for drainage.

D. Plastic pipe may be used only if buried or encased in concrete. Its use is prohibited in exposed locations.

E. Lay pipe to provide positive drainage.

3.04 INSTALLATION OF PIPE AND CASTINGS:

A. Install drainage piping to the lines and grades shown. Set inlets relative to finish grade as indicated on the drawings.

B. Locate drainage castings and set to the finished floor elevation, slabs, or inverts.

C. Install cleanouts at the locations shown or a minimum of every 50 linear feet.

3.05 PROTECTON OF DRAINAGE SYSTEM:

A. During the course of construction, maintain drainage lines free of debris and in undamaged condition.

B. Plug or close ends of completed runs of piping until the Owner’s representative approves their use.

C. Cover the inlet end of drainage piping used to convey water to wet wells at the existing drainage pumping stations with wire mesh screen.

3.06 CONNECTIONS TO SYSTEMS:

A. Provide connection to existing storm sewer per NCTCOG standards, details and specifications.

B. Connect playground subdrainage system to the drainage system for the wood fiber per manufacturer's requirements.

3.07 FIELD QUALITY CONTROL:

A. Where drainage piping is located below invert slabs, conduct a ball, shuttlecock, or mandrel test to ensure that the line is free of obstructions subsequent to the placing of porous subgrade material over the line and prior to the placement of the concrete invert slab.

B. Upon completion of the test and determination that the line is free of obstructions, plug, cap or otherwise close the open end or ends of the installed piping to prevent the entrance of debris into the lines.

C. Immediately prior to final inspection of the work, remove debris from manholes, drain inlets, and floor scupper drains. In the presence of the Contracting Officer, provide by one of the methods specified above that the piping is free of obstructions.

3.08 CLEAN - UP

A. Daily removal of rubbish and debris caused by this work from the site.

END OF SECTION 334600
